Description

The SP8782 is a multi-modulus divider which divides by 16/17 when the Ratio Select input is low and by 32/33 when the Ratio Select input is high. When high, the modulus Control input selects the lower division ratio (16 or 32) and the higher ratio (17 or 33) when it is low.

The device uses resynchronisation techniques to reduce the effects of propagation delays in frequency synthesis.

The SP8782A (ceramic DIL package) is characterised over the full military temperature range of -55 C to +125 C, the SP8782B (miniature plastic DIL package) over the industrial range of -40 C to+85 C.

Notes: 1. The set-up time t_s is defined as the minimum time that can elapse between L \rightarrow H transition of the modulus control input and the next L \rightarrow H output transition to ensure that the \div 16 (32) mode is obtained.

2. The release time t_r is defined as the minimum time that can elapse between $H \rightarrow L$ transition of the modulus control input and the next $L \rightarrow H$ output transition to ensure that the \div 17 (33) mode is obtained.
