

Crystal to LVPECL Clock Generator

Features

- One LVPECL output pair
- External crystal frequency: 25.0 MHz
- Selectable output frequency: 62.5 MHz or 75 MHz
- Low RMS phase jitter at 75 MHz, using 25 MHz crystal (1.5 MHz–10 MHz): 0.27 ps (typical)
- Low RMS phase jitter at 62.5 MHz, using 25 MHz crystal (1.5 MHz–10 MHz): 0.38 ps (typical)
- Pb-free 8-Pin TSSOP package
- Supply voltage: 3.3 V
- Commercial temperature range

Functional Description

The CY2XP41 is a PLL (Phase Locked Loop) based high performance clock generator. It is optimized to generate high performance clock frequencies for DVD-R applications. It uses Cypress's low noise VCO technology to achieve less than 1 ps typical RMS phase jitter, that meets application jitter requirements. The CY2XP41 has a crystal oscillator interface input and one LVPECL output pair.

Note

1. The voltage on any input or IO pin cannot exceed the power pin during power up. Power supply sequencing is NOT required.
2. Simulated using Apache Sentinel TI software. The board is derived from the JEDEC multilayer standard. It measures 76 x 114 x 1.6 mm and has 4-layers of copper (2/1/1/2 oz.). The internal layers are 100% copper planes, while the top and bottom layers have 50% metallization. No vias are included in the model.
3. Not 100% tested, guaranteed by design and characterization.

Application Information

Power Supply Filtering Techniques

As in any high speed analog circuitry, noise at the power supply pins degrades performance. To achieve optimum jitter performance, use good power supply isolation practices. Figure 6 shows a typical filtering scheme. Since all of the current flows through pin 1, the resistance and inductance between this pin and the supply is minimized. A 0.01 or 0.1 μF ceramic chip capacitor is also located close to this pin to provide a short and low impedance AC path to ground. A 1 to 10 μF ceramic or tantalum capacitor should be located in the vicinity of this device, and may be shared with other devices.

Figure 6. Power Supply Filtering

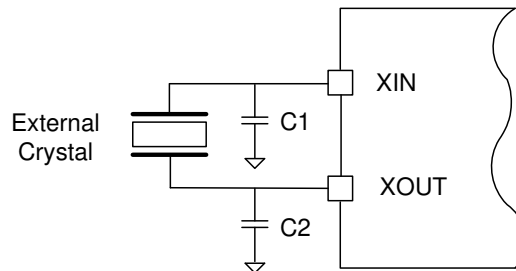

Termination for LVPECL Output

The CY2XP41 implements its LVPECL driver with a current steering design. For proper operation, it requires resistor termination. This datasheet specifies a termination voltage of $V_{DD} - 2.1\text{ V}$. Impedance matching is advised for best signal integrity. Figure 2 on page 6 shows a termination scheme that is recommended as a guideline. Other suitable clock layouts exist and it is recommended that the board designers simulate to guarantee compatibility across all printed circuit and process variations. The recommended termination is a 40Ω load, which is used to achieve the specified common mode and peak-to-peak voltage swing. For optimal signal integrity, traces should also be 40Ω . The device will also operate with 50Ω termination, but is not specified with such a load.

Crystal Interface

The CY2XP41 is characterized with 10 pF parallel resonant crystals. The capacitor values shown in Figure 7 are determined using a 25 MHz 10 pF parallel resonant crystal and are chosen to minimize the ppm error. Cypress recommends the following C1 and C2 values: $C1 = C2 = 6.8\text{ pF}$.
