## Si860xI2C EVALUATION BOARD USER'S GUIDE

---

### 1. Introduction

The Si860xI2C evaluation board allows designers to evaluate Skyworks' family of ultra-low-power I<sup>2</sup>C isolators. These isolators are CMOS devices employing RF coupler technology to transmit digital information across an isolation barrier. Very high speed operation at low power levels is achieved. These products are based on Skyworks' proprietary RF isolation technology and offer shorter propagation delays, lower power consumption, improved noise immunity, smaller installed size, and more stable operation with temperature and age versus opto couplers. The Si860x isolator series consists of single-package galvanic isolation solutions for I<sup>2</sup>C, SMBus, and other digital power supply communications, including those for bus power management. For more information, refer to the respective family data sheets.

A summary of the benefits provided by the Skyworks Si86xx digital isolator family includes the following:

- Si86xx Digital Isolators
  - 5.0 kV, 3.75 kV, and 2.5 kV isolation ratings
  - UL, CSA, CQC, and VDE certifications
  - DC to 150 Mbps
  - 2.5 to 5.5 V VDD supply range
  - Fail-safe operating mode(s)
  - -40 to 125 °C temperature range
  - 10 ns max propagation delay
  - <1.5 mA/channel @ 1 Mbps
  - <1.5 ns pulse width distortion
  - Very low EMI
  - Up to 50 V/m electric field immunity
  - >1000 A/m magnetic field immunity
  - >30 kV/μs CMTI
  - 4 kV HBM ESD immunity
- Si860x I<sup>2</sup>C-Compatible Isolators
  - Bidirectional I<sup>2</sup>C channels
  - Supports I<sup>2</sup>C clocks up to 1.7 MHz
  - 3 to 5.5 V VDD supply range
  - Open drain outputs with 35 mA sink current
- Packaging and Isolation Rating Options (kVrms) for Si860x devices
  - NB SOIC-8 (2.5 kV, 3.75 kV)
  - NB SOIC-16 (2.5 kV, 3.75 kV)
  - WB SOIC-16 (5 kV)
  - RoHS compliant

## 2. Kit Contents

The Si860xI2C Evaluation Kit contains the following items:

- Si860xI2C-EVB evaluation board shown in Figure 1.
- Si8600, Si8602, and Si8605 I<sup>2</sup>C digital isolators installed on the evaluation board.

Figure 1. Si860xI2C Evaluation Board Overview

## 3. Hardware Overview and Setup

The Si860xI2C evaluation board comes populated with an Si8600 (isolated I<sup>2</sup>C, two bidirectional), Si8602 (isolated I<sup>2</sup>C, one bidirectional), and Si8605 (I<sup>2</sup>C isolator, two bidirectional, two unidirectional). The board is designed to be powered from two separate 5 V supplies (500 mA) that power all the isolators on the boards. Power is applied to the board before evaluating any isolated channel. Power is applied to the Si860xI2C-EVB by connecting 5 V supplies to the terminal blocks (AVDD and AGND, BVDD and BGND) found near the top of the board. Supplies as low as 3.0 V and as high as 5.5 V can be used. Figure 2 provides a silkscreen overview of the board.

## 3.1. I<sup>2</sup>C Isolator Considerations

The Si8600, Si8602, and Si8605 each have one or two 1.7 MHz I<sup>2</sup>C channels that are bidirectional. After power has been supplied to the EVB, connect an I<sup>2</sup>C controller to the desired input channel. The Si860x I<sup>2</sup>C channels have 3 kΩ pull-up resistors already installed. If these resistors are redundant with the controller, the user should remove the redundant pull-up resistors to accommodate adequate drive current for the test being performed.

Figure 3 illustrates Side A pulling down, with Side B following, for the Si8600 device. An I<sup>2</sup>C pin of a microcontroller asserted a logic low at Side A, which pulls the normally high signal low. Both Side A and Side B were powered with 5 V. Channel 4 (green) is Side A, and Channel 3 (pink) is Side B.

Figure 4 illustrates Side B pulling up, with Side A following, for the same Si8600 device. An I<sup>2</sup>C pin of a microcontroller was deasserted at Side B, and the 3 kΩ pull-up resistors on each side pulls the signal high.

Figure 3. Side A Pulling Down on Si8600 I<sup>2</sup>C Channel

Figure 4. Side B Pulling Up on Si8600 I<sup>2</sup>C Channel

## 3.2. Digital Isolator Considerations

After power has been supplied to the board, connect a digital input signal (5 V<sub>peak</sub> max, with desired clock frequency up to 10 Mbps) to the desired digital input channel (Si8602 and Si8605). To view the isolated channel's data transmission, connect a scope probe to the digital output channel of interest. The board can be used to measure propagation delay, pulse-width distortion, channel-channel matching, pulse-width skew, and various other parameters.

The nominal output impedance of an isolator driver channel is approximately 50 Ω, ±40%, which is a combination of the values of the on-chip series termination resistor and the channel resistance of the output driver FET. When driving loads where transmission line effects will be a factor, output pins should be terminated with 50 Ω controlled impedance PCB traces.

Figure 5 illustrates the Si8605 transmitting a 500 kHz, 4V<sub>peak</sub> digital signal from side A to side B. AVDD and BVDD were powered with 5 V power supplies. Channel 1 (yellow) illustrates the input waveform, and Channel 3 (pink) illustrates the output waveform.
