

## Double 4 mΩ high-side driver with analog CurrentSense for automotive applications

Datasheet - production data

### Features

Max transient supply voltage	$V_{CC}$	41 V
Operating voltage range	$V_{CC}$	4.5 to 27 V
Max On-State resistance (per ch.)	$R_{ON}$	4 mΩ
Current limitation (typ)	$I_{LIMH}$	100 A
Off state supply current	$I_S$	2 μA <sup>(1)</sup>

1. Typical value with all loads connected

- AEC-Q100 qualified 
- General
  - Inrush current active management by power limitation
  - Very low stand-by current
  - 3.0 V CMOS compatible input
  - Optimized electromagnetic emission
  - Very low electromagnetic susceptibility
  - In compliance with the 2002/95/EC European directive
- Diagnostic functions
  - Proportional load current sense
  - Current sense disable
  - Thermal shutdown indication
- Protection
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Thermal shutdown
  - Self limiting of fast thermal transients
  - Protection against loss of ground and loss of  $V_{CC}$

- Reverse battery protection with self switch-on of the PowerMOS
- Electrostatic discharge protection

### Applications

- All types of resistive, inductive and capacitive loads
- Suitable for power management applications

### Description

The device is a double channel high-side driver manufactured using STMicroelectronics proprietary VIPower® M0-5 technology. It is intended for driving resistive or inductive loads with one side connected to ground. Active  $V_{CC}$  pin voltage clamp and load dump protection circuit protect the devices against transients on the  $V_{CC}$  pin.

The device integrates an analog current sense which delivers a current proportional to the load current (according to a known ratio) when CS\_DIS is driven low or left open. When CS\_DIS is driven high, the CURRENT SENSE pin is high impedance.

Output current limitation protects the devices in overload condition. In case of long duration overload, the device limits the dissipated power to a safe level up to thermal shutdown intervention. Thermal shutdown with automatic restart allows the device to recover normal operation as soon as a fault condition disappears.

### 2.1 Absolute maximum ratings

Stressing the device above the ratings listed in *Table 3* may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to the conditions in this section for extended periods may affect device reliability.

**Note:** To ensure long term reliability under heavy overload or short-circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles.

### 3 Application information

Figure 22. Application schematic

#### 3.1 MCU I/Os protection

When negative transients are present on the  $V_{CC}$  line, the control pins will be pulled negative to approximately -1.5V.

ST suggests the insertion of resistors ( $R_{prot}$ ) in the lines to prevent the  $\mu$ C I/Os pins from latching up.

The values of these resistors provide a compromise between the leakage current of the  $\mu$ C, the current required by the HSD I/Os (input levels compatibility) and the latch-up limit of the  $\mu$ C I/Os.

$$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -1.5$  V and  $I_{latchup} \geq 20$  mA;  $V_{OH\mu C} \geq 4.5$  V

$$75 \Omega \leq R_{prot} \leq 240 \text{ k}\Omega$$

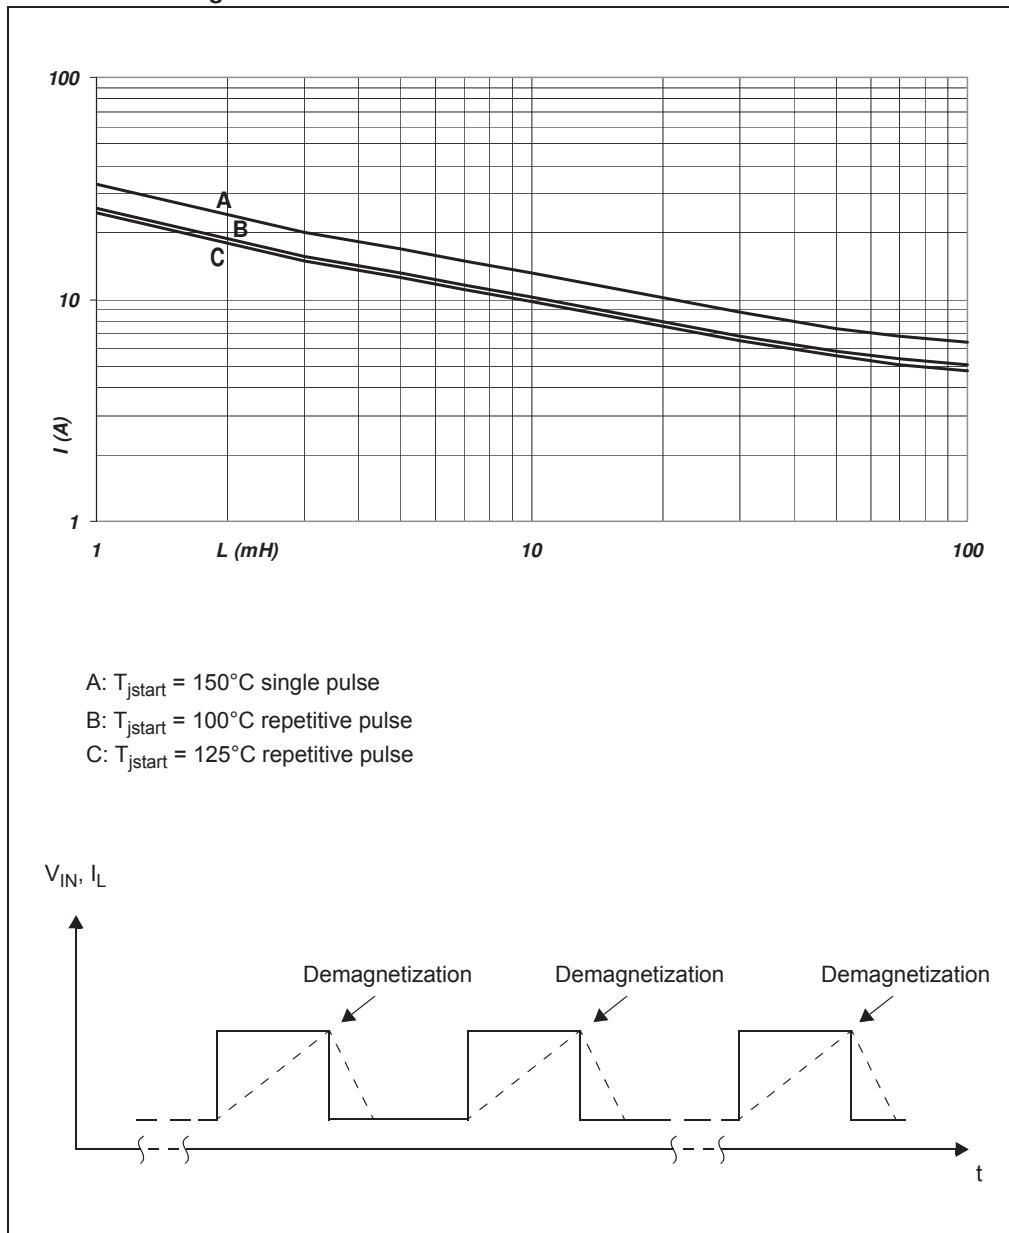

Recommended values:  $R_{prot} = 10 \text{ k}\Omega$ ,  $C_{EXT} = 10 \text{ nF}$

#### 3.2 Load dump protection

$D_{Id}$  is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds the  $V_{CCPK}$  max rating. The same applies if the device will be subject to transients on the  $V_{CC}$  line that are greater than the ones shown in [Table 11](#).

### 3.3 Maximum demagnetization energy ( $V_{CC} = 13.5$ V)

Figure 23. Maximum turn off current versus inductance

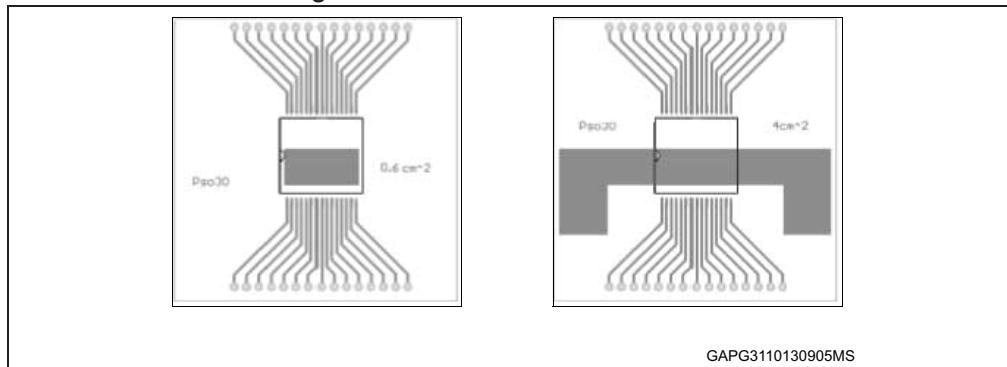

Note: Values are generated with  $R_L = 0 \Omega$ .

In case of repetitive pulses,  $T_{jstart}$  (at the beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.
