

# 5 kV<sub>rms</sub> 4.5-A/9-A Isolated Dual Channel Gate Driver

## NCP51561

SOIC-16 WB  
CASE 751G-03

The NCP51561 are isolated dual-channel gate drivers with 4.5-A/9-A source and sink peak current respectively. They are designed for fast switching to drive power MOSFETs, and SiC MOSFET power switches. The NCP51561 offers short and matched propagation delays.

Two independent and 5 kV<sub>rms</sub> internal galvanic isolation from input to each output and internal functional isolation between the two output drivers allows a working voltage of up to 1500 V<sub>DC</sub>. This driver can be used in any possible configurations of two low side, two high-side switches or a half-bridge driver with programmable dead time.

An ENA/DIS pin shutdowns both outputs simultaneously when set low or high for ENABLE or DISABLE mode respectively.

The NCP51561 offers other important protection functions such as independent under-voltage lockout for both gate drivers and a Dead Time adjustment function.

### Features

- 4.5 A Peak Source, 9 A Peak Sink Output Current Capability
- Flexible: Dual Low-Side, Dual High-Side or Half-Bridge Gate Driver
- Independent UVLO Protections for Both Output Drivers
- Output Supply Voltage from 6.5 V to 30 V with 5-V and 8-V for MOSFET, 13-V and 17-V UVLO for SiC, Thresholds.
- Common Mode Transient Immunity CMTI > 200 V/ns
- Propagation Delay Typical 36 ns with
  - ◆ 5 ns Max Delay Matching per Channel
  - ◆ 5 ns Max Pulse-Width Distortion
- User Programmable Input Logic
  - ◆ Single or Dual-Input Modes via ANB
  - ◆ ENABLE or DISABLE Mode
- User Programmable Dead-Time
- Isolation & Safety
  - ◆ 5 kV<sub>RMS</sub> Isolation for 1 Minute (per UL1577 Requirements) and 1500 V Peak Differential Voltage between Output Channels
  - ◆ 8000 V<sub>PK</sub> Reinforced Isolation Voltage (per VDE0884-11 Requirements)
  - ◆ CQC Certification per GB4943.1-2011
  - ◆ SGS FIMO Certification per IEC 62386-1
- These are Pb-Free Devices

### Typical Applications

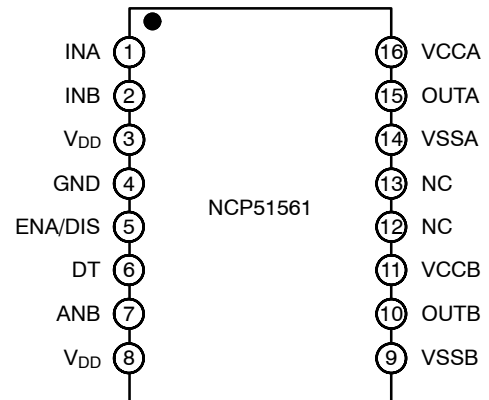

- Motor Drives
- Isolated Converters in DC-DC and AC-DC Power Supply
- Server, Telecom, and Industrial Infrastructures
- UPS and Solar Inverters

### MARKING DIAGRAM

NCP51561 = Specific Device Code  
 X = A or B or C or D for UVLO Option  
 Y = A or B for ENABLE/DISABLE  
 A = Assembly Location  
 WL = Wafer Lot  
 YY = Year  
 WW = Work Week  
 G = Pb-Free Package

### PIN ASSIGNMENT

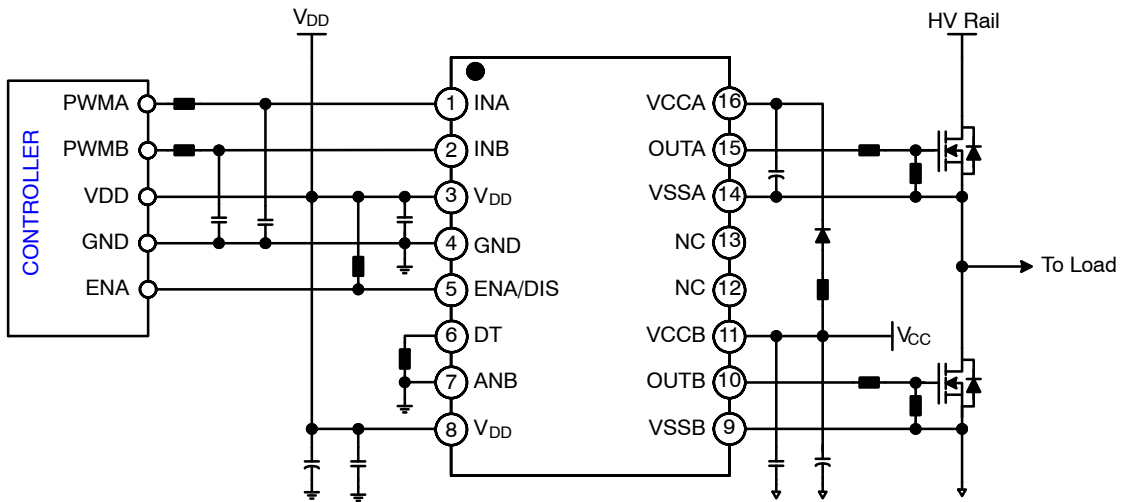

### ORDERING INFORMATION

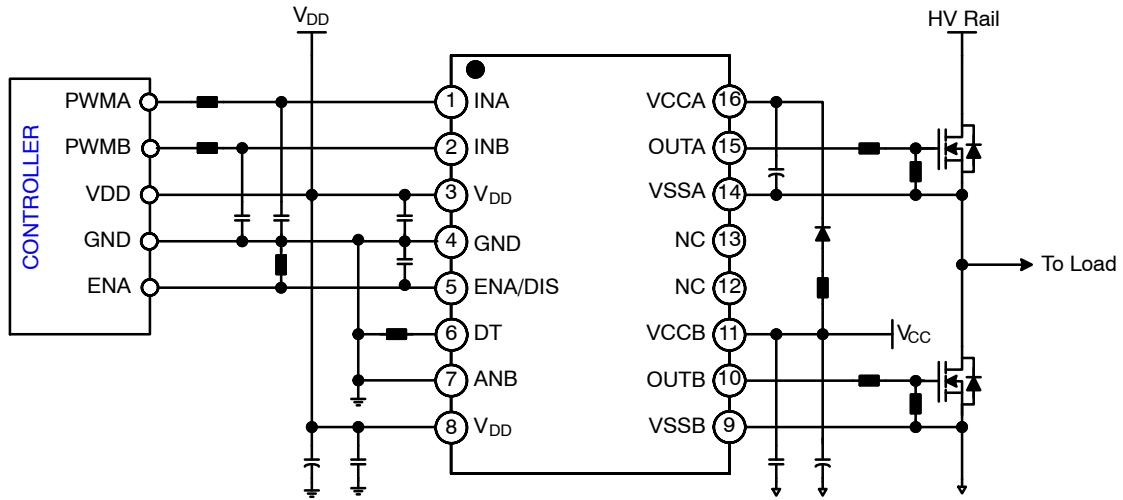

See detailed ordering and shipping information on page 30 of this data sheet.

## FUNCTIONAL TABLE

INPUT					UVLO			GATE DRIVE OUTPUT	
ENA/DIS (Note 3)		ANB	INA	INB	Input Side (V <sub>DD</sub> )	Output Side		OUTA	OUTB
ENABLE	DISABLE					Channel A (V <sub>CCA</sub> )	Channel B (V <sub>CCB</sub> )		
X	X	X	X	X	Active	X	X	L	L
X	X	X	X	X	X	Active	Active	L	L
H	L	L	X	L	Inactive	Active	Inactive	L	L
H	L	L	X	H	Inactive	Active	Inactive	L	H
H	L	L	L	X	Inactive	Inactive	Active	L	L
H	L	L	H	X	Inactive	Inactive	Active	H	L
L	H	L	X	X	Inactive	Inactive	Inactive	L	L
H	L	L	L	L	Inactive	Inactive	Inactive	L	L
H	L	L	L	H	Inactive	Inactive	Inactive	L	H
H	L	L	H	H	Inactive	Inactive	Inactive	L (Note 5)	L (Note 5)
					Inactive	Inactive	Inactive	H (Note 6)	H (Note 6)
H	L	H	L	X	Inactive	Active	Inactive	L	H
H	L	H	H	X	Inactive	Active	Inactive	L	L
H	L	H	L	X	Inactive	Inactive	Active	L	L
H	L	H	H	X	Inactive	Inactive	Active	H	L
L	H	H	X	X	Inactive	Inactive	Inactive	L	L
H	L	H	L	X	Inactive	Inactive	Inactive	L	H
H	L	H	H	X	Inactive	Inactive	Inactive	H	L

1. "L" means that LOW, "H" means that HIGH and X: Any Status
2. Inactive means that V<sub>DD</sub>, V<sub>CCA</sub>, and V<sub>CCB</sub> are above UVLO threshold voltage (Normal operation)  
Active means that UVLO disables the gate driver output stage.
3. Disables both gate drive output when the ENA/DIS pin is LOW in ENABLE version, which is default is HIGH, if this pin is open.  
Enables both gate drive output when the ENA/DIS pin is LOW in DISABLE version, which is default is LOW, if this pin is open.
4. When the ANB pin is HIGH, OUTA and OUTB are complementary outputs from PWM input signal on the INA pin regardless the INB signal.
5. DT pin is left open or programmed with R<sub>DT</sub>.
6. DT pin pulled to V<sub>DD</sub>.

# NCP51561

## PIN CONNECTIONS

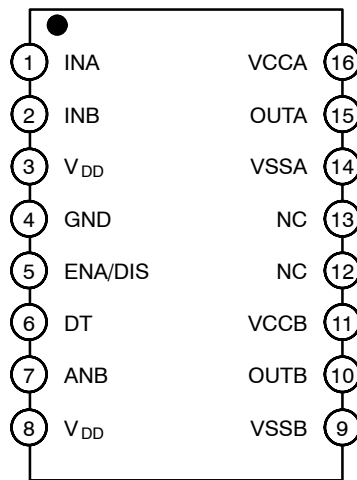

Figure 3. Pin Connections – SOIC-16 WB (Top View)

### PIN DESCRIPTION

Pin No.	Symbol	I/O	Description
1	INA	Input	Logic Input for Channel A with internal pull-down resistor to GND
2	INB	Input	Logic Input for Channel B with internal pull-down resistor to GND.
3, 8	V <sub>DD</sub>	Power	Input-side Supply Voltage. It is recommended to place a bypass capacitor from V <sub>DD</sub> to GND.
4	GND	Power	Ground Input-side. (all signals on input-side are referenced to this pin)
5	ENA/DIS	Input	Logic Input High Enables Both Output Channels with Internal pull-up resistor for an ENABLE version. Conversely, Logic Input High disables Both Output Channels with Internal pull-down resistor for the DISABLE version.
6	DT	Input	Input for programmable Dead-Time It provides three kind of operating modes according to the DT pin voltage as below. <b>Mode-A:</b> Cross-conduction both channel outputs is not allowed even though dead-time is less than maximum 20 ns when the DT pin is floating (Open). <b>Mode-B:</b> Dead-time is adjusted according to an external resistance (R <sub>DT</sub> ). $t_{DT}$ (in ns) = 10 x R <sub>DT</sub> (in kΩ) Recommended dead-time resistor (R <sub>DT</sub> ) values are between 1 kΩ and 300 kΩ. <b>MODE-C:</b> Cross-conduction both channel outputs is allowed when the DT pin pulled to VDD.
7	ANB	Input	Logic Input to change the input signal configuration with internal pull-down resistor to GND. OUTA and OUTB work as complementary outputs from INA PWM input signal regardless of the INB signal when the ANB pin is high. It is recommended to tie this pin to GND or floating (not recommended) if the ANB pin is not used to achieve better noise immunity. The ANB pin has a typical 3.3 μs internal filter to improve noise immunity but we recommend to tie to GND, if the ANB pin is not used.
9	VSSB	Power	Ground for Channel B
10	OUTB	Output	Output for Channel B
11	V <sub>CCB</sub>	Power	Supply Voltage for Output Channel B. It is recommended to place a bypass capacitor from V <sub>CCB</sub> to VSSB.
12, 13	NC	-	No Connection; Keep pin floating
14	VSSA	Power	Ground for Channel A
15	OUTA	Output	Output of Channel A
16	V <sub>CCA</sub>	Power	Supply Voltage for Output Channel A. It is recommended to place a bypass capacitor from V <sub>CCA</sub> to VSSA.

## SAFETY LIMITING VALUE

Symbol	Parameter		Side	Min	Typ	Max	Unit
P <sub>S</sub>	Safety Supply Power	Maximum Values in Failure; Input Power	P <sub>S,INPUT</sub>	-	-	88	mW
		Maximum Values in Failure; Output Power	P <sub>S,OUT</sub>	-	-	1412	
		Maximum Values in Failure; Total Power	P <sub>S,TOTAL</sub>	-	-	1500	
T <sub>S</sub>	Safety Temperature	Maximum Values in Failure; Case Temperature		-	-	150	°C

## MAXIMUM RATINGS

Symbol	Parameter	Min	Max	Unit	
V <sub>DD</sub> to GND	Power Supply Voltage – Input Side (Note 8)	-0.3	5.5	V	
V <sub>CCA</sub> – V <sub>SSA</sub> , V <sub>CCB</sub> – V <sub>SSB</sub>	Power Supply Voltage – Driver Side (Note 9)	-0.3	33	V	
OUTA to V <sub>SSA</sub> , OUTB to V <sub>SSB</sub>	Driver Output Voltage (Note 9)	-0.3	V <sub>CCA</sub> + 0.3, V <sub>CCB</sub> + 0.3	V	
OUTA to V <sub>SSA</sub> , OUTB to V <sub>SSB</sub> , Transient for 200 ns (Note 10)		-2	V <sub>CCA</sub> + 0.3, V <sub>CCB</sub> + 0.3	V	
INA, INB, and ANB	Input Signal Voltages (Note 8)	-0.3	20	V	
INA, INB Transient for 50 ns (Note 10)		-5	20	V	
ENA/DIS	Input Signal Voltages (Note 8)	-0.3	5.5	V	
ENA/DIS Transient for 50ns (Note 10)		-5	5.5	V	
DT	Dead Time Control (Note 8)	-0.3	V <sub>DD</sub> + 0.3	V	
V <sub>SSA</sub> –V <sub>SSB</sub> , V <sub>SSB</sub> –V <sub>SSA</sub>	Channel to Channel Voltage	1500	-	V	
T <sub>J</sub>	Junction Temperature	-40	+150	°C	
T <sub>S</sub>	Storage Temperature	-65	+150	°C	
Electrostatic Discharge Capability	HBM (Note 11)	Human Body Model	-	±2	kV
	CDM (Note 11)	Charged Device Model	-	±1	kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

7. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.

8. All voltage values are given with respect to GND pin.

9. All voltage values are given with respect to V<sub>SSA</sub> or V<sub>SSB</sub> pin.

10. This parameter verified by design and bench test, not tested in production.

11. This device series incorporates ESD protection and is tested by the following methods:

ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)

ESD Charged Device Model tested per AEC-Q100-011 (EIA/JESD22-C101)

Latch up Current Maximum Rating: ≤100 mA per JEDEC standard: JESD78F.

# NCP51561

## RECOMMENDED OPERATING CONDITIONS

Symbol	Rating	Min	Max	Unit	
$V_{DD}$	Power Supply Voltage – Input Side	3.0	5.0	V	
$V_{CCA}, V_{CCB}$	Power Supply Voltage – Driver Side	5-V UVLO Version	6.5	30	V
		8-V UVLO Version	9.5	30	V
		13-V UVLO Version	14.5	30	V
		17-V UVLO Version	18.5	30	V
$V_{IN}$	Logic Input Voltage at Pins INA, INB, and ANB	0	18	V	
$V_{ENA/DIS}$	Logic Input Voltage at Pin ENA/DIS	0	5.0	V	
$T_A$	Ambient Temperature	-40	+125	°C	
$T_J$	Junction Temperature	-40	+125	°C	

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

## THERMAL CHARACTERISTICS

Symbol	Rating	Condition	Value	Unit
$R_{\theta JA}$	Thermal Characteristics, (Note 13) Thermal Resistance Junction–Air 16–SOIC–WB	100 mm <sup>2</sup> , 1 oz Copper, 1 Surface Layer (1S0P)	120	°C/W
		100 mm <sup>2</sup> , 2 oz Copper, 1 Surface Layer (1S0P)	81	
$R_{\theta JC}$	Thermal Resistance Junction–Case	100 mm <sup>2</sup> , 1 oz Copper, 1 Surface Layer (1S0P)	38	°C/W
$\Psi_{JT}$	Thermal Resistance Junction–to–Top		18	°C/W
$\Psi_{JB}$	Thermal Resistance Junction–to–Board		55	°C/W
$P_D$	Power Dissipation (Note 13) 16–SOIC–WB	100 mm <sup>2</sup> , 1 oz Copper, 1 Surface Layer (1S0P)	0.8	W
		100 mm <sup>2</sup> , 2 oz Copper, 1 Surface Layer (1S0P)	1.5	

12. Refer to ELECTRICAL CHARACTERISTICS, RECOMMENDED OPERATING RANGES and/or APPLICATION INFORMATION for Safe Operating parameters.

13. JEDEC standard: JESD51–2, and JESD51–3.

## ISOLATION CHARACTERISTICS

Symbol	Parameter	Condition	Min	Typ	Max	Unit
$V_{ISO, INPUT TO OUTPUT}$	Input to Output Isolation Voltage	$T_A = 25^\circ\text{C}$ , Relative Humidity < 50%, $t = 1.0$ minute, $I_{I-O} 10$ A, 50 Hz (Notes 14, 15, 16)	5000			$V_{RMS}$
$V_{ISO, OUTA TO OUTB}$	OUTA to OUTB Isolation Voltage	Impulse Test > 10 ms (Notes 14, 15)	1500			$V_{DC}$
$R_{ISO}$	Isolation Resistance	$V_{I-O} = 500$ V (Note 14)	$10^{11}$			$\Omega$

14. Device is considered a two – terminal device: pins 1 to 8 are shorted together and pins 9 to 16 are shorted together for input to output isolation test, and pins 9 to 11 are shorted together and pins 14 to 16 are shorted together for between channel isolation test.

15. 5,000  $V_{RMS}$  for 1 – minute duration is equivalent to 6,000  $V_{RMS}$  for 1 – second duration for input to output isolation test, and Impulse Test > 10 ms; sample tested for between channel isolation test.

16. The input – output isolation voltage is a dielectric voltage rating per UL1577. It should not be regarded as an input – output continuous voltage rating. For the continuous working voltage rating, refer to equipment – level safety specification or DIN VDE V 0884 – 11 Safety and Insulation Ratings Table

PARAMETER MEASUREMENT DEFINITION

Switching Time Definitions

Figure 48 shows the switching time definitions of the turn-on ( $t_{PDON}$ ) and turn-off ( $t_{PDOFF}$ ) propagation delay time among the driver's two input signals INA, INB and two

output signals OUTA, OUTB. The typical values of the propagation delay ( $t_{PDON}$ ,  $t_{PDOFF}$ ), pulse width distortion ( $t_{PWD}$ ) and delay matching between channels times are specified in the electrical characteristics table.

Figure 48. Switching Time Definitions

Enable and Disable Function

Figure 49 shows the response time according to an ENABLE or the DISABLE operating modes. If the ENA/DIS pin voltage goes to LOW state, i.e.  $V_{ENA} \leq 1.1$  V shuts down both outputs simultaneously and Pull the ENA/DIS pin LOW (or left open), i.e.  $V_{ENA} \geq 1.6$  V to

operate normally in an ENABLE mode as shown in Figure 49 (a). Conversely, if the ENA/DIS pin voltage goes to HIGH state, i.e.  $V_{DIS} \geq 1.6$  V shuts down both outputs simultaneously and Pull the ENA/DIS pin LOW (or left open), i.e.  $V_{DIS} \leq 1.1$  V operate normally in the DISABLE mode as shown in Figure 49 (b).

Figure 49. Timing Chart of Enable and Disable Function

## Programmable Dead-Time

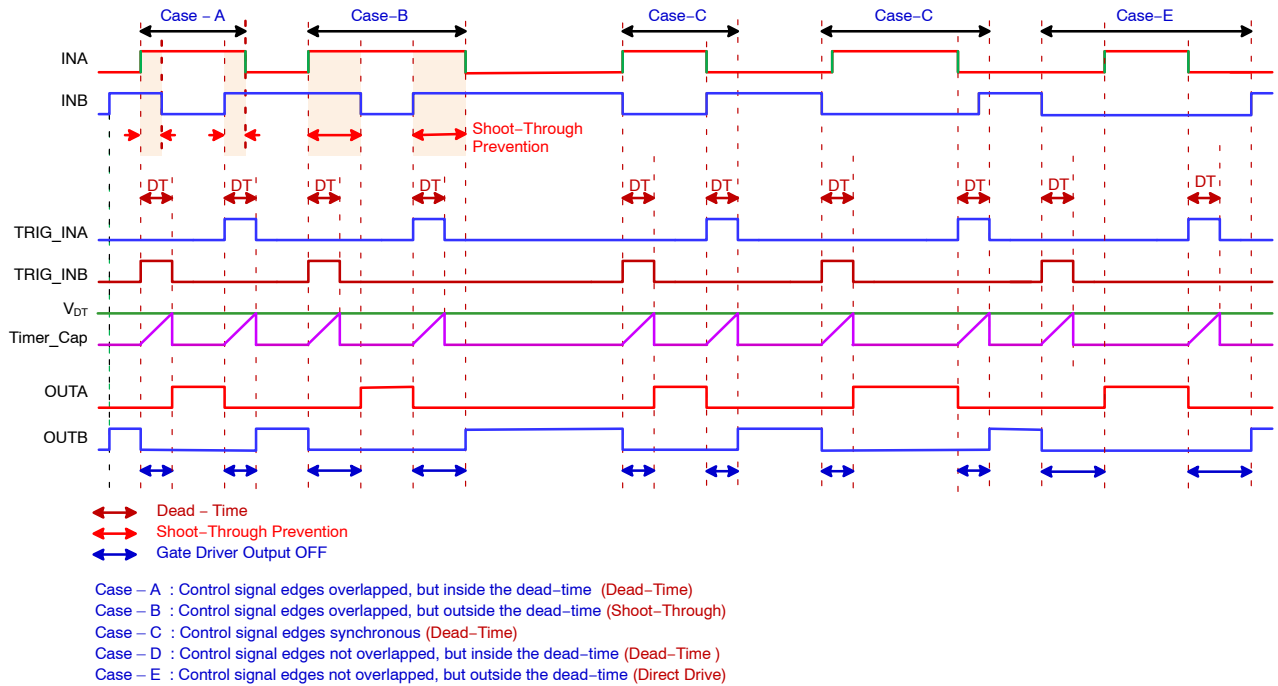

Dead time is automatically inserted whenever the dead time of the external two input signals (between INA and INB signals) is shorter than internal setting dead times (DT1 and

DT2). Otherwise, if the external input signal dead times are larger than internal dead-time, the dead time is not modified by the gate driver and internal dead-time definition as shown in Figure 50.

**Figure 50. Internal Dead-Time Definitions**

Figure 51 shows the definition of internal dead time and shoot-through prevention when input signals applied at same time.

**Figure 51. Internal Dead-Time Definitions**

DEVICE INFORMATION

Input to Output Operation Definitions

The NCP51561 provides important protection functions such as independent under-voltage lockout for both gate driver; enable or disable function and dead-time control function. Figure 52 shows an overall input to output timing diagram when shutdown mode via ENA/DIS pin in the

CASE-A, and Under-Voltage Lockout protection on the primary- and secondary-sides power supplies events in the CASE-B. The gate driver output (OUTA and OUTB) were turn-off when cross-conduction event at the dead time control mode in the CASE-C.

Figure 52. Overall Operating Waveforms Definitions at the Dead-Time Control Mode

Input and Output Logic Table

Table 1 shows an input to output logic table according to the dead time control modes and an enable or the disable operation mode.

Table 1. INPUT AND OUTPUT LOGIC TABLE

INPUT				OUTPUT		NOTE
INA	INB	ENA/DIS		OUTA	OUTB	
		ENABLE	DISABLE			
L	L	H or Left open	L or Left open	L	L	Programmable dead time control with R <sub>DT</sub> .
L	H	H or Left open	L or Left open	L	H	
H	L	H or Left open	L or Left open	H	L	
H	H	H or Left open	L or Left open	L	L	DT pin is left open Or programmed with R <sub>DT</sub> .

Left open	Left open	H or Left open	L or Left open	L	L	
X	X	L	H	L	L	

20. "X" means L, H or left open.

**Input Signal Configuration**

The NCP51561 allows to set the input signal configuration through the ANB pin for user convenience. There are four operating modes that allow to change the configuration of the input to output channels (e.g. single input – dual output, or dual input – dual output), and select

the shutdown function (e.g. Disable or Enable mode) as below Table 2. Unused input pins (e.g. INA, INB, and ANB) should be tied to GND to achieve better noise immunity. In addition, the ANB pin has an internal filter time typically 3.3  $\mu$ s to achieve the noise immunity.

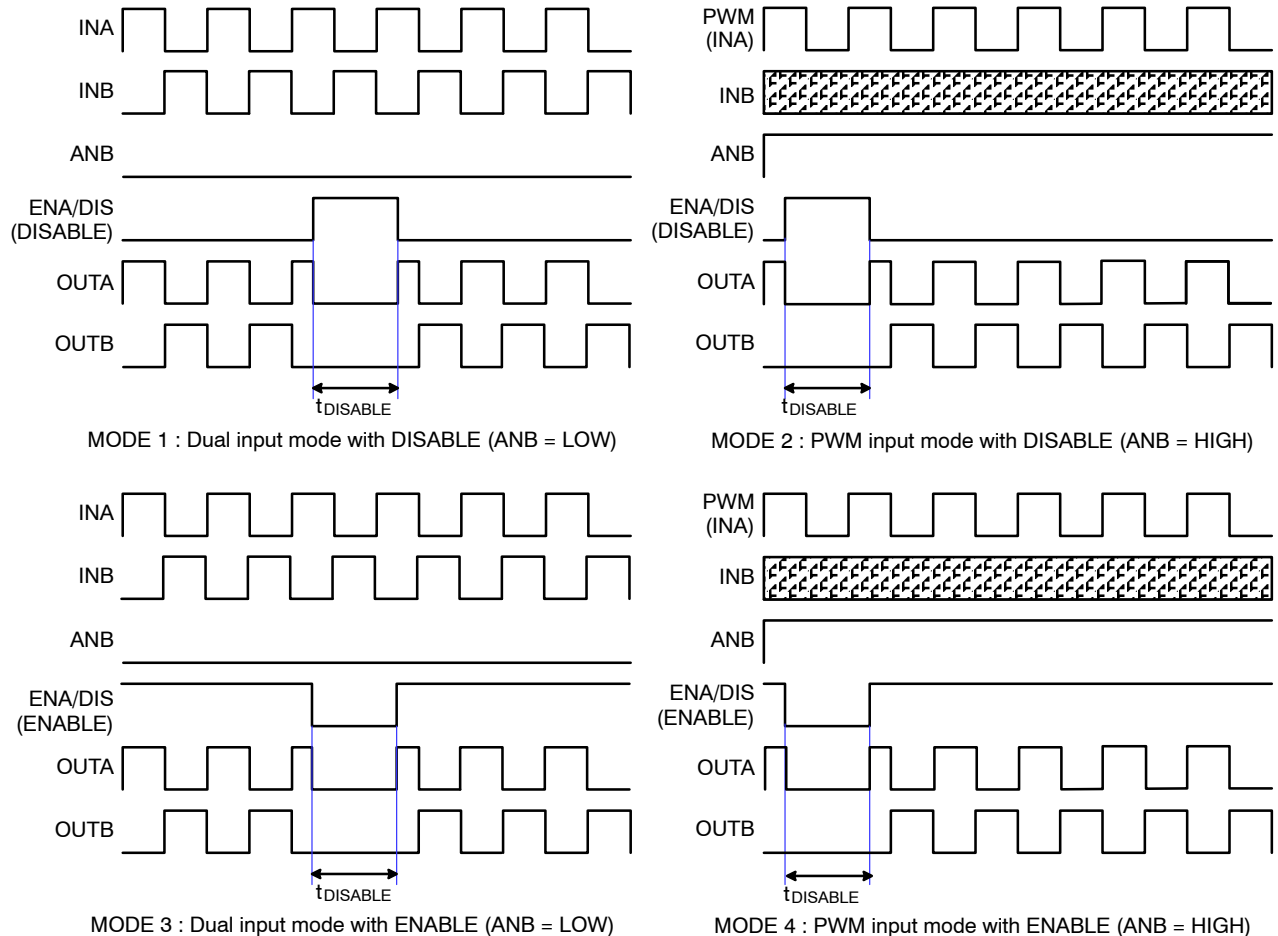

**Table 2. INPUT SIGNAL CONFIGURATION LOGIC TABLE**

Mode	Functional Input Pin				Input Configuration
	INA	INB	ANB	ENA/DIS	
1	INA	INB	L	DISABLE	Dual-Input, Dual-Output with disable mode (ENA/DIS = LOW)
2	INA	X	H	DISABLE	Single-Input (INA), Dual-Output with disable mode(ENA/DIS = LOW)
3	INA	INB	L	ENABLE	Dual-Input, Dual-Output with enable mode (ENA/DIS = HIGH)
4	INA	X	H	ENABLE	Single-Input (INA), Dual-Output with enable mode (ENA/DISE = HIGH)

Figure 53 shows an operating timing chart of input to output and shutdown function according to the ANB and ENA/DIS pins. The ENA/DIS and ANB pins are only functional when  $V_{DD}$  stays above the specified UVLO threshold. It is recommended to tie these pins to Ground if the ENA/DIS and ANB pins are not used to achieve better noise immunity, and it is recommended to bypass using a 1 nF low ESR/ESL capacitor close to these pins for the

DISABLE (e.g. NCP51561xB) mode. When it is not possible to connect ANB to GND then external pull-down resistor few ten k $\Omega$  (e.g. 10 ~47 k $\Omega$ ) is recommended to prevent unwanted ANB activation by external interference as despite its internal 3.3  $\mu$ s filter.

The OUTA and OUTB works as complementary outputs from PWM input signal on the INA pin regardless the INB signal when the ANB pin is HIGH.

**Figure 53. Timing Chart of ENABLE and DISABLE Modes**

**PROTECTION FUNCTION**

The NCP51561 provides the protection features include enable function, Cross Conduction Protection, and Under-Voltage Lockout (UVLO) of power supplies on primary-side ( $V_{DD}$ ), and secondary-side both channels ( $V_{CCA}$ , and  $V_{CCB}$ ).

**Under-Voltage Lockout Protection  $V_{DD}$  and  $V_{CCx}$**

The NCP51561 provides the Under-Voltage Lockout (UVLO) protection function for  $V_{DD}$  in primary-side and both gate drive output for  $V_{CCA}$  and  $V_{CCB}$  in secondary-side as shown in Figure 54.

The gate driver is running when the  $V_{DD}$  supply voltage is greater than the specified under-voltage lockout threshold voltage (e.g. typically 2.8 V) and ENA/DIS pin is HIGH or LOW states for an ENABLE (e.g. NCP51561xA) or the DISABLE (e.g. NCP51561xB) mode respectively.

In addition, both gate output drivers have independent under voltage lockout protection (UVLO) function and each

channel supply voltages in secondary-side (e.g.  $V_{CCA}$ , and  $V_{CCB}$ ) need to be greater than specified UVLO threshold level in secondary-side to let the output operate per input signal. The typical  $V_{CCx}$  UVLO threshold voltage levels for each option are per below Table 3.

**Table 3.  $V_{CCx}$  UVLO OPTION TABLE**

Option	$V_{CC}$ UVLO Level	Unit
5-V	6.0	V
8-V	8.7	V
13-V	13	V
17-V	17	V

UVLO protection has an hysteresis to provide immunity to short  $V_{CC}$  drops that can occur.

**Figure 54. Timing Chart Under-Voltage Lockout Protection**

# NCP51561

## V<sub>CCX</sub> Power-Up and IN<sub>X</sub> Signal

To provide a variety of Under-Voltage Lockout (UVLO) thresholds NCP51561 has an internal settling time ( $t_{PORUV,OUT} = 18 \mu s$ , typical) during initial V<sub>CCX</sub> start-up or after POR event.

In case IN<sub>X</sub> pins are active when V<sub>CCX</sub> is above 4.7 V, outputs would occur until settling time has elapsed as shown in Figure 55 (A). If IN<sub>X</sub> are only active after settling time has expired, outputs won't be active until V<sub>CCX</sub> cross NCP51561 specific V<sub>CCUV+</sub> as shown in Figure 55 (B).

(A) Power Up with PWM Signals during Preset

(B) Power Up without PWM Signals during Preset

Figure 55. V<sub>CCX</sub> Power-up

**Cross-Conduction Prevention and Allowed Overlapped Operation**

The cross conduction prevents both high- and low-side switches from conducting at the same time when the dead time (DT) control mode is in half-bridge type, as shown in Figure 56.

**Figure 56. Concept of Shoot-Through Prevention**

**Programmable Dead Time Control**

Cross-conduction between both driver outputs (OUTA, and OUTB) is not allowed with minimum dead time ( $t_{DTMIN}$ ) typically 10 ns when the DT pin is open in the **MODE-A**. External resistance ( $R_{DT}$ ) controls dead time when the DT pin resistor between 1 k $\Omega$  and 300 k $\Omega$  in the

For full topologies flexibility, cross conduction can be allowed both high- and low-side switches conduct at the same time when the DT pin is pulled to  $V_{DD}$  for example, as shown in Figure 57.

**Figure 57. Concept of Allowed the Shoot-Through**

**MODE-B**. Overlap is not allowed when the dead time (DT) control mode is activated.

The dead time (DT) between both outputs is set according to:  $DT \text{ (in ns)} = 10 \times R_{DT} \text{ (in k}\Omega\text{)}$ .

Overlap is allowed for both outputs when the DT pin is pulled to  $V_{DD}$  in the **MODE-C**, as shown in Figure 58.

**Figure 58. Timing Chart of Dead-Time Mode Control**

# NCP51561

## Common Mode Transient Immunity Testing

Figure 59 is a simplified diagram of the Common Mode Transient Immunity (CMTI) testing configuration.

CMTI is the maximum sustainable common-mode voltage slew rate while maintaining the correct output.

CMTI applies to both rising and falling common-mode voltage edges. CMTI is tested with the transient generator connected between GND and VSSA and VSSB. ( $V_{CM} = 1500\text{ V}$ )

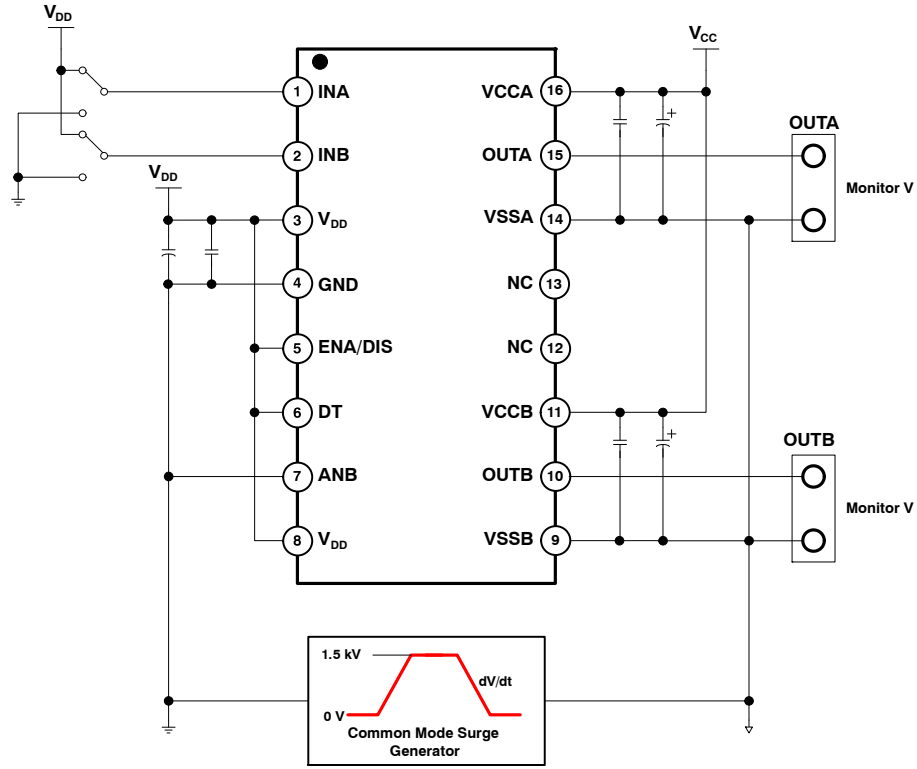

Figure 59. Common Mode Transient Immunity Test Circuit

APPLICATION INFORMATION

This section provides application guidelines when using the NCP51561.

**Power Supply Recommendations**

It is important to remember that during the Turn-On switch the output current to the Gate is drawn from the  $V_{CCA}$  and  $V_{CCB}$  supply pins. The  $V_{CCA}$  and  $V_{CCB}$  pins should be bypassed with a capacitor with a value of at least ten times the Gate capacitance, and no less than 100 nF and located as close to the device as possible for the purpose of decoupling. A low ESR, ceramic surface mount capacitor is necessary. We recommend using 2 capacitors; a 100 nF ceramic surface-mount capacitor which can be very close to the pins of the device, and another surface-mount capacitor of few microfarads added in parallel.

**Input Stage**

The input signal pins (INA, INB, ANB, and ENA/DIS) of the NCP51561 are based on the TTL compatible input-threshold logic that is independent of the  $V_{DD}$  supply voltage. The logic level compatible input provides a typically high and low threshold of 1.6 V and 1.1 V respectively. The input signal pins impedance of the NCP51561 is 200 k $\Omega$  typically and the INA, INB, and ANB pins are pulled to GND pin and ENA/DIS pin pulled to  $V_{DD}$  pin for an ENABLE mode as shown in Figure 60. Conversely, ENA/DIS pin pulled to GND pin for the DISABLE version. It is recommended that ENA/DIS pin should be tie to  $V_{DD}$  or GND pins for ENABLE and DISABLE versions respectively if the ENA/DIS pin is not used to achieve better noise immunity because the ENA/DIS pin is quite responsive, as far as propagation delay and other switching parameters are concerned.

An RC filter is recommended to be added on the input signal pins to reduce the impact of system noise and ground bounce, the time constant of the RC filter. Such a filter should use an  $R_{IN}$  in the range of 0  $\Omega$  to 100  $\Omega$  and a  $C_{IN}$  between 10 pF and 100 pF. In the example, an  $R_{IN} = 51 \Omega$  and a  $C_{IN} = 33 \text{ pF}$  are selected, with a corner frequency of approximately 100 MHz. When selecting these components, it is important to pay attention to the trade-off between good noise immunity and propagation delay.

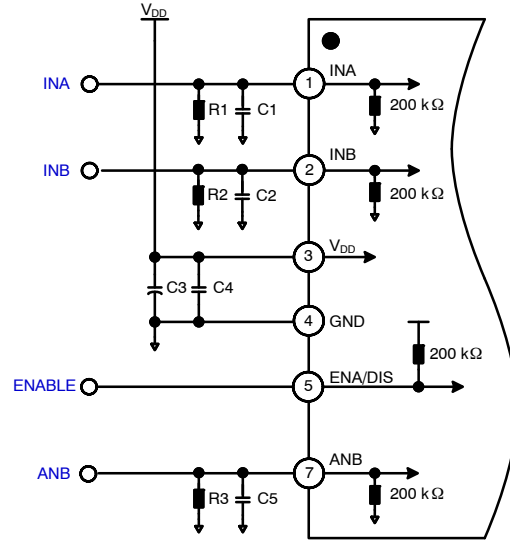

Figure 60. Schematic of Input Stage

**Output Stage**

The output driver stage of the NCP51561 features a pull up structure and a pull down structure.

The pull up structure of the NCP51561 consists of a PMOS stage ensuring to pull all the way to the  $V_{CC}$  rail. The pull down structure of the NCP51561 consists of a NMOS device as shown in Figure 61.

The output impedance of the pull up and pull down switches shall be able to provide about +4.5 A and -9 A peak currents typical at 25°C and the minimum sink and source peak currents at 125°C are -7 A sink and +2.6 A source.

Figure 61. Schematic of Output Stage

**Consideration of Driving Current Capability**

Peak source and sink currents ( $I_{SOURCE}$ , and  $I_{SINK}$ ) capability should be larger than average current ( $I_{G,AV}$ ) as shown in Figure 62.

**Figure 62. Definition of Current Driving Capability**

The approximate maximum gate charge  $Q_G$  that can be switched in the indicated time for each driver current rating may be calculate: Needed driver current ratings depend on what gate charge  $Q_G$  must be moved in what switching time  $t_{SW-ON/OFF}$  because average gate current during switching is  $I_G$ .

$$I_{G,AV} = \frac{Q_G}{t_{SW,ON/OFF}} \quad (\text{eq. 1})$$

The approximate gate driver source and sink peak currents can be calculated as below equations

At turn-on (Sourcing current)

$$I_{SOURCE} \geq 1.5 \times \frac{Q_G}{t_{SW,ON}} \quad (\text{eq. 2})$$

At turn-off (Sinking current)

$$I_{SINK} \geq 1.5 \times \frac{Q_G}{t_{SWOFF}} \quad (\text{eq. 3})$$

where,

$Q_G =$  Gate charge at  $V_{GS} = V_{CC}$

$t_{SW,ON/OFF} =$  Switch On / Off time

1.5 = empirically determined factor

(Influenced by  $I_{G,AV}$  vs.  $I_{DRV}$ , and circuit parasitic)

**Consideration of Gate Resistor**

The gate resistor is also sized to reduce ringing voltage by parasitic inductances and capacitances. However, it limits the current capability of the gate driver output. The limited current capability value induced by turn-on and off gate resistors can be obtained with below equation.

$$I_{SOURCE} = \frac{V_{CC} - V_{OH}}{R_{G,ON}}$$

$$I_{SINK} = \frac{V_{CC} - V_{OL}}{R_{G,OFF}} \quad (\text{eq. 4})$$

where:

$I_{SOURCE}$ : Source peak current

$I_{SINK}$ : Sink peak current.

$V_{OH}$ : High level output voltage drop

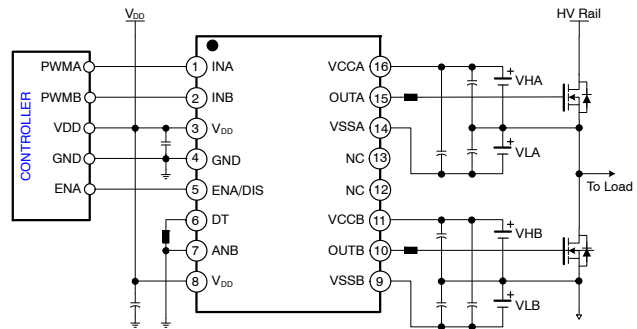

$V_{OL}$ : Low level output voltage drop

**Application Circuits with Output Stage Negative Bias**

SiC MOSFET unique operating characteristics need to be carefully considered to fully benefits from SiC characteristics. The gate driver needs to be capable of providing +20 V and -2 V to -5 V negative bias with minimum output impedance and high current capability.

When parasitic inductances are introduced by non-ideal PCB layout and long package leads (e.g. TO-220 and TO-247 type packages), there could be ringing in the gate-source drive voltage of the power transistor during high di/dt and dv/dt switching. If the ringing is over the threshold voltage, there is the risk of unintended turn-on and even shoot-through. Applying a negative bias on the gate drive is a popular way to keep such ringing below the threshold. Negative voltage can improve the noise tolerance of SiC MOSFET to suppress turning it unintentionally. The negative gate-source voltage makes the capacitance of  $C_{gd}$  becoming lower, which can reduce the ringing voltage.

Below are a few examples of implementing negative gate drive bias. The first example with negative bias with two isolated-bias power supplies as shown in Figure 63. Power supply  $V_{Hx}$  determines the positive drive output voltage and  $V_{Lx}$  determines the negative turn-off voltage for each channels. This solution requires more power supplies than the conventional bootstrapped power supply example; however, it provides more flexibility when setting the positive,  $V_{Hx}$ , and negative,  $V_{Lx}$ , rail voltages.

**Figure 63. Negative Bias with Two Isolated-Bias Power Supplies**

Figure 64 shows another example with negative bias turn-off on the gate driver using a Zener diode on an isolated power supply. The negative bias set by the voltage of Zener diode. For example, if the isolated power supply,  $V_{Hx}$  for

each channels, the turn-off voltage will be  $-5.1\text{ V}$  and turn-on voltage will be  $20\text{ V} - 5.1\text{ V} \approx 15\text{ V}$ .

**Figure 64. Negative Bias with Zener Diode on Single Isolated-Bias Power Supply**

Moreover, this configuration could easily be changed negative bias by a using different Zener diode with the same  $20\text{ V}$  isolated power supply. This configuration needs two isolated power supplies for a half-bridge configuration, but this scheme is very simple.

However, it has the disadvantage of having a steady state power consumption from  $R_{Zx}$ . Therefore, one should be careful in selecting the  $R_{Zx}$  values. It is recommended that  $R_{Zx}$  allow the minimal current flow to stabilize the Zener clamping voltage (e.g.  $I_z: 5\text{ mA} \sim 10\text{ mA}$ ).

Typical recommended values are in the few  $\text{k}\Omega$  range (e.g.  $1\text{ k}\Omega \sim 2\text{ k}\Omega$ ) of SiC MOSFETs application.

**Experimental Results**

Figure 65 show the experimental results of the negative bias with Zener diode on single isolated power supply of the NCP51561 for SiC MOSFET gate drive application. The examples were design to have a  $+15\text{ V}$  and  $-5.1\text{ V}$  drive power supply referenced to the device source by using the  $20\text{ V}$  isolated power supply.

CH1: INPUT [2V/div], and CH2: OUTPUT [5 V/div]

**Figure 65. Experimental Waveforms of Negative Bias with Zener Diode on Single Isolated Power Supply**

**PCB Layout Guideline**

To improve the switching characteristics and efficiency of design, the following should be considered before beginning a PCB layout.

*Component Placement*

- Keep the input/output traces as short as possible. Minimize influence of the parasitic inductance and capacitance on the layout. (To maintain low signal-path inductance, avoid using via.)
- Placement and routing for supply bypass capacitors for  $V_{DD}$  and  $V_{CC}$ , and gate resistors need to be located as close as possible to the gate driver.
- The gate driver should be located switching device as close as possible to decrease the trace inductance and avoid output ringing.

*Grounding Consideration*

- Have a solid ground plane underneath the high-speed signal layer.
- Have a solid ground plane next to VSSA and VSSB pins with multiple VSSA and VSSB vias to reduce the parasitic inductance and minimize the ringing on the output signals.

*High-Voltage ( $V_{ISO}$ ) Consideration*

- To ensure isolation performance between the primary and secondary side, any PCB traces or copper should be not placed under the driver device as shown in Figure 66. A PCB cutout is recommended to avoid contamination that may impair the isolation performance of NCP51561.

**Figure 66. Recommended Layer Stack**

DESCRIPTION:	SOIC-16 WB	PAGE 1 OF 1

onsemi and ONSEMI are trademarks of Semiconductor Components Industries, LLC dba onsemi or its subsidiaries in the United States and/or other countries. onsemi reserves the right to make changes without further notice to any products herein. onsemi makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does onsemi assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. onsemi does not convey any license under its patent rights nor the rights of others.

**onsemi**, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at [www.onsemi.com/site/pdf/Patent-Marking.pdf](http://www.onsemi.com/site/pdf/Patent-Marking.pdf). **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
