SWITCHMODE[™] Series NPN Silicon Power Transistor

These devices are designed for high-voltage, high-speed power switching inductive circuits where fall time is critical. They are particularly suited for 115 and 220 V SWITCHMODE applications such as Switching Regulators, Inverters, Motor Controls, Solenoid/Relay drivers and Deflection circuits.

Features

- Reverse Biased SOA with Inductive Loads @ $T_C = 100$ °C
- Inductive Switching Matrix 0.5 to 1.5 A, 25 and 100°C
 t_c @ 1 A, 100°C is 290 ns (Typ)
- 700 V Blocking Capability
- SOA and Switching Applications Information
- Pb-Free Package is Available*

MAXIMUM RATINGS

R	ating	Symbol	Value	Unit
Collector-Emitter	Voltage	V _{CEO(sus)}	400	Vdc
Collector-Emitter	Voltage	V_{CEV}	700	Vdc
Emitter Base Volta	ige	V _{EBO}	9	Vdc
Collector Current	ContinuousPeak (Note 1)	I _C	1.5 3	Adc
Base Current	ContinuousPeak (Note 1)	I _B	0.75 1.5	Adc
Emitter Current	ContinuousPeak (Note 1)	I _E	2.25 4.5	Adc
Total Power Dissip Derate above 2	pation @ T _A = 25°C 25°C	P _D	1.4 11.2	W mW/°C
Total Power Dissip Derate above 2	P _D	40 320	W mW/°C	
Operating and Sto Temperature R		T _J , T _{stg}	-65 to +150	°C

THERMAL CHARACTERISTICS

Characteristic	Symbol	Max	Unit
Thermal Resistance, Junction-to-Case	$R_{\theta JC}$	3.12	°C/W
Thermal Resistance, Junction-to-Ambient	$R_{\theta JA}$	89	°C/W
Maximum Load Temperature for Soldering Purposes: 1/8" from Case for 5 Seconds	TL	275	°C

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Pulse Test: Pulse Width = 5 ms, Duty Cycle ≤ 10%.

Figure 7. Inductive Switching Measurements

NOTE: All Data Recorded in the Inductive Switching Circuit in Table 1

SWITCHING TIMES NOTE

In resistive switching circuits, rise, fall, and storage times have been defined and apply to both current and voltage waveforms since they are in phase. However, for inductive loads which are common to SWITCHMODE power supplies and hammer drivers, current and voltage waveforms are not in phase. Therefore, separate measurements must be made on each waveform to determine the total switching time. For this reason, the following new terms have been defined.

 t_{sv} = Voltage Storage Time, 90% I_{B1} to 10% V_{clamp}

 t_{rv} = Voltage Rise Time, 10–90% V_{clamp}

 t_{fi} = Current Fall Time, 90–10% I_C

 t_{ti} = Current Tail, 10–2% I_C

 t_c = Crossover Time, 10% V_{clamp} to 10% I_C

An enlarged portion of the inductive switching waveforms is shown in Figure 7 to aid in the visual identity of these terms.

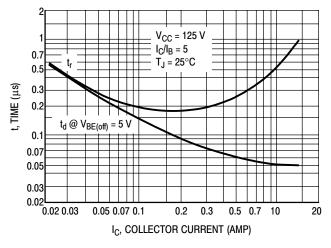

For the designer, there is minimal switching loss during storage time and the predominant switching power losses occur during the crossover interval and can be obtained using the standard equation from AN–222:

$$P_{SWT} = 1/2 V_{CC}I_{C}(t_{c})f$$

In general, $t_{rv} + t_{fi} = t_c$. However, at lower test currents this relationship may not be valid.

As is common with most switching transistors, resistive switching is specified at 25° C and has become a benchmark for designers. However, for designers of high frequency converter circuits, the user oriented specifications which make this a "SWITCHMODE" transistor are the inductive switching speeds (t_c and t_{sv}) which are guaranteed at 100° C.

RESISTIVE SWITCHING PERFORMANCE

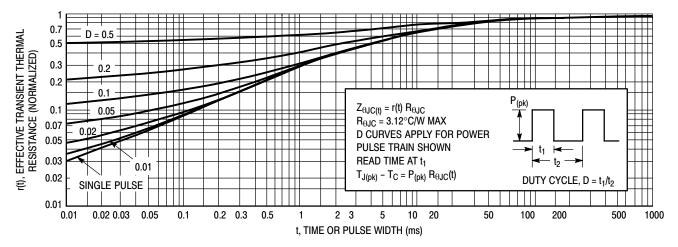

Figure 10. Thermal Response

The Safe Operating Area figures shown in Figures 11 and 12 are specified ratings for these devices under the test conditions shown.

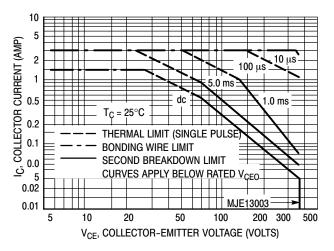

Figure 11. Active Region Safe Operating
Area

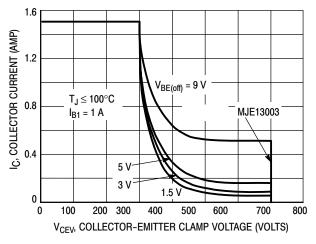

Figure 12. Reverse Bias Safe Operating Area

SAFE OPERATING AREA INFORMATION

FORWARD BIAS

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 11 is based on $T_C = 25^{\circ}C$; $T_{J(pk)}$ is variable depending on power level. Second breakdown pulse limits are valid for duty cycles to 10% but must be derated when $T_C \ge 25^{\circ}C$. Second breakdown limitations do not derate the same as thermal limitations. Allowable current at the voltages shown on Figure 11 may be found at any case temperature by using the appropriate curve on Figure 13.

 $T_{J(pk)}$ may be calculated from the data in Figure 10. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by second breakdown.

REVERSE BIAS

For inductive loads, high voltage and high current must be sustained simultaneously during turn-off, in most cases, with the base to emitter junction reverse biased. Under these conditions the collector voltage must be held to a safe level at or below a specific value of collector current. This can be accomplished by several means such as active clamping, RC snubbing, load line shaping, etc. The safe level for these devices is specified as Reverse Bias Safe Operating Area and represents the voltage-current conditions during reverse biased turn-off. This rating is verified under clamped conditions so that the device is never subjected to an avalanche mode. Figure 12 gives RBSOA characteristics.
