SN74ALS29833, SN74ALS29834
8-BIT TO 9-BIT PARITY BUS TRANSCEIVERS
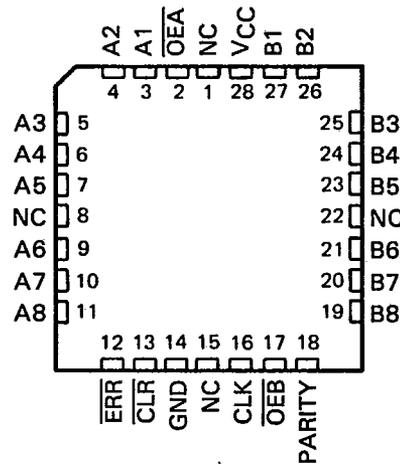

- **Functionally Similar to AMD AM29833 and AM29834**

- **High-Speed Bus Transceivers with Parity Generator/Checker**

- **Parity Error Flag with Open-Collector Outputs**

- **Has a Register for Storage of the Parity Error Flag**

- **Choice of True ('ALS29833) or Inverting ('ALS29834) Logic**

- **Package Options Include Plastic "Small Outline" Package, Plastic Chip Carriers, and Standard Plastic 300-mil Dips**
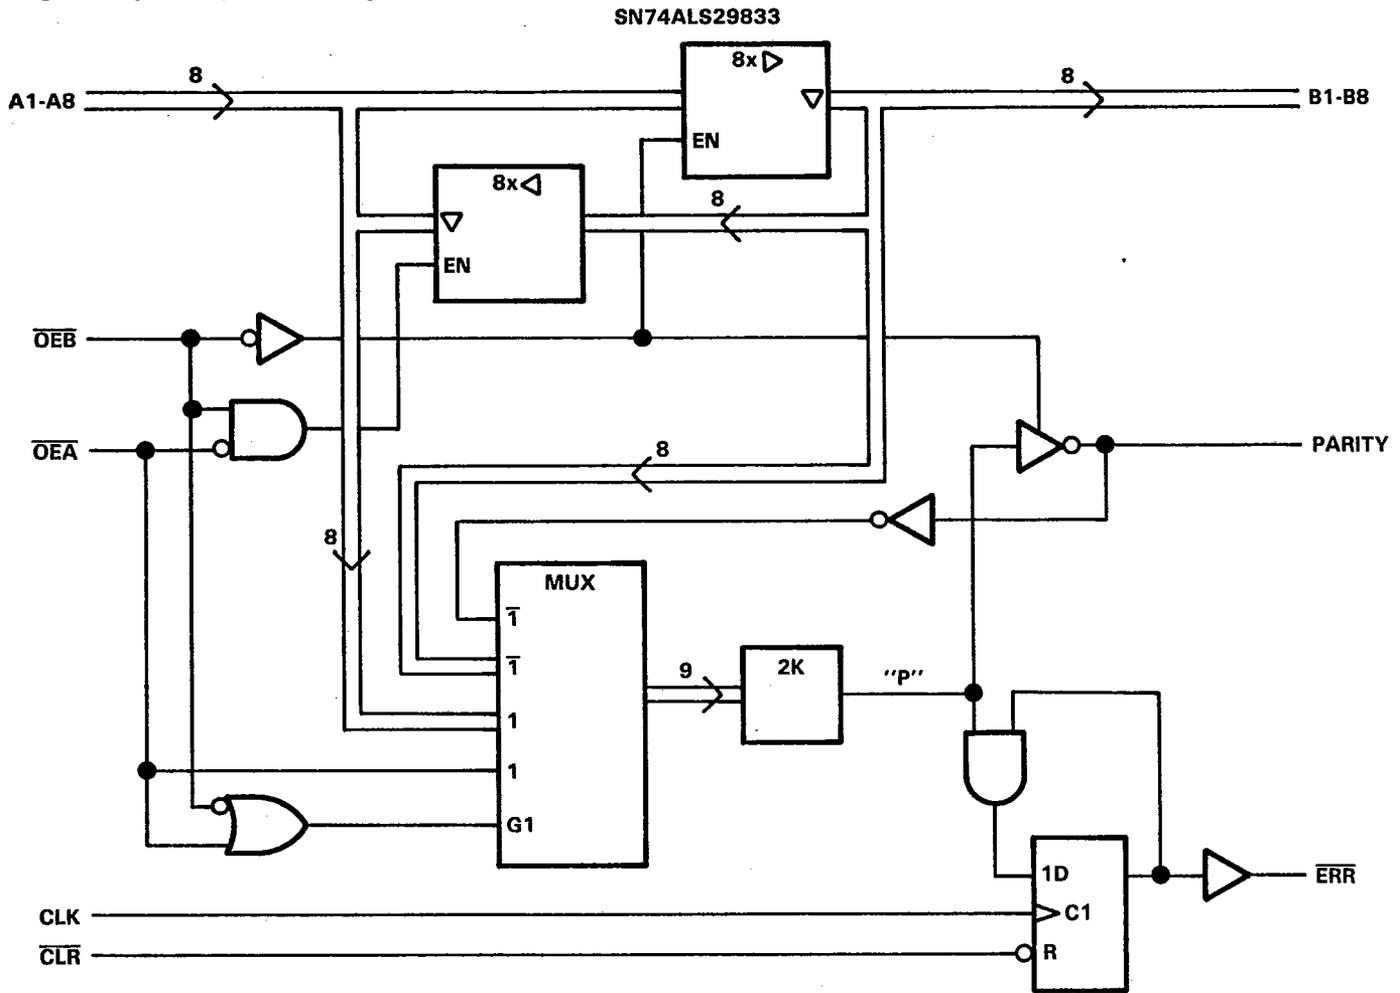

description

The SN74ALS29833 and SN74ALS29834 are 8-bit to 9-bit parity transceivers designed for two-way communication between data buses. When data is transmitted from the A bus to the B bus, a parity bit is generated. When data is transmitted from the B bus to the A bus with its corresponding parity bit, the $\overline{ERR}$ output will indicate whether or not an error in the B data has occurred. The output enable inputs $\overline{OEA}$ and $\overline{OEB}$ can be used to disable the device so that the buses are effectively isolated.

A 9-bit parity generator/checker generates a parity-odd output (PARITY), and monitors the parity of the I/O ports with an open-collector parity error flag ($\overline{ERR}$). $\overline{ERR}$ is clocked into the register on the rising edge of the CLK input. The error flag register is cleared with a low pulse on the $\overline{CLR}$ input. When both $\overline{OEA}$ and $\overline{OEB}$ are low, data is transferred from the A bus to the B bus and inverted parity is generated. Inverted parity is a forced error condition that gives the designer more system diagnostic capability.

The SN74ALS833 and SN74ALS834 are characterized for operation from 0 °C to 70 °C.
