

Type MC, Surface-Mount Mica Chip Capacitors

High-Frequency, High-Stability Chip for Instruments and RF

With self-resonant frequencies typically above one gigahertz for popular RF capacitance values and with a Q above 2,000, Type MC capacitors are the answer for high-frequency applications like flight radio and cable television. The natural mica dielectric retains its high-Q to many megahertz, so higher and higher frequency applications are limited by the circuit inductance, not the Type MC capacitor.

Performance Highlights

- Voltages: 100 Vdc, 500 Vdc, and 1000 Vdc
- Capacitance Range: .5 pF to 2,000 pF
- Capacitance Tolerance: $\pm 0.25\%$ to $\pm 5\%$
- Temperature Range: -55°C to $+125^{\circ}\text{C}$
- Low impedance to beyond 1 GHz
- Near-zero capacitance change, all environments
- Available in tight tolerance exact values
- Easy to attach to printed circuit boards
- Case sizes 0805, 1210, 1812, and 2220
- Handles pulses with $dV/dt > 20,000 \text{ V}/\mu\text{s}$
- Withstands 200% rated voltage

39	Q		

Example:
R1 = 43 pF

Multiplier	Code No.
X 0.1	0
X 1	1
X 10	2
X 100	3
X 0.01	9

Capacitance is within tolerance when measured as follows:
1–1000 pF @ 1 MHz
> 1000 pF @ 1 kHz

Dissipation Factor is no more than 0.1% when measured as above.

Quality Factor (Q) is as follows when measured at 1 MHz.

Capacitance Range	Min. Q
1 to 80 pF	500 to 3000
>80 pF	3000

Insulation Resistance is no less than 100 GΩ when measured at 100 Vdc.

Withstanding Voltage is two times the rated voltage and can be applied up to 5 seconds without damage.

Life Test: Subject capacitors to 125±3°C with 1.5 times rated voltage applied for 2000 (+72,–0) hours. There will be no visual damage and the capacitors will meet the limits of the table below.

Vibration Resistance: Subject the capacitors to simple harmonic motion with an amplitude of 0.06 inches; vary the frequency uniformly from 10 to 55 Hz and return to 10 Hz, all in one minute. Repeat that cycle continuously for two hours in each of three mutually perpendicular directions. There will be no visual damage and the capacitors will meet the limits of the table below.

Bending Test: Solder attach the capacitors to printed-circuit boards. Suspend each board between two edges separated 3.5 inches with the capacitor in the center and on the

underside. Press in the center of the suspension until the board flexes downward 0.1 inches. There will be no visual damage and the capacitors will meet the limits of the table below during and after the bending.

Moisture Resistance: Subject the capacitors to 40±2°C at 90 to 95% humidity for 500 (+24,–0) hours. Return to room ambient for 24 hours. There will be no visual damage and the capacitors will meet the limits of the table below.

Temperature Coefficient and Drift: Measure the capacitors' capacitance at 25°C, –55°C, 25°C, 125°C, and at 25°C—all ±3°C—after stabilizing at each temperature. The capacitance will meet the limits of the Characteristic table in Ordering Information.

Heat Resistance: Subject the capacitors to 125±2°C for 2 (+1,–0) hours. Then the insulation resistance will be no less than 5GΩ.

Solderability: After 2±0.5 seconds in molten solder with 2.5% silver at 270±5°C, solder coverage will be no less than 90% when examined at 10X magnification for flow soldering and no less than 75% for reflow soldering.

Solder Heat Resistance: Subject the capacitors to molten solder as above with 5 minutes preheating at 150±3°C. There will be no visual damage and the capacitors will meet the limits of the table below.

After-Test Limits
