

NCP81273

2-Phase Synchronous Buck Controller with Integrated 12 V Gate Drivers and PWM VID Interface

The NCP81273, a general-purpose 2-phase synchronous buck controller, integrates 12 V gate drivers and PWM VID interface in a QFN-24 package and provides a compact-footprint power management solution for new generation computing processors. It receives power save command (PSI) from processors and operates in 1-phase diode emulation mode to obtain high efficiency in light-load condition. Operating in high switching frequency up to 800 kHz allows employing small size inductor and capacitors. The part is able to support all-ceramic-capacitor applications.

Features

- 4.5 V to 13.2 V Single Supply Voltage
- Integrated 12 V Gate Drivers Powered by PVCC
- Integrated 5 V LDO VCC
- Output Voltage up to 2.0 V with PWM VID Interface
- Differential Output Voltage Sense
- 200 kHz ~ 800 kHz Switching Frequency
- Power Saving Interface (PSI)
- Support both 3.3 V and 1.8 V VID
- Power Good Output
- UVLO on VCC
- Programmable VIN Supply UVLO using EN
- Programmable Over Current Protection
- Over Voltage Protection
- Under Voltage Protection
- Temperature Sense and Alert Output
- Thermal Shutdown Protection
- QFN-24, 4x4 mm, 0.5 mm Pitch Package
- These are Pb-Free Devices

Typical Applications

- GPU and CPU Power
- Graphics Card Applications
- Desktop and Notebook Applications

Table 1. PIN DESCRIPTION

| Pin | Name | Type | Description |
|-----|-----------|---------------|--|
| 1 | BST1 | Analog Power | Bootstrap 1. Provides bootstrap voltage for the high-side gate drive of phase 1. A 0.1 μF ~ 1 μF ceramic capacitor is required from this pin to PH1 (pin 24). |
| 2 | HG1 | Analog Output | High-Side Gate 1. Connected with the gate of the high-side power MOSFET of phase 1. |
| 3 | EN | Logic Input | Enable. Logic high enables the device and logic low makes the device in standby mode. |
| 4 | PSI | Logic Input | Power Saving Interface. Logic high enables 2-phase CCM operation, mid-level enables 1-phase CCM operation, and logic low enables 1-phase auto CCM/DCM operation. |
| 5 | VID | Logic Input | Voltage ID. Voltage ID input from processor. |
| 6 | VIDBUF | Analog Output | Voltage ID Buffer. VID PWM pulse output from an internal buffer. |
| 7 | REFIN | Analog Input | Reference Input. Reference voltage input for output voltage regulation. The pin is connected to a non-inverting input of internal error amplifier. |
| 8 | VREF | Analog Output | Output Reference Voltage. Precise 2 V reference voltage output. A 10 nF ceramic capacitor is required from this pin to GND. |
| 9 | FS | Analog Input | Frequency Selection. A resistor from this pin to ground programs switching frequency. |
| 10 | FBRTN | Analog Input | Voltage Feedback Return Input. An inverting input of internal error amplifier. |
| 11 | FB | Analog Input | Feedback. An inverting input of internal error amplifier. |
| 12 | COMP/ILMT | Analog Output | Compensation / ILMT. Output pin of error amplifier. A resistor may be applied between this pin and GND to program OCP threshold. |
| 13 | TSNS | Analog Input | Temperature Sensing. Temperature sensing input. |
| 14 | TALERT# | Logic Output | Thermal Alert. Open drain output and active low indicates over temperature. |
| 15 | VCC | Analog Power | 5 V LDO Output and Voltage Supply of Controller. Output pin of integrated 5 V LDO and power supply of control circuits. A 4.7 μF or larger ceramic capacitor bypasses this input to GND. This capacitor should be placed as close as possible to this pin. |
| 16 | PGOOD | Logic Output | Power GOOD. Open-drain output. Provides a logic high valid power good output signal, indicating the regulator's output is in regulation window. |
| 17 | HG2 | Analog Output | High-Side Gate 2. Connected with the gate of the high-side power MOSFET in phase 2. |
| 18 | BST2 | Analog Power | Bootstrap 2. Provides bootstrap voltage for the high-side gate drive of phase 2. A 0.1 μF ~ 1 μF ceramic capacitor is required from this pin to PH2 (pin 19). |
| 19 | PH2 | Analog Input | Phase Node 2. Connected to interconnection between high-side MOSFET and low-side MOSFET in phase 2. |
| 20 | LG2 | Analog Output | Low-Side Gate 2. Connected with the gate of the low-side power MOSFET in phase 2. |
| 21 | PVCC | Analog Power | Voltage Supply of LDO and Gate Drivers. Power supply input pin of internal 5 V LDO and gate drivers. A 4.7 μF or larger ceramic capacitor bypasses this input to ground. This capacitor should be placed as close as possible to this pin. |
| 22 | PGND | Analog Ground | Power Ground. Power ground of internal gate drivers. Must be connected to the system ground. |
| 23 | LG1 | Analog Output | Low-Side Gate 1. Connected with the gate of the low-side power MOSFET in phase 1. |
| 24 | PH1 | Analog Input | Phase Node 1. Connected to interconnection between high-side MOSFET and low-side MOSFET in phase 1. |
| 25 | THERM/GND | Analog Ground | Thermal Pad and Analog Ground. Ground of internal control circuits. Must be connected to the system ground. |

Table 2. MAXIMUM RATINGS

| Rating | Symbol | Value | | Unit |
|---|-----------------|--|------------|------|
| | | Min | Max | |
| PH to PGND | V_{PH} | -0.3 -5.5 (<500 ns) -8 (<100 ns) | 30 | V |
| Gate Driver Supply Voltage PVCC to GND | V_{PVCC} | -0.3 | 15 | V |
| BST to PH | V_{BST_PH} | -0.3 | 15 | V |
| BST to GND | V_{BST_GND} | -0.3 | 30 | V |
| HG to PH | V_{HG} | -0.3 -2 (<200 ns) | BST-PH+0.3 | V |
| LG to GND | V_{LG} | -0.3 -2 (<200 ns) | PVCC+0.3 | V |
| PGND to GND | V_{PGND} | -0.3 | 0.3 | V |
| FBRTN to GND | V_{FBRTN} | -0.3 | 0.3 | V |
| Other Input Pins to GND | | -0.3 | VCC+0.3 | V |
| | | | | |
| Latch up Current: (Note 2) | I_{LU} | | | mA |
| All pins, except digital pins | | -100 | 100 | |
| Digital pins | -10 | 10 | | |
| | | | | |
| Operating Junction Temperature Range (Note 3 and 4) | T_J | -40 | 125 | °C |
| Operating Ambient Temperature Range | T_A | -40 | 100 | °C |
| Storage Temperature Range | T_{STG} | -40 | 150 | °C |
| Thermal Resistance Junction to Top Case (Note 5) | $R_{\Psi JC}$ | 7.0 | | °C/W |
| Thermal Resistance Junction to Board (Note 5) | $R_{\Psi JB}$ | 6.0 | | °C/W |
| Thermal Resistance Junction to Ambient (Note 4) | $R_{\theta JA}$ | 44.5 | | °C/W |
| Power Dissipation (Note 6) | P_D | 2.25 | | W |
| Moisture Sensitivity Level (Note 7) | MSL | 1 | | - |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. This device is ESD sensitive. Handling precautions are needed to avoid damage or performance degradation.
2. Latch up Current per JEDEC standard: JESD78 class II.
3. The thermal shutdown set to 150°C (typical) avoids potential irreversible damage on the device due to power dissipation.
4. JEDEC standard JESD 51-7 (1S2P Direct-Attach Method) with 0 LFM.
5. JEDEC standard JESD 51-7 (1S2P Direct-Attach Method) with 0 LFM. It is for checking junction temperature using external measurement.
6. The maximum power dissipation (PD) is dependent on input voltage, maximum output current and external components selected. Tambient = 25°C, Tjunc_max = 125°C, PD = (Tjunc_max - T_amb)/Theta JA.
7. Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.

DETAILED DESCRIPTION

General

The NCP81273, a 2-phase synchronous buck controller, integrates 12 V gate drivers and PWM VID interface in a QFN-24 package and provides a compact-footprint power management solution for new generation computing processors. It receives power save input (PSI) from processors and operates in 1-phase diode emulation mode to obtain high efficiency in light-load condition. Operating in high switching frequency up to 800 kHz allows employing small size inductors and capacitors. The part is able to support all-ceramic-capacitor applications.

Operation Modes

The NCP81273 has total 3 power operation modes responding to PSI levels as shown in Table 4. The three operation modes can be changed on the fly. In 1-phase operation, no switching in phase 2.

Table 4. POWER SAVING INTERFACE (PSI) Configurations

| PSI Level | Power Mode | Phase Configuration |
|-----------|------------|-----------------------|
| High | PS0 | 2-Phase, CCM |
| Middle | PS1 | 1-Phase, CCM |
| Low | PS2 | 1-Phase, Auto CCM/DCM |

The NCP81273 is also able to support pure 1-phase applications without a need to stuff components for phase 2. In this configuration, the four pins including BST2, HG2, LG2, and PH2 can be float, but make sure the voltage at PSI pin is never in high level.

Enable and Input UVLO

The NCP81273 is enabled when the voltage at EN pin is higher than an internal threshold $V_{EN_TH} = 1.2\text{ V}$. A hysteresis can be programmed by an external resistor R_{EN} connected to EN pin as shown in Figure 4. The high threshold V_{EN_H} in ENABLE signal is

$$V_{EN_H} = V_{EN_TH} \quad (\text{eq. 1})$$

The low threshold V_{EN_L} in ENABLE signal is

$$V_{EN_L} = V_{EN_TH} - V_{EN_HYS} \quad (\text{eq. 2})$$

The hysteresis V_{EN_HYS} is

$$V_{EN_HYS} = I_{EN_HYS} \cdot (R_{EN_INT} + R_{EN}) \quad (\text{eq. 3})$$

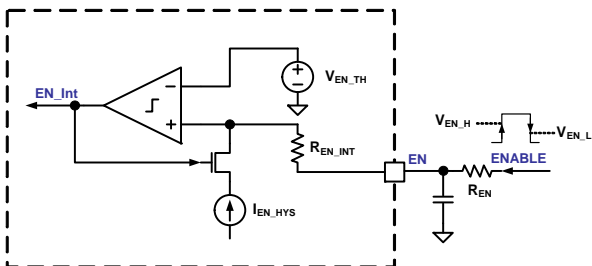

Figure 4. Enable and Hysteresis Programming

A UVLO function for input power supply can be implemented at EN pin. As shown in Figure 5, the UVLO thresholds can be programmed by two external resistors. The high threshold V_{IN_H} in VIN signal is

$$V_{IN_H} = \left(\frac{R_{EN1}}{R_{EN2}} + 1 \right) \cdot V_{EN_TH} \quad (\text{eq. 4})$$

The low threshold V_{IN_L} in VIN signal is

$$V_{IN_L} = V_{IN_H} - V_{IN_HYS} \quad (\text{eq. 5})$$

The hysteresis V_{IN_HYS} is

$$V_{IN_HYS} = I_{EN_HYS} \cdot (R_{EN_INT} + R_{EN1}) \quad (\text{eq. 6})$$

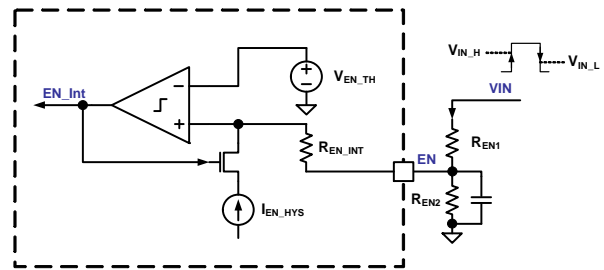

Figure 5. Enable and Input Supply UVLO Circuit

To avoid undefined operation, EN pin cannot be left float in applications.

Remote Voltage Sense

A high performance and high input impedance differential error amplifier, as shown in Figure 6, provides an accurate sense for the output voltage of the regulator. The output voltage and FBRTN inputs should be connected to the regulator's output voltage sense points via a Kelvin-sense pair. The output voltage sense signal goes through a compensation network and into the inverting input (FB pin) of the error amplifier. The non-inverting input of the error amplifier is connected to the reference input (REFIN pin).

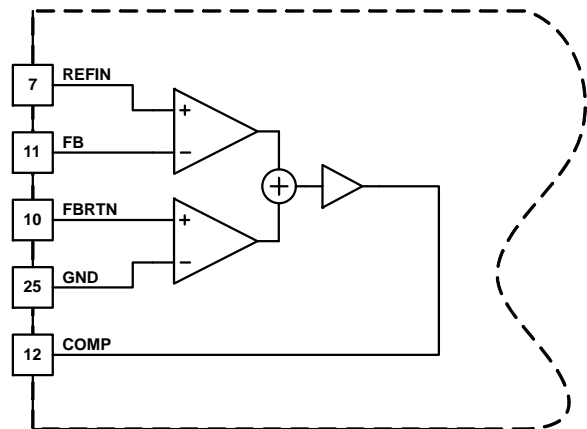

Figure 6. Differential Error Amplifier

PWM VID

The NCP81273 receives a PWMVID signal at VID pin for the output voltage regulation. Figure 7 shows the PWMVID dynamic voltage control circuit diagram. The duty cycle modulated PWM VID signal, independent from its signal level of 3.3 V or 1.8 V, is converted into a fixed-amplitude 2 V PWM-VID signal and passed to the VIDBUF output. If VID input is left floating or driven by z-state signal for more than ~100 ns, VIDBUF enters into z-state. The VIDBUF

signal is filtered through an external low-pass filter constructed by R_VIDBUF and C_REFIN. The filtered output is connected to REFIN pin. REFIN is the voltage reference of the output voltage regulator. The dynamic range of the circuit is determined by the external resistor network. The resistor network and capacitor C_REFIN function as a filter for the PWMVID signal, and will affect ripple voltage and transition slew rate in REFIN signal.

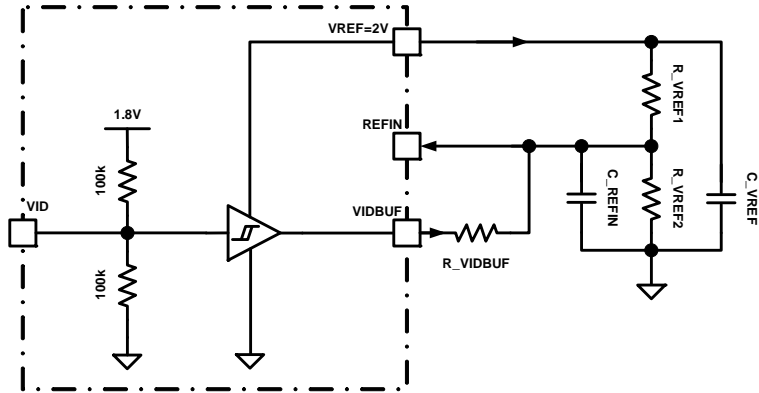

Figure 7. PWM VID Interface

Switching Frequency

Switching frequency is programmed by a resistor R_{FS} applied from the FS pin to ground. The typical frequency range is from 200 KHz to 800 kHz. The FS pin provides approximately 2 V out and the source current is mirrored into the internal ramp generator. The switching frequency in 2-phase operation (PS0 mode) can be estimated by

$$F_{SW(kHz)} = 16486 \cdot R_{FS(k\Omega)}^{-0.961}. \quad (\text{eq. 7})$$

To reduce output ripple in 1-phase operation, the switching frequency in PS1 and PS2 modes is set to be higher than PS0 mode, which can be estimated by

$$F_{SW(kHz)} = 15783 \cdot R_{FS(k\Omega)}^{-0.873}. \quad (\text{eq. 8})$$

Figure 8 shows a measurement based on a typical application under condition of V_{in} = 12 V, V_{out} = 0.9 V, I_{out} = 10 A for PS1 mode operation and I_{out} = 20 A for PS0 mode operation. It can also be found that the lower R_{dson} of the low-side MOSFETs the smaller frequency difference between PS0 mode and PS1 mode.

Figure 8. Switching Frequency Programmed by Resistor R_{FS} at FS Pin

Soft Start

The NCP81273 has a soft start function. The output starts to ramp up following a system reset period after the device is enabled. The device is able to start up smoothly under an output pre-biased condition without discharging the output before ramping up.

REFIN Discharge

An internal switch in REFIN pin starts to short REFIN to GND just after EN is pulled high and it turns off just before the beginning of the soft start. The typical on resistance of the switch is 6.25 Ω.

Output Discharge in Shut Down

The NCP81273 has an output discharge function when the device is in shutdown mode. The resistors from PH node to PGND in both phases are active to discharge the output capacitors.

Over Current Protection

The NCP81273 protects converters from over current. The current through each phase is monitored by voltage sensing from phase node PHx to GND pin. The sense signal is compared to an internal voltage threshold. Once over load happens, the inductor current is limited to an average current per phase, which can be estimated by

$$I_{LMT(phase)} = \frac{V_{thOC}}{R_{DS(phase)}}, \quad (\text{eq. 9})$$

where $R_{DS(phase)}$ is a total on conduction resistance of low-side MOSFETs per phase. Normally, a continuous over load event leads to a voltage drop in the output voltage and possible to eventually trip under voltage protection.

The over-current threshold can be externally programmed by adding a 1% tolerance resistor between COMP pin and GND. The selectable thresholds can be found in the electrical table. To assure accurate resistance detection, the total capacitance from COMP pin to FB pin should be less than 330 pF.

Under Voltage Protection

There are two under voltage protections implemented in the NCP81273, which are fast under voltage protection and slow under voltage protection.

Fast under voltage protection (FUVP) protects converters in case of an extreme short circuit in output by monitoring

FB voltage. Once FB voltage drops below 0.2 V for more than 1 μs, the NCP81273 latches off, both the high-side MOSFETs and the low-side MOSFETs in all phases are turned off. The fault remains set until the system has either VCC or EN toggled state. The FUVF function is disabled in soft start.

Slow under voltage protection (SUVP) of the NCP81273 is based on voltage detection at COMP pin. In normal operation, COMP level is below 2.5 V. When the output voltage drops below REFIN voltage for long time and COMP rises to be over 2.95 V, an internal UV fault timer will be triggered. If the fault still exists after 50μs, the NCP81273 latches off, both the high-side MOSFETs and the low-side MOSFETs in all phases are turned off. The fault remains set until the system has either VCC or EN toggled state.

Over Voltage Protection

Over voltage protection of the NCP81273 is based on voltage detection at FB pin. Once FB voltage is over 2 V for more than 1 μs, all the high-side MOSFETs are turned off and all the low-side MOSFETs are latched on. The NCP81273 latches off until the system has either VCC or EN has toggled state.

Temperature Sense and Thermal Alert

The NCP81273 provides external temperature sense and thermal alert in the normal operation mode, and disables the function in the standby mode. The temperature sense and thermal alert circuit diagram is shown in Figure 9. An external voltage divider, consisting of a NTC thermistor R_{NTC} and a resistor R_{TSNS} , is employed to sense temperature and program alert level. Usually the thermistor is placed close to a hot spot like a power MOSFET. The NCP81273 monitors the voltage at TSNS pin and compares the voltage to an internal 1 V threshold by an internal comparator. Once the TSNS voltage drops below 1 V, the comparator turns on an open-drain switch at TALERT# pin and thus indicates a high temperature alert. The thermal alert can be de-asserted when TSNS voltage raises back to be higher than 1.05 V. In an exemplary application where a 100 kΩ ($B = 4250$ at 25°C) NTC thermistor is applied together with a 5.62 kΩ resistor, a low-valid thermal alert signal is asserted when the temperature of the NTC thermistor reaches 100°C and de-asserted when the temperature drops down to 97°C.

Thermal Shutdown

The NCP81273 has a thermal shutdown protection to protect the device from overheating when the die temperature exceeds 150°C. Once the thermal protection is triggered, the fault state can be ended by re-applying VCC and/or EN if the temperature drops down below 125°C.

LAYOUT GUIDELINES

Electrical Layout Considerations

Good electrical layout is a key to make sure proper operation, high efficiency, and noise reduction.

- **Power Paths:** Use wide and short traces for power paths to reduce parasitic inductance and high-frequency loop area. It is also good for efficiency improvement.
- **Power Supply Decoupling:** The power MOSFET bridges should be well decoupled by input capacitors and input loop area should be as small as possible to reduce parasitic inductance, input voltage spike, and noise emission. Place decoupling caps as close as possible to the controller VCC and VCCP pins.
- **Output Decoupling:** The output capacitors should be as close as possible to the load like a GPU. If the load is distributed, the capacitors should also be distributed and generally placed in greater proportion where the load is more dynamic.
- **Switching Nodes:** Switching nodes between HS and LS MOSFETs should be copper pours to carry high current and dissipate heat, but compact because they are also noise sources.
- **Gate Drive:** All the gate drive traces such as HGx, LGx, PHx, and BSTx should be short, straight as possible, and not too thin. The bootstrap cap and an option resistor need to be very close and directly connected between BSTx pin and PHx pin.
- **Ground:** It would be good to have separated ground planes for PGND and GND and connect the two planes at one point. PGND plane is an isolation plane between noisy power traces and all the sensitive control circuits. Directly connect the exposed pad (GND pin) to GND ground plane through vias. The analog control circuits should be surrounded by GND ground plane. GND ground plane is connected to PGND plane by single joint with low impedance.
- **Voltage Sense:** Use Kelvin sense pair and arrange a “quiet” path for the differential output voltage sense.

- **Current Sense:** The NCP81273 senses phase currents by monitoring voltages from phase nodes PHx to the common ground PGND pin. PGND ground plane should be well underneath PHx traces. To get better current balance between the two phases, try to make a layout as symmetrical as possible and balance the current flow in PGND plane for the two phases.
- **Temperature Sense:** A NTC thermistor is placed close to a hot spot like a power MOSFET, and a filter capacitor is placed close to TSNS pin of the controller. To avoid the traces from/to the NTC thermistor to cross over other sensitive control circuits.
- **Compensation Network:** The compensation network should be close to the controller. Keep FB trace short to minimize their capacitance to GND.
- **PWM VID Circuit:** The PWM VID is a high slew-rate digital signal from GPU to the controller. The trace routing of it should be done to avoid noise coupling from the switching node and to avoid coupling to other sensitive analog circuit as well. The RC network of the PWM VID circuit needs to be close to the controller. A 10 nF ceramic cap is connected from VREF pin to GND plane, and another small ceramic cap is connected from REFIN pin to GND plane.

Thermal Layout Considerations

Good thermal layout helps high power dissipation from a small-form factor VR with reduced temperature rise.

- The exposed pads of the controller and power MOSFETs must be well soldered on the board.
- A four or more layers PCB board with solid ground planes is preferred for better heat dissipation.
- More vias are welcome to be underneath the exposed pads and surrounding the power devices to connect the inner ground layers to reduce thermal resistances.
- Use large area copper pour to help thermal conduction and radiation.
- Try distributing multiple heat sources to reduce temperature rise in hot spots.

NCP81273

PACKAGE DIMENSIONS

QFN24, 4x4, 0.5P
CASE 485L
ISSUE B

DETAIL A
ALTERNATE
CONSTRUCTIONS

DETAIL B
ALTERNATE TERMINAL
CONSTRUCTIONS

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.25 AND 0.30 MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

| DIM | MILLIMETERS | |
|-----|-------------|------|
| | MIN | MAX |
| A | 0.80 | 1.00 |
| A1 | 0.00 | 0.05 |
| A3 | 0.20 | REF |
| b | 0.20 | 0.30 |
| D | 4.00 | BSC |
| D2 | 2.70 | 2.90 |
| E | 4.00 | BSC |
| E2 | 2.70 | 2.90 |
| e | 0.50 | BSC |
| L | 0.30 | 0.50 |
| L1 | 0.05 | 0.15 |
