User's Guide

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

EVM IMPORTANT NOTICE

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation kit being sold by TI is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not considered by TI to be fit for commercial use. As such, the goods being provided may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety measures typically found in the end product incorporating the goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may not meet the technical requirements of the directive.

Should this evaluation kit not meet the specifications indicated in the EVM User's Guide, the kit may be returned within 30 days from the date of delivery for a full refund. **THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.**

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Please be aware that the products received may not be regulatory compliant or agency certified (FCC, UL, CE, etc.). Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive**.

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein**.

Please read the EVM User's Guide and, specifically, the EVM Warnings and Restrictions notice in the EVM User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact the TI application engineer.

Persons handling the product must have electronics training and observe good laboratory practice standards.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

Post Office Box 655303
Dallas, Texas 75265

EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM within the input voltage range of 5 V and the output voltage range of 3 V and 3.6 V.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 50°C. The EVM is designed to operate properly with certain components above 50°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

About This Manual

This manual describes the hardware and use of the TUSB6250 demonstration board.

How to Use This Manual

This document contains the following chapters:

Chapter 1—Introduction

Chapter 2—TUSB6250 Demonstration Board Hardware

Chapter 3—TUSB6250 Demonstration Board Functions

Chapter 4—TUSB6250 Firmware Programmer User's Guide

Appendix A—Bill of Materials

Appendix B—Power Regulator Suggestions

Appendix C—Schematics

Appendix D—Demonstration Board Revisions

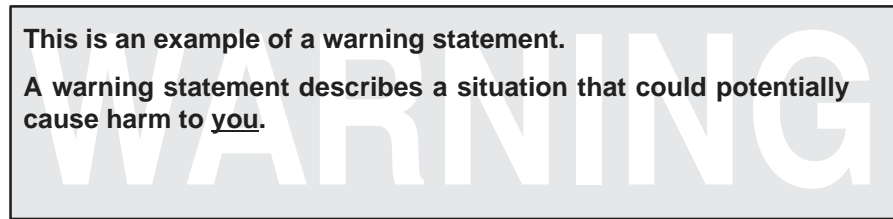

Appendix E—Suspend Current Measurement Procedure

Information About Cautions and Warnings

This book may contain cautions and warnings.

This is an example of a caution statement.

A caution statement describes a situation that could potentially damage your software or equipment.

The information in a caution or a warning is provided for your protection. Please read each caution and warning carefully.

Introduction

This chapter gives a brief introduction to the TSUB6250 demonstration board.

Topic	Page
1.1 Introduction	1-2
1.2 TUSB6250 Demonstration Board Feature Set	1-2

1.1 Introduction

The TUSB6250 demonstration board is a free standing reference design that acts as a bridge between a (PC or Mac™) hi-speed USB and an ATA/ATAPI device. It is used to evaluate system compatibility and to develop firmware that resides in external I²C memory, which is executed by the TUSB6250 embedded microcontroller. It also provides a TUSB6250 hardware reference design for connection to an ATA/ATAPI device such as a hard disk drive (HDD), ZIP drive, magneto-optical drive (MO), ORB, CD-ROM, CD-R/W, DVD-ROM, or DVD-RAM.

Figure 1–1. TUSB6250 Demonstration Board

1.2 TUSB6250 Demonstration Board Feature Set

The demonstration board provides the following features:

- One type-B hi-speed USB port connector
- 40-pin ATA/ATAPI header connector
- Serial I²C EEPROM (32K × 8)
- Supports hi-speed USB (HS, 480 Mb/s) and USB (full speed, FS, 12 Mb/s)
- Access to 16 GPIOs for optional uses

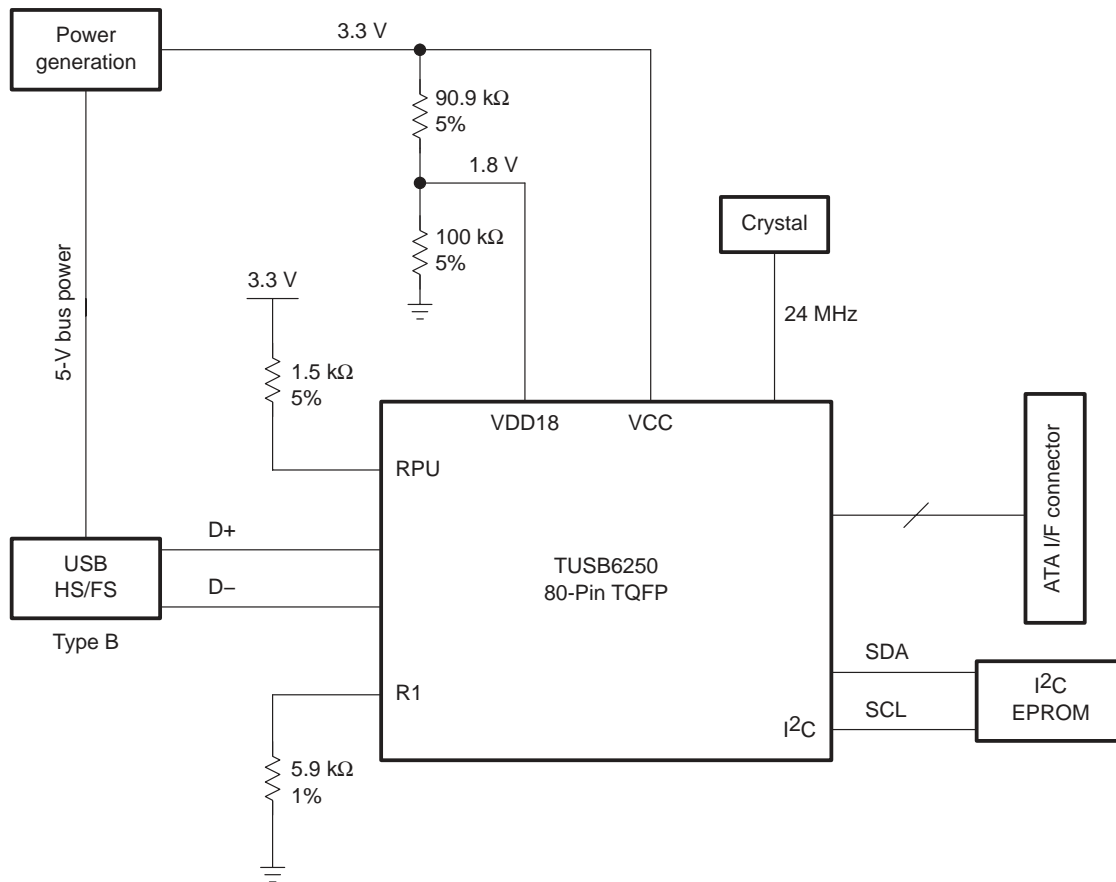

TUSB6250 Demonstration Board Hardware

This chapter gives an overview of the TUSB6250 hardware and installation.

Topic	Page
2.1 Hardware Overview	2-2
2.2 Hardware Installation	2-5

2.1 Hardware Overview

Figure 2–1. Basic Block Diagram of the TUSB6250 Demonstration Board

TUSB6250 demonstration board hardware can be divided into four functional areas. See Figure 2–1 for a block diagram, Figure 2–2 for a component layout, and Figure 2–3 and Figure 2–4 for specific location information.

- Hi-speed USB interface. The demonstration board connects to a PC or Mac via a hi-speed USB port. This is controlled by an integrated HS/FS PHY device.
- The TUSB6250 functions as a bridge between the ATA/ATAPI drive and the PC or Mac.
- ATA/ATAPI 40-pin header connector. Adapters can be used for 44-pin connection.
- Serial I²C serial EEPROM (32K byte)

Figure 2-2. Component Layout Diagram of the TUSB6250 Demonstration Board

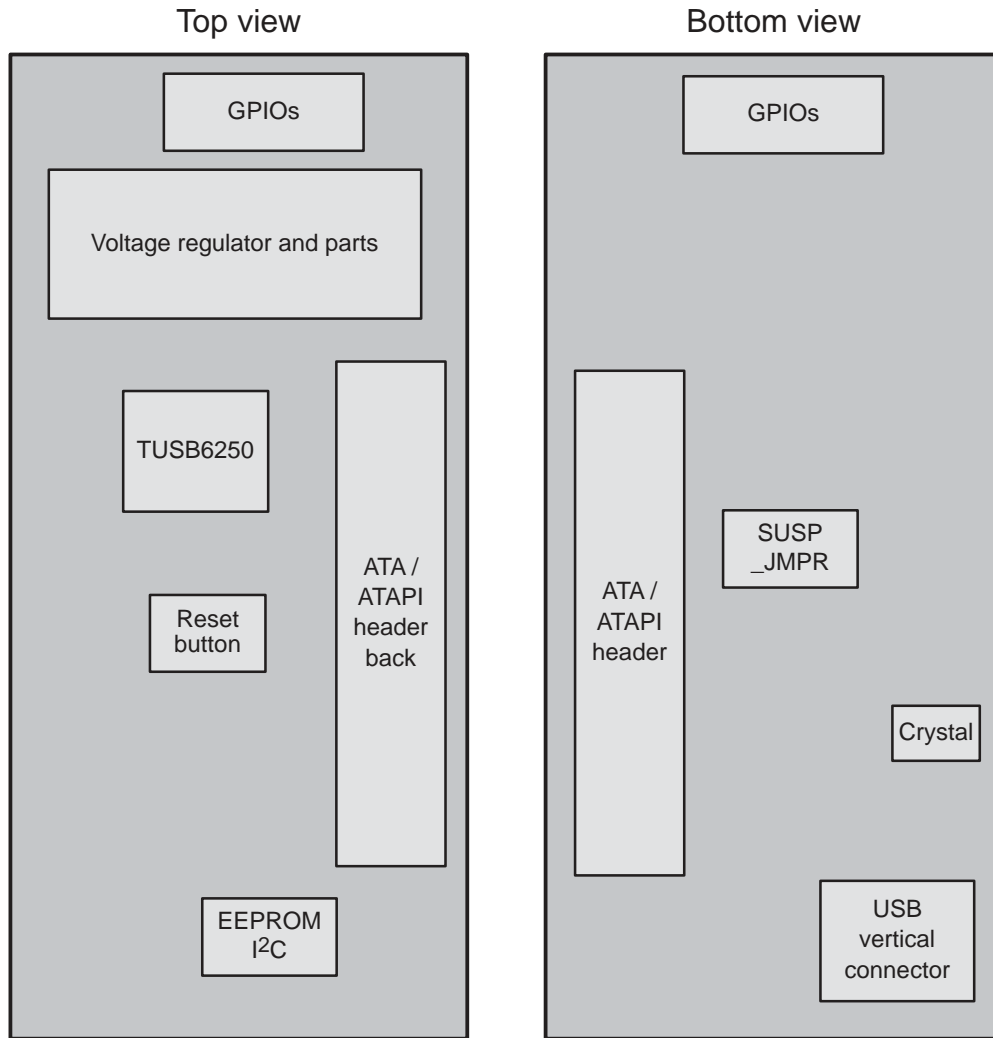

Figure 2–3. TUSB6250 Demonstration Board, Silkscreen—Bottom View

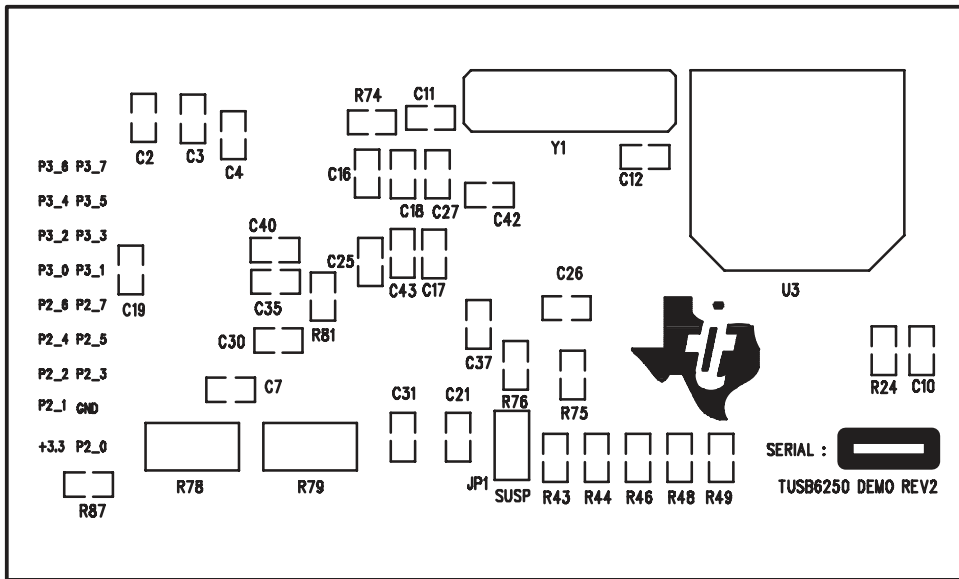

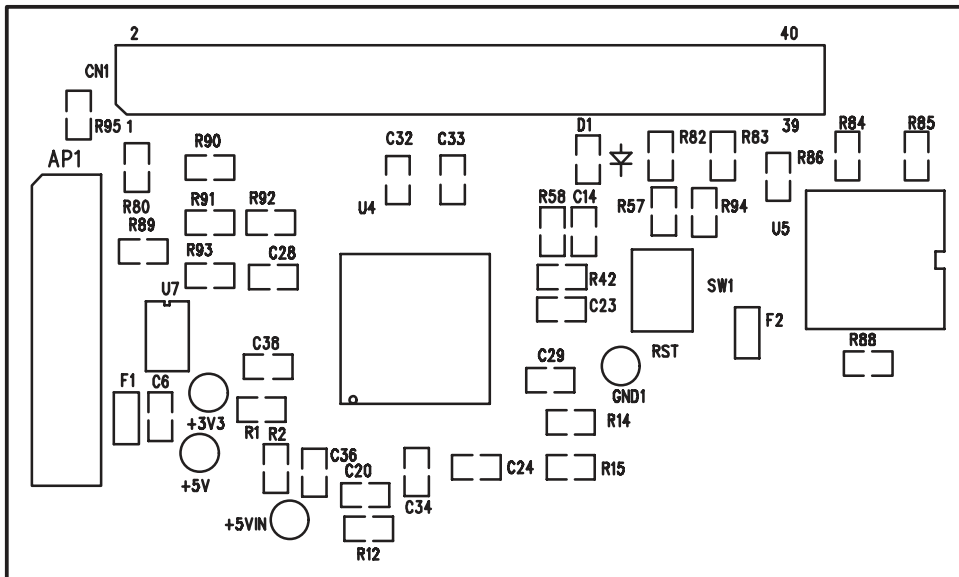

Figure 2–4. TUSB6250 Demonstration Board, Silkscreen—Top View

2.2 Hardware Installation

The following parts/devices are needed to set up the demonstration board:

- Hi-speed USB cable
- ATA/ATAPI device (HDD, CDROM, DVD, etc.)
- ATA/66 ribbon cable, 40-pin, 80-conductor cable
- Power source for ATA/ATAPI device
- PC or Mac with USB host controller or PC/Mac with USB onboard host controller card. A high-speed host controller is required for high-speed operation.

To set up the demonstration board, perform the following steps:

- 1) Ensure the ATA/ATAPI device power source is off.
- 2) Connect the ribbon cable (pin 1 is identified on the board) between the demonstration board and the ATA/ATAPI device.
- 3) Connect the ATA/ATAPI device to its power source.
- 4) Configure the demonstration board optional jumper (as shown Table 2–1) if the suspend LED is desired to be operational. Turn on the ATA/ATAPI device power supply.

Note:

Use of the suspend LED consumes 2 mA of current, and it is recommended that the LED jumper be removed for board current measurements.

- 5) Connect the hi-speed USB cable between the demonstration board and the PC or Mac. The PC or Mac may be running.

Table 2–1. Jumper/Switch Settings for the TUSB6250 Demonstration Board

Jumper	Setting	
Jumper 1 (suspend LED)	On = suspend LED	Off = no LED
Switch 1 (reset switch)	Depressed = reset	—

TUSB6250 Demonstration Board Functions

The demonstration board circuitry encompasses the following functions:

- Power generation
- Reset circuitry
- Required supporting circuitry
- GPIO access
- I²C serial EEPROM for firmware code and VID/PID storage
- EMI/ESD protection (optional)

Topic	Page
3.1 Power Generation	3-2
3.2 Reset Circuitry	3-2
3.3 Required Supporting Circuitry	3-2
3.4 I²C CMOS Serial EEPROM	3-2
3.5 GPIO Access	3-3
3.6 EMI/ESD Protection (Optional)	3-4

3.1 Power Generation

The demonstration board power generation uses a TPS77633D (U7), which converts 5 V to 3.3 V.

Cost versus application need determines the type of LDO or switching regulator used; see Appendix B for more information.

3.2 Reset Circuitry

The power-on-reset (POR) time is recommended to be at least 1 ms. With the demonstration board reset circuitry (R57: 15 k Ω and C14: 1 μ F), the time constant is 15 ms and the POR is more than 1.5 ms.

3.3 Required Supporting Circuitry

Bandgap reference: R74 on terminal 11 (of the TUSB6250 device) must be 5.9 k Ω at 1% tolerance.

3.4 I²C CMOS Serial EEPROM

The I²C serial EEPROM, U5, is a Microchip Technology Inc. 24LC256 32K \times 8 (256K bits). The I²C interface of the TUSB6250 device (terminals 21, SCL, and 22, SDA) have been pulled high through R87 and R88.

Note:

The TUSB6250 I²C implementation does not support master/slave bus arbitration.

3.5 GPIO Access

Sixteen general-purpose input/output signals are available for optional functional use at location AP1 as described in Table 3–1.

Table 3–1. GPIO Access-Point Header

Terminal	Signal	Comment
1	3.3 V	
2	P2_0	
3	P2_1/ $\overline{\text{PWR100}}$	This terminal is asserted by bootcode.
4	GND	
5	P2_2/ $\overline{\text{PWR500}}$	
6	P2_3	
7	P2_4	
8	P2_5	
9	P2_6	
10	P2_7	
11	P3_0/SIN	This dual-function terminal can be used as either GPIO or as the serial data input of the integrated 8051 microcontroller serial port.
12	P3_1/SOUT	This dual-function terminal can be used as either GPIO or as the serial data output of the integrated 8051 microcontroller serial port.
13	P3_2/ $\overline{\text{CD1}}$	These terminals can be used as either GPIOs or compact flash card insertion/removal detection function implemented by the end-product developer's custom firmware.
14	P3_3/ $\overline{\text{CD2}}$	
15	P3_4	
16	P3_5	
17	P3_6	
18	P3_7	

Note:

See the TUSB6250 data manual (SLLS535) for further details on the signals and their uses.

3.6 EMI/ESD Protection (Optional)

EMI protection can be accomplished, if needed, by using the TDK ACM2012-900-2P or the Murata DLW21SN900SQ2, (common mode choke, i.e., CMC). At this time, neither the TDK nor the Murata CMC devices are designed on the TUSB6250 demonstration board, but have been used on previous TUSB6250 board designs at Texas Instruments.

ESD protection can be accomplished, if needed, with Pulse-Guard™ discharging diodes; at this time Pulse-Guard diodes are not used but have been used on previous designs. Pulse-Guard ESD suppressors help protect sensitive electronic equipment against electrostatic discharge (ESD). They supplement the on-chip protection of the TUSB6250 device.

Note:

ESD testing by the Texas Instruments ESD testing center has determined that no extra ESD protection is required for the TUSB6250 demonstration board design. The TUSB6250 demonstration board is compliant with CE mark 8-kV ESD testing as well as industrial 16-kV levels.

TUSB6250 Firmware Programmer User's Guide

The TUSB6250 device requires an EEPROM for firmware storage. This EEPROM is read at device power up, and the code is executed from internal RAM. The TUSB6250-based storage device can have firmware upgraded via the USB bus. This feature allows for end-user field upgradeability. This function requires firmware version 00.00.01.10.x or later. A driver is also required to execute this function. When the update is initiated, the TUSB6250 firmware is put in a firmware update mode. The firmware disconnects from USB, and then reconnects with a different VID and PID. This causes the FWUpdate driver to load. At this point, the application can send data to the device through this driver. This chapter describes how to use the application.

Topic	Page
4.1 Firmware Programmer Utility	4-2

4.1 Firmware Programmer Utility

This functionality is supported with Windows™ 98SE (with TI-provided USB mass storage driver), Windows 2000, Windows ME, and Windows XP.

Step 1: Run the install executable. This installs the application and driver necessary for the firmware update functionality.

Step 2: Plug in the device to the host PC. When the application is first opened, a warning message appears (see Figure 4–1).

Figure 4–1. Warning Message

This message warns the user of the potential for data loss. If the device attached is a removable media device (CD, DVD, Zip, etc.), then it is recommended that the user eject the disk before proceeding. If the device is a fixed media type (HDD), then it is recommended that the user first stop the device using the Safely Remove Hardware application by double-clicking the plug-and-play icon in the system tray (see Figure 4–2), selecting the USB Mass Storage Device, and clicking on the Stop button. After the device is stopped, it must be unplugged from the USB, then plugged into the USB. Make sure no data is being written to the drive and click OK on the warning message to continue.

Figure 4–2. Windows Plug-and-Play Icon

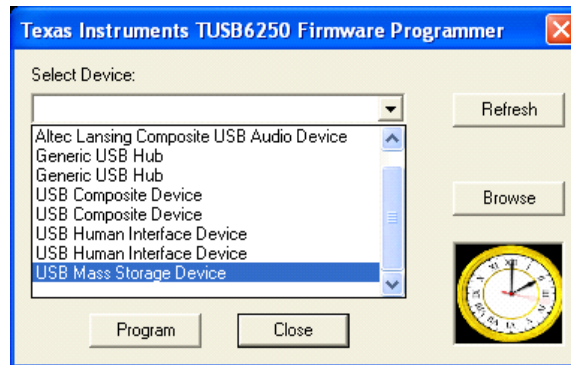

Step 3: Figure 4–3 shows the application when it first appears.

Figure 4–3. Initial View of Application

Select the device from the drop-down list. It should be listed as USB Mass Storage Device, as in Figure 4–4.

Figure 4–4. Select Device From List

Then select the proper hex file and press Program.

Step 4: After a few seconds, the device disconnects itself from the USB bus and reconnects as a different device. This causes a special driver to be loaded so the application can send the proper data (firmware) to the device. When this occurs, the Unsafe Removal notice may appear, depending on the OS (see Figure 4–5). This is normal. No user action is required in this step.

Figure 4–5. Unsafe Removal Notice

Step 5: Once the special driver is loaded, the application starts sending the data (firmware) to the device. As this is happening, the progress bar displays the progress, as seen in Figure 4–6. No user action is required in this step.

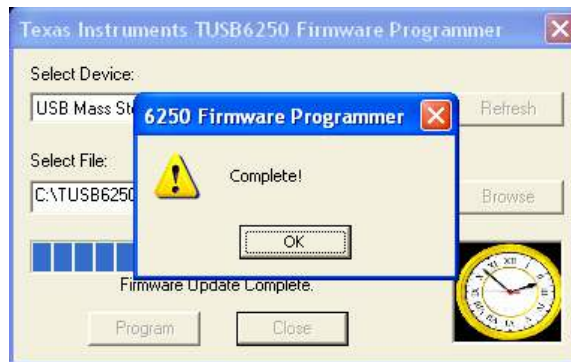

Figure 4–6. In the Progress of Updating

Step 6: When complete, a message box appears (see Figure 4–7). The whole process may take as much as two minutes to complete. When the process has completed, the firmware again disconnects from the USB bus. After closing the application, the user must unplug power to the device for the changes to take effect.

Figure 4–7. Firmware Update Completed

Bill of Materials

This appendix contains the bill of materials for the TUSB6250 demonstration board.

Topic	Page
A.1 Bill of Materials	A-2

Power Regulator Suggestions

This appendix provides the leading particulars on the suggested three power regulators.

Topic	Page
B.1 TPS76633 Linear LDO	B-2
B.2 TPS77633 Linear LDO	B-2
B.3 TPS62007 Switching Regulator	B-2

B.1 TPS76633 Linear LDO

Device Part Number	Output Current	Quiescent Current	Package	Suitable Application
TPS76633	250 mA	35 μ A	8 pin	Self-powered

Linear LDO Good for bus-powered captive cable with self-powered drive
Also good for 5-V drive, regardless if it is bus- or self-powered.

Pros Low cost at high volume

Cons Not enough output current for bus-powered applications

Comment Recommend this one for self-powered or bus-powered captive cable with self-powered drive application

B.2 TPS77633 Linear LDO

Device Part Number	Output Current	Quiescent Current	Package	Suitable Application
TPS77633	500 mA	85 μ A	8 pin	Bus-powered

Linear LDO Used on demonstration board

Pros 500-mA output current
Low cost savings compared to switching regulator

Cons Only good for bus-powered drive when drive itself meets the following requirements:
– The drive must consume less than 380 mA to 400 mA (depending on ATA modes) during worst-case normal operation
– Need to pay attention to higher quiescent current (85 μ A)

B.3 TPS62007 Switching Regulator

Device Part Number	Output Current	Quiescent Current	Package	Suitable Application
TPS62007	600 mA	50 μ A	10 pin	Bus powered

Switching Regulator

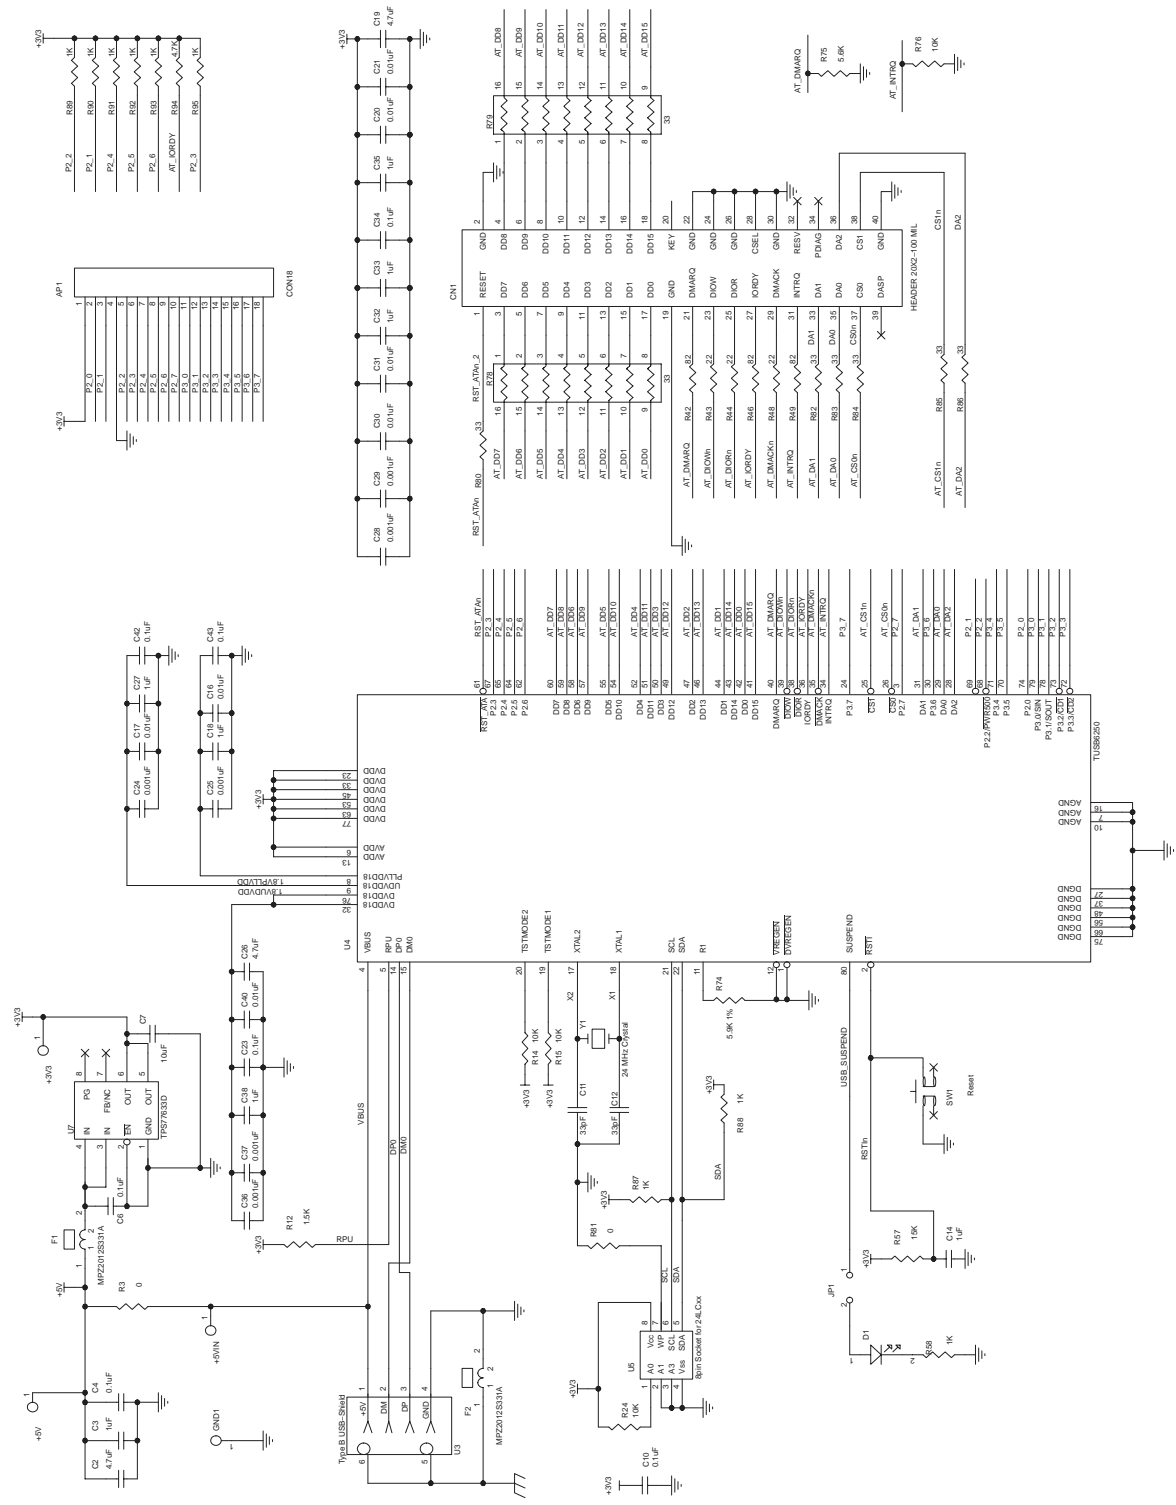

Pros 600-mA output current
Much higher efficiency: about 90%
Lower quiescent current (50 μ A)
Only one regulator is needed for bridge and drive with one additional power MOSFET
Perfect for a true bus-powered 3.3-V 1.8-in. HDD solution

- Cons** Major drawback is expense:
- Cost is nearly double that of an LDO
 - Needs more external components like one inductor and a couple of capacitors
 - Needs one power MOSFET as the power switch to control the power of hard-drive
- Comment** Only good for bus-powered drive when the drive itself meets the following:
- The drive must be 3.3 V and consume less than 517 mA (an estimate)
 - Operating at UDMA-66 Read/Write/Startup during worst case of normal operation

Schematic

This chapter contains the schematic for the TUSB6250 demonstration board.

Demonstration Board Revisions

This appendix provides information on the differences between the multiple versions of the TUSB6250 demonstration boards supplied by Texas Instruments.

Topic	Page
D.1 Green Board Version (First Board Created)	D-2
D.2 Blue Board Version (First Revision)	D-2
D.3 Red Board Version (Second Revision)	D-3
D.4 Yellow Board Version (Third Revision)	D-3
D.5 Lime Board Version (Fourth Revision)	D-3

D.1 Green Board Version (First Board Created)

- The TUSB6250 terminal grounds are isolated from the demonstration board ground. Terminal grounds were attached to the board ground after production.
- Contains buried capacitor effect between board layers two and three power/ground (2 mil dielectric) to improve EMI.
- DP/DM USB differential signal impedance is approximately 80 Ω
- Contains optional ESD component footprints for protection: D3, D4 (Not populated)
- Includes a jumper for USB bus-power or self-power selection. Jumper installed indicates bus power.
- Built with 16 access points for user access to GPIOs.
- UDVDD18 and PLLVDD18 are connected with DVDD18 through two ferrites: F6 and F7 on the board.
- The VREGEN and DVREGEN terminals are connected to the SUSPEND terminal.
- The PDIAG and DASP signals from the ATA/ATAPI interface are connected to the TUSB6250 terminals P3.6 and P3.7, respectively.

D.2 Blue Board Version (First Revision)

- The TUSB6250 terminal grounds are attached to the demonstration board ground (true of all later revisions).
- Buried capacitor effect between board layers two and three removed (true of all later revisions).
- DP/DM USB differential signal impedance is about 90 Ω
- Contains optional ESD component footprints for protection: D3, D4 (Not populated)
- A jumper for USB bus-power or self-power selection. Jumper installed indicates bus power.
- 16 access points for user access to GPIOs.
- UDVDD18 and PLLVDD18 are connected with DVDD18 through two ferrites: F6 and F7 on the board.
- The VREGEN and DVREGEN terminals are connected to the SUSPEND terminal.
- The PDIAG and DASP signals from the ATA/ATAPI interface are connected to the TUSB6250 terminals P3.6 and P3.7, respectively.

D.3 Red Board Version (Second Revision)

- Removed optional ESD component footprints (true of all later revisions).
- Removed jumper for power selection. This demonstration board revision is always configured for USB bus power.
- Built with 18 access points for user access to GPIOs
- UDVDD18 and PLLVDD18 are separated from DVDD18 via capacitors to ground.
- The VREGEN and DVREGEN terminals are connected to the SUSPEND terminal.
- The PDIAG and DASP signals from the ATA/ATAPI interface are connected to the TUSB6250 terminals P3.6 and P3.7, respectively.

D.4 Yellow Board Version (Third Revision)

- Ground test point near I²C is removed to ease EEPROM installation/removal.
- Resistor size is decreased to reduce board congestion.
- Added resistor R3 to act as a power-selection device. When R3 is installed, the demonstration board is configured for USB bus power. When R3 is not installed, the demonstration board is configured to be self-powered.
- The DVREGEN terminal is connected to the SUSPEND terminal. The VREGEN terminal is connected to ground.
- The PDIAG and DASP signals from the ATA/ATAPI interface are no longer connected to the TUSB6250; the TUSB6250 does not use them during normal operations.

D.5 Lime Board Version (Fourth Revision)

- Voltage divider resistors R1 and R2 removed
- DVREGEN terminal is connected to ground.

Suspend Current Measurement Procedure

This appendix details the procedure for measuring the USB suspend current for a system with a bus-powered TUSB6250 demonstration board and a self-powered ATA/ATAPI device.

Topic	Page
E.1 Suspend Current Measurement	E-2

E.1 Suspend Current Measurement

The ATA/ATAPI specification states that a pullup resistor is required on the IORDY signal of the ATA/ATAPI interface. On the most recent revision of demonstration board (yellow), the AT_IORDY signal is pulled high to 3.3 V through a 4.7-k Ω resistor.

During USB suspend, the ATA/ATAPI device is powered down. If the AT_IORDY signal remains pulled high during the USB suspend, then current flows back to the ATA/ATAPI device increasing power consumption. To prevent increased power consumption in a bus-powered design, the AT_IORDY should be pulled high through a resistor to 3.3 V via a FET controlled by the PWR500 (P2.2) terminal and the TUSB6250 firmware should be set to enable the internal pulldown resistors on the ATA/ATAPI signals during USB suspend. A reference design is available.

In order to obtain a valid suspend current measurement of the TUSB6250 for each version of the demonstration boards, the following modifications must be completed:

E.1.1 Green Board Version

- The IORDY terminal is pulled high through the R77 chip resistor. The AT_IORDY trace needs to be cut and left open.
- The AT_PDIAGn and AT_DASPN signals are multiplexed with the GPIO signals P3.6 and P3.7. During the USB suspend, TUSB6250 terminals P3.6 and P3.7 are pulled high internally by the firmware. From the ATA/ATAPI interface side, the AT_PDIAGn and AT_DASPN are pulled low. The AT_PDIAGn and AT_DASPN traces should be cut and left open.

E.1.2 Blue Board Version

- The IORDY terminal is pulled high through the R77 chip resistor. The AT_IORDY trace needs to be cut and left open.
- The AT_PDIAGn and AT_DASPN signals are multiplexed with the GPIO signals P3.6 and P3.7. During the USB suspend, TUSB6250 terminals P3.6 and P3.7 are pulled high internally by the firmware. From the ATA/ATAPI interface side, the AT_PDIAGn and AT_DASPN are pulled low. The AT_PDIAGn and AT_DASPN traces should be cut and left open.

E.1.3 Red Board Version

- AT_IORDY is pulled high through a resistor, R94. R94 should be removed.
- The PDIAG and DASP signals from the ATA/ATAPI are not connected and therefore no modification is required.

E.1.4 Yellow Board Version

- AT_IORDY is pulled high through a resistor, R94. R94 should be removed.
- The PDIAG and DASP signals from the ATA/ATAPI are not connected and therefore no modification is required.
