Timing-Safe™ Peak EMI Reduction IC

Functional Description

P3P623S00B/E is a versatile, 3.3 V Zero-delay buffer designed to distribute Timing-Safe clocks with Peak EMI reduction. P3P623S00B is an eight-pin version, accepts one reference input and drives out one low-skew Timing-Safe clock. P3P623S00E accepts one reference input and drives out eight low-skew Timing-Safe clocks.

P3P623S00B/E has an SS% that selects 2 different Deviation and associated Input-Output Skew (T_{SKEW}). Refer to the *Spread Spectrum Control* and *Input-Output Skew* table for details.

P3P623S00E has a CLKOUT for adjusting the Input-Output clock delay, depending upon the value of capacitor connected at this pin to GND.

P3P623S00B/E operates from a 3.3 V supply and is available in two different packages, as shown in the ordering information table.

Application

P3P623S00B/E is targeted for use in Displays and memory interface systems.

General Features

- Clock Distribution with Timing-Safe Peak EMI Reduction
- Input Frequency Range: 20 MHz – 50 MHz
- 2 Different Spread Selection Options
- Spread Spectrum can be Turned ON/OFF
- External Input-Output Delay Control Option
- Supply Voltage: 3.3 V \pm 0.3 V
- P3P623S00B: 8 Pin SOIC
P3P623S00E: 16 Pin TSSOP
- The First True Drop-in Solution
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Figure 1. General Block Diagram

Spread Spectrum Frequency Generation

The clocks in digital systems are typically square waves with a 50% duty cycle and as frequencies increase the edge rates also get faster. Analysis shows that a square wave is composed of fundamental frequency and harmonics. The fundamental frequency and harmonics generate the energy peaks that become the source of EMI. Regulatory agencies test electronic equipment by measuring the amount of peak energy radiated from the equipment. In fact, the peak level allowed decreases as the frequency increases. The standard methods of reducing EMI are to use shielding, filtering, multi-layer PCBs, etc. These methods are expensive. Spread spectrum clocking reduces the peak energy by reducing the Q factor of the clock. This is done by slowly modulating the clock frequency. The P3P623S00B/E uses the center modulation spread spectrum technique in which the modulated output frequency varies above and below the reference frequency with a specified modulation rate. With

center modulation, the average frequency is the same as the unmodulated frequency and there is no performance degradation.

Zero Delay and Skew Control

All outputs should be uniformly loaded to achieve Zero Delay between input and output. Since the CLKOUT pin is the internal feedback to the PLL, its relative loading can adjust the input–output delay.

For applications requiring zero input–output delay, all outputs, including CLKOUT, must be equally loaded. Even if CLKOUT is not used, it must have a capacitive load equal to that on other outputs, for obtaining zero input–output delay.

Timing-Safe Technology

Timing-Safe technology is the ability to modulate a clock source with Spread Spectrum technology and maintain synchronization with any associated data path.
