

## MH005-Series Power Modules: 4.5 Vdc to 14 Vdc Input; 5 W

The MH005-Series Power Modules use advanced, surface-mount technology and deliver high-quality, compact, dc-dc conversion at an economical price.

### Applications

- Distributed power architectures
- Communication equipment
- Computer equipment

### Options

- Long pins: 5.8 mm ± 0.5 mm (0.230 in. ± 0.020 in.)
- Metal case with case ground pin

### Description

The MH005-Series Power Modules are dc-dc converters that operate over an input voltage range of 4.5 Vdc to 14 Vdc and provide precisely regulated dc outputs. The outputs are isolated from the inputs, allowing versatile polarity configurations and grounding connections. The modules have maximum power ratings of 5 W with a typical full-load efficiency of 73%.

The modules are PC board mountable and encapsulated in nonconductive cases. The modules are rated to full load at 100 °C case temperature with no external filtering or heat sinking.

### Features

- Small size: 50.8 mm x 27.9 mm x 11.7 mm (2.00 in. x 1.10 in. x 0.46 in.)
- Wide 3:1 input range
- Operating ambient temperature range: -10 °C to +70 °C, no derating
- High reliability
- High efficiency: 73% typical
- Input-to-output isolation
- No external filtering required
- No heat sink required
- Overcurrent protection
- Output overvoltage protection
- PC board mountable
- *UL*\* 1950 Recognized, *CSA*† C22.2 No. 950-95 Certified, *VDE*‡ 0805 (EN60950, IEC950) Licensed
- Meets FCC Class A requirements

\* *UL* is a registered trademark of Underwriters Laboratories, Inc.  
† *CSA* is a registered trademark of Canadian Standards Association.

## Absolute Maximum Ratings

Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operations sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Parameter	Symbol	Min	Max	Unit
Input Voltage (continuous)	$V_I$	—	15	Vdc
Operating Case Temperature (See Thermal Considerations section.)	$T_C$	-10	100	°C
Storage Temperature	$T_{stg}$	-40	110	°C
I/O Isolation Voltage (1 minute)	—	—	500	Vdc

## Electrical Specifications

Unless otherwise indicated, specifications apply over all operating input voltage, resistive load, and temperature conditions.

**Table 1. Input Specifications**

Parameter	Symbol	Min	Typ	Max	Unit
Operating Input Voltage	$V_I$	4.5	5	14	Vdc
Maximum Input Current ( $V_I = 0$ V to 14 V; $I_O = I_{O,max}$ ; see Figure 1.)	$I_{I,max}$	—	—	2.5	A
Inrush Transient	$i^2t$	—	—	0.2	A <sup>2</sup> s
Input Reflected-ripple Current, Peak-to-peak (5 Hz to 20 MHz, 500 nH source impedance, $T_A = 25$ °C; see Figure 15 and Design Considerations section.)	$I_r$	—	45	—	mAp-p
Input Ripple Rejection (120 Hz)	—	—	50	—	dB

## Fusing Considerations

**CAUTION: This power module is not internally fused. An input line fuse must always be used.**

This encapsulated power module can be used in a wide variety of applications, ranging from simple stand-alone operation to an integrated part of a sophisticated power architecture. To preserve maximum flexibility, internal fusing is not included; however, to achieve maximum safety and system protection, always use an input line fuse. The safety agencies require a normal-blow fuse with a maximum rating of 5 A in series with the input (see Safety Considerations section). Based on the information provided in this data sheet on inrush energy and maximum dc input current, the same type of fuse with a lower rating can be used. Refer to the fuse manufacturer's data for further information.

**Electrical Specifications** (continued)

**Table 2. Output Specifications**

Parameter	Device	Symbol	Min	Typ	Max	Unit	
Output Voltage Set Point ( $V_I = 5\text{ V}$ ; $I_O = I_{O, \text{max}}$ ; $T_A = 25\text{ }^\circ\text{C}$ )	MH005A	$V_{O, \text{set}}$	4.85	5.0	5.15	Vdc

Test Configurations

Note: Input reflected-ripple current is measured with a simulated source impedance of 500 nH. Capacitor  $C_s$  offsets possible battery impedance. Current is measured at the input of the module.

Figure 15. Input Reflected-Ripple Test Setup

8-513(C)

Note: Use a 0.1  $\mu F$  ceramic capacitor. Scope measurement should be made using a BNC socket. Position the load between 50 mm and 75 mm (2 in. and 3 in.) from the module.

Figure 16. Peak-to-Peak and RMS Output Noise Measurement Test Setup

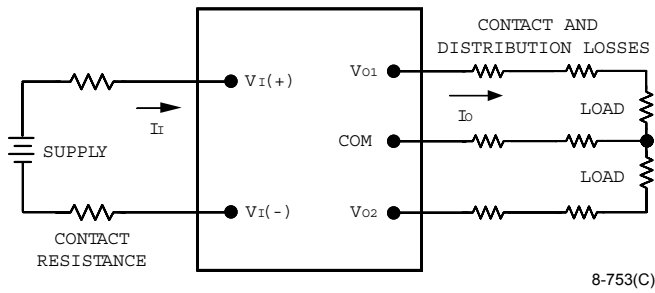

8-204(C)

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \left( \frac{[V_o(+)-V_o(-)] I_o}{[V_i(+)-V_i(-)] I_i} \right) \times 100 \quad \%$$

Figure 17. Single-Output Voltage and Efficiency Measurement Test Setup

Test Configurations (continued)

Note: All measurements are taken at the module terminals. When socketing, place Kelvin connections at module terminals to avoid measurement errors due to socket contact resistance.

$$\eta = \frac{\sum_{j=1}^n [|V_{Oj}(+) - V_{COM}] |I_{Oj}|}{[V_{I(+)} - V_{I(-)}] I_i} \times 100 \quad \%$$

Figure 18. Dual-Output Voltage and Efficiency Measurement Test Setup

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Source impedances greater than 4 μH can affect the stability of the power module. A 33 μF electrolytic capacitor (ESR < 0.7 Ω at 100 kHz) mounted close to the power module helps ensure stability of the unit.

Safety Considerations

For safety-agency approval of the system in which the power module is used, the power module must be installed in compliance with the spacing and separation requirements of the end-use safety agency standard, i.e., UL 1950, CSA C22.2 No. 950-95, and VDE 0805 (EN60950, IEC950).

For the converter output to be considered meeting the requirements of safety extra-low voltage (SELV), the input must meet SELV requirements.

The power module has extra-low voltage (ELV) outputs when all inputs are ELV.

The input to these units is to be provided with a maximum 5 A normal-blow fuse in the ungrounded lead.

Feature Descriptions

Overcurrent Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current-limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. If the output voltage is pulled very low during a severe fault, the current-limit circuit can exhibit either foldback or tailout characteristics (output current decrease or increase). The unit operates normally once the output current is brought back into its specified range.

Output Overvoltage Protection

The output overvoltage clamp consists of control circuitry, which is independent of the primary regulation loop, that monitors the voltage on the output terminals. The control loop of the clamp has a higher voltage set point than the primary loop (see Feature Specifications table). This provides a redundant voltage-control that reduces the risk of output overvoltage.

## Thermal Considerations

The MH005-Series Power Modules are designed to operate in a variety of thermal environments. As with any electronic component, sufficient cooling must be provided to help ensure reliable operation. Heat-dissipating components inside the module are thermally coupled to the case to enable heat removal by conduction, convection, and radiation to the surrounding environment.

The thermal data presented is based on measurements taken in a wind tunnel. The test setup shown in Figures 19 and 20 was used to collect data for Figures 21 and 22.

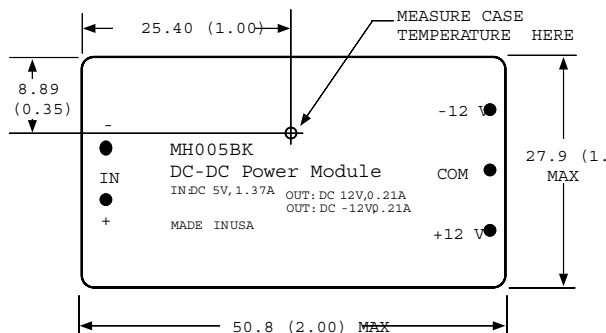

The graphs in Figures 21 and 22 provide general guidelines for use. Actual performance can vary depending on the particular application environment. The maximum case temperature of 100 °C must not be exceeded.

8-899(C)

Note: Measurements are in millimeters and (inches).

Figure 19. Thermal Test Setup

8-2240(C)

Note: Pin locations are for reference only. Measurements are in millimeters and (inches).

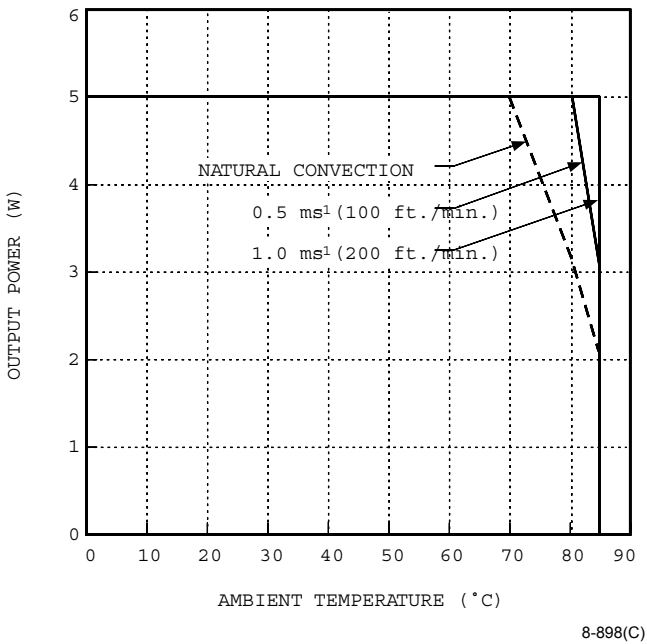

Figure 20. Case Temperature Measurement Location

**Thermal Considerations** (continued)

**Basic Thermal Performance**

The MH005-Series Power Modules are designed to operate at full load in natural convection at 70 °C without the use of an external heat sink (see Figure 21).

Higher ambient temperatures can be sustained by increasing the airflow. As stated, this data is based on a maximum case temperature of 100 °C and measured in the test configuration of Figure 19. The location for the temperature measurement is shown in Figure 20.

**Figure 21. MH005A, B, C Derating Curve**

**Case-to-Ambient Thermal Impedance**

Figure 22 shows the case-to-ambient thermal impedance,  $\theta_{ca}$  (°C/W) for the MH005 modules. This information is used to predict the case temperature for a given operating point and airflow by using the equation:

$$T_C = P_O \left( \frac{1 - \eta}{\eta} \right) \theta_{ca} + T_A$$

where  $T_C$  is the case temperature (°C),  $P_O$  is the output power (W),  $\eta$  is the efficiency for the desired voltage and load (see Characteristics Curves section), and  $T_A$  is the ambient inlet temperature (°C).

**Figure 22. MH005A, B, C Case-to-Ambient Thermal Impedance**
