

MPC5121E/MPC5123

MPC5121E/MPC5123 Data Sheet

516 TEPBGA
27 mm x 27 mm

The MPC5121e/MPC5123 integrates a high performance e300 CPU core based on the Power Architecture® Technology with a rich set of peripheral functions focused on communications and systems integration.

- On-chip temperature sensor
- IIM – IC Identification module

Major features of the MPC5121e/MPC5123 are:

- e300 Power Architecture processor core
- Power modes include doze, nap, sleep, deep sleep, and hibernate
- AXE – Auxiliary Execution Engine
- MBX Lite – 2D/3D graphics engine (not available in MPC5123)
- DIU – Display interface unit
- DDR1, DDR2, and LPDDR/mobile-DDR SDRAM memory controller
- MEM – 128 KB on-chip SRAM
- USB 2.0 OTG controller with integrated physical layer (PHY)
- DMA subsystem
- EMB – Flexible multi-function external memory bus interface
- NFC – NAND flash controller
- LPC – LocalPlus interface
- 10/100Base Ethernet
- PCI interface, version 2.3
- PATA – Parallel ATA integrated development environment (IDE) controller
- SATA – Serial ATA controller with integrated physical layer (PHY)
- SDHC – MMC/SD/SDIO card host controller
- PSC – Programmable serial controller
- I²C – inter-integrated circuit communication interfaces
- S/PDIF – Serial audio interface
- CAN – Controller area network
- BDLC – J1850 interface
- VIU – Video Input, ITU-656 compliant
- RTC – On-Chip real-time clock

- ¹ This pins should have an external pull-up resistor. Follow PCI specification and see System Design Information.
- ² This pin contains an enabled internal Schmitt trigger.
- ³ These JTAG pins have internal pull-up P-FETs. This pin can not be configured.
- ⁴ This pin is an input only. This pin can not be configured.
- ⁵ This test pin must be tied to V_{SS} .
- ⁶ This pin is an input or open-drain output. This pin can not be configured. There is an internal pull-up resistor implemented.

NOTE

This table indicates only the pins with permanently enabled internal pull-up, pull-down, or Schmitt trigger. Most of the digital I/O pins can be configured to enable internal pull-up, pull-down, or Schmitt trigger. See the *MPC5121e Microcontroller Reference Manual*, IO Control chapter.

3 Electrical and Thermal Characteristics

3.1 DC Electrical Characteristics

3.1.1 Absolute Maximum Ratings

The tables in this section describe the MPC5121e/MPC5123 DC Electrical characteristics. [Table 4](#) gives the absolute maximum ratings.

Table 4. Absolute Maximum Ratings¹

Characteristic	Symbol	Min	Max	Unit	SpecID
Supply voltage – e300 core and peripheral logic	V_{DD_CORE}	-0.3	1.47	V	D1.1
Supply voltage – I/O buffers	$V_{DD_IO}, V_{DD_MEM_IO}$	-0.3	3.6	V	D1.2
Input reference voltage (DDR/DDR2)	MVREF	-0.3	3.6	V	
Termination Voltage (DDR2)	MVTT	-0.3	3.6	V	
Supply voltage – System APLL, System Oscillator	SYS_PLL_AVDD	-0.3	3.6	V	D1.3
Supply voltage – e300 APLL	CORE_PLL_AVDD	-0.3	3.6	V	D1.4
Supply voltage – RTC (Hibernation)	VBAT_RTC	-0.3	3.6	V	D1.5
Supply voltage – FUSE Programming	AVDD_FUSEWR	-0.3	3.6	V	D1.6
Supply voltage – SATA PHY analog	SATA_VDDA_3P3	-0.3	3.6	V	D1.8
Supply voltage – SATA PHY voltage regulator	SATA_VDDA_VREG	-0.3	2.6	V	D1.9
Supply voltage – SATA PHY Tx/Rx	SATA_VDDA_1P2	-0.3	1.47	V	D1.10
Supply voltage – SATA PHY PLL	SATA_PLL_VDDA1P2	-0.3	1.47	V	D1.11
Supply voltage – USB PHY PLL and OSC	USB_PLL_PWR3	-0.3	3.6	V	D1.12
Supply voltage – USB PHY transceiver	USB_VDDA	-0.3	3.6	V	D1.13
Supply voltage – USB PHY bandgap bias	USB_VDDA_BIAS	-0.3	3.6	V	D1.14
Input voltage – USB PHY cable	USB_VBUS	-0.3	3.6	V	D1.15
Input voltage (V_{DD_IO})	V_{in}	-0.3	$V_{DD_IO} + 0.3$	V	D1.16
Input voltage ($V_{DD_MEM_IO}$)	V_{in}	-0.3	$V_{DD_MEM_IO} + 0.3$	V	D1.17
Input voltage (VBAT_RTC)	V_{in}	-0.3	$VBAT_RTC + 0.3$	V	D1.18
Input voltage overshoot	V_{inos}	—	1	V	D1.19
Input voltage undershoot	V_{inus}	—	1	V	D1.20
Storage temperature range	Tstg	-55	150	°C	D1.21

¹ Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage.

3.1.2 Recommended Operating Conditions

Table 5 gives the recommended operating conditions.

Table 5. Recommended Operating Conditions

Characteristic	Symbol	Min ¹	Typ	Max ¹	Unit	SpecID
Supply voltage – e300 core and peripheral logic	V_{DD_CORE}	1.33	1.4	1.47	V	D2.1
State Retention voltage – e300 core and peripheral logic ²		1.08	—	—	V	D2.2
Supply voltage – standard I/O buffers	V_{DD_IO}	3.0	3.3	3.6	V	D2.3
Supply voltage – memory I/O buffers (DDR)	$V_{DD_MEM_IO_DDR}$	2.3	2.5	2.7	V	D2.4
Supply voltage – memory I/O buffers (DDR2, LPDDR)	$V_{DD_MEM_IO_DDR2}$ $V_{DD_MEM_IO_LPDDR}$	1.7	1.8	1.9	V	D2.5
Input Reference Voltage (DDR/DDR2)	MVREF	$0.49 \times V_{DD_MEM_IO}$	$0.50 \times V_{DD_MEM_IO}$	$0.51 \times V_{DD_MEM_IO}$	V	D2.6
Termination Voltage (DDR2)	MVTT	MVREF – 0.04	MVREF	MVREF + 0.04	V	D2.7
Supply voltage – System APLL, System Oscillator	SYS_PLL_AVDD	3.0	3.3	3.6	V	D2.8
Supply voltage – e300 APLL	CORE_PLL_AVDD	3.0	3.3	3.6	V	D2.9
Supply voltage – RTC (Hibernation) ³	VBAT_RTC	3.0	3.3	3.6	V	D2.10
Supply voltage – FUSE Programming	AVDD_FUSEWR	3.3		3.6	V	D2.11
Supply voltage – SATA PHY analog and OSC	SATA_VDDA_3P3	3.0	3.3	3.6	V	D2.13
Supply voltage – SATA PHY voltage regulator	SATA_VDDA_VREG	1.7		2.6	V	D2.14
Supply voltage – SATA PHY Tx/Rx	SATA_VDDA_1P2	1.14	1.2	1.47	V	D2.15
Supply voltage – SATA PHY PLL	SATA_PLL_VDDA1P2	1.33	1.4	1.47	V	D2.16
Supply voltage – USB PHY PLL and OSC	USB_PLL_PWR3	3.0	3.3	3.6	V	D2.17
Supply voltage – USB PHY transceiver	USB_VDDA	3.0	3.3	3.6	V	D2.18
Supply voltage – USB PHY bandgap bias	USB_VDDA_BIAS	3.0	3.3	3.6	V	D2.19
Input voltage – USB PHY cable	USB_VBUS	1.4	—	3.6	V	D2.20
Input voltage – standard I/O buffers	V_{in}	0	—	V_{DD_IO}	V	D2.21
Input voltage – memory I/O buffers (DDR)	V_{in_DDR}	0	—	$V_{DD_MEM_IO_DDR}$	V	D2.22
Input voltage – memory I/O buffers (DDR2)	V_{in_DDR2}	0	—	$V_{DD_MEM_IO_DDR2}$	V	D2.23
Input voltage – memory I/O buffers (LPDDR)	V_{in_LPDDR}	0	—	$V_{DD_MEM_IO_LPDDR}$	V	D2.24
Ambient operating temperature range	TA	–40	—	+85	°C	D2.25
Junction operating temperature range	TJ	–40	—	+125	°C	D2.26

¹ These are recommended and tested operating conditions. Proper device operation outside these conditions is not guaranteed.

² The State Retention voltage can be applied to V_{DD_CORE} after the device is placed in Deep-Sleep mode.

³ VBAT_RTC should not be supplied by a battery of voltage less than 3.0 V.

3.1.3 DC Electrical Specifications

Table 6 gives the DC Electrical characteristics for the MPC5121e/MPC5123 at recommended operating conditions.

Table 6. DC Electrical Specifications

Characteristic	Condition	Symbol	Min	Max	Unit	SpecID
Input high voltage	Input type = TTL V_{DD_IO}	V_{IH}	$0.51 \times V_{DD_IO}$	—	V	D3.1
Input high voltage	Input type = TTL $V_{DD_MEM_IO_DDR}$	V_{IH}	MVREF + 0.15	—	V	D3.2
Input high voltage	Input type = TTL $V_{DD_MEM_IO_DDR2}$	V_{IH}	MVREF + 0.125	—	V	D3.3
Input high voltage	Input type = TTL $V_{DD_MEM_IO_LPDDR}$	V_{IH}	$0.7 \times V_{DD_MEM_IO_LPDDR}$	—	V	D3.4
Input high voltage	Input type = PCI V_{DD_IO}	V_{IH}	$0.5 \times V_{DD_IO}$	—	V	D3.5

¹ This parameter is meant for those who do not use quartz crystals or resonators, but CAN osc, in crystal mode. In that case, $V_{extal} - V_{xtal} - 400mV$ criteria has to be met for oscillator's comparator to produce output clock.

² This parameter is meant for those who do not use quartz crystals or resonators, but signal generator clock to drive, in bypass mode. In that case, drive only the EXTAL pin not connecting anything to other pin for the oscillator's comparator to produce output clock.

³ This parameter is meant for those who do not use quartz crystals or resonators, but CAN osc, in crystal mode. In that case, drive one of the XTAL_IN or XTAL_OUT pins not connecting anything to other pin for the oscillator's comparator to produce output clock.

⁴ This parameter is meant for those who do not use quartz crystals or resonators, but signal generator clock to drive, in bypass mode. In that case, drive only the xtal_in pin not connecting anything to other pin for the oscillator's comparator to produce output clock.

⁵ Leakage current is measured with output drivers disabled and pull-up/pull-downs inactive.

⁶ Pullup current is measured at VIL and pulldown current is measured at VIH.

Electrical and Thermal Characteristics

- ⁷ See Table 7 for the typical drive capability of a specific signal pin based on the type of output driver associated with that pin as listed in Table 3.
- ⁸ All injection current is transferred to $V_{DD_IO}/V_{DD_MEM_IO}$. An external load is required to dissipate this current to maintain the power supply within the specified voltage range.
Total injection current for all digital input-only and all digital input/output pins must not exceed 10 mA. Exceeding this limit can cause disruption of normal operation.

Table 7. I/O Pads—Drive Current, Slew Rate

Pad Type	Supply Voltage	Drive Select/Slew Rate Control	Rise time max (ns)	Fall time max (ns)	Current loh (mA)	Current lol (mA)	SpecID
General IO	$V_{DD_IO} = 3.3V$	configuration 3 (11)	1.4	1.6	35	35	D3.41
		configuration 2 (10)	9.8	12			D3.42
		configuration 1 (01)	19	24			D3.43
		configuration 0 (00)	140	183			D3.44
DDR	$V_{DD_MEM_IO} = 2.5V$ (DDR)	configuration 3 (011)	2	2	16.2	16.2	D3.45
	$V_{DD_MEM_IO} = 1.8V$ (LPDDR)	configuration 0 (000)	1	1	4.6	4.6	D3.46
		configuration 1 (001)			8.1	8.1	D3.47
	$V_{DD_MEM_IO} = 1.8V$ (DDR2)	configuration 2 (010)	1	1	5.3	5.3	D3.48
		configuration 6 (110)			13.4	13.4	D3.49
PCI	$V_{DD_IO} = 3.3V$	configuration 1 (1)	1.4	1.4	11	17	D3.50
		configuration 0 (0)	2	2			D3.51

Notes:

- General IO – Rise and Fall Times at Drive load 50pF.
- PCI – Rise and Fall Times at Drive load 10pF.
- DDR – for LPDDR/Mobile-DDR, slew rate is measured between 20% of $V_{DD_MEM_IO}$ and 80% of $V_{DD_MEM_IO}$.
- DDR – for DDR, DDR2, rising signals, slew rate is measured between $V_{DD_MEM_IO} \times 0.5$ and V_{IH_AC} . For falling signals, slew rate is measured between $V_{DD_MEM_IO} \times 0.5$ and V_{IL_AC} .
- DDR – Rise and Fall Times terminated at the destination with 50 ohm to MVTT ($0.5 \times V_{DD_MEM_IO}$), with 4 pF representing the DDR input capacitance.

3.1.4 Electrostatic Discharge

CAUTION

This device contains circuitry that protects against damage due to high-static voltage or electrical fields. However, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages. Operational reliability is enhanced if unused inputs are tied to an appropriate logic voltage level (GND or VDD). Table 10 gives package thermal characteristics for this device.

Table 8. ESD and Latch-Up Protection Characteristics

Symbol	Rating	Min	Max	Unit	SpecID
V _{HBM}	Human Body Model (HBM) – JEDEC JESD22-A114-B	2000	—	V	D4.1
V _{MM}	Machine Model (MM) – JEDEC JESD22-A115	200	—	V	D4.2
V _{CDM}	Charge Device Model (CDM) – JEDEC JESD22-C101	500	—	V	D4.3

3.1.5 Power Dissipation

Power dissipation of the MPC5121e/MPC5123 is caused by 4 different components: the dissipation of the internal or core digital logic (supplied by V_{DD_CORE}), the dissipation of the analog circuitry (supplied by SYS_PLL_AVDD and CORE_PLL_AVDD), the dissipation of the IO logic (supplied by V_{DD_MEM_IO} and V_{DD_IO}) and the dissipation of the PHYs (supplied by own supplies). Table 9 details typical measured core and analog power dissipation figures for a range of operating modes. However, the dissipation due to the switching of the IO pins can not be given in general, but must be calculated for each application case using the following formula:

$$P_{IO} = P_{IOint} + \sum_M N \times C \times V_{DD_IO}^2 \times f \quad \text{Eqn. 1}$$

where N is the number of output pins switching in a group M, C is the capacitance per pin, V_{DD_IO} is the IO voltage swing, f is the switching frequency and P_{IOint} is the power consumed by the unloaded IO stage. The total power consumption of the device must not exceed the value that would cause the maximum junction temperature to be exceeded.

$$P_{total} = P_{core} + P_{analog} + P_{IO} + P_{PHYS} \quad \text{Eqn. 2}$$

Table 9. Power Dissipation

Core Power Supply (V _{DD_CORE})			SpecID
Mode	High-Performance e300 = 300 MHz, CSB = 200 MHz	Unit	
Operational ¹	800	mW	D5.1
Deep-Sleep ¹	1	mW	D5.2
Hibernation	20	uW	D5.3
PLL/OSC Power Supplies (SYS_PLL_AVDD, CORE_PLL_AVDD)			
Typical	25	mW	D5.4
Unloaded I/O Power Supplies (V _{DD_IO} , V _{DD_MEM_IO})			

Table 9. Power Dissipation (continued)

Core Power Supply (V _{DD_CORE})			SpecID
Mode	High-Performance	Unit	
			e300 = 300 MHz, CSB = 200 MHz
Typical	300	mW	D5.5
PHY Power Supplies (USB_VDDA, SATA_VDDA)			
Typical	200	mW	D5.6

¹ Typical core power is measured at V_{DD_CORE} = 1.4 V, T_j = 25 °C.

NOTE

The maximum power depends on the supply voltage, process corner, junction temperature, and the concrete application and clock configurations.

The worst case power consumption could reach a maximum of 2000 mW.

3.1.6 Thermal Characteristics

Table 10. Thermal Resistance Data

Rating	Board Layers	Symbol	TEPBGA	TEPBGA 2	Value	Unit	SpecID
Junction to Ambient Natural Convection ^{1,2}	Single layer board (1s)	R _{θJA}	31	24	30	°C/W	D6.1
Junction to Ambient Natural Convection ^{1,3}	Four layer board (2s2p)	R _{θJMA}	22	17	22	°C/W	D6.2
Junction to Ambient (@200 ft/min) ^{1,3}	Single layer board (1s)	R _{θJMA}	25	19	24	°C/W	D6.3
Junction to Ambient (@200 ft/min) ^{1,3}	Four layer board (2s2p)	R _{θJMA}	19	14	19	°C/W	D6.4
Junction to Board ⁴	—	R _{θJB}	14	9	14	°C/W	D6.5
Junction to Case ⁵	—	R _{θJC}	9	7	8	°C/W	D6.6
Junction to Package Top ⁶	Natural Convection	Ψ _{JT}	2	7	2	°C/W	D6.7

¹ Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

² Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.

³ Per JEDEC JESD51-6 with the board horizontal.

⁴ Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

⁵ Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

⁶ Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

3.1.6.1 Heat Dissipation

An estimation of the chip-junction temperature, T_J , can be obtained from the following equation:

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad \text{Eqn. 3}$$

where:

- T_A = ambient temperature for the package ($^{\circ}\text{C}$)
- $R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)
- P_D = power dissipation in package (W)

The junction to ambient thermal resistance is an industry standard value, which provides a quick and easy estimation of thermal performance. Unfortunately, there are two values in common usage: the value determined on a single layer board, and the value obtained on a board with two planes. For packages such as the PBGA, these values can be different by a factor of two. Which value is correct depends on the power dissipated by other components on the board. The value obtained on a single layer board is appropriate for the tightly packed printed circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated.

Historically, the thermal resistance has frequently been expressed as the sum of a junction to case thermal resistance and a case to ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA} \quad \text{Eqn. 4}$$

where:

- $R_{\theta JA}$ = junction to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)
- $R_{\theta JC}$ = junction to case thermal resistance ($^{\circ}\text{C}/\text{W}$)
- $R_{\theta CA}$ = case to ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ is device related and cannot be influenced by the user. You control the thermal environment to change the case to ambient thermal resistance, $R_{\theta CA}$. For instance, you can change the air flow around the device, add a heat sink, change the mounting arrangement on printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This description is most useful for ceramic packages with heat sinks where some 90% of the heat flow is through the case to the heat sink to ambient. For most packages, a better model is required.

A more accurate thermal model can be constructed from the junction to board thermal resistance and the junction to case thermal resistance. The junction to case covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction to board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. This model can be used for hand estimations or for a computational fluid dynamics (CFD) thermal model.

To determine the junction temperature of the device in the application after prototypes are available, the Thermal Characterization Parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D) \quad \text{Eqn. 5}$$

where:

- T_T = thermocouple temperature on top of package ($^{\circ}\text{C}$)
- Ψ_{JT} = thermal characterization parameter ($^{\circ}\text{C}/\text{W}$)
- P_D = power dissipation in package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned, so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over approximately one mm of wire extending

Electrical and Thermal Characteristics

from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

3.2 Oscillator and PLL Electrical Characteristics

The MPC5121e/MPC5123 System requires a system-level clock input SYS_XTALI. This clock input may be driven directly from an external oscillator or with a crystal using the internal oscillator.

There is a separate oscillator for the independent Real Time Clock (RTC) system.

The MPC5121e/MPC5123 clock generation uses two phase locked loop (PLL) blocks.

- The system PLL (SYS_PLL) takes an external reference frequency and generates the internal system clock. The system clock frequency is determined by the external reference frequency and the settings of the SYS_PLL configuration.
- The e300 core PLL (CORE_PLL) generates a master clock for all of the CPU circuitry. The e300 core clock frequency is determined by the system clock frequency and the settings of the CORE_PLL configuration.

The USB PHY contains its own oscillator with the input USB_XTALI and an embedded PLL.

The SATA PHY contains its own oscillator with the input SATA_XTALI and an embedded PLL.

3.2.1 System Oscillator Electrical Characteristics

Table 11. System Oscillator Electrical Characteristics

Characteristic	Symbol	Min	Typical	Max	Unit	SpecID
SYS_XTALI frequency	$f_{\text{sys_xtal}}$	15.6	33.3	35.0	MHz	O1.1

The system oscillator can work in oscillator mode or in bypass mode to support an external input clock as clock reference.

Figure 3. Timing Diagram—SYS_XTALI

Table 12. SYS_XTALI Timing

Sym	Description	Min	Max	Units	SpecID
t_{CYCLE}	SYS_XTALI cycle time ^{1, 2}	64.1	28.57	ns	O.1.2
t_{RISE}	SYS_XTALI rise time ³	1	4	ns	O.1.3
t_{FALL}	SYS_XTALI fall time ⁴	1	4	ns	O.1.4
t_{DUTY}	SYS_XTALI duty cycle ⁵	40	60	%	O.1.5

¹ The SYS_XTALI frequency and system PLL settings must be chosen such that the resulting system frequencies do not exceed their respective maximum or minimum operating frequencies. See the *MPC5121e Microcontroller Reference Manual*.

² The MIN/Max cycle times are calculated using $1/f_{\text{sys_xtal}}$ (MIN/MAX) where the $f_{\text{sys_xtal}}$ (MIN/MAX) (15.6/35 MHz) are taken from [Table 11](#).

³ Rise time is measured from 20% of vdd to 80% of V_{DD} .

⁴ Fall time is measured from 20% of vdd to 80% of V_{DD} .

⁵ SYS_XTALI duty cycle is measured at V_M .

3.2.2 RTC Oscillator Electrical Characteristics

Table 13. RTC Oscillator Electrical Characteristics

Characteristic	Symbol	Min	Typical	Max	Unit	SpecID
RTC_XTALI frequency	f_{rtc_xtal}	—	32.768	—	kHz	O2.1

3.2.3 System PLL Electrical Characteristics

Table 14. System PLL Specifications

Characteristic	Symbol	Min	Typical	Max	Unit	SpecID
Sys PLL input clock frequency ¹	f_{sys_xtal}	16	33.3	67	MHz	O3.1
Sys PLL input clock jitter ²	t_{jitter}	—	—	10	ps	O3.2
Sys PLL VCO frequency ¹	f_{VCOsys}	400	—	800	MHz	O3.3
Sys PLL VCO output jitter (Dj), peak to peak / cycle	$f_{VCOjitterDj}$	—	—	40	ps	O3.4
Sys PLL VCO output jitter (Rj), RMS 1 sigma	$f_{VCOjitterRj}$	—	—	12	ps	O3.5
Sys PLL relock time—after power up ³	t_{lock1}	—	—	200	μ s	O3.6
Sys PLL relock time—when power was on ⁴	t_{lock2}	—	—	170	μ s	O3.7

¹ The SYS_XTALI frequency and PLL Configuration bits must be chosen such that the resulting system frequency, CPU (core) frequency, and PLL (VCO) frequency do not exceed their respective maximum or minimum operating frequencies.

² This represents total input jitter—short term and long term combined. Two different types of jitter can exist on the input to CORE_SYSCLK, systemic and true random jitter. True random jitter is rejected. Systemic jitter is passed into and through the PLL to the internal clock circuitry.

³ PLL relock time is the maximum amount of time required for the PLL lock after a stable VDD and CORE_SYSCLK are reached during the power-on reset sequence.

⁴ PLL relock time is the maximum amount of time required for the PLL lock after the PLL has been disabled and subsequently re-enabled during sleep modes.

3.2.4 e300 Core PLL Electrical Characteristics

The internal clocking of the e300 core is generated from and synchronized to the system clock by means of a voltage-controlled core PLL.

Table 15. e300 PLL Specifications

Characteristic	Symbol	Min	Typical	Max	Unit	SpecID
e300 frequency ¹	f_{core}	200	—	400	MHz	O4.1
e300 PLL VCO frequency ¹	$f_{VCOcore}$	400	—	800	MHz	O4.3
e300 PLL input clock frequency	f_{CSB_CLK}	50	—	200	MHz	O4.4
e300 PLL input clock cycle time	t_{CSB_CLK}	5	—	20	ns	O4.5
e300 PLL relock time ²	t_{lock}	—	—	200	μ s	O4.6

Electrical and Thermal Characteristics

- ¹ The frequency and e300 PLL Configuration bits must be chosen such that the resulting system frequencies, CPU (core) frequency, and e300 PLL (VCO) frequency do not exceed their respective maximum or minimum operating frequencies in [Table 16](#). There is a hard coded relationship between f_{core} and f_{VCOcore} ($f_{\text{core}} = f_{\text{VCOcore}}/2$).
- ² PLL relock time is the maximum amount of time required for the PLL lock after a stable VDD and CORE_SYSCLK are reached during the power-on reset sequence. This specification also applies when the PLL has been disabled and subsequently re-enabled during sleep modes.

3.3 AC Electrical Characteristics

3.3.1 Overview

Hyperlinks to the indicated timing specification sections are provided in the following:

- [AC Operating Frequency Data](#)
- [Resets](#)
- [External Interrupts](#)
- [SDRAM \(DDR\)](#)
- [PCI](#)
- [LPC](#)
- [NFC](#)
- [PATA](#)
- [SATA PHY](#)
- [FEC](#)
- [USB ULPI](#)
- [On-Chip USB PHY](#)
- [SDHC](#)
- [DIU](#)
- [SPDIF](#)
- [CAN](#)
- [I²C](#)
- [J1850](#)
- [PSC](#)
- [GPIOs and Timers](#)
- [Fusebox](#)
- [IEEE 1149.1 \(JTAG\)](#)
- [VIU](#)

AC Test Timing Conditions:

Unless otherwise noted, all test conditions are as follows:

- $T_A = -40$ to 85 °C
- $V_{DD_CORE} = 1.33$ to 1.47 V
 $V_{DD_IO} = 3.0$ to 3.6 V
- Input conditions:
All Inputs: $t_r, t_f \leq 1$ ns
- Output Loading:
All Outputs: 50 pF

3.3.2 AC Operating Frequency Data

Table 16 provides the operating frequency information for the MPC5121e/MPC5123.

Table 16. Clock Frequencies

	Min	Max	Units	SpecID
e300 Processor Core	200	400	MHz	A1.1
SDRAM Clock	28.6	200	MHz	A1.2
CSB Bus Clock	50.0	200	MHz	A1.3
IP Bus Clock	8.3	83	MHz	A1.4
PCI Clock	4.43	66	MHz	A1.5
LPC Clock	2.08	83	MHz	A1.6

Table 16. Clock Frequencies (continued)

	Min	Max	Units	SpecID
NFC Clock	2.08	83	MHz	A1.7
DIU Clock	0.78	100	MHz	A1.8
SDHC Clock	0.78	66.6	MHz	A1.9
MBX Clock	6.25	100	MHz	A1.10

NOTES:

1. The SYS_XTALI frequency, Sys PLL, and CORE PLL settings must be chosen so that the resulting e300 clk, csb_clk, MCK, frequencies do not exceed their respective maximum or minimum operating frequencies.
2. The values are valid for the user operation mode. There can be deviations for test modes.
3. The selection of the peripheral clock frequencies needs to take care about requirements for baud rates and minimum frequency limitation.
4. The DDR data rate is 2x the DDR memory bus frequency.

See the *MPC5121e Microcontroller Reference Manual* for more information on the clock subsystem.

3.3.3 Resets

The MPC5121e/MPC5123 has three reset pins:

- $\overline{\text{PORESET}}$ —Power on Reset
- $\overline{\text{HRESET}}$ —Hard Reset
- $\overline{\text{SRESET}}$ —Software Reset

These signals are asynchronous I/O signals and can be asserted at any time. The input side uses a Schmitt trigger and requires the same input characteristics as other MPC5121e/MPC5123 inputs, as specified in [Section 3.1, “DC Electrical Characteristics.”](#)

As long as V_{DD} is not stable the $\overline{\text{HRESET}}$ output is not stable.

Table 17. Reset Rise / Fall Timing

Description	Min	Max	Unit	SpecID
$\overline{\text{PORESET}}$ ¹ fall time	—	1	ms	A3.4
$\overline{\text{PORESET}}$ rise time	—	1	ms	A3.5
$\overline{\text{HRESET}}$ ^{2,3} fall time	—	1	ms	A3.6
$\overline{\text{HRESET}}$ rise time	—	1	ms	A3.7
$\overline{\text{SRESET}}$ fall time	—	1	ms	A3.8
$\overline{\text{SRESET}}$ rise time	—	1	ms	A3.9

¹ Make sure that the $\overline{\text{PORESET}}$ does not carry any glitches. The MPC5121e/MPC5123 has no filter to prevent them from getting into the chip.

² $\overline{\text{HRESET}}$ and $\overline{\text{SRESET}}$ must have a monotonous rise time.

³ The assertion of $\overline{\text{HRESET}}$ becomes active at Power on Reset without any SYS_XTALI clock.

The timing relationship is shown in [Figure 4](#).

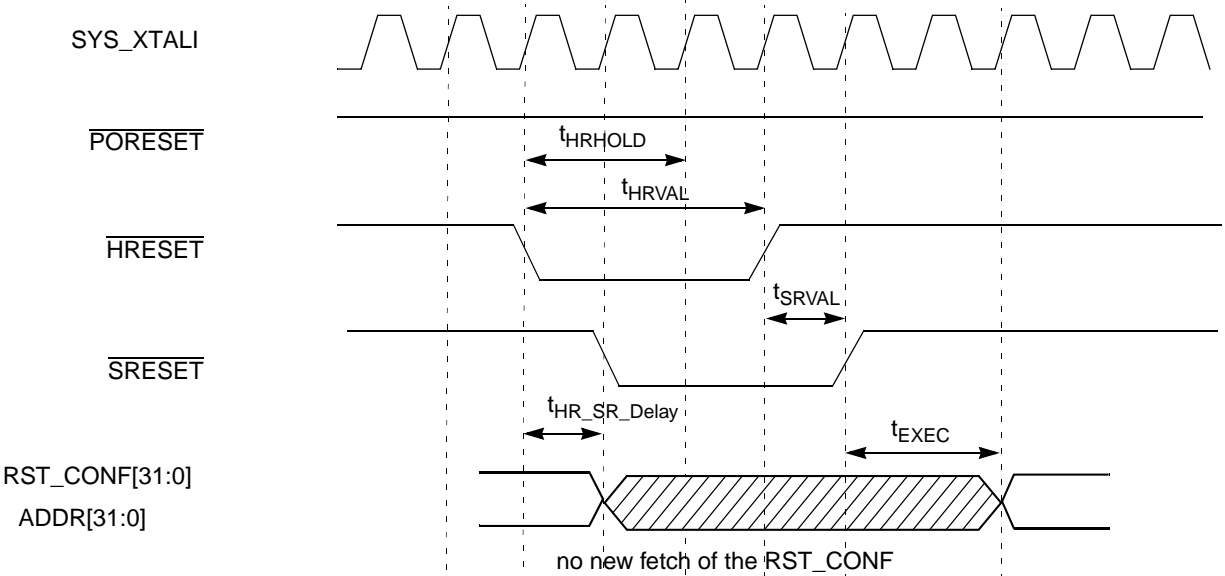

Figure 6. HRESET Behavior

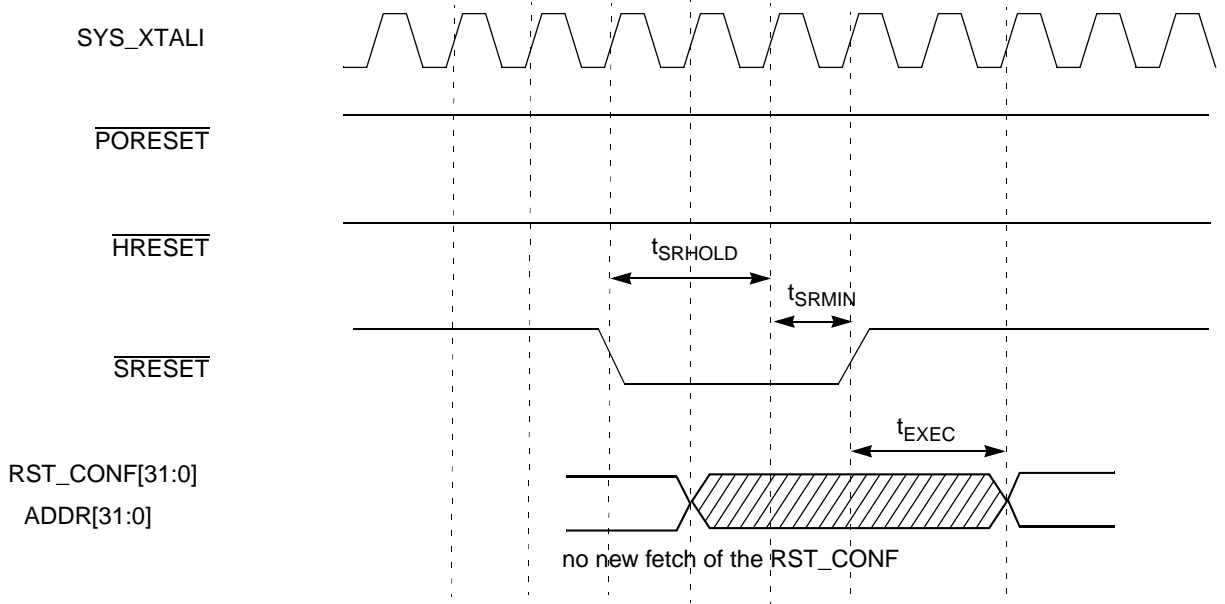

Figure 7. SRESET Behavior

Table 18. Reset Timing

Symbol	Description	Value SYS_XTALI	SpecID
$t_{PORHOLD}$	Time $\overline{PORESET}$ must be held low before a qualified reset occurs	4 cycles	A3.10
t_{HRVAL}	Time \overline{HRESET} is asserted after a qualified reset occurs	26810 cycles	A3.11
t_{SRVAL}	Time \overline{SRESET} is asserted after assertion of \overline{HRESET}	32 cycles	A3.12
t_{EXEC}	Time between \overline{SRESET} assertion and first core instruction fetch	4 cycles	A3.13

Table 18. Reset Timing (continued)

Symbol	Description	Value SYS_XTALI	SpecID
$t_{S_POR_CONF}$	Reset configuration setup time before assertion of $\overline{PORESET}$	1 cycle	A3.14
$t_{H_POR_CONF}$	Reset configuration hold time after assertion of $\overline{PORESET}$	1 cycle	A3.15
$t_{HR_SR_DELAY}$	Time from falling edge of HRESET to falling edge of SRESET	4 cycles	A3.16
t_{HRHOLD}	Time \overline{HRESET} must be held low before a qualified reset occurs	4 cycles	A3.17
t_{SRHOLD}	Time \overline{SRESET} must be held low before a qualified reset occurs	4 cycles	A3.18
t_{SRMIN}	Time \overline{SRESET} is asserted after it has been qualified	1 cycles	A3.19

3.3.4 External Interrupts

The MPC5121e/MPC5123 provides three different kinds of external interrupts:

- IRQ interrupts
- GPIO interrupts with simple interrupt capability (not available in power-down mode)
- WakeUp interrupts

Table 19. IPIC Input AC Timing Specifications¹

Description	Symbol	Min	Unit	SpecID
IPIC inputs—minimum pulse width	t_{PICWID}	2T	ns	A4.1

¹ T is the IP bus clock cycle. T = 12 ns is the minimum value (for the maximum IP bus frequency of 83 MHz).

IPIC inputs must be valid for at least t_{PICWID} to ensure proper operation in edge triggered mode.

3.3.5 SDRAM (DDR)

The MPC5121e/MPC5123 memory controller supports three types of DDR devices:

- DDR-1 (SSTL_2 class II interface)
- DDR-2 (SSTL_18 interface)
- LPDDR/Mobile-DDR (1.8V I/O supply voltage)

JEDEC standards define the minimum set of requirements for compliant memory devices:

- JEDEC STANDARD, DDR2 SDRAM SPECIFICATION, JESD79-2C, May 2006
- JEDEC STANDARD, Double Data Rate (DDR) SDRAM Specification, JESD79E, May 2005
- JEDEC STANDARD, Low Power Double Data Rate (LPDDR) SDRAM Specification, JESD79-4, May 2006

The MPC5121e/MPC5123 supports the configuration of two output drive strengths for DDR2 and LPDDR:

- Full drive strength
- Half drive strength (intended for lighter loads or point-to-point environments)

The MPC5121e/MPC5123 memory controller supports dynamic on-die termination in the host device and in the DDR2 memory device.

This section includes AC specifications for all DDR SDRAM pins. The DC parameters are specified in the DC Electrical Characteristics.

3.3.5.1 DDR and DDR2 SDRAM AC Timing Specifications

Table 20. DDR and DDR2 (DDR2-400) SDRAM Timing Specifications

At recommended operating conditions with $V_{DD_MEM_IO}$ of $\pm 5\%$

Parameter	Symbol	Min	Max	Unit	Notes	SpecID
Clock cycle time, CL=x	t_{CK}	5000	—	ps		A5.1
CK HIGH pulse width	t_{CH}	0.47	0.53	t_{CK}	^{1,2}	A5.3
CK LOW pulse width	t_{CL}	0.47	0.53	t_{CK}	^{1,2}	A5.4
Skew between MCK and DQS transitions	t_{DQSS}	-0.25	0.25	t_{CK}	^{2,3}	A5.5
Address and control output setup time relative to MCK rising edge	$t_{OS(base)}$	$(t_{CK}/2 - 750)$	—	ps	^{2,3}	A5.6
Address and control output hold time relative to MCK rising edge	$t_{OH(base)}$	$(t_{CK}/2 - 750)$	—	ps	^{2,3}	A5.7
DQ and DM output setup time relative to DQS	$t_{DS1(base)}$	$(t_{CK}/4 - 500)$	—	ps	^{2,3}	A5.8
DQ and DM output hold time relative to DQS	$t_{DH1(base)}$	$(t_{CK}/4 - 500)$	—	ps	^{2,3}	A5.9
DQS-DQ skew for DQS and associated DQ inputs	t_{DQSQ}	$-(t_{CK}/4 - 600)$	$(t_{CK}/4 - 600)$	ps	²	A5.10
DQS window start position related to CAS read command	t_{DQSEN}	TBD	TBD	ps	^{1,2,3,4,5}	A5.11

- ¹ Measured with clock pin loaded with differential 100 termination resistor.
- ² All transitions measured at mid-supply ($V_{DD_MEM_IO}/2$).
- ³ Measured with all outputs except the clock loaded with 50 Ω termination resistor to $V_{DD_MEM_IO}/2$.
- ⁴ In this window, the first rising edge of DQS should occur. From the start of the window to DQS rising edge, DQS should be low.
- ⁵ Window position is given for $t_{DQSEN} = 2.0 t_{CK}$. For other values of t_{DQSEN} , window position is shifted accordingly.

Figure 8 shows the DDR SDRAM write timing.

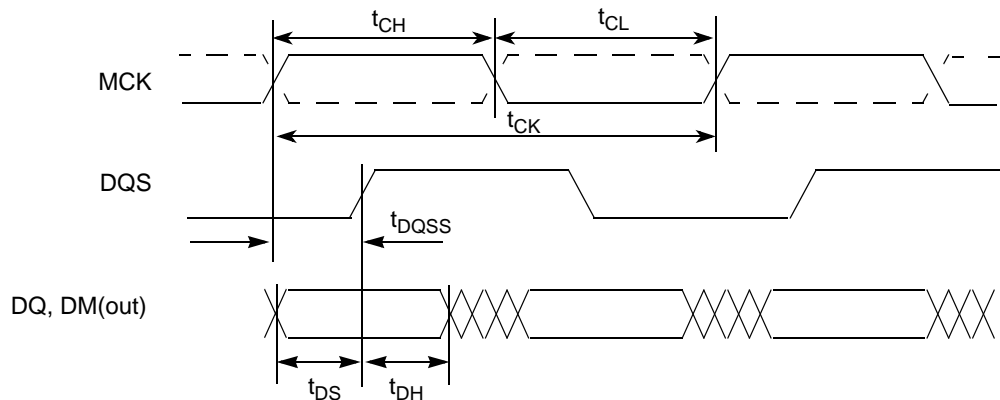

Figure 8. DDR Write Timing

Figure 9 and Figure 10 shows the DDR SDRAM read timing.

Figure 9. DDR Read Timing, DQ vs DQS

Figure 11 provides the AC test load for the DDR bus.

Figure 11. DDR AC Test Load

3.3.6 PCI

The PCI interface on the MPC5121e/MPC5123 is designed to PCI Version 2.3 and supports 33 and 66 MHz PCI operations. See the PCI Local Bus Specification; the component section specifies the electrical and timing parameters for PCI components with the intent that components connect directly together whether on the planar or an expansion board, without any external buffers or other glue logic. Parameters apply at the package pins, not at expansion board edge connectors.

The PCI_CLK is used as output clock, the MPC5121e/MPC5123 is a PCI host device only.

Figure 12 shows the clock waveform and required measurement points for 3.3 V signaling environments. Table 21 summarizes the clock specifications.

Figure 12. PCI CLK Waveform

Table 21. PCI CLK Specifications

Sym	Description	66 MHz ¹		33 MHz		Units	SpecID
		Min ²	Max	Min	Max		
t _{cyc}	PCI CLK Cycle Time ^{1,3}	15	30	30	—	ns	A6.1
t _{high}	PCI CLK High Time	6	—	11	—	ns	A6.2
t _{low}	PCI CLK Low Time	6	—	11	—	ns	A6.3
—	PCI CLK Slew Rate ²	1.5	4	1	4	V/ns	A6.4

- ¹ In general, all 66 MHz PCI components must work with any clock frequency up to 66 MHz. CLK requirements vary depending upon whether the clock frequency is above 33 MHz.
- ² Rise and fall times are specified in terms of the edge rate measured in V/ns. This slew rate must be met across the minimum peak-to-peak portion of the clock waveform as shown in Figure 12.
- ³ The minimum clock period must not be violated for any single clock cycle, i.e., accounting for all system jitter.

Table 22. PCI Timing Parameters¹

Sym	Description	66 MHz		33 MHz		Units	SpecID
		Min ²	Max	Min	Max		
t _{val}	CLK to Signal Valid Delay – based signals ^{1,2,3}	2	6	2	11	ns	A6.5
t _{val(ptp)}	CLK to Signal Valid Delay – point to point ^{1,2,3}	2	6	2	12	ns	A6.6
t _{on}	Float to Active Delay ¹	2	—	2	—	ns	A6.7
t _{off}	Active to Float Delay ¹	—	14	—	28	ns	A6.8
t _{su}	Input Setup Time to CLK – based signals ^{3,4}	3	—	7	—	ns	A6.9
t _{su(ptp)}	Input Setup Time to CLK – point to point ^{3,4}	5	—	10,12	—	ns	A6.10
t _h	Input Hold Time from CLK ⁴	0	—	0	—	ns	A6.11

- ¹ See the timing measurement conditions in the PCI Local Bus Specification. It is important that all driven signal transitions drive to their V_{oh} or V_{ol} level within one T_{cyc}.
- ² Minimum times are measured at the package pin with the load circuit, and maximum times are measured with the load circuit as shown in the PCI Local Bus Specification.
- ³ REQ# and GNT# are point-to-point signals and have different input setup times than do bused signals. GNT# and REQ# have a setup of 5 ns at 66 MHz. All other signals are bused.

⁴ See the timing measurement conditions in the PCI Local Bus Specification.

For Measurement and Test Conditions, see the PCI Local Bus Specification.

3.3.7 LPC

The Local Plus Bus is the external bus interface of the MPC5121e/MPC5123. A maximum of eight configurable chip selects (CS) are provided. There are two main modes of operation: non-MUXed and MUXED. The reference clock is the LPC CLK. The maximum bus frequency is 83 MHz.

Definition of Acronyms and Terms:

- WS = Wait State
- DC = Dead Cycle
- HC = Hold Cycle
- DS = Data Size in Bytes
- BBT = Burst Bytes per Transfer
- AL = Address latch enable Length
- ALT = Chip select/Address Latch Timing
- t_{LPCck} = LPC clock period

Table 23. LPC Timing

Sym	Description	Min	Max	Units	SpecID
t_{OD}	$\overline{CS}[x]$, ADDR, R/ \overline{W} , TSIZ, DATA (wr), \overline{TS} , \overline{OE} valid after LPC CLK (Output Delay related to LPC CLK)	0	5	ns	A7.1
t_1	Non-MUXed non-Burst $\overline{CS}[x]$ pulse width	$(2 + WS) \times t_{LPCck}$	$(2 + WS) \times t_{LPCck}$	ns	A7.2
t_2	ADDR, R/ \overline{W} , TSIZ, DATA (wr) valid before $\overline{CS}[x]$ assertion	$t_{LPCck} - t_{OD}$	$t_{LPCck} + t_{OD}$	ns	A7.3
t_3	\overline{OE} assertion after $\overline{CS}[x]$ assertion	$t_{LPCck} - t_{OD}$	$t_{LPCck} + t_{OD}$	ns	A7.4
t_4	ADDR, R/ \overline{W} , TSIZ, Data (wr) hold after $\overline{CS}[x]$ negation	$t_{LPCck} - t_{OD}$	$(HC + 1) \times t_{LPCck} + t_{OD}$	ns	A7.5
t_5	\overline{TS} pulse width	t_{LPCck}	t_{LPCck}	ns	A7.6
t_6	DATA (rd) setup before LPC CLK	4	—	ns	A7.7
t_7	DATA (rd) input hold	0	$(DC + 1) \times t_{LPCck}$	ns	A7.8
t_8	Non-MUXed read Burst $\overline{CS}[x]$ pulse width	$(2 + WS + BBT/DS) \times t_{LPCck}$	$(2 + WS + BBT/DS) \times t_{LPCck}$	ns	A7.9
t_9	Burst \overline{ACK} pulse width	$(BBT/DS) \times t_{LPCck}$	$(BBT/DS) \times t_{LPCck}$	ns	A7.10
t_{10}	Burst DATA (rd) input hold	0	—	ns	A7.11
t_{11}	Read Burst \overline{ACK} assertion after $\overline{CS}[x]$ assertion	$(2 + WS) \times t_{LPCck}$	$(2 + WS) \times t_{LPCck}$	ns	A7.12
t_{12}	Non-muxed write Burst $\overline{CS}[x]$ pulse width	$(2.5 + WS + BBT/DS) \times t_{LPCck}$	$(2.5 + WS + BBT/DS) \times t_{LPCck}$	ns	A7.13
t_{13}	Write Burst ADDR, R/ \overline{W} , TSIZ, DATA (wr) hold after $\overline{CS}[x]$ negation	$0.5 \times t_{LPCck} - t_{OD}$	$(HC + 0.5) \times t_{LPCck} + t_{OD}$	ns	A7.14

Table 23. LPC Timing (continued)

Sym	Description	Min	Max	Units	SpecID
t ₁₄	Write Burst \overline{ACK} assertion after $\overline{CS}[x]$ assertion	$(2.5 + WS) \times t_{LPCck} - t_{OD}$	$(2.5 + WS) \times t_{LPCck} + t_{OD}$	ns	A7.15
t ₁₅	Write Burst DATA valid	$t_{LPCck} - t_{OD}$	—	ns	A7.16
t ₁₆	Non-MUXed Mode: asynchronous write Burst ADDR valid before write DATA valid	$0.5 \times t_{LPCck} - t_{OD}$	$0.5 \times t_{LPCck} + t_{OD}$	ns	A7.17
t ₁₇	MUXed Mode: ADDR cycle	$AL \times 2 \times t_{LPCck} - t_{OD}$	$AL \times 2 \times t_{LPCck}$	ns	A7.18
t ₁₈	MUXed Mode: \overline{ALE} cycle	$AL \times t_{LPCck}$	$AL \times t_{LPCck}$	ns	A7.19
t ₁₉	Non-MUXed Mode Page Burst: ADDR cycle	$t_{LPCck} - t_{OD}$	t_{LPCck}	ns	A7.20
t ₂₀	Non-MUXed Mode Page Burst: Burst DATA (rd) input setup before next ADDR cycle	$t_{OD} + t_6$	—	ns	A7.21
t ₂₁	Non-MUXed Mode Page Burst: Burst DATA (rd) input hold after next ADDR cycle	0	—	ns	A7.22
t ₂₂	MUXed Mode: non-Burst $\overline{CS}[x]$ pulse width	$(ALT \times (AL \times 2) + 2 + WS) \times t_{LPCck}$	$(ALT \times (AL \times 2) + 2 + WS) \times t_{LPCck}$	ns	A7.23
t ₂₃	MUXed Mode: read Burst $\overline{CS}[x]$ pulse width	$[ALT \times (AL \times 2) + 2 + WS + BBT/DS] \times t_{LPCck}$	$[ALT \times (AL \times 2) + 2 + WS + BBT/DS] \times t_{LPCck}$	ns	A7.24
t ₂₄	MUXed Mode: write Burst $\overline{CS}[x]$ pulse width	$[ALT \times (AL \times 2) + 2.5 + WS + BBT/DS] \times t_{LPCck}$	$[ALT \times (AL \times 2) + 2.5 + WS + BBT/DS] \times t_{LPCck}$	ns	A7.25

3.3.7.1 Non-MUXed Mode

3.3.7.1.1 Non-MUXed Non-Burst Mode

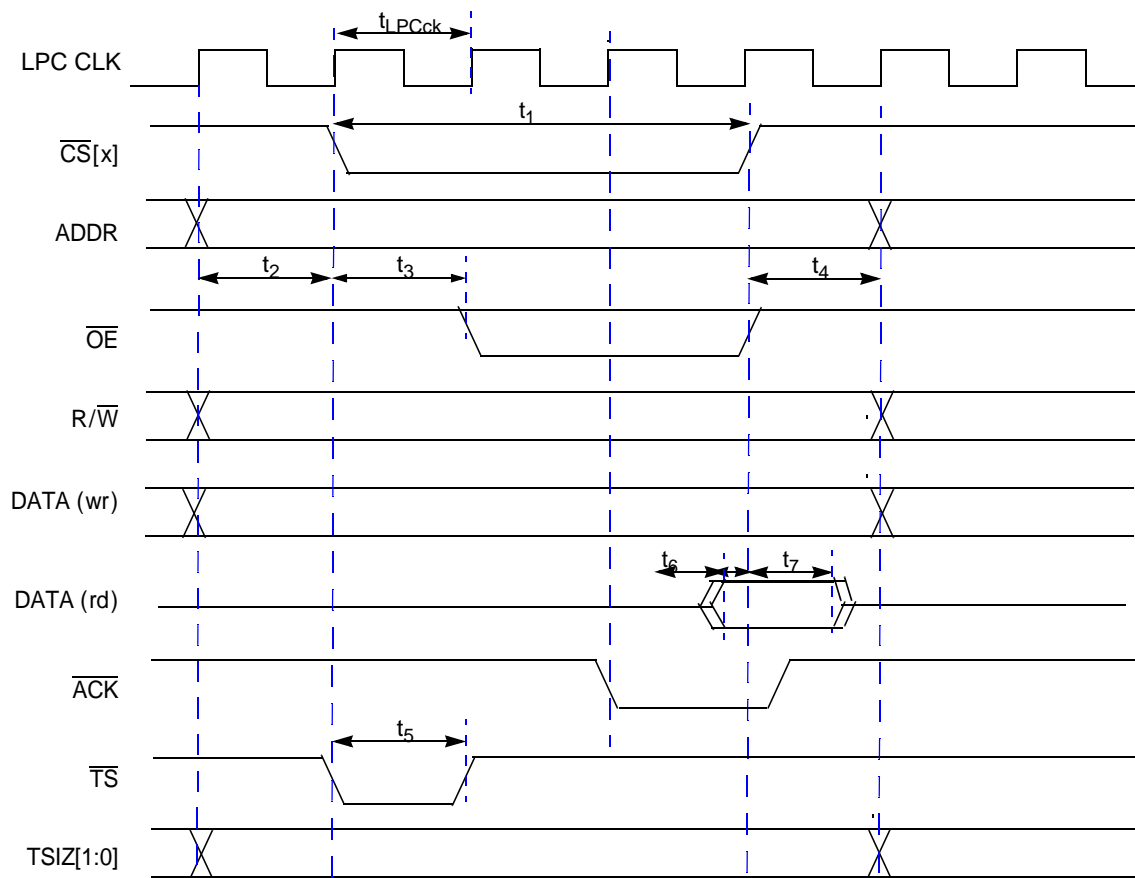

Figure 13. Timing Diagram – Non-MUXed Non-Burst Mode

NOTE

\overline{ACK} is asynchronous input signal and has no timing requirements. \overline{ACK} needs to be deasserted after $\overline{CS}[x]$ is deasserted.

¹ T is the flash clock cycle.

T = 45 ns, frequency = 22 MHz (boot configuration, IP bus = 66 MHz)

T = 36 ns, frequency = 27 MHz (maximum configurable frequency, IP bus = 83 MHz)

3.3.9 PATA

The MPC5121e/MPC5123 ATA Controller (PATA) is completely software programmable. It can be programmed to operate with ATA protocols using their respective timing, as described in the ANSI ATA-4 specification. The ATA interface is completely asynchronous in nature. Signal relationships are based on specific fixed timing in terms of timing units (nanoseconds).

ATA data setup and hold times, with respect to Read/Write strobes, are software programmable inside the ATA Controller. Data setup and hold times are implemented using counters. The counters count the number of ATA clock cycles needed to meet the ANSI ATA-4 timing specifications. For details, see the ANSI ATA-4 specification and how to program an ATA Controller and ATA drive for different ATA protocols and their respective timing. See the *MPC5121e Microcontroller Reference Manual*.

The MPC5121e/MPC5123 ATA Host Controller design makes data available coincidentally with the active edge of the WRITE strobe in PIO and Multiword DMA modes.

- Write data is latched by the drive at the inactive edge of the WRITE strobe. This gives ample setup-time beyond that required by the ATA-4 specification.
- Data is held unchanged until the next active edge of the WRITE strobe. This gives ample hold-time beyond that required by the ATA-4 specification.

Electrical and Thermal Characteristics

All ATA transfers are programmed in terms of system clock cycles (IP bus clocks) in the ATA Host Controller timing registers. This puts constraints on the ATA protocols and their respective timing modes in which the ATA Controller can communicate with the drive.

Faster ATA modes (i.e., UDMA 0, 1, 2) are supported when the system is running at a sufficient frequency to provide adequate data transfer rates. Adequate data transfer rates are a function of the following:

- The MPC5121e/MPC5123 operating frequency (IP bus clock frequency)
- Internal MPC5121e/MPC5123 bus latencies
- Other system load dependent variables

The ATA clock is the same frequency as the IP bus clock in MPC5121e/MPC5123. See the *MPC5121e Microcontroller Reference Manual*.

NOTE

All output timing numbers are specified for nominal 50 pF loads.

3.3.9.1 PATA Timing Parameters

In the timing equations, some timing parameters are used. These parameters depend on the implementation of the ATA interface in silicon, the bus transceiver used, the cable delay and cable skew. The parameters shown in [Table 3-26](#) specify the ATA timing.

Table 3-26. PATA Timing Parameters

Name	Meaning	Controlled by	Value	SpecID
T	PATA Bus clock period	MPC5121E/MPC5123	15 ns	A9.1
t _{i_ds}	Set-up time ATA_DATA to ATA_IORDY edge (UDMA-in only)	MPC5121E/MPC5123	2 ns	A9.2
t _{i_dh}	Hold time ATA_IORDY edge to ATA_DATA (UDMA-in only)	MPC5121E/MPC5123	5 ns	A9.3
t _{co}	Propagation delay bus clock L-to-H to: ATA_CS0, ATA_CS1, ATA_DA2, ATA_DA1, ATA_DA0, ATA_DIOR, ATA_DIOW, ATA_DMACK, ATA_DATA, ATA_BUFFER_EN	MPC5121E/MPC5123	2 ns	A9.4
t _{su}	Set-up time ATA_DATA to bus clock L-to-H	MPC5121E/MPC5123	2 ns	A9.5
t _{sui}	Set-up time ATA_IORDY to bus clock H-to-L	MPC5121E/MPC5123	2 ns	A9.6
t _{hi}	Hold time ATA_IORDY to bus clock H to L	MPC5121E/MPC5123	2 ns	A9.7
t _{skew1}	Max difference in propagation delay bus clock L-to-H to any of following signals: ATA_CS0, ATA_CS1, ATA_DA2, ATA_DA1, ATA_DA0, ATA_DIOR, ATA_DIOW, ATA_DMACK, ATA_DATA (WRITE), ATA_BUFFER_EN	MPC5121E/MPC5123	1.7 ns	A9.8
t _{skew2}	Max difference in buffer propagation delay for any of following signals: ATA_CS0, ATA_CS1, ATA_DA2, ATA_DA1, ATA_DA0, ATA_DIOR, ATA_DIOW, ATA_DMACK, ATA_DATA (WRITE), ATA_BUFFER_EN	Transceiver		A9.9
t _{skew3}	Max difference in buffer propagation delay for any of following signals: ATA_IORDY, ATA_DATA (read)	Transceiver		A9.10
t _{buf}	Max buffer propagation delay	Transceiver		A9.11
t _{cable1}	Cable propagation delay for ata_data	Cable		A9.12
t _{cable2}	Cable propagation delay for control signals: ATA_DIOR, ATA_DIOW, ATA_IORDY, ATA_DMACK	Cable		A9.13

Table 3-26. PATA Timing Parameters (continued)

Name	Meaning	Controlled by	Value	SpecID
t_{skew4}	Max difference in cable propagation delay between: ATA_IORDY and ATA_DATA (read)	Cable		A9.14
t_{skew5}	Max difference in cable propagation delay between: ATA_DIOR, ATA_DIOW, ATA_DMACK and ATA_CS0, ATA_CS1, ATA_DA2, ATA_DA1, ATA_DA0, ATA_DATA (write)	Cable		A9.15
t_{skew6}	Max difference in cable propagation delay without accounting for ground bounce	Cable		A9.16

3.3.9.2 PIO Mode Timing

A timing diagram for the PIO read mode is given in Figure 26.

Figure 26. PIO Read Mode Timing

To fulfill read mode timing, the different timing parameters given in Table 3-27 must be observed.

Table 3-27. Timing Parameters PIO Read

ATA Parameter	PIO Read Mode Timing Parameter	Value	How to meet	SpecID
t_1	t_1	$t_1(\min) = (\text{time_1} \times T) - (t_{skew1} + t_{skew2} + t_{skew5})$	calculate and programming time_1. ¹	A9.20
t_2	t_{2r}	$t_2(\min) = (\text{time_2r} \times T) - (t_{skew1} + t_{skew2} + t_{skew5})$	calculate and programming time_2r. ¹	A9.21
t_9	t_9	$t_9(\min) = (\text{time_9} \times T) - (t_{skew1} + t_{skew2} + t_{skew6})$	calculate and programming time_9. ¹	A9.22

Table 3-27. Timing Parameters PIO Read (continued)

ATA Parameter	PIO Read Mode Timing Parameter	Value	How to meet	SpecID
t_5	t_5	$t_5(\min) = t_{co} + t_{su} + t_{buf} + t_{buf} + t_{cable1} + t_{cable2}$	If not met, increase time_2r	A9.23
t_6	t_6	0	—	A9.24
t_A	t_A	$t_{A(\min)} = (1.5 + \text{time_ax}) \times T - (t_{co} + t_{sui} + t_{cable2} + t_{cable2} + 2 \times t_{buf})$	calculate and programming time_ax. ¹	A9.25
t_{rd}	t_{rd1}	$t_{rd1(\max)} = (-t_{rd}) + (t_{skew3} + t_{skew4})$ $t_{rd1(\min)} = (\text{time_pio_rdx} - 0.5) \times T - (t_{su} + t_{hi})$ $(\text{time_pio_rdx} - 0.5) \times T > t_{su} + t_{hi} + t_{skew3} + t_{skew4}$	calculate and programming time_pio_rdx. ¹	A9.26
t_0	—	$t_0(\min) = (\text{time_1} + \text{time_2} + \text{time_9}) \times T$	time_1, time_2r, time_9	A9.27

¹ See the MPC5121e Microcontroller Reference Manual.

In PIO write mode, timing waveforms are somewhat different as shown in Figure 27.

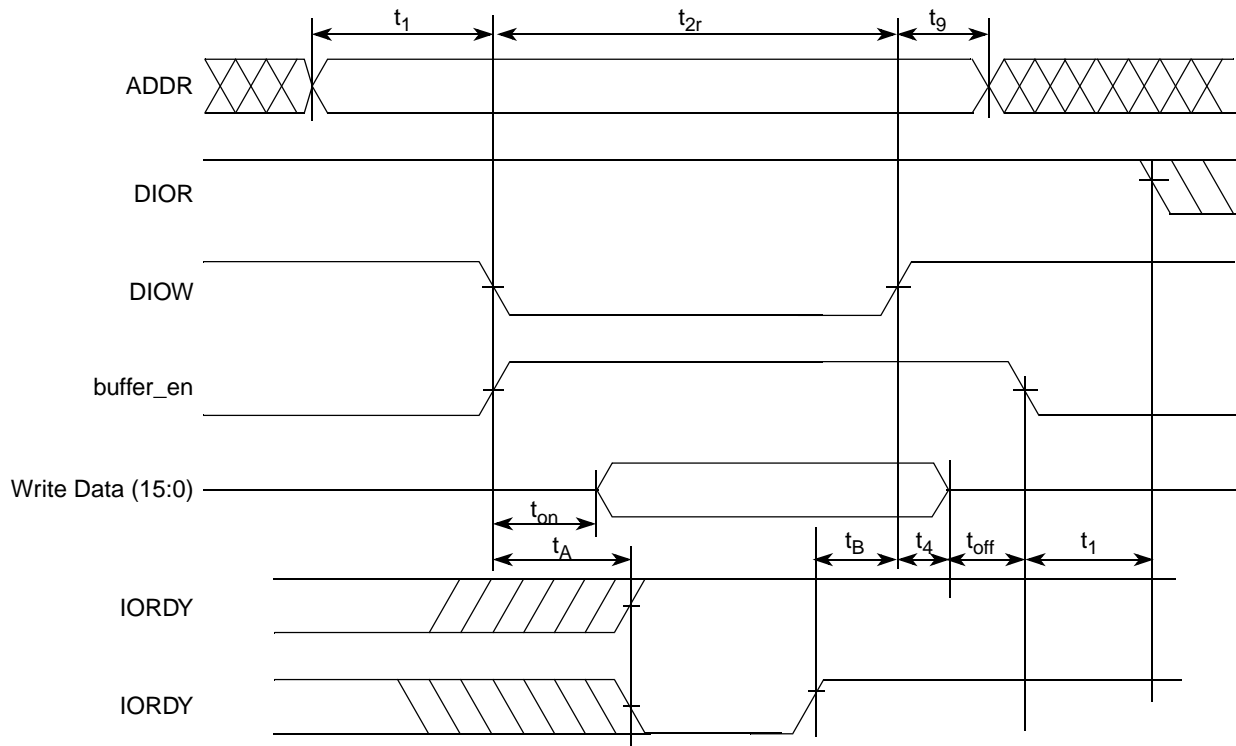

Figure 27. PIO Write Mode Timing

To fulfill this timing, several parameters need to be observed as shown in Table 3-28.

Table 3-28. Timing Parameters PIO Write

ATA Parameter	PIO Write Mode Timing Parameter	Value	How to meet	SpecID
t1	t1	$t1(\text{min}) = \text{time_1} \times T - (\text{tskew1} + \text{tskew2} + \text{tskew5})$	time_1. ¹	A9.30
t2	t2r	$t2(\text{min}) = \text{time_2w} \times T - (\text{tskew1} + \text{tskew2} + \text{tskew5})$	calculate and programming time_2w. ¹	A9.31

3.3.9.3 Timing in Multiword DMA Mode

Timing in multiword DMA mode is given in [Figure 28](#) and [Figure 29](#).

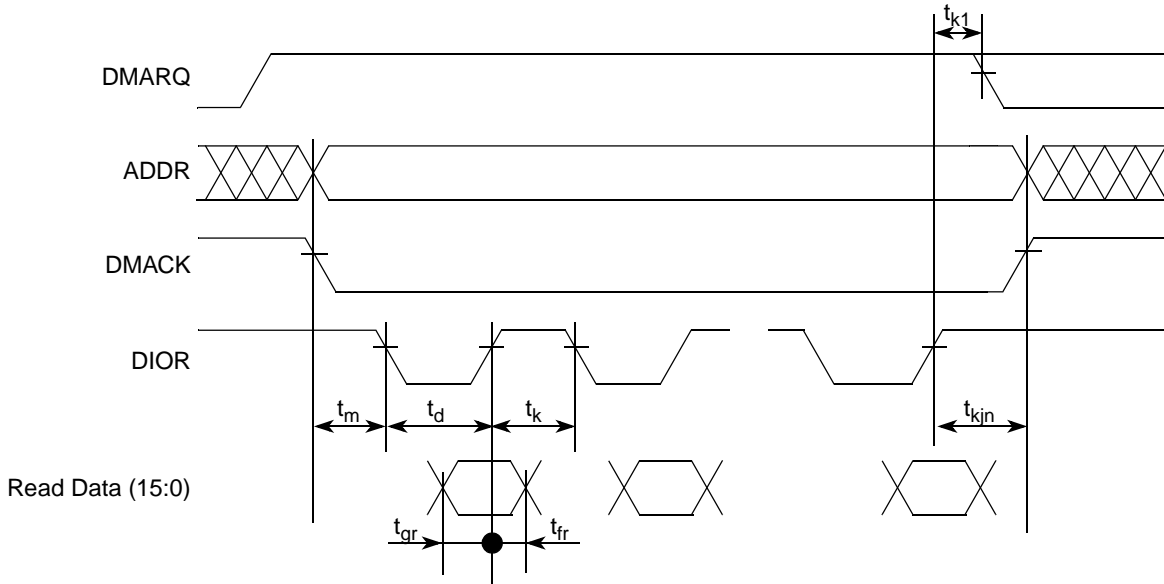

Figure 28. MDMA Read Timing

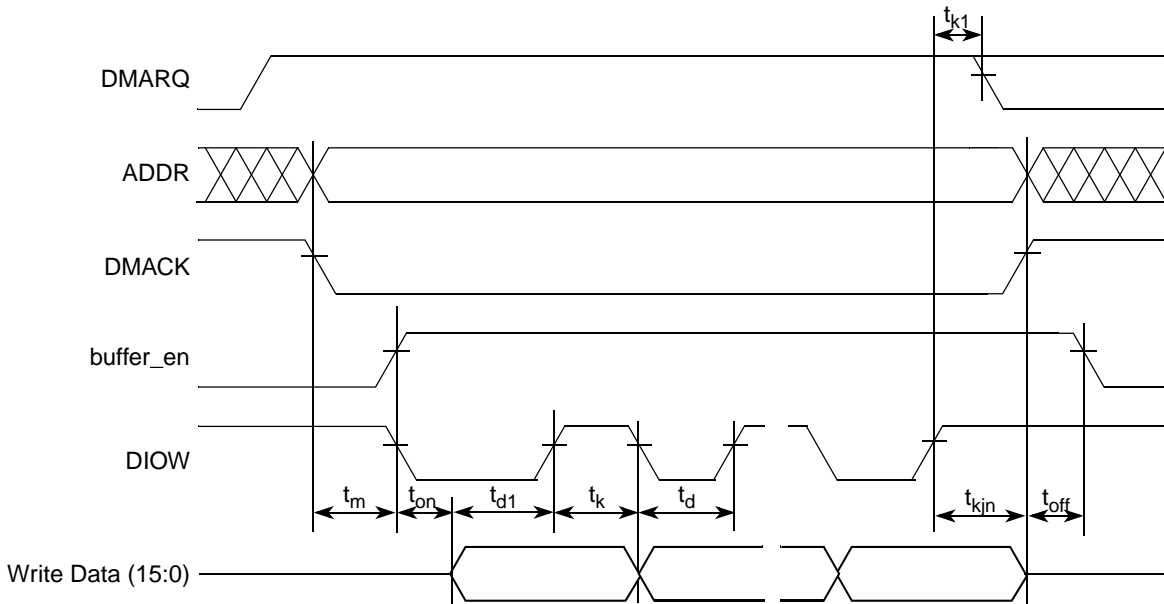

Figure 29. MDMA Write Timing

To meet this timing, a number of timing parameters must be controlled as shown in [Table 3-29](#).

Table 3-29. Timing Parameters MDMA Read and Write

ATA Parameter	MDMA Read/Write Timing Parameter	Value	How to meet	SpecID
t_m, t_i	t_m	$t_{m(\min)} = t_{i(\min)} = (\text{time_m} \times T) - (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew5}})$	calculate and programming time_m. ¹	A9.40
t_d	t_d, t_{d1}	$t_{d1(\min)} = t_{d(\min)} = (\text{time_d} \times T) - (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew6}})$	calculate and programming time_d. ¹	A9.41
t_k	t_k	$t_{k(\min)} = (\text{time_k} \times T) - (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew6}})$	calculate and programming time_k. ¹	A9.42
t_0	—	$t_{0(\min)} = (\text{time_d} + \text{time_k}) \times T$	time_d, time_k	A9.43
$t_{g(\text{read})}$	t_{gr}	$t_{gr(\text{min-read})} = t_{co} + t_{su} + t_{buf} + t_{buf} + t_{cable1} + t_{cable2}$ $t_{gr(\text{min-drive})} = t_d - t_e(\text{drive})$	time_d. ¹	A9.44
$t_{f(\text{read})}$	t_{fr}	$t_{fr(\text{min-drive})} = 0$	—	A9.45
$t_{g(\text{write})}$	—	$t_{g(\text{min-write})} = \text{time_d} \times T - (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew5}})$	time_d	A9.46
$t_{f(\text{write})}$	—	$t_{f(\text{min-write})} = \text{time_k} \times T - (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew6}})$	time_k	A9.47
t_L	—	$t_{L(\text{max})} = [(\text{time_d} + \text{time_k} - 2) \times T]$ $- [t_{su} + t_{co} + (2 \times t_{buf}) + (2 \times t_{cable2})]$	time_d, time_k	A9.48
t_n, t_j	t_{kjn}	$t_n = t_j = t_{kjn} = [\max(\text{time_k}, \text{time_jn}) \times T]$ $- (t_{\text{skew1}} + t_{\text{skew2}} + t_{\text{skew6}})$	calculate and programming time_jn. ¹	A9.49
—	t_{on} t_{off}	$t_{on} = (\text{time_on} \times T) - t_{\text{skew1}}$ $t_{off} = (\text{time_off} \times T) - t_{\text{skew1}}$	—	A9.50

¹ See the MPC5121e Microcontroller Reference Manual.

3.3.9.4 UDMA In Timing Diagrams

UDMA mode timing is more complicated than PIO mode or MDMA mode. In this section, timing diagrams for UDMA in are given:

- [Figure 30](#) gives timing for UDMA in transfer start
- [Figure 31](#) gives timing for host terminating UDMA in transfer
- [Figure 32](#) gives timing for device terminating UDMA in transfer.

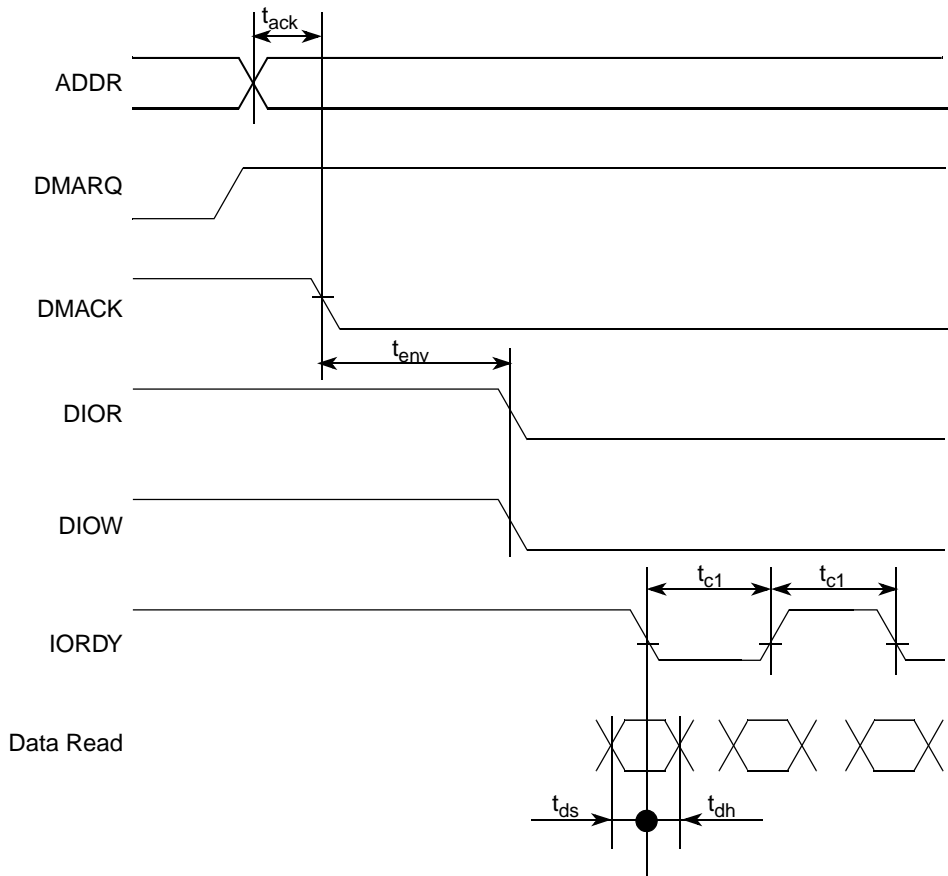

Figure 30. UDMA In Transfer Start Timing Diagram

Figure 31. UDMA In Host Terminates Transfer

Figure 32. UDMA In Device Terminates Transfer

Timing parameters are explained in Table 30.

Table 30. Timing Parameters UDMA in Burst

ATA Parameter	UDMA In Timing Parameter	Value	How to Meet	SpecID
t _{ack}	t _{ack}	t _{ack(min)} = (time_ack × T) – (t _{skew1} + t _{skew2})	calculate and programming time_ack. ¹	A9.51
t _{env}	t _{env}	t _{env(min)} = (time_env × T) – (t _{skew1} + t _{skew2}) t _{env(max)} = (time_env × T) + (t _{skew1} + t _{skew2})	calculate and programming time_env. ¹	A9.52
t _{ds}	t _{ds1}	t _{ds} – (t _{skew3}) – ti_ds > 0	t _{skew3} , ti_ds, ti_dh should be low enough	A9.53
t _{dh}	t _{dh1}	t _{dh} – (t _{skew3}) – ti_dh > 0		A9.54
t _{cyc}	t _{c1}	(t _{cyc} – t _{skew}) > T	Bus clock period T big enough	A9.55
t _{rp}	t _{rp}	t _{rp(min)} = time_rp × T – (t _{skew1} + t _{skew2} + t _{skew6})	calculate and programming time_rp. ¹	A9.56
—	t _{x1} ²	(time_rp × T) – [tco + tsu + 3T + (2 × t _{buf}) + (2 × t _{table2})] > trfs (drive)	calculate and programming time_rp. ¹	A9.57
t _{mli}	t _{mli1}	t _{mli1(min)} = (time_mlix + 0.4) × T	calculate and programming time_mlix. ¹	A9.58
t _{zah}	t _{zah}	t _{zah(min)} = (time_zah + 0.4) × T	calculate and programming time_zah. ¹	A9.59
t _{dzfs}	t _{dzfs}	t _{dzfs} = (time_dzfs × T) – (t _{skew1} + t _{skew2})	calculate and programming time_dzfs. ¹	A9.60
t _{cvh}	t _{cvh}	t _{cvh} = (time_cvh × T) – (t _{skew1} + t _{skew2})	calculate and programming time_cvh. ¹	A9.61
—	t _{on} ³ t _{off} ³	t _{on} = (time_on × T) – t _{skew1} t _{off} = (time_off × T) – t _{skew1}	—	A9.62

¹ See the MPC5121e Microcontroller Reference Manual.

² A special timing requirement in the ATA host requires the internal D1OW to go only high three clocks after the last active edge on the DSTROBE signal. The equation given on this line tries to capture this constraint.

³ Make t_{on} and t_{off} large enough to avoid bus contention.

3.3.9.5 UDMA Out Timing Diagrams

UDMA mode timing is more complicated than PIO mode or MDMA mode. In this section, timing diagrams for UDMA out are given:

- [Figure 33](#) gives timing for UDMA out transfer start
- [Figure 34](#) gives timing for host terminating UDMA out transfer
- [Figure 35](#) gives timing for device terminating UDMA out transfer

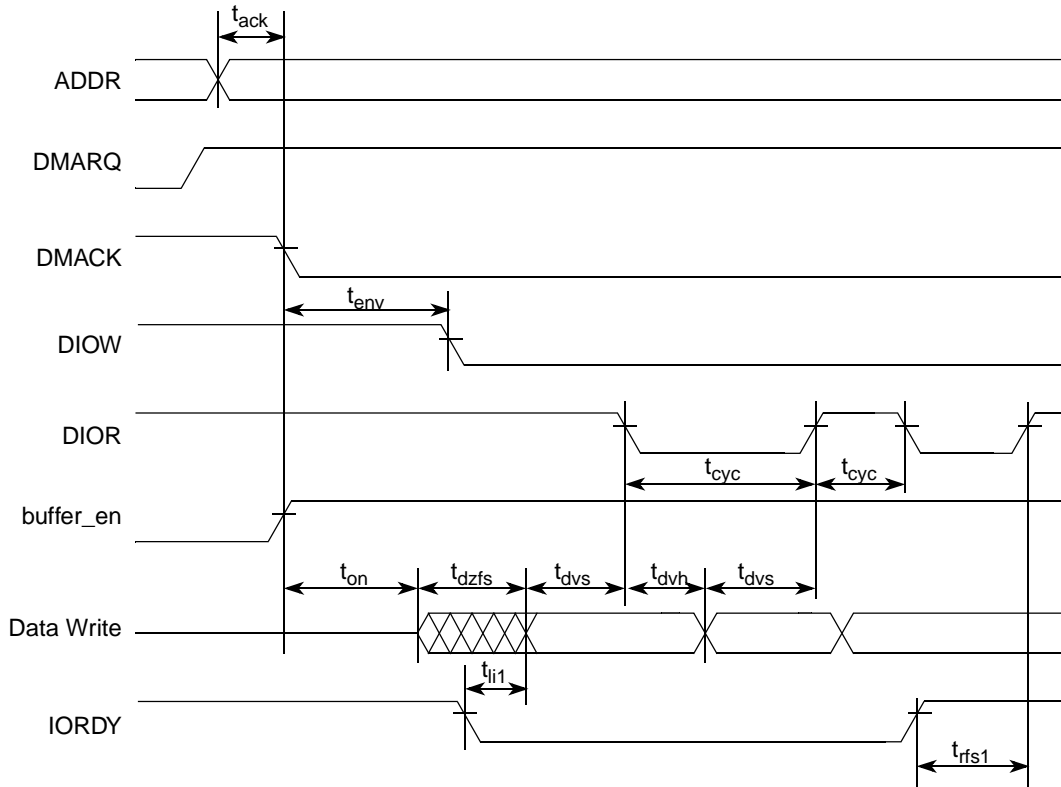

Figure 33. UDMA Out Transfer Start Timing Diagram

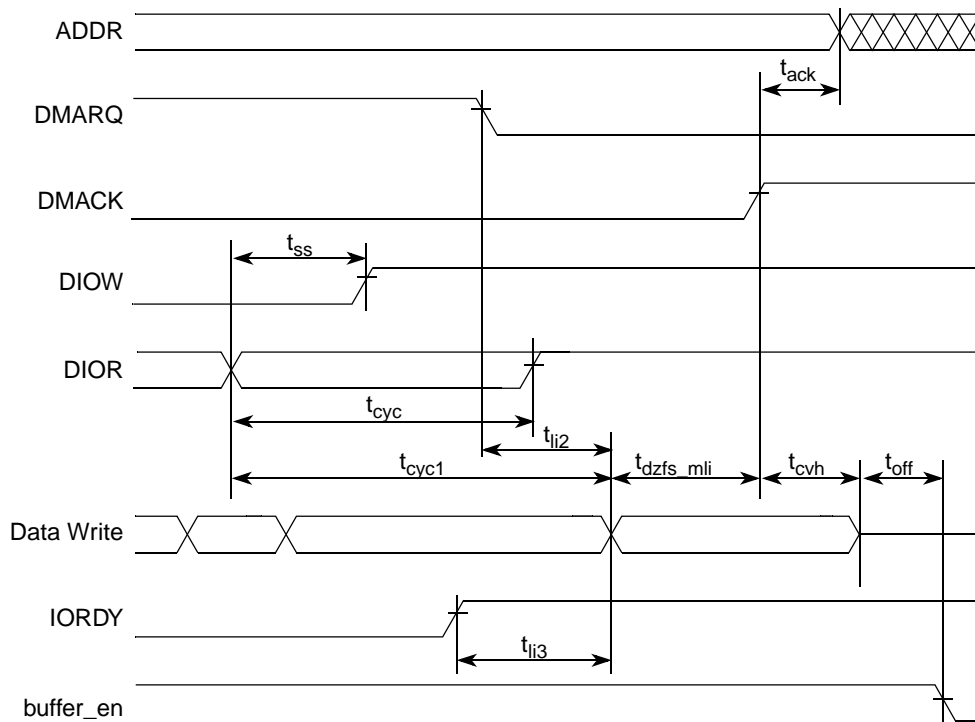

Figure 34. UDMA Out Host Terminates Transfer

Figure 35. UDMA Out Device Terminates Transfer

Timing parameters are explained in Table 31.

Table 31. Timing Parameters UDMA Out Burst

ATA Parameter	UDMA Out Timing Parameter	Value	How to meet	SpecID
t_{ack}	t_{ack}	$t_{ack(min)} = (time_ack \times T) - (t_{skew1} + t_{skew2})$	calculate and program $time_ack$. ¹	A9.63
t_{env}	t_{env}	$t_{env(min)} = (time_env \times T) - (t_{skew1} + t_{skew2})$ $t_{env(max)} = (time_env \times T) + (t_{skew1} + t_{skew2})$	calculate and program $time_env$. ¹	A9.64

10	MDC falling edge to MDIO output delay	0	25	ns	A11.10
11	MDIO (input) to MDC rising edge setup	10	—	ns	A11.11
12	MDIO (input) to MDC rising edge hold	0	—	ns	A11.12
13	MDC pulse width high ¹	160	—	ns	A11.13
14	MDC pulse width low ¹	160	—	ns	A11.14
15	MDC period ²	400	—	ns	A11.15

¹ MDC is generated by MPC5121e/MPC5123 with a duty cycle of 50% except when MII_SPEED in the FEC MII_SPEED control register is changed during operation. See the MPC5121e/MPC5123 Reference Manual.

² The MDC period must be set to a value of less than or equal to 2.5 MHz (to be compliant with the IEEE MII characteristic) by programming the FEC MII_SPEED control register. See the MPC5121e/MPC5123 Reference Manual.

Figure 39. Ethernet Timing Diagram – MII Serial Management

3.3.12 USB ULPI

This section specifies the USB ULPI timing.

For more information refer to UTMI+ Low Pin Interface (ULPI) Specification, Revision 1.1, October 20, 2004.

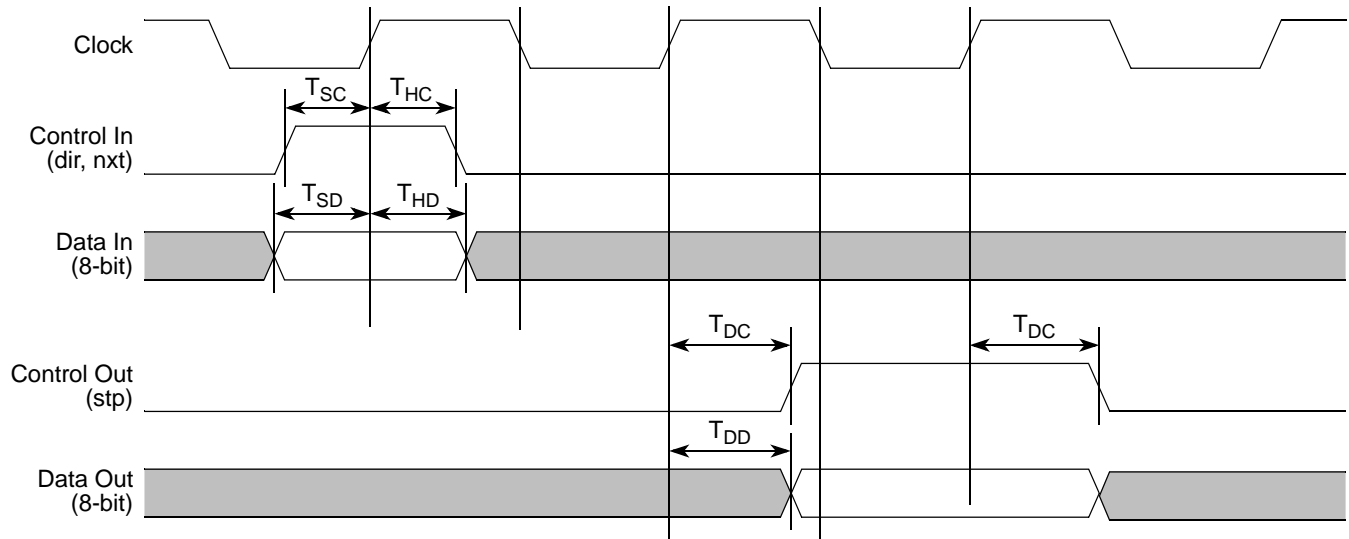

Figure 40. ULPI Timing Diagram

Table 36. Timing Specifications – ULPI

Symbol	Description	Min	Max	Units	SpecID
T_{CK}	Clock Period	15	—	ns	A12.1
T_{SC}, T_{SD}	Setup time (control in, 8-bit data in)	—	6.0	ns	A12.2
T_{HC}, T_{HD}	Hold time (control in, 8-bit data in)	0.0	—	ns	A12.3
T_{DC}, T_{DD}	Output delay (control out, 8-bit data out)	—	9.0	ns	A12.4

NOTE

Output timing is specified at a nominal 50 pF load.

3.3.13 On-Chip USB PHY

The USB PHY is an USB2.0 compatible PHY integrated on-chip. See Chapter 7 in the USB Specification Rev. 2.0 at www.usb.org.

3.3.14 SDHC

Figure 41 shows the timings of the SDHC.

Figure 41. SDHC Timing Diagram

Table 37 lists the timing parameters.

Table 37. MMC/SD Interface Timing Parameters

ID	Parameter	Symbols	Min	Max	Unit	SpecID
Card Input Clock						
SD1	Clock Frequency (Low Speed)	f_{PP}^1	0	400	kHz	A14.1
	Clock Frequency (SD/SDIO Full Speed/High Speed)	f_{PP}^2	0	25/50	MHz	A14.2
	Clock Frequency (MMC Full Speed/High Speed)	f_{PP}^3	0	20/52	MHz	A14.3
	Clock Frequency (Identification Mode)	f_{OD}^4	100	400	kHz	A14.4
SD2	Clock Low Time (Full Speed/High Speed)	t_{WL}	10/7		ns	A14.5
SD3	Clock High Time (Full Speed/High Speed)	t_{WH}	10/7		ns	A14.6
SD4	Clock Rise Time (Full Speed/High Speed)	t_{TLH}		10/3	ns	A14.7
SD5	Clock Fall Time (Full Speed/High Speed)	t_{THL}		10/3	ns	A14.8
SDHC Output / Card Inputs CMD, DAT (Reference to CLK)						
SD6	SDHC Output Delay	t_{OD}	$TH^5 - 3$	$TH+3$	ns	A14.9
SDHC Input / Card Outputs CMD, DAT (Reference to CLK)						
SD7	SDHC Input Setup Time	t_{ISU}	2.5		ns	A14.10
SD8	SDHC Input Hold Time	t_{IH}	2.5		ns	A14.11

¹ In low speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In normal data transfer mode for SD/SDIO card, clock frequency can be any value between 0 ~ 25 MHz.

³ In normal data transfer mode for MMC card, clock frequency can be any value between 0 ~ 20 MHz.

⁴ In card identification mode, card clock must be 100 kHz ~ 400 kHz, voltage ranges from 2.7 to 3.6 V.

⁵ Suggested ClockPeriod = T, CLK_DIVIDER (in SDHC Clock Rate Register) = D, then $TH = [(D + 1)/2]/(D + 1) \times T$ where the value is rounded.

3.3.15 DIU

The DIU is a display controller designed to manage the TFT LCD display.

3.3.15.1 Interface to TFT LCD Panels, Functional Description

Figure 42 shows the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with positive polarity. The sequence of events for active matrix interface timing is:

- DIU_CLK latches data into the panel on its positive edge (when positive polarity is selected). In active mode, DIU_CLK runs continuously. This signal frequency could be from 5 to 100 MHz depending on the panel type.
- DIU_HSYNC causes the panel to start a new line. It always encompasses at least one DIU_CLK pulse.
- DIU_VSYNC causes the panel to start a new frame. It always encompasses at least one DIU_HSYNC pulse.
- DIU_DE acts like an output enable signal to the LCD panel. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off.

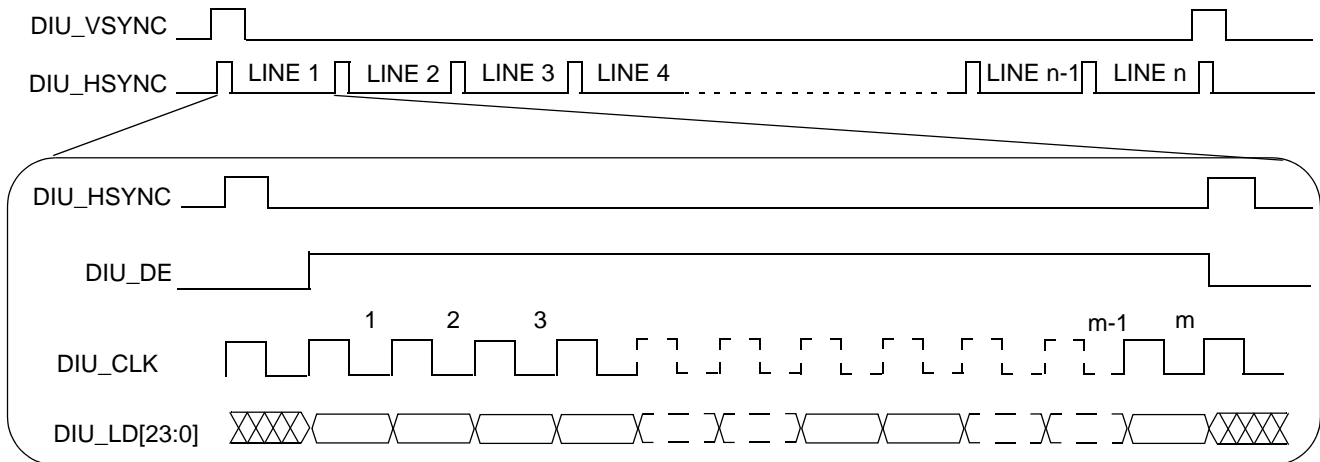

Figure 42. Interface Timing Diagram for TFT LCD Panels

3.3.15.2 Interface to TFT LCD Panels, Electrical Characteristics

Figure 43 shows the horizontal timing (timing of one line), including the horizontal sync pulse and the data. All parameters shown in the diagram are programmable. This timing diagram corresponds to positive polarity of the DIU_CLK signal (meaning the data and sync. signals change at the rising edge of it) and active-high polarity of the DIU_HSYNC, DIU_VSYNC and DIU_DE signal. You can select the polarity of the DIU_HSYNC and DIU_VSYNC signal via the SYN_POL register, whether active-high or active-low, the default is active-high. The DIU_DE signal is always active-high. And, pixel clock inversion and a flexible programmable pixel clock delay is also supported, programmed via the DIU Clock Config Register (DCCR) in the system clock module.

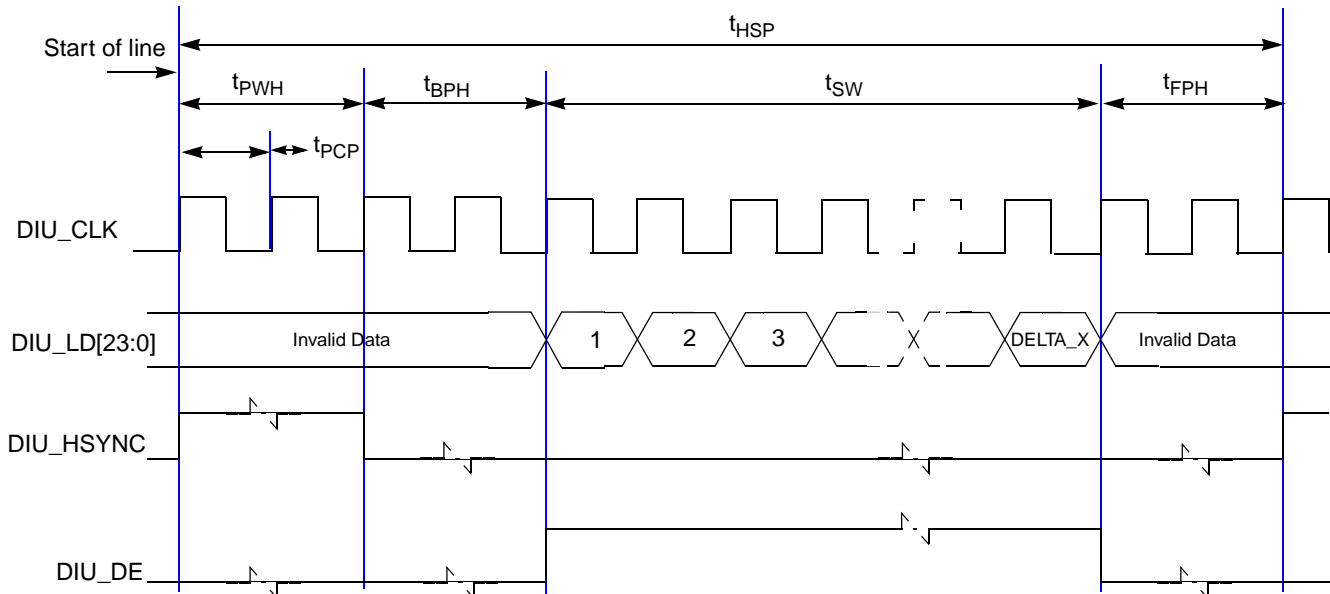

Figure 43. TFT LCD Interface Timing Diagram – Horizontal Sync Pulse

Figure 44 shows the vertical timing (timing of one frame), including the vertical sync pulse and the data. All parameters shown in the diagram are programmable.

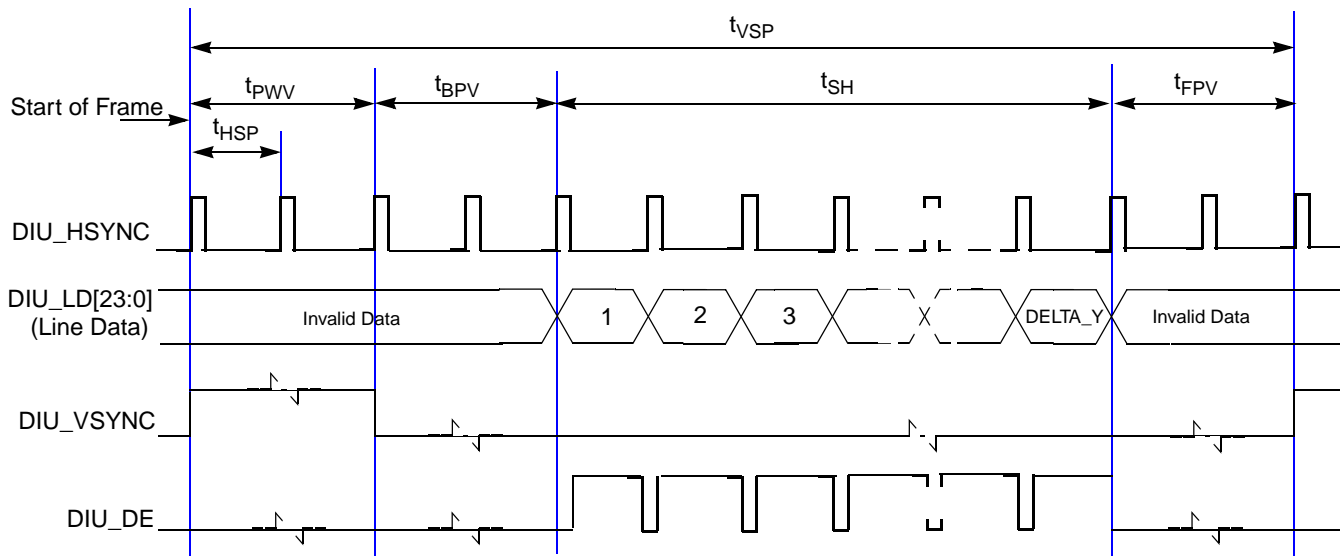

Figure 44. TFT LCD Interface Timing Diagram – Vertical Sync Pulse

Table 38 shows timing parameters of signals.

Table 38. LCD Interface Timing Parameters – Pixel Level

Name	Description	Value	Unit	SpecID
t _{PCP}	Display Pixel Clock Period	15 ¹	ns	A15.1
t _{PWH}	HSYNC Pulse Width	PW_H × t _{PCP}	ns	A15.2
t _{BPH}	HSYNC Back Porch Width	BP_H × t _{PCP}	ns	A15.3

Table 38. LCD Interface Timing Parameters – Pixel Level (continued)

Name	Description	Value	Unit	SpecID
t_{FPH}	HSYNC Front Porch Width	$FP_H \times t_{PCP}$	ns	A15.4
t_{SW}	Screen Width	$DELTA_X \times t_{PCP}$	ns	A15.5
t_{HSP}	HSYNC (Line) Period	$(PW_H + BP_H + DELTA_X + FP_H) \times t_{PCP}$	ns	A15.6
t_{PWV}	VSYNC Pulse Width	$PW_V \times t_{HSP}$	ns	A15.7
t_{BPV}	VSYNC Back Porch Width	$BP_V \times t_{HSP}$	ns	A15.8
t_{FPV}	VSYNC Front Porch Width	$FP_V \times t_{HSP}$	ns	A15.9
t_{SH}	Screen Height	$DELTA_Y \times t_{HSP}$	ns	A15.10
t_{VSP}	VSYNC (Frame) Period	$(PW_V + BP_V + DELTA_Y + FP_H) \times t_{HSP}$	ns	A15.11

¹ Display interface pixel clock period immediate value (in nanosecond).

The DELTA_X and DELTA_Y parameters are programmed via the DISP_SIZE register; The PW_H, BP_H, and FP_H parameters are programmed via the HSYN_PARA register; And the PW_V, BP_V and FP_V parameters are programmed via the VSYN_PARA register. See appropriate section in the reference manual for detailed descriptions on these parameters.

Figure 45 shows the synchronous display interface timing for access level, and Table 39 lists the timing parameters.

Figure 45. LCD Interface Timing Diagram – Access Level

Table 39. LCD Interface Timing Parameters – Access Level

Parameter	Description	Min	Typ	Max	Unit	SpecID
t_{CKH}	LCD Interface Pixel Clock High Time	$t_{PCP} \times 0.4$	$t_{PCP} \times 0.5$	$t_{PCP} \times 0.6$	ns	A15.12
t_{CKL}	LCD Interface Pixel Clock Low Time	$t_{PCP} \times 0.4$	$t_{PCP} \times 0.5$	$t_{PCP} \times 0.6$	ns	A15.13
t_{DSU}	LCD Interface Data Setup Time	5.0	—	—	ns	A15.14
t_{DHD}	LCD Interface Data Hold Time	6.0	—	—	ns	A15.15
t_{CSU}	LCD Interface Control Signal Setup Time	5.0	—	—	ns	A15.16
t_{CHD}	LCD Interface Control Signal Hold Time	6.0	—	—	ns	A15.17

3.3.16 SPDIF

The Sony/Philips Digital Interface (SPDIF) timing is totally asynchronous, therefore there is no need for relationship with the clock.

3.3.17 CAN

The CAN functions are available as TX and CAN3/4_RX pins at normal IO pads and as CAN1/2 RX pins at the VBAT_RTC domain. There is no filter for the WakeUp dominant pulse. Any High-to-Low edge can cause WakeUp, if configured.

3.3.18 I²C

This section specifies the timing parameters of the Inter-Integrated Circuit (I²C) interface. Refer to the I²C Bus Specification.

Table 40. I²C Input Timing Specifications – SCL and SDA

Symbol	Description	Min	Max	Units	SpecID
1	Start condition hold time	2	—	IP-Bus Cycle ¹	A18.1
2	Clock low time	8	—	IP-Bus Cycle ¹	A18.2
4	Data hold time	0.0	—	ns	A18.3
6	Clock high time	4	—	IP-Bus Cycle ¹	A18.4
7	Data setup time	0.0	—	ns	A18.5
8	Start condition setup time (for repeated start condition only)	2	—	IP-Bus Cycle ¹	A18.6
9	Stop condition setup time	2	—	IP-Bus Cycle ¹	A18.7

¹ Inter Peripheral Clock is defined in the MPC5121e/MPC5123 *Reference Manual*.

Table 41. I²C Output Timing Specifications – SCL and SDA

Symbol	Description	Min	Max	Units	SpecID
1 ¹	Start condition hold time	6	—	IP-Bus Cycle ²	A18.8
2 ¹	Clock low time	10	—	IP-Bus Cycle ²	A18.9
3 ³	SCL/SDA rise time	—	7.9	ns	A18.10
4 ¹	Data hold time	7	—	IP-Bus Cycle ²	A18.11
5 ¹	SCL/SDA fall time	—	7.9	ns	A18.12
6 ¹	Clock high time	10	—	IP-Bus Cycle ²	A18.13
7 ¹	Data setup time	2	—	IP-Bus Cycle ²	A18.14
8 ¹	Start condition setup time (for repeated start condition only)	20	—	IP-Bus Cycle ²	A18.15
9 ¹	Stop condition setup time	10	—	IP-Bus Cycle ²	A18.16

¹ Programming IFDR with the maximum frequency results in the minimum output timings listed. The I²C interface is designed to scale the data transition time, moving it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed in IFDR.

² Because SCL and SDA are open-drain-type outputs, which the processor can only actively drive low, the time SCL or SDA takes to reach a high level depends on external signal capacitance and pull-up resistor values.

³ Inter Peripheral Clock is defined in the MPC5121e/MPC5123 *Reference Manual*.

NOTE

Output timing is specified at a nominal 50 pF load.

Figure 46. Timing Diagram – I²C Input/Output

3.3.19 J1850

See the MPC5121e/MPC5123 Reference Manual.

3.3.20 PSC

The Programmable Serial Controllers (PSC) support different modes of operation (UART, Codec, AC97, SPI). UART is an asynchronous interface, there is no AC characteristic.

3.3.20.1 Codec Mode (8,16,24 and 32-bit)/I²S Mode

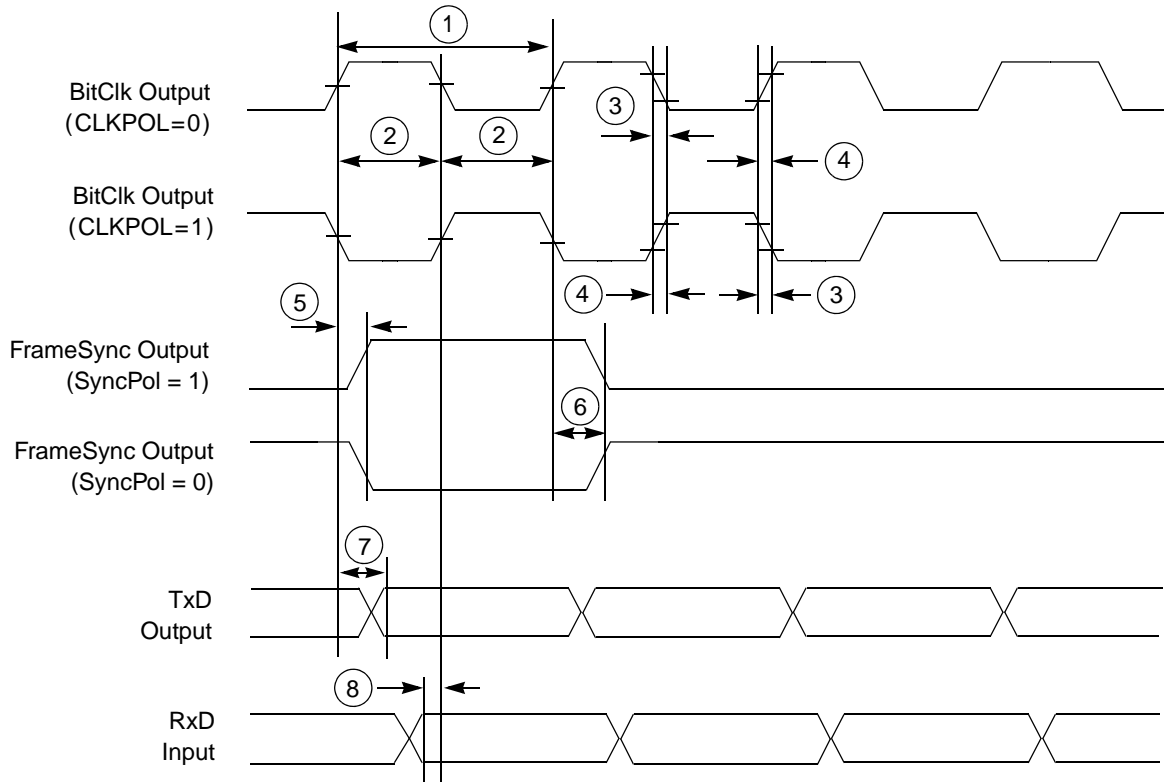

Table 42. Timing Specifications – 8,16, 24, and 32-bit CODEC/I²S Master Mode

3.3.21 GPIOs and Timers

The MPC5121e/MPC5123 contains several sets of I/Os that do not require special setup, hold, or valid requirements. The external events (GPIO or timer inputs) are asynchronous to the system clock. The inputs must be valid for at least t_{IOWID} to ensure proper capture by the internal IP clock.

Table 49. GPIO/Timers Input AC Timing Specifications

Symbol	Description	Min	Unit	SpecID
t_{IOWID}	GPIO/Timers inputs—minimum pulse width	$2T^1$	ns	A21.1

¹ T is the IP bus clock cycle. T = 12 ns is the minimum value (for the maximum IP bus frequency of 83 MHz).

3.3.22 Fusebox

Table 50 gives the Fusebox specification.

Table 50. Fusebox Characteristics

Symbol	Description	Min	Max	Units	SpecID
t_{FUSEWR}	Program time ¹ for Fuse	125	—	us	A22.1
I_{FUSEWR}	Program current to program one fuse bit	—	10	mA	A22.2

¹ The program length is defined by the value defined in the EPM_PGM_LENGTH bits of the IIM module.

3.3.23 IEEE 1149.1 (JTAG)

Table 51. JTAG Timing Specification

Symbol	Characteristic	Min	Max	Unit	SpecID
—	TCK frequency of operation	0	25	MHz	A23.1
1	TCK cycle time	40	—	ns	A23.2
2	TCK clock pulse width measured at 1.5V	1.08	—	ns	A23.3
3	TCK rise and fall times	0	3	ns	A23.4
4	$\overline{\text{TRST}}$ setup time to tck falling edge ¹	10	—	ns	A23.5
5	$\overline{\text{TRST}}$ assert time	5	—	ns	A23.6
6	Input data setup time ²	5	—	ns	A23.7
7	Input data hold time ²	15	—	ns	A23.8
8	TCK to output data valid ³	0	30	ns	A23.9
9	TCK to output high impedance ³	0	30	ns	A23.10
10	TMS, TDI data setup time.	5	—	ns	A23.11
11	TMS, TDI data hold time.	1	—	ns	A23.12
12	TCK to TDO data valid.	0	15	ns	A23.13
13	TCK to TDO high impedance.	0	15	ns	A23.14

¹ $\overline{\text{TRST}}$ is an asynchronous signal. The setup time is for test purposes only.

² Non-test, other than TDI and TMS, signal input timing with respect to TCK.

³ Non-test, other than TDO, signal output timing with respect to TCK.

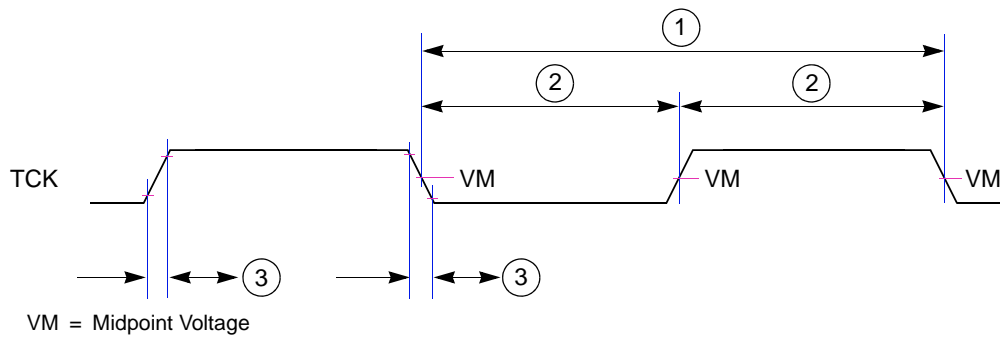

Figure 54. Timing Diagram – JTAG Clock Input

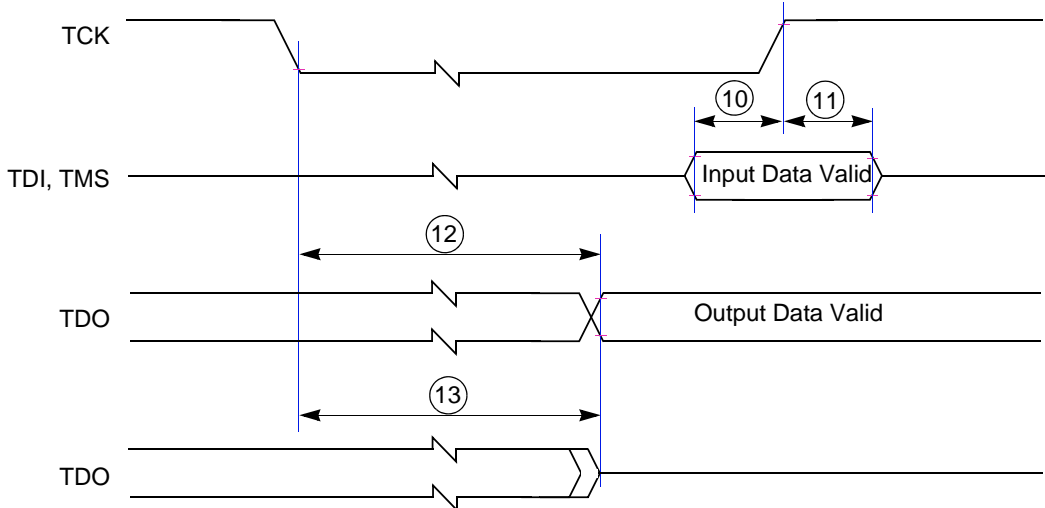

Figure 57. Timing Diagram – Test Access Port

3.3.24 VIU

The Video Input Unit (VIU) is an interface which accepts the ITU656 format compatible video stream.

Figure 58 shows the VIU interface timing and Table 52 lists the timing parameters.

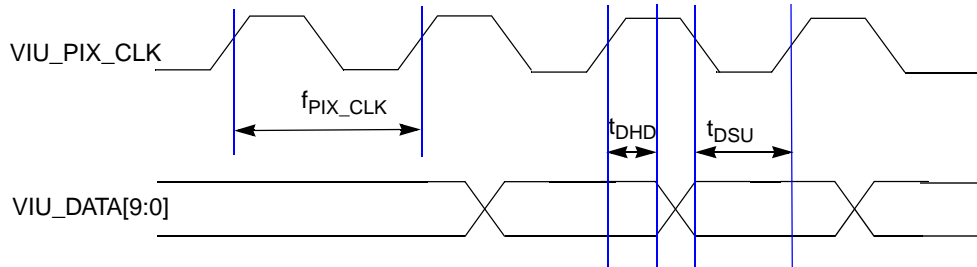

Figure 58. VIU Interface Timing Diagram

Table 52. VIU Interface Timing Parameters

Parameter	Description	Min	Typ	Max	Unit	SpecID
f_{PIX_CK}	VIU Pixel Clock Frequency	—	—	83	MHz	A24.1
t_{DSU}	VIU Data Setup Time	2.5	—	—	ns	A24.2
t_{DHD}	VIU Data Hold Time	2.5	—	—	ns	A24.3

4 System Design Information

4.1 Power Up/Down Sequencing

Power sequencing between the 1.4 V power supply V_{DD_CORE} and the remaining supplies is required to prevent excessive current during power up phase.

The required power sequence is as follows:

- Use 12 V/millisecond or slower time for all supplies.
- Power up V_{DD_IO} , PLL_AV_{DD} , V_{BAT_RTC} (if not applied permanently), $V_{DD_MEM_IO}$, USB PHY, and SATA PHY supplies first in any order and then power up V_{DD_CORE} . If required, AV_{DD_FUSEWR} should be powered up afterwards.
- All the supplies must reach the specified operating conditions before the $\overline{PORESET}$ can be released.
- For power down, drop AV_{DD_FUSEWR} to 0 V first, drop V_{DD_CORE} to 0 V, and then drop all other supplies.
- V_{DD_CORE} should not exceed V_{DD_IO} , $V_{DD_MEM_IO}$, V_{BAT_RTC} , or PLL_AV_{DD} s by more than 0.4 V at any time, including power-up.

4.2 System and CPU Core AVDD Power Supply Filtering

Each of the independent PLL power supplies require filtering external to the device. The following drawing [Figure 59](#) is a recommendation for the required filter circuit.

Each circuit should be placed as close as possible to the specific AV_{DD} pin being supplied to minimize noise coupled from nearby circuits.

All traces should be as low impedance as possible, especially ground pins to the ground plane.

The filter for System/Core PLL V_{DD} to V_{SS} should be connected to the power and ground planes, respectively, not fingers of the planes.

In addition to keeping the filter components for System/Core PLL V_{DD} as close as practical to the body of the MPC5121e as previously mentioned, special care should be taken to avoid coupling switching power supply noise or digital switching noise onto the portion of that supply between the filter and the MPC5121e.

Figure 59. Power Supply Filtering

The capacitors for C2 in [Figure 59](#) should be rated X5R or better due to temperature performance. It is recommended to add a bypass capacitance of at least 1 μF for the V_{BAT_RTC} pin.

4.3 Connection Recommendations

To ensure reliable operation, connect unused inputs to an appropriate signal level. Unused active low inputs should be tied to V_{DD_IO} . Unused active high inputs should be connected to V_{SS} . All NC (no-connect) signals must remain unconnected.

Power and ground connections must be made to all external V_{DD} and V_{SS} pins of the MPC5121e/MPC5123.

The unused AV_{DD_FUSEWR} power should be connected to V_{SS} directly or via a resistor.

For DDR or LPDDR modes the unused pins MVT[3:0] for DDR2 Termination voltage can be unconnected.

System Design Information

The SATA PHY needs to be powered even if it is not used in an application. In this case, you should not enable the SATA oscillator and the SATA PHY by software.

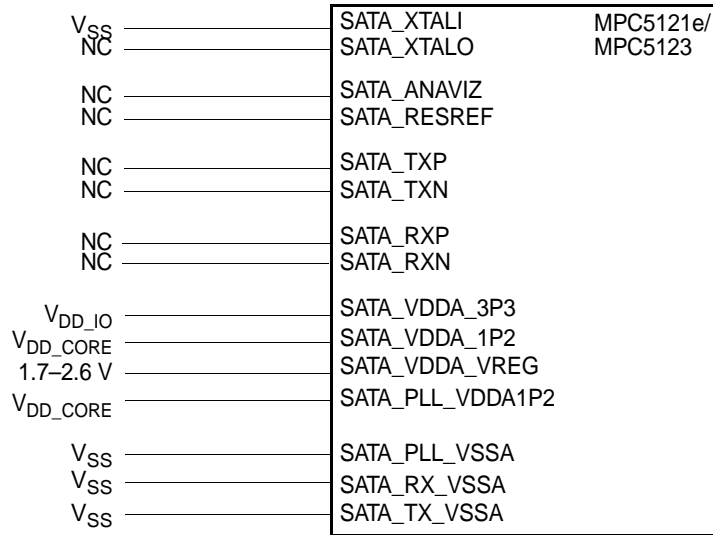

Figure 60. Recommended Connection for Pins of Unused SATA PHY

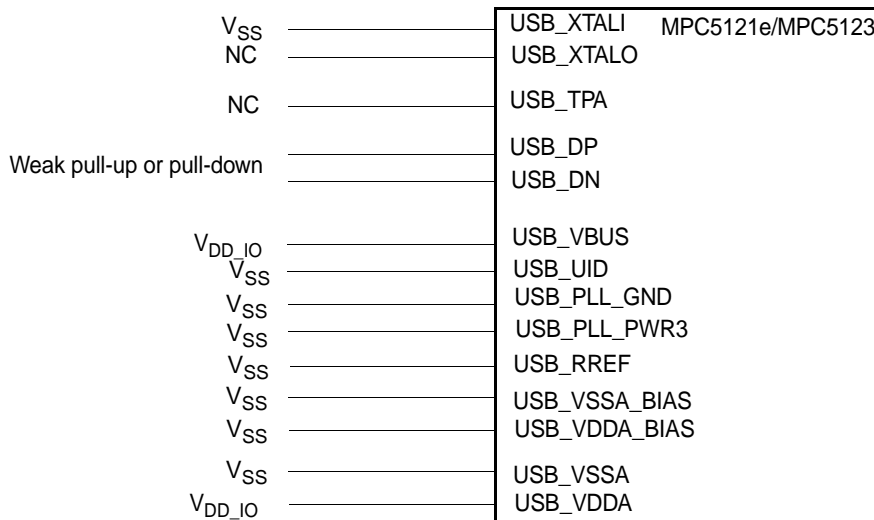

Figure 61. Recommended connection for pins of unused USB PHY

4.4 Pull-Up/Pull-Down Resistor Requirements

The MPC5121e/MPC5123 requires external pull-up or pull-down resistors on certain pins.

4.4.1 Pull-Down Resistor Requirements for TEST pin

The MPC5121e/MPC5123 requires a pull-down resistor on the test pin TEST.

4.4.2 Pull-Up Requirements for the PCI Control Lines

PCI control signals always require pull-up resistors on the motherboard (not the expansion board) to ensure that they contain stable values when no agent is actively driving the bus. This includes $\overline{\text{PCI_FRAME}}$, $\overline{\text{PCI_TRDY}}$, $\overline{\text{PCI_IRDY}}$, $\overline{\text{PCI_DEVSEL}}$, $\overline{\text{PCI_STOP}}$, $\overline{\text{PCI_SERR}}$, $\overline{\text{PCI_PERR}}$, and $\overline{\text{PCI_REQ}}$.

Refer to the PCI Local Bus specification.

4.5 JTAG

The MPC5121e/MPC5123 provides you with an IEEE 1149.1 JTAG interface to facilitate board/system testing. It also provides a Common On-Chip Processor (COP) Interface, which shares the IEEE 1149.1 JTAG port.

The COP Interface provides access to the MPC5121e/MPC5123's embedded e300 processor and to other on-chip resources. This interface provides a means for executing test routines and for performing software development and debug functions.

4.5.1 $\overline{\text{TRST}}$

Boundary scan testing is enabled through the JTAG interface signals. The $\overline{\text{TRST}}$ signal is optional in the IEEE 1149.1 specification but is provided on all processors that implement the Power Architecture. To obtain a reliable power-on reset performance, the $\overline{\text{TRST}}$ signal must be asserted during power-on reset.

4.5.1.1 $\overline{\text{TRST}}$ and $\overline{\text{PORESET}}$

The JTAG interface can control the direction of the MPC5121e/MPC5123 I/O pads via the boundary scan chain. The JTAG module must be reset before the MPC5121e/MPC5123 comes out of power-on reset; do this by asserting $\overline{\text{TRST}}$ before $\overline{\text{PORESET}}$ is released.

For more details refer to the Reset and JTAG Timing Specification.

Figure 62. $\overline{\text{PORESET}}$ vs. $\overline{\text{TRST}}$

4.5.2 e300 COP/BDM Interface

There are two possibilities to connect the JTAG interface: using it with a COP connector and without a COP connector.

4.5.2.1 Boards Interfacing the JTAG Port via a COP Connector

The MPC5121e/MPC5123 functional pin interface and internal logic provides access to the embedded e300 processor core through the Freescale standard COP/BDM interface. Table 53 gives the COP/BDM interface signals. The pin order shown reflects only the COP/BDM connector order.

Table 53. COP/BDM Interface Signals

BDM Pin #	MPC5121e/MPC5123 I/O Pin	BDM Connector	Internal Pull Up/Down	External Pull Up/Down	I/O ¹
16	—	GND	—	—	—
15	$\overline{\text{CKSTP_OUT}}$	ckstp_out	—	10 k Ω Pull-up	I
14	—	KEY	—	—	—
13	$\overline{\text{HRESET}}$	hreset	Pull-up	10 k Ω Pull-up	O
12	—	GND	—	—	—
11	$\overline{\text{SRESET}}$	sreset	Pull-up	10 k Ω Pull-up	O
10	—	N/C	—	—	—
9	TMS	tms	Pull-up	10 k Ω Pull-up	O
8	$\overline{\text{CKSTP_IN}}$	ckstp_in	—	10 k Ω Pull-up	O
7	TCK	tck	Pull-up	10 k Ω Pull-up	O
6	—	VDD ²	—	—	—
5	See Note ³	halted ³	—	—	I
4	$\overline{\text{TRST}}$	trst	Pull-up	10 k Ω Pull-up	O
3	TDI	tdi	Pull-up	10 k Ω Pull-up	O
2	See Note ⁴	qack ⁴	—	—	O
1	TDO	tdo	—	—	I

- ¹ With respect to the emulator tool's perspective:
Input is really an output from the embedded e300 core.
Output is really an input to the core.
- ² From the board under test, power sense for chip power.
- ³ HALTED is not available from e300 core.
- ⁴ Input to the e300 core to enable/disable soft-stop condition during breakpoints. MPC5121e/MPC5123 internally ties CORE_QACK to GND in its normal/functional mode (always asserted).

For a board with a COP (common on-chip processor) connector that accesses the JTAG interface and needs to reset the JTAG module, only wiring $\overline{\text{TRST}}$ and $\overline{\text{PORESET}}$ is not recommended.

To reset the MPC5121e/MPC5123 via the COP connector, the $\overline{\text{HRESET}}$ pin of the COP should be connected to the $\overline{\text{HRESET}}$ pin of the MPC5121e/MPC5123. The circuitry shown in [Figure 63](#) allows the COP to assert $\overline{\text{HRESET}}$ or $\overline{\text{TRST}}$ separately, while any other board sources can drive $\overline{\text{PORESET}}$.

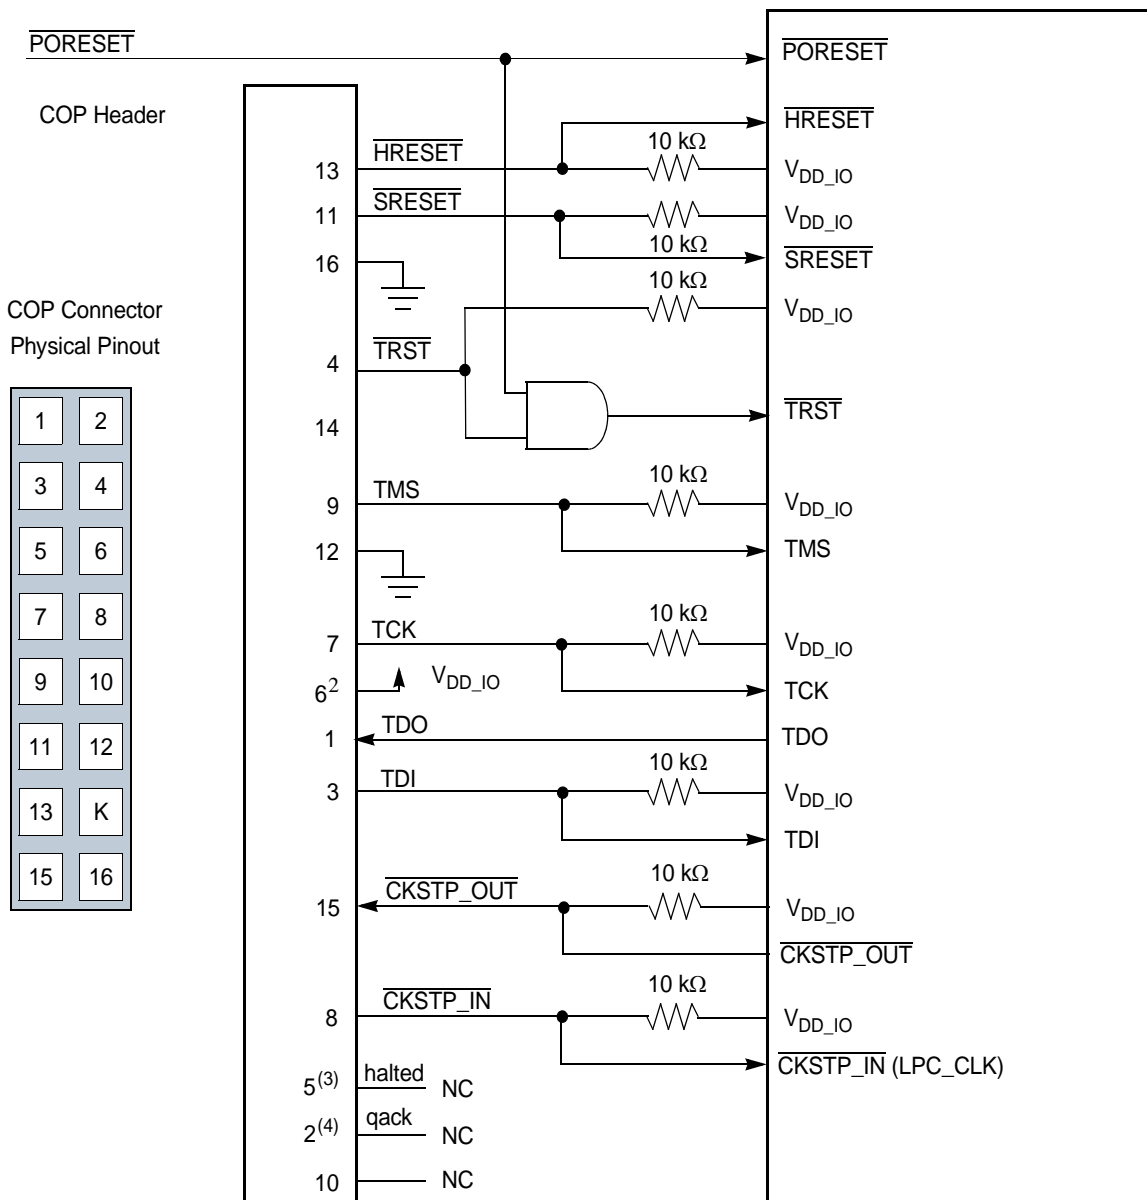

Figure 63. COP Connector Diagram

4.5.2.2 Boards Without COP Connector

If the JTAG interface is not used, $\overline{\text{TRST}}$ should be tied to $\overline{\text{PORESET}}$, so that it is asserted when the system reset signal ($\overline{\text{PORESET}}$) is asserted. This ensures that the JTAG scan chain is initialized during power on. Figure 64 shows the connection of the JTAG interface without COP connector.

Figure 64. $\overline{\text{TRST}}$ Wiring for Boards without COP Connector

5 Package Information

This section details package parameters and dimensions. The MPC5121e/MPC5123 is available in a Thermally Enhanced Plastic Ball Grid Array (TEPBGA), see [Section 5.1, “Package Parameters,”](#) and [Section 5.2, “Mechanical Dimensions,”](#) for information on the TEPBGA.

5.1 Package Parameters

Table 54. TEPBGA Parameters

Package outline	27 mm × 27 mm
Interconnects	516
Pitch	1.00 mm
Module height (typical)	2.25 mm
Solder Balls	96.5 Sn/3.5Ag (VY package)
Ball diameter (typical)	0.6 mm

5.2 Mechanical Dimensions

[Figure 65](#) shows the mechanical dimensions and bottom surface nomenclature of the MPC5121e/MPC5123 516 PBGA package.

Figure 65. Mechanical Dimension and Bottom Surface Nomenclature of the MPC5121e/MPC5123 TEPBGA

- 1 All dimensions are in millimeters.
- 2 Dimensions and tolerances per ASME Y14.5M-1994.
- 3 Maximum solder ball diameter measured parallel to datum A.
- 4 Datum A, the seating plane, is determined by the spherical crowns of the solder balls.

6 Product Documentation

This Data Sheet is labeled as a particular type: Product Preview, Advance Information, or Technical Data. Definitions of these types are available at: <http://www.freescale.com>.

Table 55 provides a revision history for this document.

Table 55. Document Revision History

Revision	Substantive Change(s)
Rev. 0, DraftA	First Draft (5/2008)
Rev. 0, DraftB	Second Draft (5/2008)
Rev. 0, DraftC	Third Draft (7/2008)
Rev. 1	Advance Information (10/2008)
Rev. 2	Technical Data (2/2009)
Rev. 3	Technical Data (2/2009). Corrected Table 5, Footnote 3.
Rev. 3.1	Technical Data (12/2009). Interim release for removing AVDD_FUSERD throughout document, changing pin D9 to VDD_IO, and adding D9 to list of pins for VDD_IO.
Rev. 4	Technical Data (1/2010). Minor editorial and graphical updates. No technical updates.
Rev 5	<ul style="list-style-type: none"> — Updated table “DDR and DDR2 SDRAM Timing Specification”, removed the row of ‘MCK AC differential crosspoint voltage’. — Updated table “Thermal Resistance Data”. — Added table “NFC Timing Characteristics in Symmetric Mode ”and added figure “Read data latch timing in Symmetric Mode”. — Published as Rev. 5
