MC10EP446, MC100EP446

3.3 V/5 V 8-Bit CMOS/ECL/TTL Data Input Parallel/Serial Converter

ON Semiconductor®

http://onsemi.com

Description

The MC10/100EP446 is an integrated 8−bit parallel to serial data converter. The device is designed with unique circuit topology to operate for NRZ data rates up to 3.2 Gb/s. The conversion sequence from parallel data into a serial data stream is from bit D0 to D7. The parallel input pins D0−D7 are configurable to be threshold controlled by CMOS, ECL, or TTL level signals. The serial data rate output can be selected at internal clock data rate or twice the internal clock data rate using the CKSEL pin.

Control pins are provided to reset (SYNC) and disable internal clock circuitry (CKEN). In either CKSEL modes, the internal flip−flops are triggered on the rising edge for CLK and the multiplexers are switched on the falling edge of CLK, therefore, all associated specification limits are referenced to the negative edge for the clock input. Additionally, V_{BB} pin is provided for single−ended input condition.

The 100 Series devices contain temperature compensation network.

Features

- 3.2 Gb/s Typical Data Rate Capability
- Differential Clock and Serial Outputs
- V_{BB} Output for Single-ended Input Applications
- Asynchronous Data Reset (SYNC)
- PECL Mode Operating Range:
  V_{CC} = 3.0 V to 5.5 V with V_{EE} = 0 V
- NECL Mode Operating Range:
  V_{CC} = 0 V with V_{EE} = −3.0 V to −5.5 V
- Open Input Default State
- Safety Clamp on Inputs
- Parallel Interface Can Support PECL, TTL or CMOS
- These Devices are Pb−Free and are RoHS Compliant

YY	= Year
WW	= Work Week
G or ▪	= Pb−Free Package

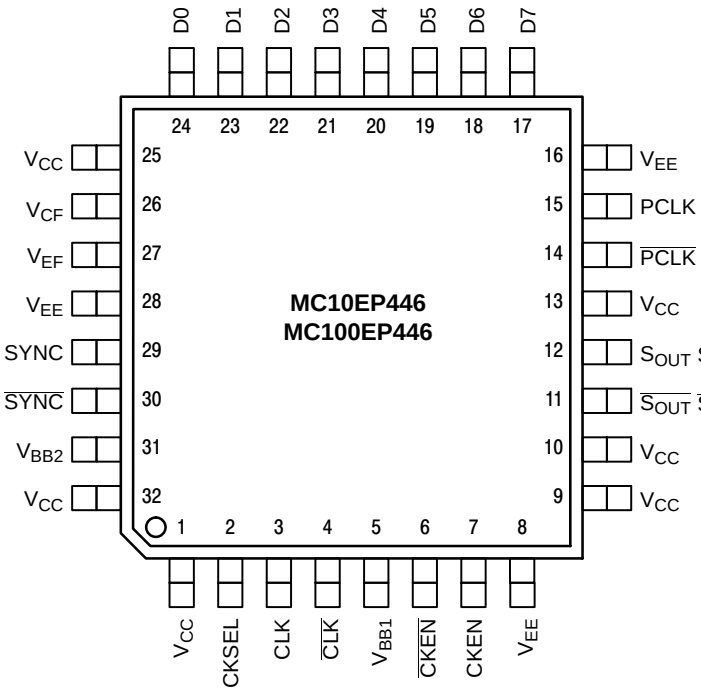
(Note: Microdot may be in either location)

*For additional marking information, refer to Application Note AND8002/D.

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 18 of this data sheet.

© Semiconductor Components Industries, LLC, 2014



Warning: All V_{CC} and V_{EE} pins must be externally connected to Power Supply to guarantee proper operation.

Figure 1. LQFP−32 Pinout (Top View)

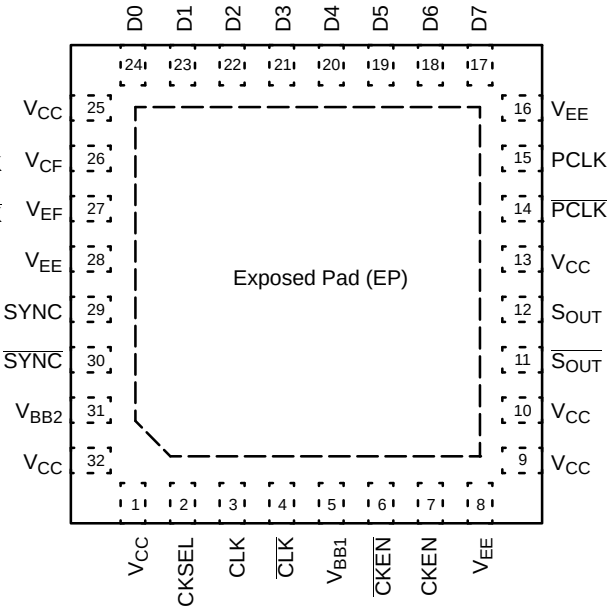


Figure 2. QFN−32 Pinout (Top View)

Table 1. PIN DESCRIPTION

PIN	FUNCTION
D0*−D7*	ECL, CMOS, or TTL Parallel Data Input
S_{OUT}, $\overline{S_{OUT}}$	ECL Differential Serial Data Output
CLK*, $\overline{CLK}$*	ECL Differential Clock Input
PCLK, $\overline{PCLK}$	ECL Differential Parallel Clock Output
SYNC*, $\overline{SYNC}$**	ECL Conversion Synchronizing Differential Input (Reset)***
CKSEL*	ECL Clock Input Selector
CKEN*, $\overline{CKEN}$*	ECL Clock Enable Differential Input
V_{CF}	ECL, CMOS, or TTL Input Selector
V_{EF}	ECL Reference Mode Connection
V_{BB1}, V_{BB2}	Reference Voltage Output
V_{CC}	Positive Supply
V_{EE}	Negative Supply

* Pins will default LOW when left open.
**Pins will default HIGH when left open.
***The rising edge of SYNC will asynchronously reset the internal circuitry. The falling edge of the SYNC followed by the falling edge of CLK initiates the conversion process synchronously on the next rising edge of CLK.

Table 2. TRUTH TABLE

Pin	Function	
	HIGH	LOW
CKSEL	S_{OUT}: PCLK = 8:1 CLK: S_{OUT} = 1:1 	S_{OUT}: PCLK = 8:1 CLK: S_{OUT} = 1:2 CKEN	Synchronously Disables Normal Parallel to Serial Conversion	Synchronously Enables Normal Parallel to Serial Conversion
SYNC	Asynchronously Resets Internal Flip−Flops*	Synchronous Enable

*The rising edge of SYNC will asynchronously reset the internal circuitry. The falling edge of the SYNC followed by the falling edge of CLK initiates the conversion process synchronously on the next rising edge of CLK.

Table 3. INPUT VOLTAGE LEVEL SELECTION TABLE

Input Function	Connect To V_{CF} Pin
ECL Mode	V_{EF} Pin
CMOS Mode	No Connect
TTL Mode*	1.5 V ± 100 mV

*For TTL Mode, if no external voltage can be provided, the reference voltage can be provided by connecting the appropriate resistor between V_{CF} and V_{EE} pins.

Table 4. DATA INPUT OPERATING VOLTAGE TABLE

Power Supply (V_{CC},V_{EE})	Data Inputs (D [0:7])			
	CMOS	TTL	PECL	NECL
PECL	√	√	√	N/A
NECL	N/A	N/A	N/A	√

Power Supply	Resistor Value 10% (Tolerance)
3.3 V	1.5 kΩ
5.0 V	500 Ω

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

2. Input and output parameters vary 1:1 with V_{CC}. V_{EE} can vary +0.3 V to −2.2 V.
3. All loading with 50 Ω to V_{CC} − 2.0 V.
4. V_{IHCMR} min varies 1:1 with V_{EE}, V_{IHCMR} max varies 1:1 with V_{CC}. The V_{IHCMR} range is referenced to the most positive side of the differential input signal.

NOTE: Device will meet the specifications after thermal equilibrium has been established when mounted in a test socket or printed circuit board with maintained transverse airflow greater than 500 lfpm. Electrical parameters are guaranteed only over the declared operating temperature range. Functional operation of the device exceeding these conditions is not implied. Device specification limit values are applied individually under normal operating conditions and not valid simultaneously.

20. Measured using a 750 mV source, 50% duty cycle clock source. All loading with 50 Ω to V_{CC} − 2.0 V.
21. V_{PP}(min) is the minimum input swing for which AC parameters are guaranteed.
22. The minimum pulse width is valid only if the setup and hold times are respected.

APPLICATION INFORMATION

The MC10/100EP446 is an integrated 8:1 parallel to serial converter. An attribute for EP446 is that the parallel inputs D0–D7 (Pins 17 – 24) can be configured to accept either CMOS, ECL, or TTL level signals by a combination of interconnects between V_{EF} (Pin 27) and V_{CF} (Pin 26) pins. For CMOS input levels, leave V_{EF} and V_{CF} open. For ECL operation, short V_{CF} and V_{EF} (Pins 26 and 27). For TTL operation, connect a 1.5 V supply reference to V_{CF} and leave the V_{EF} pin open. The 1.5 V reference voltage to V_{CF} pin can be accomplished by placing a 1.5 kΩ or 500 Ω between V_{CF} and V_{EE} for 3.3 V or 5.0 V power supplies, respectively. Note: all pins requiring ECL voltage inputs must have a 50 Ω terminating resistor to V_{TT} ($V_{TT} = V_{CC} – 2.0$ V).

The CKSEL input (Pin 2) is provided to enable the user to select the serial data rate output between internal clock data rate or twice the internal clock data rate. For CKSEL LOW operation, the time from when the parallel data is latched ① to when the data is seen on the S_{OUT} ② is on the falling edge of the 7th clock cycle plus internal propagation delay (Figure 7). Note the PCLK switches on the falling edge of CLK.

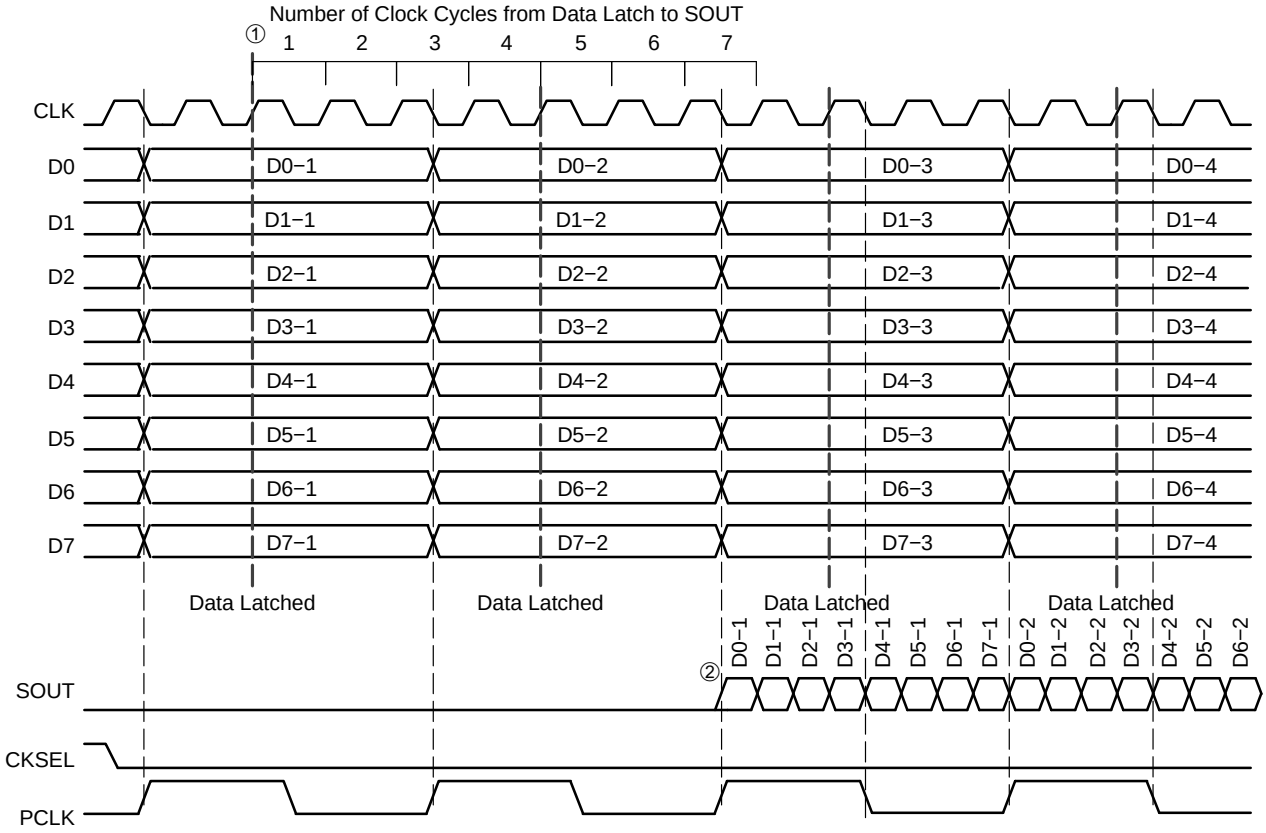

Figure 7. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL LOW

Similarly, for CKSEL HIGH operation, the time from when the parallel data is latched ① to when the data is seen on the S_{OUT} ② is on the rising edge of the 14th clock cycle plus internal propagation delay (Figure 8). Furthermore, the PCLK switches on the rising edge of CLK.

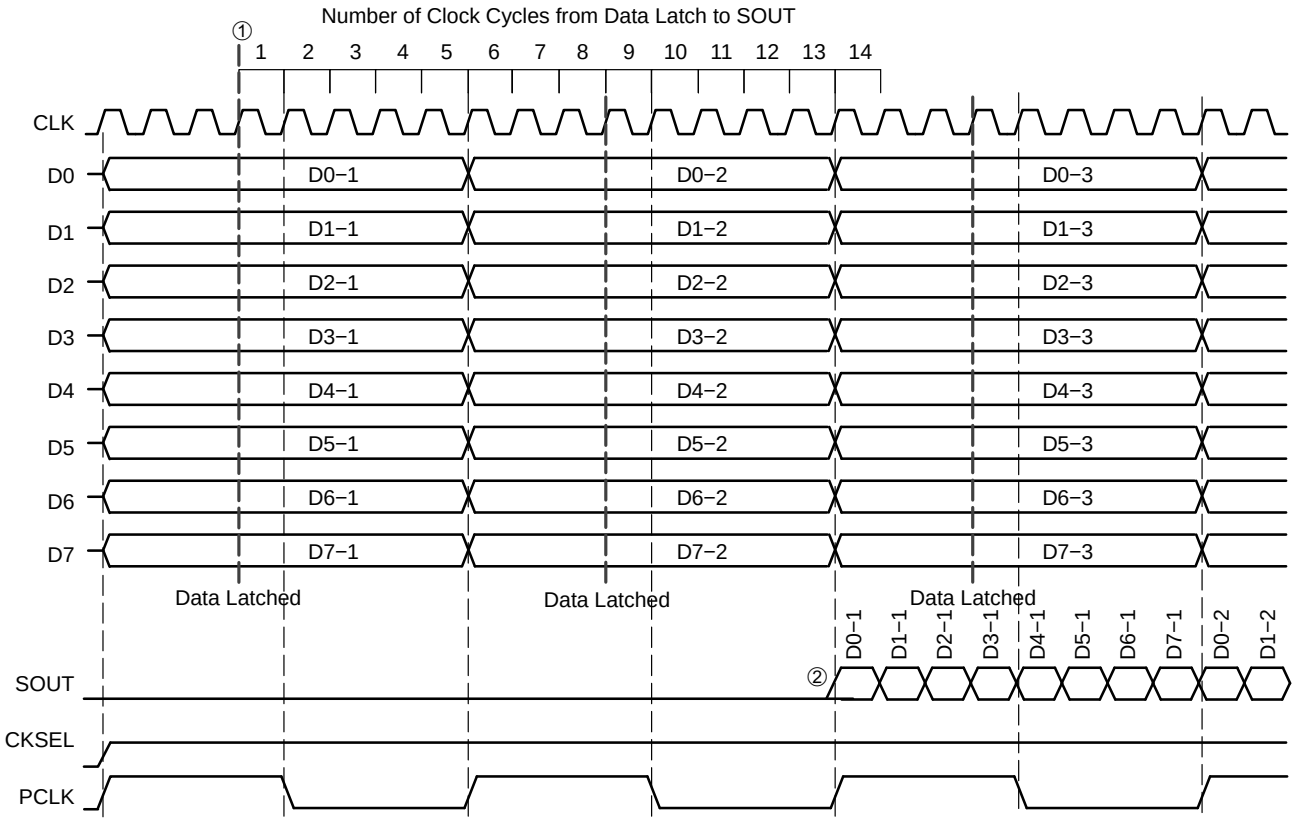

Figure 8. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL HIGH

The device also features a differential SYNC input (Pins 29 and 30), which asynchronously reset all internal flip–flops and clock circuitry on the rising edge of SYNC. The release of SYNC is a synchronous process, which ensures that no runt serial data bits are generated. The falling edge of the SYNC followed by a falling edge of CLK initiates the start of the conversion process on the next rising edge of CLK (Figures 9 and 10). As shown in the figures below, the device will start to latch the parallel input data after the a falling edge of SYNC ①, followed by the falling edge CLK ②, on the next rising of edge of CLK ③ for CKSEL LOW

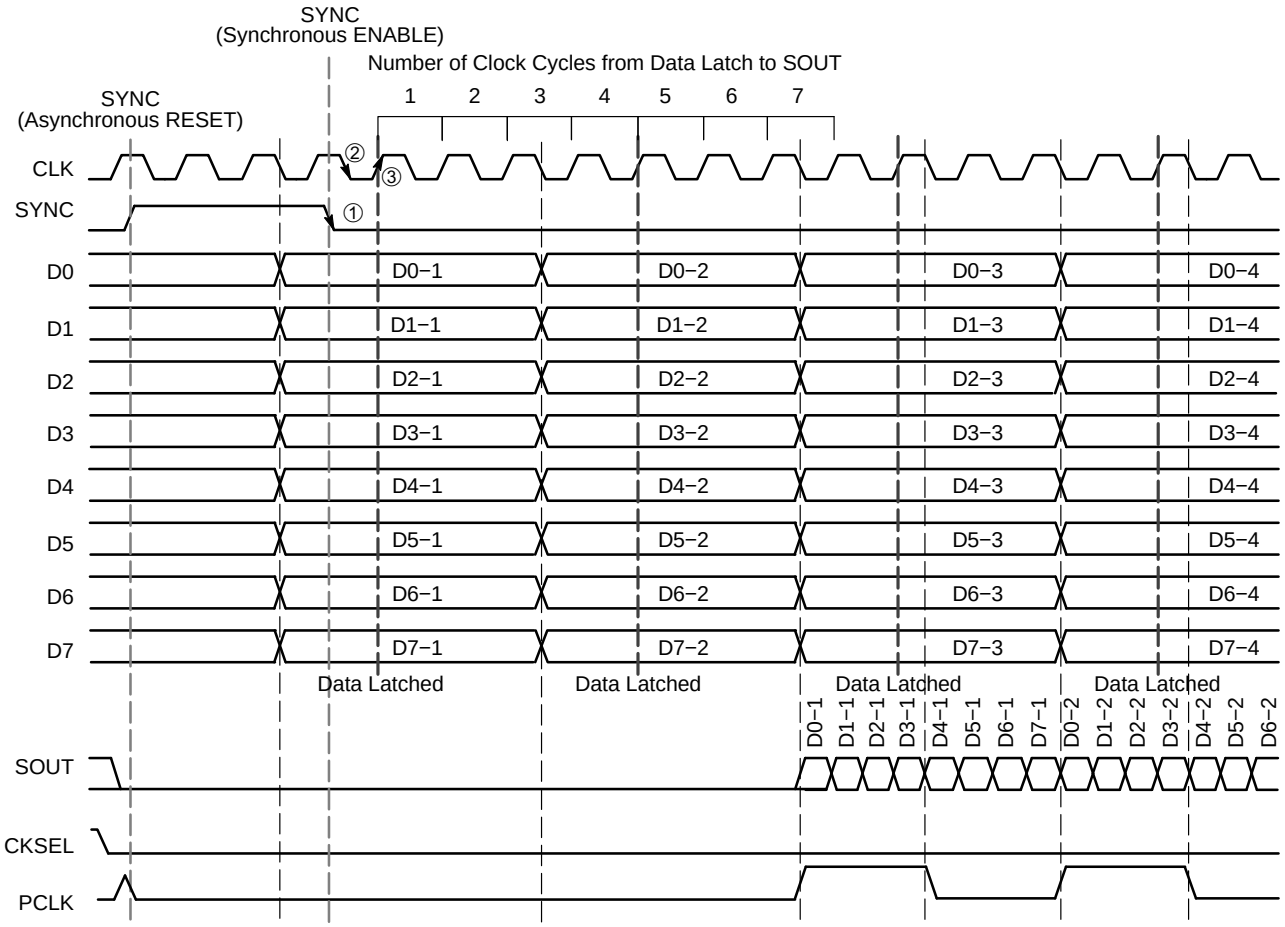

Figure 9. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL LOW and SYNC

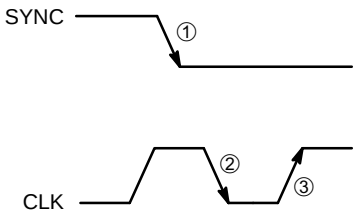

Figure 10. Synchronous Release of SYNC for CKSEL LOW

For CKSEL HIGH, as shown in the timing diagrams below, the device will start to latch the parallel input data after the falling edge of SYNC ①, followed by the falling edge CLK ②, on the second rising edge of CLK ③ (Figures 11 and 12).

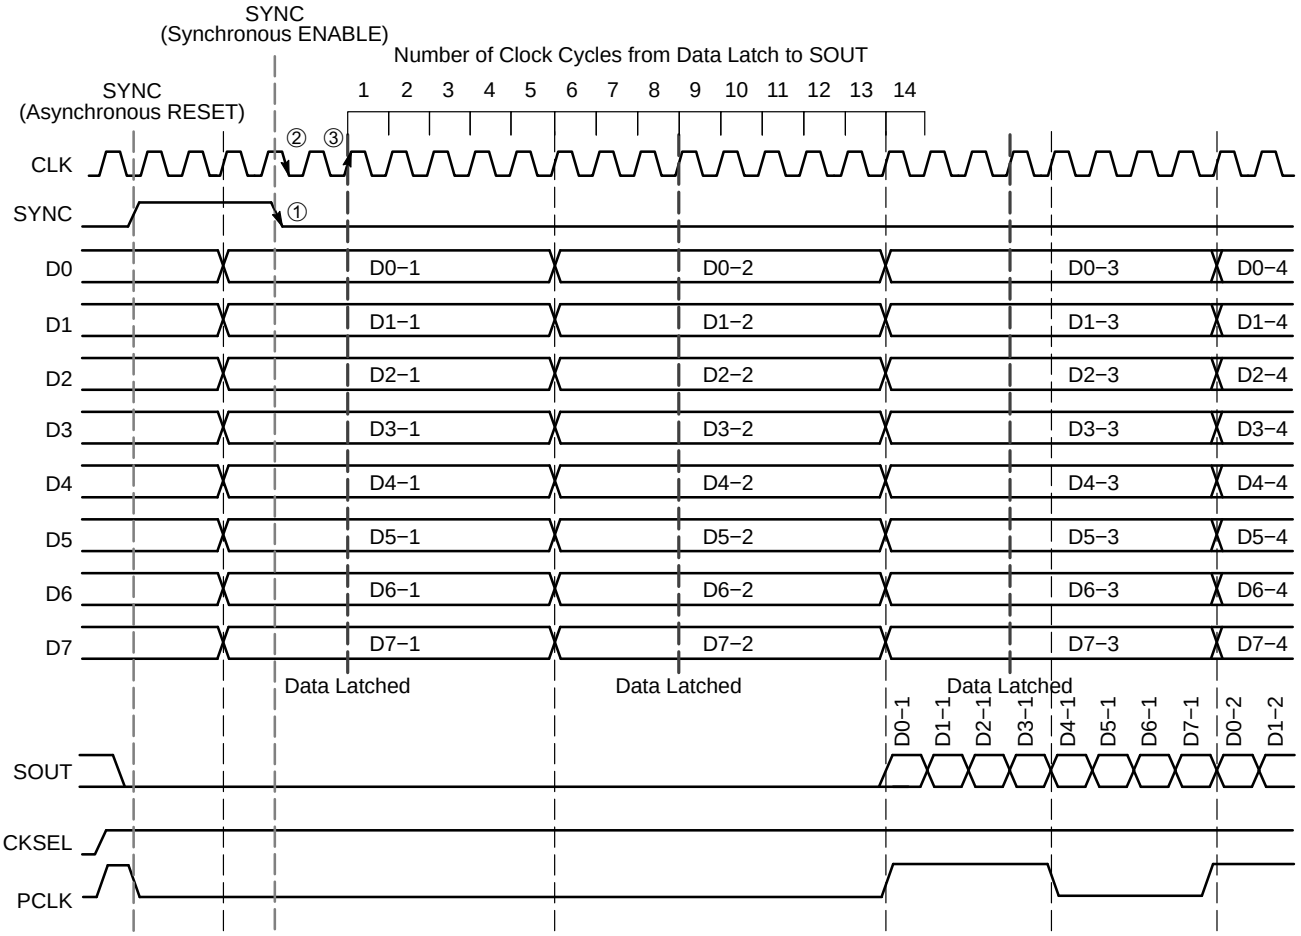

Figure 11. Timing Diagram 1:8 Parallel to Serial Conversion with CKSEL HIGH and SYNC

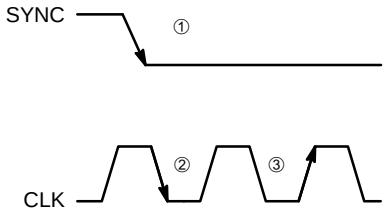

Figure 12. Synchronous Release of SYNC for CKSEL HIGH

The differential synchronous CKEN inputs (Pins 6 and 7), disable the internal clock circuitry. The synchronous CKEN will suspend all of the device activities and prevent runt pulses from being generated. The rising edge of CKEN followed by the falling edge of CLK will suspend all activities. The falling edge of CKEN followed by the falling edge of CLK will resume all activities (Figure 13).

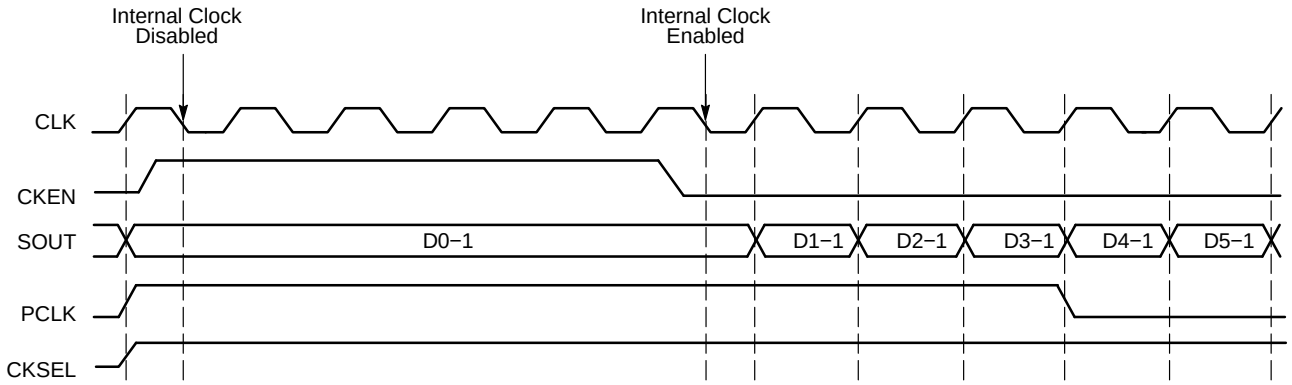

Figure 13. Timing Diagram with CKEN with CKSEL HIGH

The differential PCLK output (Pins 14 and 15) is a word framer and can help the user synchronize the serial data output, S_{OUT} (Pins 11 and 12), in their applications. Furthermore, PCLK can be used as a trigger for input parallel data (Figure 14).

An internally generated voltage supply, the V_{BB} pin, is available to this device only. For single–ended input conditions, the unused differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} and V_{CC} via a 0.01 μF capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} should be left open. Also, both outputs of the differential pair must be terminated (50 Ω to V_{TT}) even if only one output is used.

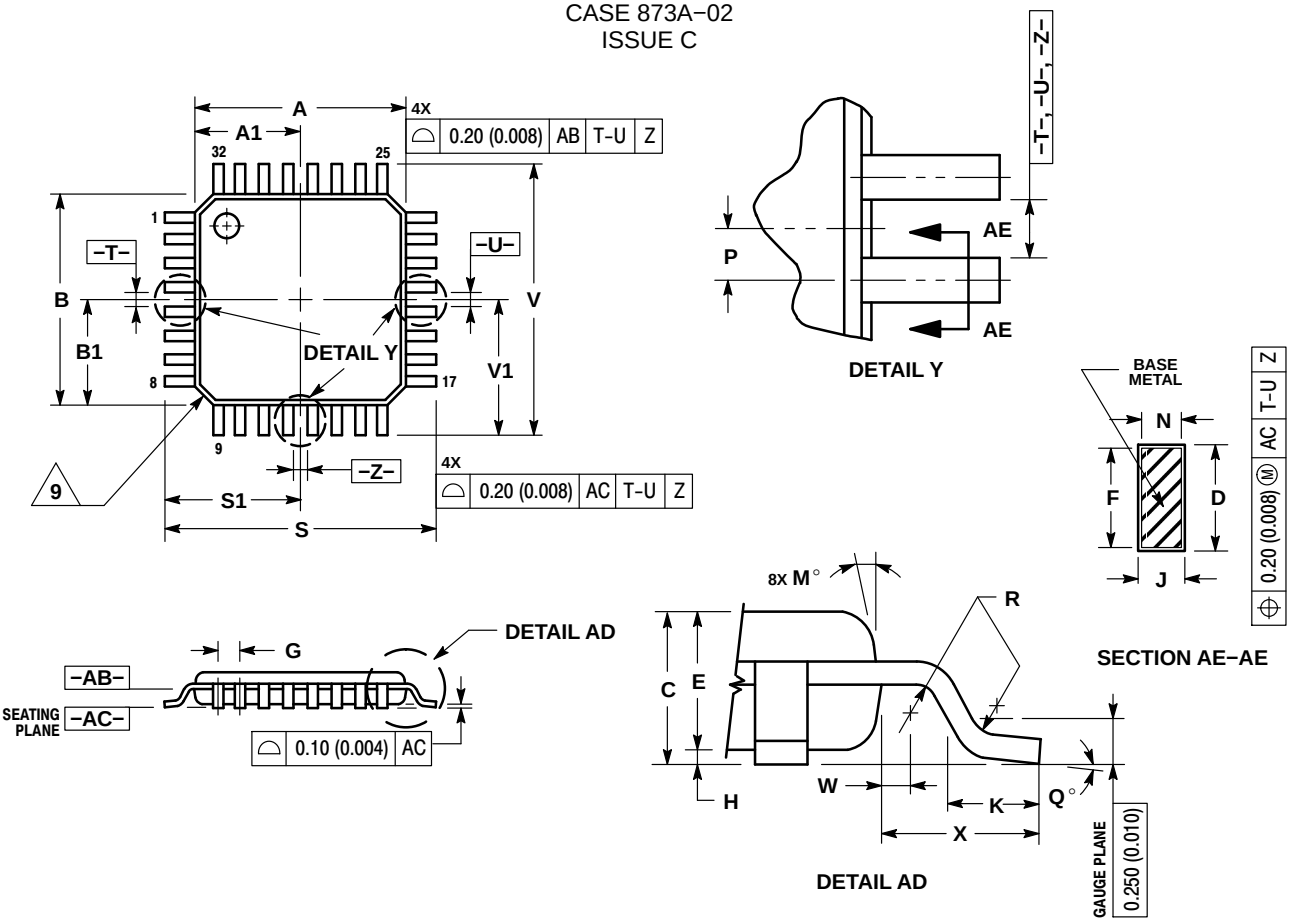
PACKAGE DIMENSIONS

32 LEAD LQFP
CASE 873A−02
ISSUE C



NOTES:
1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982.
2. CONTROLLING DIMENSION: MILLIMETER.
3. DATUM PLANE −AB− IS LOCATED AT BOTTOM OF LEAD AND IS COINCIDENT WITH THE LEAD WHERE THE LEAD EXITS THE PLASTIC BODY AT THE BOTTOM OF THE PARTING LINE.
4. DATUMS −T−, −U−, AND −Z− TO BE DETERMINED AT DATUM PLANE −AB−.
5. DIMENSIONS S AND V TO BE DETERMINED AT SEATING PLANE −AC−.
6. DIMENSIONS A AND B DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.250 (0.010) PER SIDE. DIMENSIONS A AND B DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE −AB−.
7. DIMENSION D DOES NOT INCLUDE DAMBAR PROTRUSION. DAMBAR PROTRUSION SHALL NOT CAUSE THE D DIMENSION TO EXCEED 0.520 (0.020).
8. MINIMUM SOLDER PLATE THICKNESS SHALL BE 0.0076 (0.0003).
9. EXACT SHAPE OF EACH CORNER MAY VARY FROM DEPICTION.
