

Features

- ESD protection for one line with uni-direction
- Provide transient protection for one line to
IEC 61000-4-2 (ESD) ±30kV (air/contact)
IEC 61000-4-4 (EFT) 80A (5/50ns)
IEC 61000-4-5 (Lightning) 140A (8/20μs)
- Suitable for, **20V and below**, operating voltage applications
- 2.0mm x 1.8mm DFN package saves board space
- High surge protection
- Protect one I/O line or one power line
- Fast turn-on and low clamping voltage
- Solid-state silicon-avalanche and active circuit triggering technology
- **Green part**

Applications

- Power supply protection
- USB VBUS protection
- Cellular handsets and accessories
- Panel modules
- Portable devices
- Touch panels
- Notebooks and handhelds
- Peripherals

Description

AZ4920-01F is a design which includes a uni-directional surge rated clamping cell to protect one power line, one control line, or one low-speed data line in an electronic system. The AZ4920-01F has been specifically designed to protect sensitive components which are connected to power and control lines from over-voltage damage caused by Electrostatic Discharging (ESD), Electrical Fast Transient (EFT), Lightning, and Cable Discharge Event (CDE).

AZ4920-01F is a unique design which includes proprietary clamping cell in a single package. During transient conditions, the proprietary clamping cell prevents over-voltage on the power line, control lines, or data lines, protecting any downstream component.

AZ4920-01F may be used to meet the ESD immunity requirements of IEC 61000-4-2, Level 4 (±15kV air, ±8kV contact discharge).

Application Information

The AZ4920-01F is designed to protect one line against system ESD/EFT/Lightning pulses by clamping them to an acceptable reference.

The usage of the AZ4920-01F is shown in Fig. 1. Protected lines, such as data lines, control lines, or power lines, are connected to pin-1. The pin-5, pin-6 and center tabs should be connected directly to a ground plane on the board. All path lengths connected to the pins of AZ4920-01F should be kept as short as possible to minimize parasitic inductance in the board traces.

In order to obtain enough suppression of ESD induced transient, a good circuit board is critical. Thus, the following guidelines are recommended:

- Minimize the path length between the protected lines and the AZ4920-01F.
- Place the AZ4920-01F near the input terminals or connectors to restrict transient coupling.
- The ESD current return path to ground should be kept as short as possible.
- Use ground planes whenever possible.
- NEVER route critical signals near board edges and near the lines which the ESD transient easily injects to.
