

Analog Potentiometer Volume Adjustable TRRS Headset

PRODUCT ID: 3959

Most modern headphone sets are purely digital – with three volume control buttons in-line with the cable. These headphones are interesting in that they have an *analog* volume control potentiometer. Perfect for use with electronic projects that don't have a volume control, or for phones that don't know how to use the digital buttons. There is one button on the headset, often used for 'pause' or 'mute' – when pressed it grounds the microphone pin.

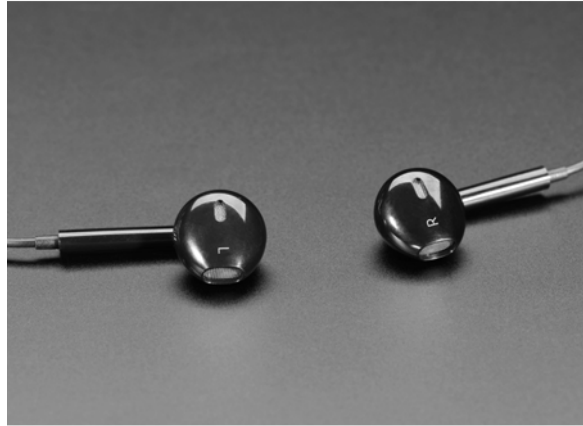

These earbud headphones are the perfect accessory for your FONA – they've been tested to work with our modules – but can be used with any iOS or Android device that uses a TRRS pinout.

The buds themselves are 16mm in diameter and at a nice 46" long. They come with a standard 3.5mm headphone jack, handy volume control box, and shirt clip.

TECHNICAL DETAILS

Headphone Diameter: 16mm / .63"

Overall Length: 116.8cm / 3.8'
