

FDC633N

N-Channel Enhancement Mode Field Effect Transistor

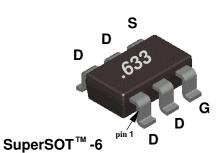

General Description

This N-Channel enhancement mode power field effect transistors is produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications in notebook computers, portable phones, PCMICA cards, and other battery powered circuits where fast switching,low in-line power loss and resistance to transients are needed in a very small outline surface mount package.

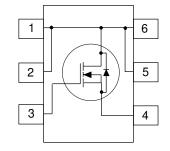

Features

- SuperSOT[™]-6 package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low R_{DS(ON)}.
- Exceptional on-resistance and maximum DC current capability.

Absolute Maximum Ratings T_A = 25°C unless otherwise noted

Notes:

^{1.} $R_{g,M}$ is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{g,C}$ is guaranteed by design while $R_{g,C}$ is determined by the user's board design.
