1. Clamping voltage: Per IEC61000-4-2, Level 4 waveform (8 kV direct 30 A) measured 30 ns after initial pulse.

2. Trigger voltage: Trigger measurement made using transmission line pulse (TLP) method.

3. Minor shifting in characteristics may be observed over multiple ESD pulses at very rapid rate.

4. Part number definition: 0603ESDA-MLP7

Recommended pad layout

Design considerations

The location in the circuit for the 0603ESDA-MLP7 has to be carefully determined. For better performance, the device should be placed as close to the signal input as possible and ahead of any other component. Due to the high current associated with an ESD event, it is recommended to use a "0-stub" pad design (pad directly on the signal/data line and second pad directly on common ground).
