Description

The ST16C32245 is a dual supply low voltage CMOS 14-bit bus transceiver fabricated with sub-micron silicon gate and five-layer metal wiring C²MOS technology. Designed for use as an interface between a 3.3 V bus and a 2.5 V or 1.8 V bus in a mixed 3.3 V/1.8 V, 3.3 V/2.5 V and 2.5 V/1.8 V supply systems, it achieves high speed operation while maintaining the CMOS low power dissipation and it includes 2-bit I²C level translation. This IC is intended for two-way asynchronous communication between data buses and the direction of data transmission is determined by nDIR inputs. The enable inputs \overline{nG} can be used to disable the device so that the buses are effectively isolated. The A-port interfaces with the 3 V bus, the B-port with the 2.5 V and 1.8 V bus. All inputs are equipped with protection circuits against static discharge, giving them 2 KV ESD immunity and transient excess voltage. All floating bus terminals during high Z state do not need external pull-up or pull-down resistor.

1. C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to test circuit). Average current can be obtained by the following equation.

$$I_{CC(opr)} = C_{PD} \times V_{CC} \times f_{IN} + I_{CC}/14 \text{ (per circuit)}$$
