NEC

MOS INTEGRATED CIRCUIT
μPD48288209, 48288218, 48288236

288M-BIT Low Latency DRAM
Common I/O

Description

The μPD48288209 is a 33,554,432-word by 9 bit, the μPD48288218 is a 16,777,216 word by 18 bit and the μPD48288236 is a 8,388,608 word by 36 bit synchronous double data rate Low Latency RAM fabricated with advanced CMOS technology using one-transistor memory cell.

The μPD48288209, μPD48288218 and μPD48288236 integrate unique synchronous peripheral circuitry and a burst counter. All input registers controlled by an input clock pair (CK and CK#) are latched on the positive edge of CK and CK#.

These products are suitable for application which require synchronous operation, high speed, low voltage, high density and wide bit configuration.

Specification

- Density: 288M bit
- Organization
  - Common I/O: 4M words x 9 bits x 8 banks
    2M words x 18 bits x 8 banks
    1M words x 36 bits x 8 banks
- Operating frequency: 400 / 300 / 200 MHz
- Interface: HSTL I/O
- Package: 144-pin TAPE FBGA
  - Package size: 18.5 x 11
  - Leaded and Lead free
- Power supply
  - 2.5 V V_{EXT}
  - 1.8 V V_{DD}
  - 1.5 V or 1.8 V $V_{DD}Q$
- Refresh command
  - Auto Refresh
  - 8192 cycle / 32 ms for each bank
  - 64K cycle / 32 ms for total
- Operating case temperature : Tc = 0 to 95°C

Features

- SRAM-type interface
- Double-data-rate architecture
- PLL circuitry
- Cycle time: 2.5 ns @ t_{RC} = 20 ns
  3.3 ns @ t_{RC} = 20 ns
  5.0 ns @ t_{RC} = 20 ns
- Non-multiplexed addresses
- Multiplexing option is available.
- Data mask for WRITE commands
- Differential input clocks (CK and CK#)
- Differential input data clocks (DK and DK#)
- Data valid signal (QVLD)
- Programmable burst length: 2 / 4 / 8 (x9 / x18)
  2 / 4 (x36)
- User programmable impedance output (25 Ω - 60 Ω)
- JTAG boundary scan

Pin Identification **(1/2)**

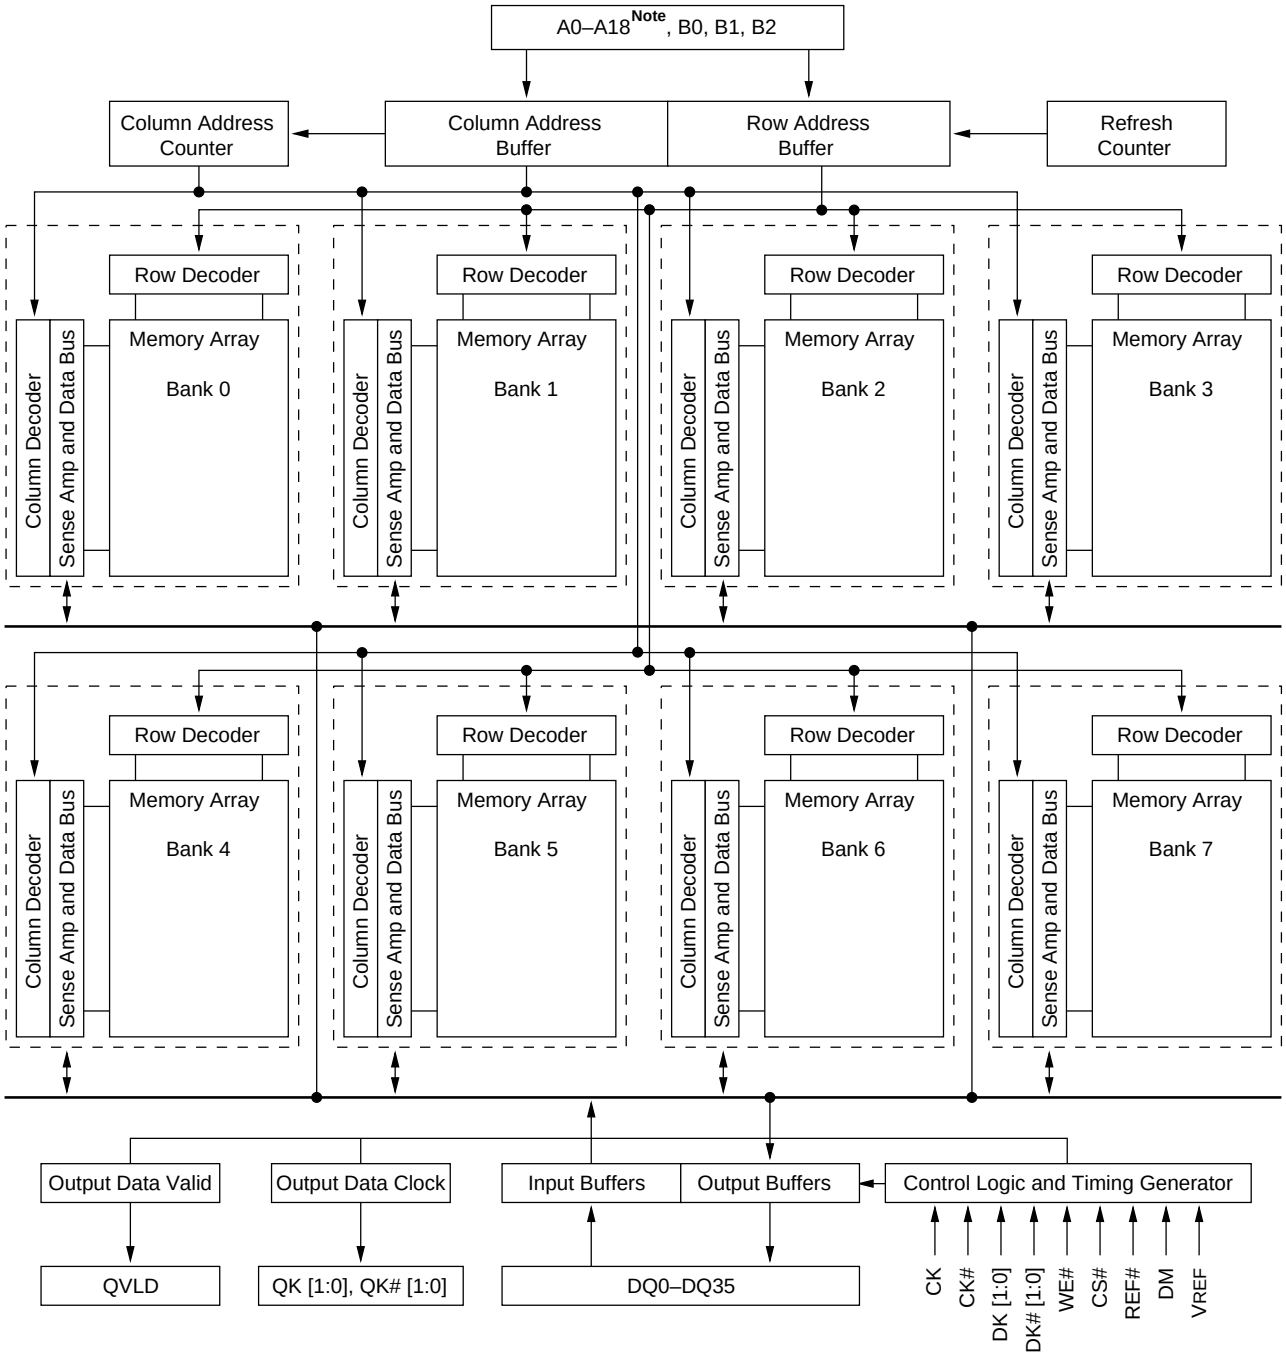
Symbol	Type	Description
CK, CK#	Input	Clock inputs: CK and CK# are differential clock inputs. This input clock pair registers address and control inputs on the rising edge of CK. CK# is ideally 180 degrees out of phase with CK.
CS#	Input	Chip select CS# enables the commands when CS# is LOW and disables them when CS# is HIGH. When the command is disabled, new commands are ignored, but internal operations continue.
WE#, REF#	Input	Write Command pin, Refresh Command Pin: WE#, REF# are sampled at the positive edge of CK, WE#, and REF# define (together with CS#) the command to be executed.
A[20:0]	Input	Address inputs: A[20:0] define the row and column addresses for READ and WRITE operations. During a MODE REGISTER SET, the address inputs define the register settings. They are sampled at the rising edge of CK. In the x36 configuration, A[20:19] are reserved for address expansion; in the x18 configuration, A[20] is reserved for address expansion. These expansion addresses can be treated as address inputs, but they do not affect the operation of the device.
A[22:21]	Input	Reserved for future use: These signals should be tied to V_{SS} or leave open.
BA[2:0]	Input	Bank address inputs; Select to which internal bank a command is being applied.
DQ[35:0]	Input /Output	Data input/output: The DQ signals form the 36 bit data bus. During READ commands, the data is referenced to both edges of QKx. During WRITE commands, the data is sampled at both edges of DKx.
QKx, QKx#	Output	Output data clocks: QKx and QKx# are opposite polarity, output data clocks. They are always free running and edge-aligned with data output from the μPD48288209/18/36. QKx# is ideally 180 degrees out of phase with QKx. For the x36 device, QK0 and QK0# are aligned with DQ17–DQ0. QK1 and QK1# are aligned with DQ35–DQ18. For the x18 device, QK0 and QK0# are aligned with DQ8–DQ0. QK1 and QK1# are aligned with DQ17–DQ9. For the x9 device, QK0 and QK0# are aligned with DQ8–DQ0.
DKx, DKx#	Input	Input data clock; DKx and DKx# are the differential input data clocks. All input data is referenced to both edges of DK. DK# is ideally 180 degrees out of phase with DK. For the x36 device, DQ17–DQ0 are referenced to DK0 and DK0#, and DQ35–DQ18 are referenced to DK1 and DK1#. For the x9 and x18 devices, all DQs are referenced to DK and DK#.
DM	Input	Input data mask; The DM signal is the input mask signal for WRITE data. Input data is masked when DM is sampled HIGH along with the WRITE input data. DM is sampled on both edges of DK (DK1 for the x36 configuration). The signal should be V_{SS} if not used.
QVLD	Output	Data valid; The QVLD indicates valid output data. QVLD is edge-aligned with QKx and QKx#.

(2/2)

Symbol	Type	Description
ZQ	Input /Output	External impedance [25 Ω – 60 Ω]; This signal is used to tune the device outputs to the system data bus impedance. DQ output impedance is set to 0.2 x RQ, where RQ is a resistor from this signal to V_{SS}. Connecting ZQ to V_{SS} invokes the minimum impedance mode. Connecting ZQ to $V_{DD}Q$ invokes the maximum impedance mode. Refer to **Figure 2-5. Mode Register Bit Map** to activate this function.
TMS , TDI	Input	JTAG function pins: IEEE 1149.1 test inputs: These balls may be left as no connects if the JTAG function is not used in the circuit
TCK	Input	JTAG function pin; IEEE 1149.1 clock input: This ball must be tied to V_{SS} if the JTAG function is not used in the circuit.
TDO	Output	JTAG function pin; IEEE 1149.1 test output: JTAG output. This ball may be left as no connect if JTAG function is not used.
V_{REF}	Input	Input reference voltage; Nominally $V_{DD}Q/2$. Provides a reference voltage for the input buffers.
V_{EXT}	Supply	Power supply; 2.5 V nominal. See **Recommended DC Operating Conditions** for range.
V_{DD}	Supply	Power supply; 1.8 V nominal. See **Recommended DC Operating Conditions** for range.
$V_{DD}Q$	Supply	DQ power supply; Nominally, 1.5 V or 1.8 V. Isolated on the device for improved noise immunity. See **Recommended DC Operating Conditions** for range.
V_{SS}	Supply	Ground
$V_{SS}Q$	Supply	DQ ground; Isolated on the device for improved noise immunity.
V_{TT}	Supply	Power supply; Isolated termination supply. Nominally, $V_{DD}Q/2$. See **Recommended DC Operating Conditions** for range.
NF		No function; These balls may be connected to V_{SS}.
DNU		Do not use; These balls may be connected to V_{SS}.

Block Diagram

8M x 36



Note When the BL=4 setting is used, A18 is “Don’t care”.

<R> **Absolute Maximum Ratings**

Parameter	Symbol	Conditions	Rating	Unit	Note
Supply voltage	V_{EXT}		–0.3 to +2.8	V	
Supply voltage	V_{DD}		–0.3 to +2.1	V	
Output supply voltage,	$V_{DD}Q$	1.8V nominal	–0.3 to +2.1	V	1
Input voltage, Input / Output voltage		1.5V nominal	–0.3 to +1.975	V	1
Input / Output voltage	V_{IH} / V_{IL}	1.8V nominal	–0.3 to +2.1	V	1
		1.5V nominal	–0.3 to +1.975	V	1
Junction temperature	T_j MAX.		110	°C	
Storage temperature	T_{stg}		–55 to +125	°C	

Note 1. The μPD48288209/18/36FF-E support 1.8 V $V_{DD}Q$ nominal.
The μPD48288209/18/36FF-EF support 1.5 V $V_{DD}Q$ nominal.

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

<R> **Recommended DC Operating Conditions**

0°C ≤ T_C ≤ 95°C; 1.7 V ≤ V_{DD} ≤ 1.9 V, unless otherwise noted

Supply voltage	V_{EXT}		2.38	2.5	2.63	V	1
Supply voltage	V_{DD}		1.7	1.8	1.9	V	1
Output supply voltage	$V_{DD}Q$		1.7	1.8	1.9	V	1, 2, 3
			1.4	1.5	1.6	V	1, 3
Reference Voltage	V_{REF}		0.49 x $V_{DD}Q$	0.5 x $V_{DD}Q$	0.51 x $V_{DD}Q$	V	1, 4, 5
Termination voltage	V_{TT}		0.95 x V_{REF}	V_{REF}	1.05 x V_{REF}	V	1, 6
Input HIGH voltage	$V_{IH\ (DC)}$		V_{REF} + 0.1			V	1
Input LOW voltage	$V_{IL\ (DC)}$				V_{REF} – 0.1	V	1

Notes 1. All voltage referenced to V_{SS} (GND).

2. During normal operation, $V_{DD}Q$ must not exceed V_{DD}.

3. The μPD48288209/18/36FF-E support 1.8 V $V_{DD}Q$ nominal.
The μPD48288209/18/36FF-EF support 1.5 V $V_{DD}Q$ nominal.

4. Typically the value of V_{REF} is expect to be 0.5 x $V_{DD}Q$ of the transmitting device. V_{REF} is expected to track variations in $V_{DD}Q$.

5. Peak-to-peak AC noise on V_{REF} must not exceed ± 2% V_{REF}(DC).

6. V_{TT} is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF}.

DC Characteristics

0°C ≤ T_C ≤ 95°C; 1.7 V ≤ V_{DD} ≤ 1.9 V, unless otherwise noted

Parameter	Symbol	Test condition	MIN.	MAX.	Unit	Note
Input leakage current	I_{LI}		–5	+5	μA	1,2
Output leakage current	I_{LO}		–5	+5	μA	1,2
Reference voltage current	I_{REF}		–5	+5	μA	1,2
Output high current	I_{OH}	V_{OH} = $V_{DD}Q/2$	($V_{DD}Q$/2) / (1.15 x RQ/5)	($V_{DD}Q$/2) / (0.85 x RQ/5)	mA	3,4
Output low current	I_{OL}	V_{OL} = $V_{DD}Q/2$	($V_{DD}Q$/2) / (1.15 x RQ/5)	($V_{DD}Q$/2) / (0.85 x RQ/5)	mA	3,4

Notes 1. Outputs are impedance-controlled. | I_{OH} | = ($V_{DD}Q$/2)/(RQ/5) for values of 125 Ω ≤ RQ ≤ 300 Ω.

2. Outputs are impedance-controlled. I_{OL} = ($V_{DD}Q$/2)/(RQ/5) for values of 125 Ω ≤ RQ ≤ 300 Ω.

3. I_{OH} and I_{OL} are defined as absolute values and are measured at $V_{DD}Q$/2. I_{OH} flows from the device, I_{OL} flows into the device.

4. If MRS bit A8 is 0, use RQ = 250 Ω in the equation in lieu of presence of an external impedance matched resistor.

Capacitance (T_A = 25 °C, f = 1MHz)

Parameter	Symbol	Test conditions	MIN.	MAX.	Unit
Address / Control Input capacitance	C_{IN}	V_{IN} = 0 V	1.5	2.5	pF
I/O, Output, Other capacitance (DQ, DM, QK, QVLD)	$C_{I/O}$	$V_{I/O}$ = 0 V	3.5	5.0	pF
Clock Input capacitance	C_{clk}	V_{clk} = 0 V	2.0	3.0	pF
JTAG pins	C_J	V_J = 0 V	2.0	5.0	pF

Remark These parameters are periodically sampled and not 100% tested.
Capacitance is not tested on ZQ pin.

Recommended AC Operating Conditions

0°C ≤ T_C ≤ 95°C; 1.7 V ≤ V_{DD} ≤ 1.9 V, unless otherwise noted

Parameter	Symbol	Conditions	MIN.	MAX.	Unit	Note
Input HIGH voltage	$V_{IH\,(AC)}$		V_{REF} + 0.2		V	1
Input LOW voltage	$V_{IL\,(AC)}$			V_{REF} – 0.2	V	1

Note 1. Overshoot: $V_{IH\,(AC)} \le V_{DD}Q + 0.7$ V for $t \le t_{CK}/2$
Undershoot: $V_{IL\,(AC)} \ge -0.5$ V for $t \le t_{CK}/2$
Control input signals may not have pulse widths less than t_{CKH} (MIN.) or operate at cycle rates less than t_{CK} (MIN.).

				x18/x9	550	450	–	
			V_{EXT}		60	51	–	

Remarks 1. I_{DD} specifications are tested after the device is properly initialized. +0°C ≤ T_C ≤ +95°C; +1.7 V ≤ V_{DD} ≤ +1.9 V, +2.38 V ≤ V_{EXT} ≤ +2.63 V, +1.4 V ≤ $V_{DD}Q$ ≤ +1.6 V (–E), +1.7 V ≤ $V_{DD}Q$ ≤ +1.9 V (–EF), V_{REF} = $V_{DD}Q$/2

2. t_{CK} = t_{DK} = MIN., t_{RC} = MIN.

3. Input slew rate is specified in **Recommended DC Operating Conditions** and **Recommended AC Operating Conditions**.

4. I_{DD} parameters are specified with ODT disabled.

5. Continuous data is defined as half the DQ signals changing between HIGH and LOW every half clock cycles (twice per clock).

6. Continuous address is defined as half the address signals between HIGH and LOW every clock cycles (once per clock).

7. Sequential bank access is defined as the bank address incrementing by one ever t_{RC}.

8. Cyclic bank access is defined as the bank address incrementing by one for each command access. For BL=4 this is every other clock.

9. CS# is HIGH unless a READ, WRITE, AREF, or MRS command is registered. CS# never transitions more than per clock cycle.

Data-in and data mask to DK	t_{DH}	0.25		0.3		0.4		ns	

Notes 1. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.

<R> **2.** Frequency drift is not allowed.

3. t_{QKQ0} is referenced to Q17–Q0 in x36 and Q8–Q0 in x18.
t_{QKQ1} is referenced to Q35–Q18 in x36 and Q17–Q9 in x18.

4. t_{QKQ} takes into account the skew between any QKx and any Q.

5. t_{QKQ}, t_{QKQX} are guaranteed by design.

Remark All timing parameters are measured relative to the crossing point of CK/CK#, DK/DK# and to the crossing point with V_{REF} of the command, address, and data signals.

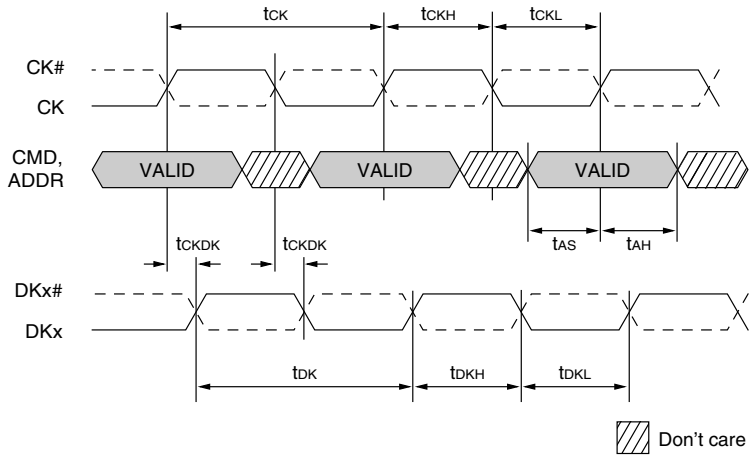
3. t_{QKQ0} is referenced to Q17–Q0 in x36 and Q8–Q0 in x18.
t_{QKQ1} is referenced to Q35–Q18 in x36 and Q17–Q9 in x18.

4. t_{QKQ} takes into account the skew between any QKx and any Q.

5. t_{QKQ}, t_{QKQX} are guaranteed by design.

Remark All timing parameters are measured relative to the crossing point of CK/CK#, DK/DK# and to the crossing point with V_{REF} of the command, address, and data signals.

Figure 1-1. Clock / Input Data Clock Command / Address Timings



Temperature and Thermal Impedance

<R> **Temperature Limits**

Parameter	Symbol	MIN.	MAX.	Unit	Note
Reliability junction temperature	T_J	0	+110	°C	1
Operating junction temperature	T_J	0	+100	°C	2
Operating case temperature	T_C	0	+95	°C	3

Notes 1. Temperatures greater than 110°C may cause permanent damage to the device. This is a stress rating only and functional operation of the device at or above this is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability of the part.

2. Junction temperature depends upon cycle time, loading, ambient temperature, and airflow.

3. MAX operating case temperature; T_C is measured in the center of the package. Device functionality is not guaranteed if the device exceeds maximum T_C during operation.

Thermal Impedance

Substrate	Ball	θja (°C/W)			θjb	θjc
		Air Flow = 0 m/s	Air Flow = 1 m/s	Air Flow = 2 m/s	(°C/W)	(°C/W)
4 - Layer	Lead	32.4	26.8	24.6	23.0	1.8
8 - Layer	Lead	26.5	22.3	20.8	16.8	1.8
4 - Layer	Lead free	32.1	26.6	24.4	22.7	1.8
8 - Layer	Lead free	26.3	22.1	20.6	16.6	1.8

2. Operation

2.1 Command Operation

According to the functional signal description, the following command sequences are possible. All input states or sequences not shown are illegal or reserved. All command and address inputs must meet setup and hold times around the rising edge of CK.

Table 2-1. Address Widths at Different Burst Lengths

Burst Length	Configuration		
	x36	x18	x9
BL=2	A[18:0]	A[19:0]	A[20:0]
BL=4	A[17:0]	A[18:0]	A[19:0]
BL=8	NA	A[17:0]	A[18:0]

Table 2-2. Command Table

Operation	Code	CS#	WE#	REF#	A[20:0]	BA[2:0]	Note
Device DESELECT / No Operation	DESEL / NOP	H	X	X	X	X	
MRS: Mode Register Set	MRS	L	L	L	OPCODE	X	1
READ	READ	L	H	H	A	BA	2
WRITE	WRITE	L	L	H	A	BA	2
AUTO REFRESH	AREF	L	H	L	X	BA	

Notes 1. Only A[17:0] are used for the MRS command.

2. See **Table 2-1.**

Remark X = "Don't Care", H = logic HIGH, L = logic LOW, A = valid address, BA = valid bank address

2.2 Description of Commands

DESEL / NOP [Note1]

The NOP command is used to perform a no operation to the μPD48288209/18/36, which essentially deselects the chip. Use the NOP command to prevent unwanted commands from being registered during idle or wait states. Operations already in progress are not affected. Output values depend on command history.

MRS

The mode register is set via the address inputs A[17:0]. See **Figure 2-5. Mode Register Bit Map** for further information. The MRS command can only be issued when all banks are idle and no bursts are in progress.

READ

The READ command is used to initiate a burst read access to a bank. The value on the BA[2:0] inputs selects the bank, and the address provided on inputs A[20:0] selects the data location within the bank.

WRITE

The WRITE command is used to initiate a burst write access to a bank. The value on the BA[2:0] inputs selects the bank, and the address provided on inputs A[20:0] selects the data location within the bank. Input data appearing on the DQ is written to the memory array subject to the DM input logic level appearing coincident with the data. If the DM signal

is registered LOW, the corresponding data will be written to memory. If the DM signal is registered HIGH, the corresponding data inputs will be ignored (i.e., this part of the data word will not be written).

AREF

The AREF is used during normal operation of the μPD48288209/18/36 to refresh the memory content of a bank. The command is non-persistent, so it must be issued each time a refresh is required. The value on the BA[2:0] inputs selects the bank. The refresh address is generated by an internal refresh controller, effectively making each address bit a "Don't Care" during the AREF command. The μPD48288209/18/36 requires 64K cycles at an average periodic interval of 0.49 μs Note2 (MAX.). To improve efficiency, eight AREF commands (one for each bank) can be posted to μPD48288209/18/36 at periodic intervals of 3.9 μs Note3.

Within a period of 32 ms, the entire memory must be refreshed. The delay between the AREF command and a subsequent command to same bank must be at least t_{RC} as continuous refresh. Other refresh strategies, such as burst refresh, are also possible.

Notes 1. When the chip is deselected, internal NOP commands are generated and no commands are accepted.

2. Actual refresh is 32 ms / 8k / 8 = 0.488 μs.

3. Actual refresh is 32 ms / 8k = 3.90 μs.

2.3 Initialization

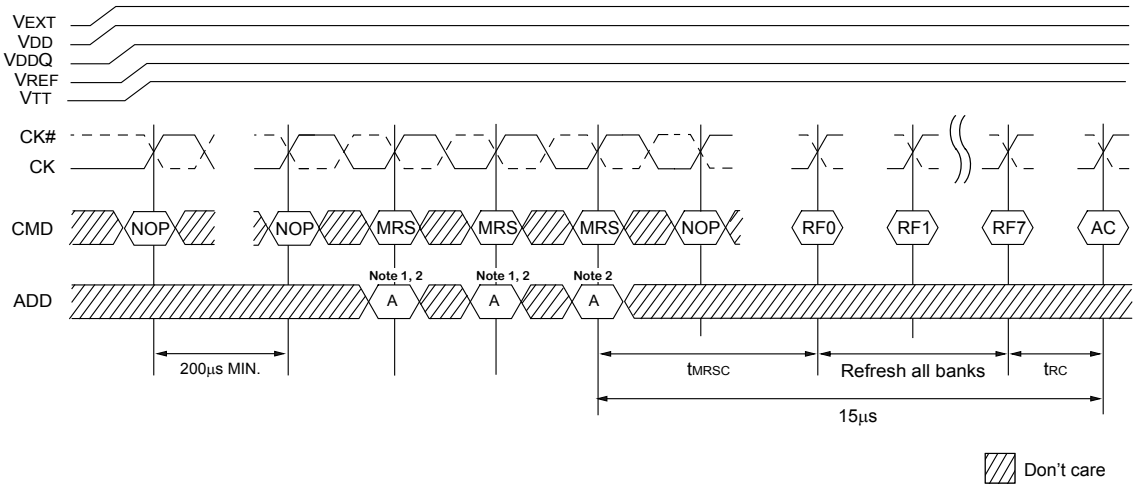
The μPD48288209/18/36 must be powered up and initialized in a predefined manner. Operational procedures other than those specified may result in undefined operations or permanent damage to the device. The following sequence is used for Power-Up:

1. Apply power (V_{EXT}, V_{DD}, $V_{DD}Q$, V_{REF}, V_{TT}) and start clock as soon as the supply voltages are stable. Apply V_{DD} and V_{EXT} before or at the same time as $V_{DD}Q$. Apply $V_{DD}Q$ before or at the same time as V_{REF} and V_{TT}. Although there is no timing relation between V_{EXT} and V_{DD}, the chip starts the power-up sequence only after both voltages are at their nominal levels. $V_{DD}Q$ supply must not be applied before V_{DD} supply. CK/CK# must meet $V_{ID(DC)}$ prior to being applied. Maintain all remaining balls in NOP conditions.

   Note No rule of apply power sequence is the design target.
2. Maintain stable conditions for 200 μs (MIN.).
3. Issue three or more back-to-back and clock consecutive MRS commands: two dummies plus one valid MRS. It is recommended that the dummy MRS commands are the same value as the desired MRS.
4. t_{MRSC} after valid MRS, an AUTO REFRESH command to all 8 banks must be issued and wait for 15 μs with CK/CK# toggling in order to lock the PLL prior to normal operation.
5. After t_{RC}, the chip is ready for normal operation.

2.4 Power-On Sequence

Figure 2-1. Power-Up Sequence



Notes 1. Recommended all address pins held LOW during dummy MRS commands.

2. A10-A17 must be LOW.

Remark MRS: MRS command
RFx: REFRESH Bank x
AC: Any command

2.5 Programmable Impedance Output Buffer

The μPD48288209/18/36 is equipped with programmable impedance output buffers. This allows a user to match the driver impedance to the system. To adjust the impedance, an external precision resistor (RQ) is connected between the ZQ ball and V_{SS}. The value of the resistor must be five times the desired impedance. For example, a 300 Ω resistor is required for an output impedance of 60 Ω. To ensure that output impedance is one fifth the value of RQ (within 15 percent), the range of RQ is 125 Ω to 300 Ω. Output impedance updates may be required because, over time, variations may occur in supply voltage and temperature. The device samples the value of RQ. An impedance update is transparent to the system and does not affect device operation. All data sheet timing and current specifications are met during an update.

2.6 PLL Reset

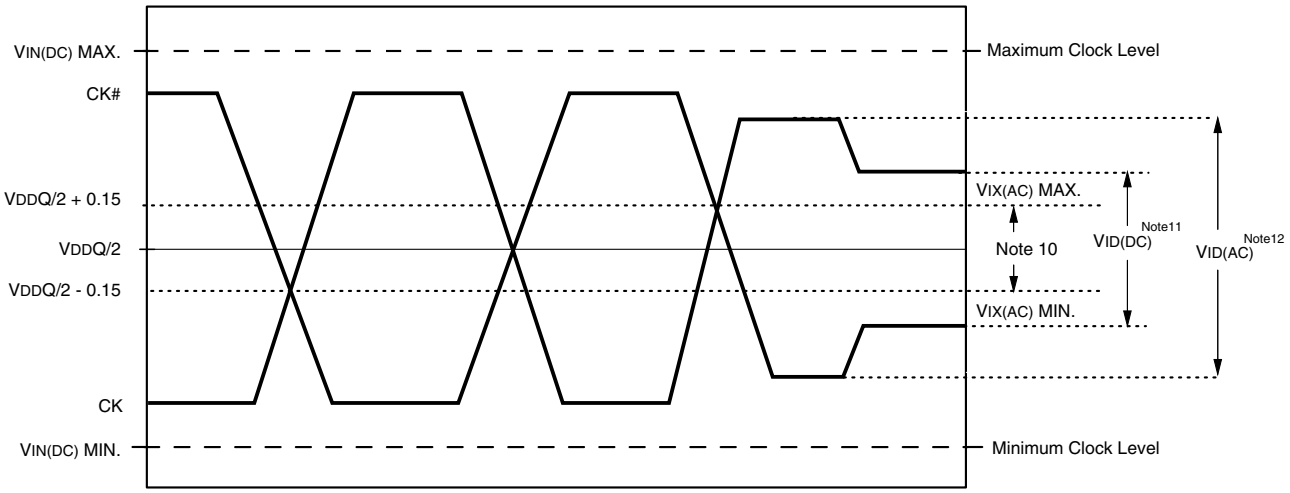
The μPD48288209/18/36 utilizes internal Phase-locked loops for maximum output, data valid windows. It can be placed into a stopped-clock state to minimize power with a modest restart time of 15 μs. The clock (CK/CK#) must be toggled for 15 μs in order to stabilize PLL circuits for next READ operation.

2.7 Clock Input

Table 2-3. Clock Input Operation Conditions

Parameter	Symbol	Conditions	MIN.	MAX.	Unit	Note
Clock Input Voltage Level	$V_{IN\ (DC)}$	CK and CK#	-0.3	$V_{DD}Q$ + 0.3	V	
Clock Input Differential Voltage Level	$V_{ID\ (DC)}$	CK and CK#	0.2	$V_{DD}Q$ + 0.6	V	8
Clock Input Differential Voltage Level	$V_{ID\ (AC)}$	CK and CK#	0.4	$V_{DD}Q$ + 0.6	V	8
Clock Input Crossing Point Voltage Level	$V_{IX\ (AC)}$	CK and CK#	$V_{DD}Q$/2 - 0.15	$V_{DD}Q$/2 + 0.15	V	9

Figure 2-2. Clock Input



Notes 1. DKx and DKx# have the same requirements as CK and CK#.

2. All voltages referenced to V_{SS}.

3. Tests for AC timing, IDD and electrical AC and DC characteristics may be conducted at normal reference/supply voltage levels; but the related specifications and device operations are tested for the full voltage range specified.

4. AC timing and IDD tests may use a V_{IL} to V_{IH} swing of up to 1.5 V in the test environment, but input timing is still referenced to V_{REF} (or the crossing point for CK/CK#), and parameters specifications are tested for the specified AC input levels under normal use conditions. The minimum slew rate for the input signals used to test the device is 2V/ns in the range between $V_{IL(AC)}$ and $V_{IH(AC)}$.

5. The AC and DC input level specifications are as defined in the HSTL Standard (i.e. the receiver will effectively switch as a result of the signal crossing the AC input level, and will remain in that state as long as the signal does not ring back above[below] the DC input LOW[HIGH] level).

6. The CK/CK# input reference level (for timing referenced to CK/CK#) is the point at which CK and CK# cross. The input reference level for signal other than CK/CK# is V_{REF}.

7. CK and CK# input slew rate must be >= 2V/ns (>=4V/ns if measured differentially).

8. V_{ID} is the magnitude of the difference between the input level on CK and input level on CK#.

9. The value of V_{IX} is expected to equal $V_{DD}Q/2$ of the transmitting device and must track variations in the DC level of the same.

10. CK and CK# must cross within the region.

11. CK and CK# must meet at least $V_{ID(DC)}$ (MIN.) when static and centered around $V_{DD}Q/2$.

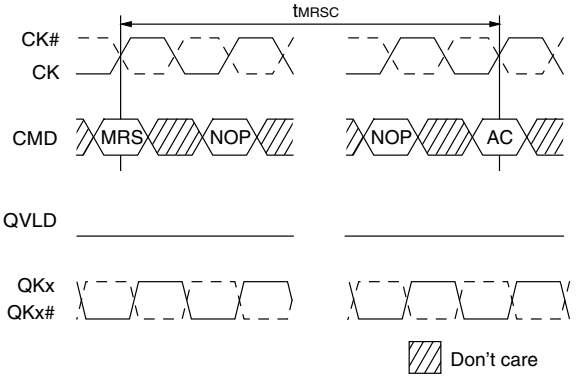
12. Minimum peak-to-peak swing.

2.8 Mode Register Set Command (MRS)

The mode register stores the data for controlling the operating modes of the memory. It programs the μPD48288209/18/36 configuration, burst length, and I/O options. During a MRS command, the address inputs A[17:0] are sampled and stored in the mode register. t_{MRSC} must be met before any command can be issued to the μPD48288209/18/36. The mode register may be set at any time during device operation. However, any pending operations are not guaranteed to successfully complete.

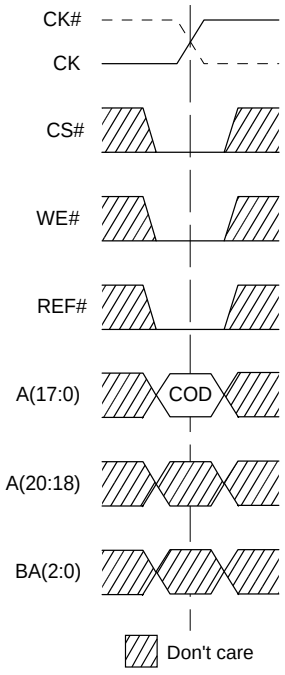
Since MRS is used for internal test mode entry, the designated bit at **Figure 2-5. Mode Register Bit Map** and **Figure 2-27. Mode Register Set Command in Multiplexed Address Mode** should be set.

Figure 2-3. Mode Register Set Timing



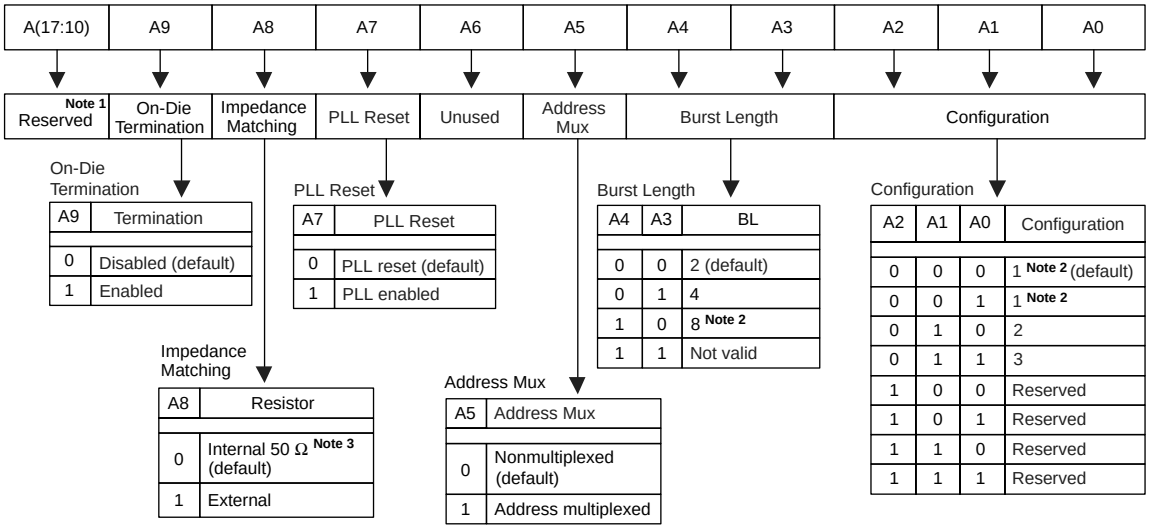
Remark MRS: MRS command
AC: any command

Figure 2-4. Mode Register Set



Remark COD: code to be loaded into the register.

Figure 2-5. Mode Register Bit Map



Notes 1. Bits A[17:10] must be set to all '0'. A18-An are "Don't Care".

2. BL=8 is not available for configuration 1.

3. ±15% temperature variation.

2.9 Read & Write configuration (Non Multiplexed Address Mode)

Table 2-4 shows, for different operating frequencies, the different μPD48288209/18/36 configurations that can be programmed into the mode register. The READ and WRITE latency (t_{RL} and t_{WL}) values along with the row cycle times (t_{RC}) are shown in clock cycles as well as in nanoseconds. The shaded areas correspond to configurations that are not allowed.

Table 2-4. Configuration Table

Frequency	Symbol	Configuration			Unit
		1 Note	2	3	
	t_{RC}	4	6	8	Cycles
	t_{RL}	4	6	8	Cycles
	t_{WL}	5	7	9	Cycles
400MHz	t_{RC}			20.0	ns
	t_{RL}			20.0	ns
	t_{WL}			22.5	ns
300MHz	t_{RC}		20.0	26.7	ns
	t_{RL}		20.0	26.7	ns
	t_{WL}		23.3	30.0	ns
200MHz	t_{RC}	20.0	30.0	40.0	ns
	t_{RL}	20.0	30.0	40.0	ns
	t_{WL}	25.0	35.0	45.0	ns

Note BL=8 is not available for configuration 1.

2.10 Write Operation (WRITE)

Write accesses are initiated with a WRITE command, as shown in **Figure 2-6**. Row and bank addresses are provided together with the WRITE command. During WRITE commands, data will be registered at both edges of DK according to the programmed burst length (BL). A WRITE latency (WL) one cycle longer than the programmed READ latency (RL + 1) is present, with the first valid data registered at the first rising DK edge WL cycles after the WRITE command.

Any WRITE burst may be followed by a subsequent READ command. **Figure 2-10. WRITE Followed By READ: BL=2, RL=4, WL=5, Configuration 1** and **Figure 2-11. WRITE Followed By READ: BL=4, RL=4, WL=5, Configuration 1** illustrate the timing requirements for a WRITE followed by a READ for bursts of two and four, respectively.

Setup and hold times for incoming input data relative to the DK edges are specified as t_{DS} and t_{DH}. The input data is masked if the corresponding DM signal is HIGH. The setup and hold times for data mask are also t_{DS} and t_{DH}.

RD: READ
Qxy : Data y from bank x
RL: READ latency

2.11 Read Operation (READ)

Read accesses are initiated with a READ command, as shown in **Figure 2-12**. Row and bank addresses are provided with the READ command.

During READ bursts, the memory device drives the read data edge-aligned with the QK signal. After a programmable READ latency, data is available at the outputs. The data valid signal indicates that valid data will be present in the next half clock cycle.

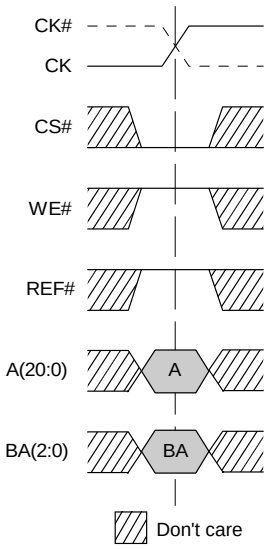
The skew between QK and the crossing point of CK is specified as t_{CKQK}. t_{QKQ0} is the skew between QK0 and the last valid data edge considered the data generated at the Q17-Q0 in x36 and Q8-Q0 in x18 data signals. t_{QKQ1} is the skew between QK1 and the last valid data edge considered the data generated at the Q35-Q18 in x36 and Q17-Q9 in x18 data signals. t_{QKQx} is derived at each QKx clock edge and is not cumulative over time.

After completion of a burst, assuming no other commands have been initiated, Q will go High-Z. Back-to-back READ commands are possible, producing a continuous flow of output data.

Minimum READ data valid window can be expressed as MIN.(t_{QKH}, t_{QKL}) – 2 x MAX.(t_{QKQx})

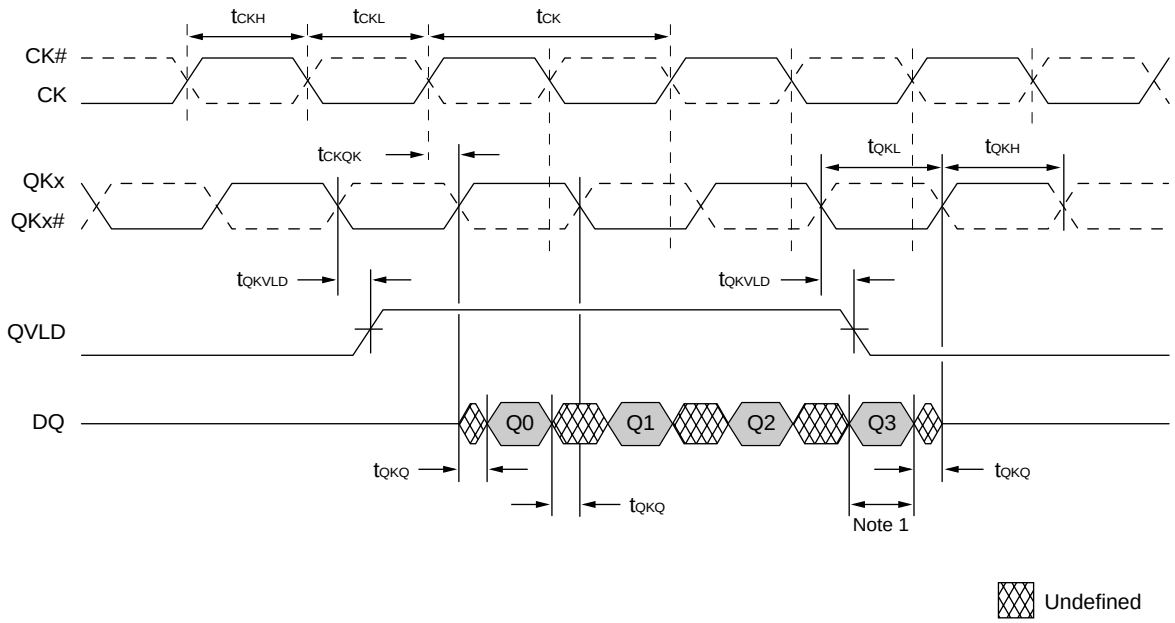
Any READ burst may be followed by a subsequent WRITE command. **Figure 2-16. READ followed by WRITE, BL=2, RL=4, WL=5, Configuration 1** and **Figure 2-17. READ followed by WRITE, BL=4, RL=4, WL=5, Configuration 1** illustrate the timing requirements for a READ followed by a WRITE.

Figure 2-12. READ Command



Remark A: Address
BA: Bank address

Figure 2-13. Basic READ Burst Timing



Note 1. Minimum READ data valid window can be expressed as MIN.(t_{QKH}, t_{QKL}) – 2 x MAX.(t_{QKQx})
t_{CKH} and t_{CKL} are recommended to have 50% / 50% duty.

Remarks 1. t_{QKQ0} is referenced to DQ17-DQ0 in x36 and DQ8-DQ0 in x18.
t_{QKQ1} is referenced to DQ35-DQ18 in x36 and DQ17-DQ9 in x18.

2. t_{QKQ} takes into account the skew between any QKx and any DQ.

3. t_{CKQK} is specified as CK rising edge to QK rising edge.

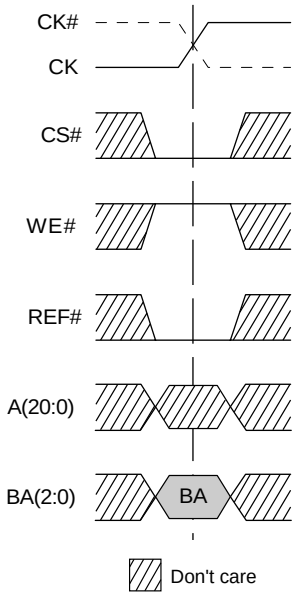
Qxy : Data y from bank x
RL: READ latency

2.12 Refresh Operation: AUTO REFRESH Command (AREF)

AREF is used to perform a REFRESH cycle on one row in a specific bank. The row addresses are generated by an internal refresh counter; external address balls are “Don’t Care.” The delay between the AREF command and a subsequent command to the same bank must be at least t_{RC}.

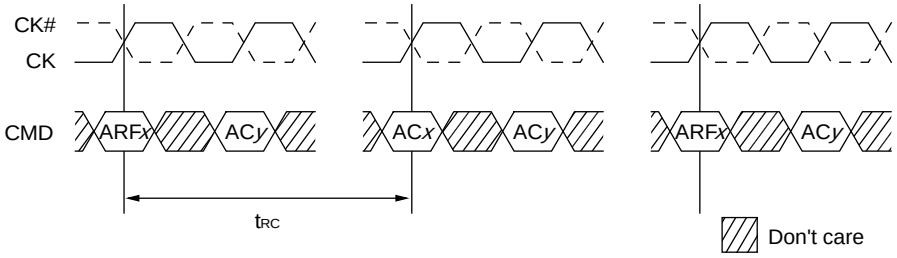
Within a period of 32 ms (t_{REF}), the entire memory must be refreshed. **Figure 2-19** illustrates an example of a continuous refresh sequence. Other refresh strategies, such as burst refresh, are also possible.

Figure 2-18. AUTO REFRESH Command



Remark BA: Bank address

Figure 2-19. AUTO REFRESH Cycle



Remarks 1. ACx: Any command on bank x
ARFx: Auto refresh bank x
ACy: Any command on different bank.

2. t_{RC} is configuration-dependent. Refer to **Table 2-4. Configuration Table**.

2.13 On-Die Termination

On-die termination (ODT) is enabled by setting A9 to "1" during an MRS command. With ODT on, all the DQs and DM are terminated to V_{TT} with a resistance R_{TT}. The command, address, and clock signals are not terminated. **Figure 2-20** below shows the equivalent circuit of a DQ receiver with ODT. ODTs are dynamically switched off during READ commands and are designed to be off prior to the μPD48288209/18/36 driving the bus. Similarly, ODTs are designed to switch on after the μPD48288209/18/36 has issued the last piece of data.

Table 2-5. On-Die Termination DC Parameters

Description	Symbol	MIN.	MAX.	Units	Note
Termination voltage	V_{TT}	0.95 x V_{REF}	1.05 x V_{REF}	V	1, 2
On-Die termination	R_{TT}	125	185	Ω	3

Notes 1. All voltages referenced to V_{SS} (GND).

2. V_{TT} is expected to be set equal to V_{REF} and must track variations in the DC level of V_{REF}.

3. The R_{TT} value is measured at 95°C T_C.

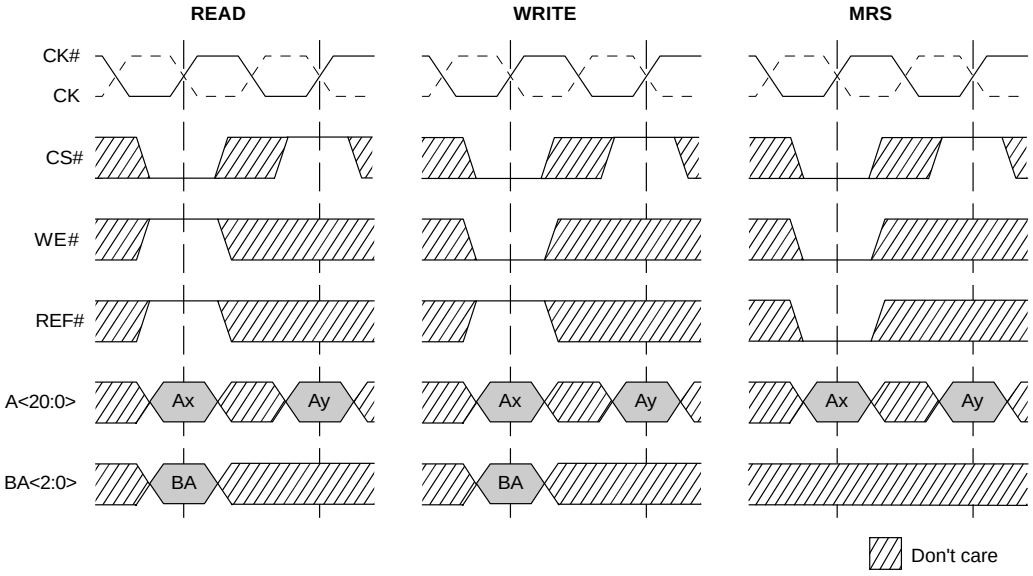
2.14 Operation with Multiplexed Address

In multiplexed address mode, the address can be provided to the μPD48288209/18/36 in two parts that are latched into the memory with two consecutive rising clock edges. This provides the advantage that a maximum of 11 address balls are required to control the μPD48288209/18/36, reducing the number of balls on the controller side. The data bus efficiency in continuous burst mode is not affected for BL=4 and BL=8 since at least two clocks are required to read the data out of the memory. The bank addresses are delivered to the μPD48288209/18/36 at the same time as the write command and the first address part, Ax.

This option is available by setting bit A5 to “1” in the mode register. Once this bit is set, the READ, WRITE, and MRS commands follow the format described in **Figure 2-26**. See **Figure 2-28. Power-Up Sequence in Multiplexed Address Mode** for the power-up sequence.

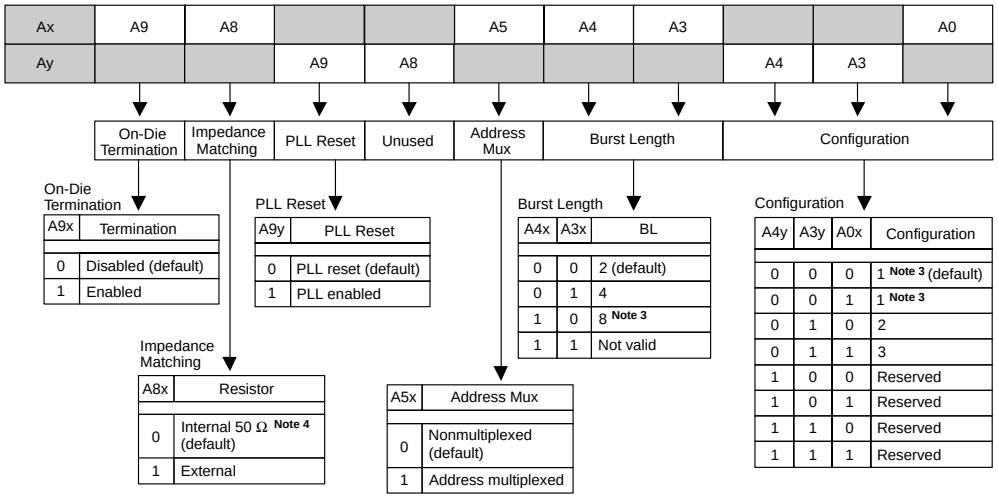
Figure 2-26. Command Description in Multiplexed



Remarks 1. Ax: Ay: Address
BA: Bank Address

2. The minimum setup and hold times of the two address parts are defined t_{AS} and t_{AH}.

Figure 2-27. Mode Register Set Command in Multiplexed Address Mode



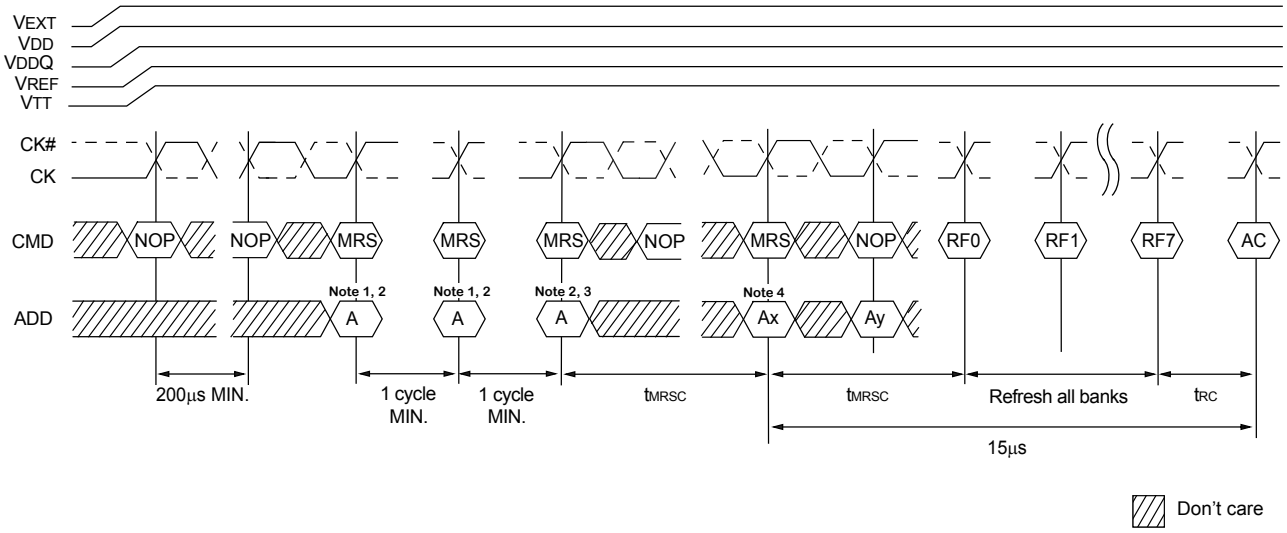
Notes 1. The address A0, A3, A4, A5, A8, and A9 must be set as follows in order to activate the mode register in the multiplexed address mode.

2. Bits A[17:10] must be set to all '0'.

3. BL=8 is not available for configuration 1.

4. ±15% temperature variation.

Figure 2-28. Power-Up Sequence in Multiplexed Address Mode



Notes 1. Recommended all address pins held LOW during dummy MRS command.

2. A10-A17 must be LOW.

3. Address A5 must be set HIGH (muxed address mode setting when μPD48288209/18/36 is in normal mode of operation).

4. Address A5 must be set HIGH (muxed address mode setting when μPD48288209/18/36 is already in muxed address mode).

Remark MRS: MRS command
RFx: REFRESH Bank x
AC: any command

2.15 Address Mapping in Multiplexed Mode

The address mapping is described in **Table 2-6** as a function of data width and burst length.

Table 2-6. Address Mapping in Multiplexed Address Mode

Data Width	Burst Length	Ball	Address										
			A0 Note 1	A3	A4	A5 Note 2	A8	A9	A10	A13	A14	A17	A18
X36	BL=2	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	A18
		Ay	X	A1	A2	X	A6	A7	X	A11	A12	A16	A15
	BL=4	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	X
		Ay	X	A1	A2	X	A6	A7	X	A11	A12	A16	A15
X18	BL=2	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	A18
		Ay	X	A1	A2	X	A6	A7	A19	A11	A12	A16	A15
	BL=4	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	A18
		Ay	X	A1	A2	X	A6	A7	X	A11	A12	A16	A15
	BL=8	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	X
		Ay	X	A1	A2	X	A6	A7	X	A11	A12	A16	A15

		Ay	A20	A1	A2	X	A6	A7	A19	A11	A12	A16	A15
	BL=4	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	A18
		Ay	X	A1	A2	X	A6	A7	A19	A11	A12	A16	A15
	BL=8	Ax	A0	A3	A4	A5	A8	A9	A10	A13	A14	A17	A18
		Ay	X	A1	A2	X	A6	A7	X	A11	A12	A16	A15

Notes 1. Reserved for A20 expansion in multiplexed mode.

2. Reserved for A21 expansion in multiplexed mode.

Remark X means “Don’t care”.

2.16 Read& Write configuration in Multiplexed Address Mode

In multiplexed address mode, the read and write latencies are increased by one clock cycle. The μPD48288209/18/36 cycle time remains the same, as described in **Table 2-7**.

Table 2-7. Configuration in Multiplexed Address Mode

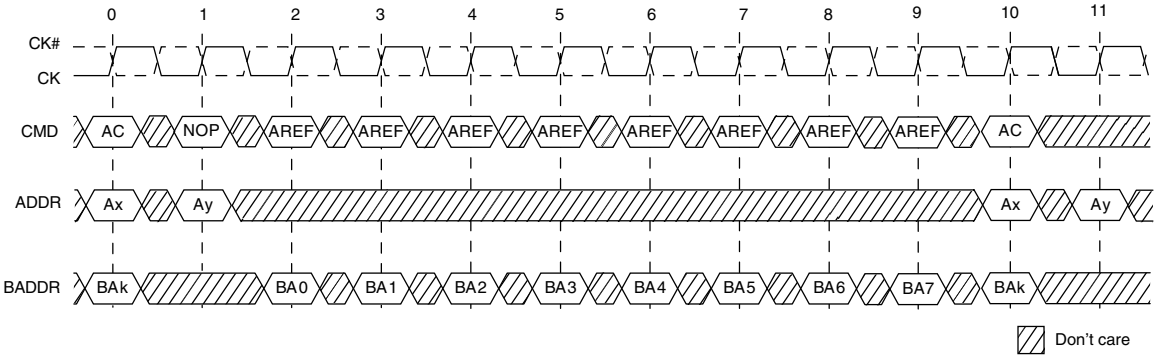
Frequency	Symbol	Configuration			Unit
		1 [Note]	2	3	
	t_{RC}	4	6	8	Cycles
	t_{RL}	5	7	9	Cycles
	t_{WL}	6	8	10	Cycles
400MHz	t_{RC}			20.0	ns
	t_{RL}			22.5	ns
	t_{WL}			25.0	ns
300MHz	t_{RC}		20.0	26.7	ns
	t_{RL}		23.3	30.0	ns
	t_{WL}		26.7	33.3	ns
200MHz	t_{RC}	20.0	30.0	40.0	ns
	t_{RL}	25.0	35.0	45.0	ns
	t_{WL}	30.0	40.0	50.0	ns

Note BL=8 is not available for configuration 1.

2.17 Refresh Command in Multiplexed Address Mode

Similar to other commands, the refresh command is executed on the next rising clock edge when in the multiplexed address mode. However, since only bank address is required for AREF, the next command can be applied on the following clock. The operation of the AREF command and any other command is represented in **Figure 2-29**.

Figure 2-29. Burst REFRESH Operation



Remark AREF: AUTO REFRESH
AC: Any command
Ax: First part Ax of address
Ay: Second part Ay of address
BAk: Bank k: k is chosen so that t_{RC} is met.

Figure 2-30. WRITE Burst Basic Sequence: BL=4, with Multiplexed Addresses, Configuration 1

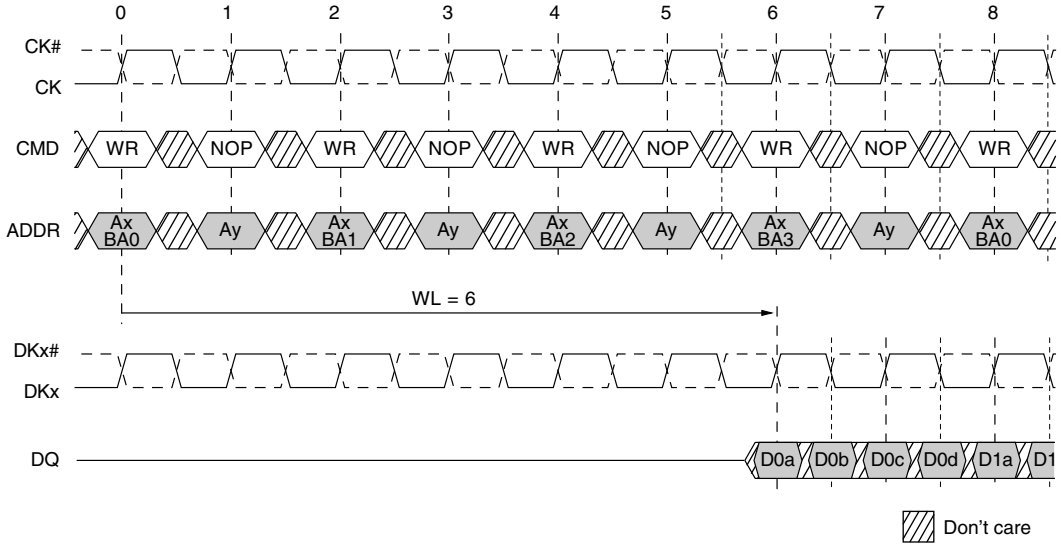


Figure 2-31. READ Burst Basic Sequence: BL=4, with Multiplexed Addresses, Configuration 1, RL=5

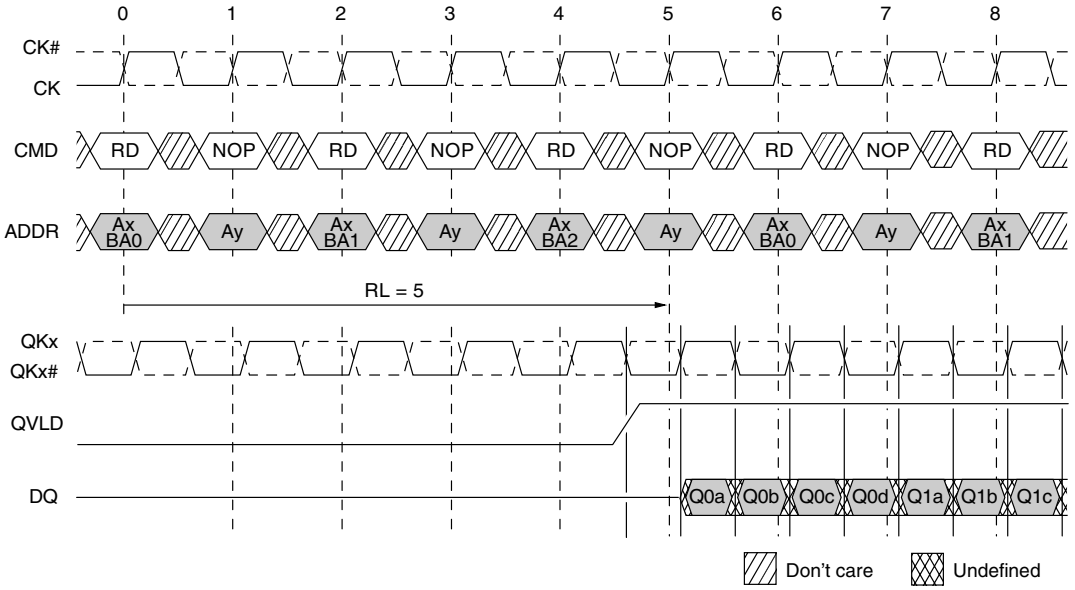

Remark Ax/BAk: Address Ax of bank k
Ay: Address Ay of bank k
WR: WRITE
Djk: Data k to bank j
WL: WRITE latency
RD: READ
RL: READ latency

3. JTAG Specification

These products support a limited set of JTAG functions as in IEEE standard 1149.1.

Table 3-1. Test Access Port (TAP) Pins

Pin name	Pin assignments	Description
TCK	12A	Test Clock Input. All input are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	11A	Test Mode Select. This is the command input for the TAP controller state machine.
TDI	12V	Test Data Input. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP controller state machine and the instruction that is currently loaded in the TAP instruction.
TDO	11V	Test Data Output. This is the output side of the serial registers placed between TDI and TDO. Output changes in response to the falling edge of TCK.

Remark The device does not have TRST (TAP reset). The Test-Logic Reset state is entered while TMS is held HIGH for five rising edges of TCK. The TAP controller state is also reset on the POWER-UP.

Table 3-2. JTAG DC Characteristics ($0°C \leq T_C \leq 95°C$, $1.7\ V \leq V_{DD} \leq 1.9\ V$, unless otherwise noted)

Parameter	Symbol	Conditions	MIN.	MAX.	Unit

Output time						
TCK LOW to TDO unknown	t_{TLOX}		0		ns	
TCK LOW to TDO valid	t_{TLOV}			10	ns	
Setup time						
TMS setup time	t_{MVTH}		5		ns	
TDI valid to TCK HIGH	t_{DVTH}		5		ns	
Capture setup time	t_{CSJ}		5		ns	1
Hold time						
TMS hold time	t_{THMX}		5		ns	
TCK HIGH to TDI invalid	t_{THDX}		5		ns	
Capture hold time	t_{CHJ}		5		ns	1

Note 1. t_{CSJ} and t_{CHJ} refer to the setup and hold time requirements of latching data from the boundary scan register.

JTAG Timing Diagram

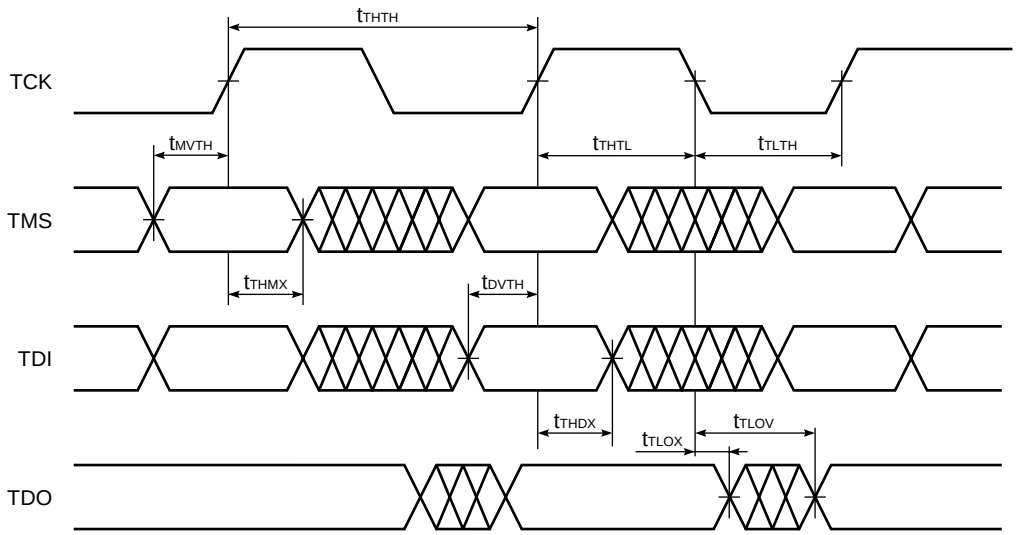

Table 3-4. Scan Register Definition (1)

Register name	Description
Instruction register	The 8 bit instruction registers hold the instructions that are executed by the TAP controller. The register can be loaded when it is placed between the TDI and TDO pins. The instruction register is automatically preloaded with the IDCODE instruction at power-up whenever the controller is placed in test-logic-reset state.
Bypass register	The bypass register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAMs TAP to another device in the scan chain with as little delay as possible. The bypass register is set LOW (V_{SS}) when the bypass instruction is executed.
ID register	The ID Register is a 32 bit register that is loaded with a device and vendor specific 32 bit code when the controller is put in capture-DR state with the IDCODE command loaded in the instruction register. The register is then placed between the TDI and TDO pins when the controller is moved into shift-DR state.
Boundary register	The boundary register, under the control of the TAP controller, is loaded with the contents of the RAMs I/O ring when the controller is in capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to shift-DR state. Several TAP instructions can be used to activate the boundary register. The Scan Exit Order tables describe which device bump connects to each boundary register location. The first column defines the bit's position in the boundary register. The second column is the name of the input or I/O at the bump and the third column is the bump number.

Table 3-5. Scan Register Definition (2)

Register name	Bit size	Unit
Instruction register	8	bit
Bypass register	1	bit
ID register	32	bit
Boundary register	113	bit

Note Any unused balls that are in the order will read as a logic “0”.

JTAG Instructions

Many different instructions (2^8) are possible with the 8-bit instruction register. All used combinations are listed in **Table 3-8**, Instruction Codes. These six instructions are described in detail below. The remaining instructions are reserved and should not be used.

The TAP controller used in this RAM is fully compliant to the 1149.1 convention. Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction once it is shifted in, the TAP controller needs to be moved into the Update-IR state.

Table 3-8

Instructions	Instruction Code [7:0]	Description
EXTEST	0000 0000	The EXTEST instruction allows circuitry external to the component package to be tested. Boundary-scan register cells at output pins are used to apply test vectors, while those at input pins capture test results. Typically, the first test vector to be applied using the EXTEST instruction will be shifted into the boundary scan register using the PRELOAD instruction. Thus, during the update-IR state of EXTEST, the output drive is turned on and the PRELOAD data is driven onto the output pins.
IDCODE	0010 0001	The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in capture-DR mode and places the ID register between the TDI and TDO pins in shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the test-logic-reset state.
SAMPLE / PRELOAD	0000 0101	SAMPLE / PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is loaded in the instruction register, moving the TAP controller into the capture-DR state loads the data in the RAMs input and Q pins into the boundary scan register. Because the RAM clock(s) are independent from the TAP clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e., in a metastable state). Although allowing the TAP to sample metastable input will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture setup plus hold time (t_{CS} plus t_{CH}). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the boundary scan register. Moving the controller to shift-DR state then places the boundary scan register between the TDI and TDO pins.
CLAMP	0000 0111	When the CLAMP instruction is loaded into the instruction register, the data driven by the output balls are determined from the values held in the boundary scan register. Selects the bypass register to be connected between TDI and TDO. Data driven by output balls are determined from values held in the boundary scan register.
High-Z	0000 0011	The High-z instruction causes the boundary scan register to be connected between the TDI and TDO. This places all RAMs outputs into a High-Z state. Selects the bypass register to be connected between TDI and TDO. All outputs are forced into high impedance state.
BYPASS	1111 1111	When the BYPASS instruction is loaded in the instruction register, the bypass register is placed between TDI and TDO. This occurs when the TAP controller is moved to the shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.
Reserved for Future Use	–	The remaining instructions are not implemented but are reserved for future use. Do not use these instructions.

5. Recommended Soldering Condition

Please consult with our sales offices for soldering conditions of these products.

Types of Surface Mount Devices

μPD48288209FF-DW1 : 144-pin TAPE FBGA (18.5 x 11)
μPD48288218FF-DW1 : 144-pin TAPE FBGA (18.5 x 11)
μPD48288236FF-DW1 : 144-pin TAPE FBGA (18.5 x 11)
μPD48288209FF-DW1-A : 144-pin TAPE FBGA (18.5 x 11)
μPD48288218FF-DW1-A : 144-pin TAPE FBGA (18.5 x 11)
μPD48288236FF-DW1-A : 144-pin TAPE FBGA (18.5 x 11)

6. Revision History

Edition/ Date	Page		Type of revision	Location	Description (Previous edition → This edition)
	This edition	Previous edition			
2nd edition/ July 2008	p.10	p.10	Addition	Absolute Maximum Ratings	Input / Output voltage
			Modification		Tj → Tj MAX.
			Addition		Note1
	p.10	p.10	Addition	Recommended	Spec of Typ.
			Deletion	DC Operating Conditions	Spec of $V_{IH(DC)}$ MAX. and $V_{IL(DC)}$ MIN.
	p.12	p.12	Modification	DC Characteristics I_{DD} /I_{SB} Operating Conditions	Spec
	pp.15-16	pp.15-16	Addition	AC Characteristics ($V_{DD}Q$=1.8V),	Spec of "$t_{JIT\ PER}$" and "$t_{JIT\ CC}$"
			Addition	AC Characteristics ($V_{DD}Q$=1.5V)	Note2
	p.16	p.16	Modification	AC Characteristics ($V_{DD}Q$=1.5V)	Spec of t_{DS} and t_{DH}
	p.17	p.17	Modification	Temperature Limits	Spec of "T_J" MIN.= "–" → "0"

[MEMO]

NOTES FOR CMOS DEVICES

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements.

Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

- The information in this document is current as of August, 2008. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".
  The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.
  "Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.
  "Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).
  "Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)
(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
