RoHS

1.1 Overview

The TLE4963-1M is a high precision Hall effect sensor with a latch characteristic and highly accurate switching thresholds for operating temperatures up to 170°C.

Characteristic	Supply Voltage	Supply Current	Sensitivity	Interface	Temperature
Bipolar Hall Effect Latch	3.0 V ~ 5.5 V	1.5 mA	High B_{OP} : 2 mT B_{RP} : -2 mT	Open Drain Output	-40°C to 170°C

Figure 1 TLE4963-1M in the PG-SOT23-3-15 package

1.2 Features

- 3.0 V to 5.5 V operating supply voltage
- Operation from regulated power supply
- Active error compensation
- High stability of magnetic thresholds
- Low jitter (typ. 0.28 μ s)
- 4 kV ESD (HBM) performance
- Small SMD package PG-SOT23-3-15

Table 1 Ordering information

Product name	Product type	Ordering code	Package
TLE4963-1M	Bipolar Hall Latch	SP000930182	PG-SOT23-3-15

Product description**1.3 Target applications**

Target applications for the TLE496x Hall Latch family are all applications which require a high precision Hall Latch with an operating temperature range from -40°C to 170°C.

The magnetic behavior as a latch and switching thresholds of typical ± 2 mT make the device especially suited for the use with a pole wheel for index counting applications, e.g. power closing and window lifter or brush less DC motors for commutation.

1.4 Product validation

Qualified for automotive applications. Product validation according to AEC-Q100.

Functional description

2 Functional description

2.1 General

The TLE4963-1M is an integrated Hall effect latch designed specifically for highly accurate applications where the sensor is connected to a regulated power supply voltage in the range of 3.0 V to 5.5 V. It provides a large operating temperature range and temperature stability of the magnetic thresholds.

2	Q	Output
3	GND	Ground

Functional description

2.4 Block diagram

Figure 3 Functional block diagram TLE4963-1M

Functional description

2.5 Functional block description

The chopped Hall IC switch comprises a Hall probe, bias generator, compensation circuits, oscillator and output transistor.

The bias generator provides currents for the Hall probe and the active circuits. Compensation circuits stabilize the temperature behavior and reduce influence of technology variations.

The active error compensation (chopping technique) rejects offsets in the signal path and the influence of mechanical stress to the Hall probe caused by molding and soldering processes and other thermal stress in the package. The chopped measurement principle together with the threshold generator and the comparator ensures highly accurate and temperature stable magnetic thresholds.

Figure 4 Timing diagram TLE4963-1M

Figure 5 Output signal TLE4963-1M

Functional description

2.6 Default start-up behavior

The magnetic thresholds exhibit a hysteresis $B_{HYS} = B_{OP} - B_{RP}$. In case of a power-on with a magnetic field B within hysteresis ($B_{OP} > B > B_{RP}$) the output of the sensor is set to the pull up voltage level (V_Q) per default. After the first crossing of B_{OP} or B_{RP} of the magnetic field the internal decision logic is set to the corresponding magnetic input value.

V_{DDA} is the internal supply voltage which is following the external supply voltage V_{DD} .

This means for $B > B_{OP}$ the output is switching, for $B < B_{RP}$ and $B_{OP} > B > B_{RP}$ the output stays at V_Q .

Figure 6 Start-up behavior of the TLE4963-1M

Specification**3 Specification****3.1 Application circuit**

The following **Figure 7** shows one option of an application circuit.

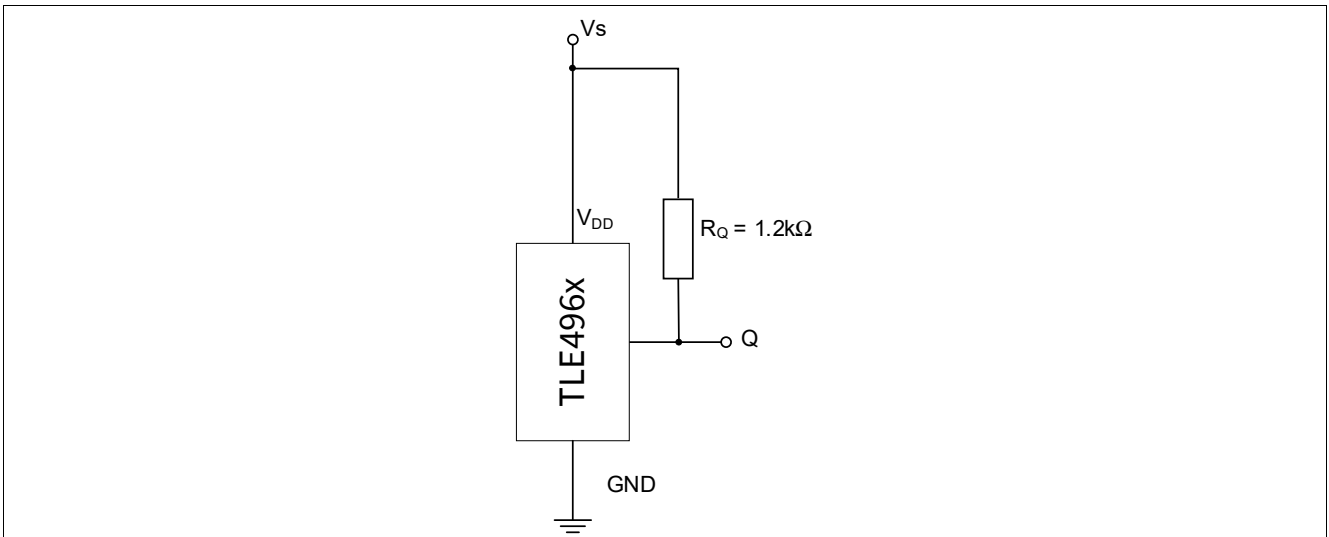

Figure 7 Application circuit

Specification

3.2 Absolute maximum ratings

Table 3 Absolute maximum rating parameters

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply voltage ¹⁾	V_{DD}	-0.3	–	6	V	–
Output voltage	V_Q	-0.5	–	6	V	–
Junction temperature ¹⁾	T_J	-40	–	155 165 175 195	°C	for 2000h (not additive) for 1000h (not additive) for 168h (not additive) for 3 x 1h (additive)
Thermal resistance Junction ambient	R_{thJA}	–	–	300	K/W	for PG-SOT23-3-15 (2s2p)
Thermal resistance Junction lead	R_{thJL}	–	–	100	K/W	for PG-SOT23-3-15

1) This lifetime statement is an anticipation based on an extrapolation of Infineon's qualification test results. The actual lifetime of a component depends on its form of application and type of use etc. and may deviate from such statement. The lifetime statement shall in no event extend the agreed warranty period.

Attention: Stresses above the max. values listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Maximum ratings are absolute ratings; exceeding only one of these values may cause irreversible damage to the integrated circuit.

Calculation of the dissipated power P_{DIS} and junction temperature T_J of the chip (SOT23 example):

e.g. for: $V_{DD} = 5\text{ V}$, $I_S = 2\text{ mA}$, $V_{QSAT} = 0.5\text{ V}$, $I_Q = 1\text{ mA}$

Power dissipation: $P_{DIS} = 5\text{ V} \times 2\text{ mA} + 0.5\text{ V} \times 1\text{ mA} = 10\text{ mW} + 0.5\text{ mW} = 10.5\text{ mW}$

Temperature $\Delta T = R_{thJA} \times P_{DIS} = 300\text{ K/W} \times 10.5\text{ mW} = 3.15\text{ K}$

For $T_A = 150^\circ\text{C}$: $T_J = T_A + \Delta T = 150^\circ\text{C} + 3.15\text{ K} = 153.15^\circ\text{C}$

Specification

Table 4 ESD protection¹⁾ ($T_A = 25^\circ\text{C}$)

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
ESD voltage (HBM) ²⁾	V_{ESD}	-4	-	4	kV	$R = 1.5 \text{ k}\Omega, C = 100 \text{ pF}$
ESD voltage (CDM) ³⁾	V_{ESD}	-1	-	1	kV	-

1) Characterization of ESD is carried out on a sample basis, not subject to production test.

2) Human Body Model (HBM) tests according to ANSI/ESDA/JEDEC JS-001.

3) Charge device model (CDM) tests according to JESD22-C101.

3.3 Operating range

The following operating conditions must not be exceeded in order to ensure correct operation of the TLE4963-1M.

All parameters specified in the following sections refer to these operating conditions unless otherwise mentioned.

The maximum tested magnetic field is 600 mT.

Table 5 Operating conditions parameters

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply voltage	V_{DD}	3.0	-	5.5	V	-
Output voltage	V_{Q}	-0.3	-	5.5	V	-
Junction temperature	T_{J}	-40	-	170	$^\circ\text{C}$	-
Output current	I_{Q}	0	-	5	mA	-
Magnetic signal input frequency ¹⁾	f_{SW}	0	-	10	kHz	-

1) For operation at the maximum switching frequency the magnetic input signal must be 1.4 times higher than for static fields. This is due to the -3 dB corner frequency of the internal low-pass filter in the signal path.

Specification

3.4 Electrical and magnetic characteristics

Product characteristics involve the spread of values guaranteed within the specified voltage and ambient temperature range. Typical characteristics are the median of the production and correspond to $V_{DD} = 5\text{ V}$ and $T_A = 25^\circ\text{C}$. The below listed specification is valid in combination with the application circuit shown in [Figure 7](#).

Table 6 General electrical characteristics

Parameter	Symbol	Values			Unit	Note or Test Condition
		Min.	Typ.	Max.		
Supply current	I_S	1.1	1.5	2.5	mA	–
Reverse current ¹⁾	I_{SR}	–	–	2.5	mA	for $V_{DD} = -0.3\text{ V}$ and 170°C
Output saturation voltage	V_{QSAT}	–	0.2	0.5	V	$I_Q = 5\text{ mA}$
Output leakage current	I_{QLEAK}	–	–	10	μA	–
Output fall time ¹⁾	t_f	0.17	0.24	1	μs	1.2 k Ω / 50 pF, see Figure 4
Output rise time ¹⁾	t_r	0.4	0.5	1	μs	1.2 k Ω / 50 pF, see Figure 4
Output jitter ¹⁾²⁾	t_{QJ}	–	0.28	1	μs	for square wave signal with 1 kHz
Delay time ¹⁾³⁾	t_d	11.5	15	30	μs	see Figure 4
Power-on time ¹⁾⁴⁾	t_{PON}	–	50	100	μs	$V_{DD} = 3\text{ V}$, $B \leq B_{RP} - 0.5\text{ mT}$ or $B \geq B_{OP} + 0.5\text{ mT}$
Chopper frequency ¹⁾	f_{OSC}	–	350		kHz	–

- 1) Not subject to production test, verified by design/characterization.
- 2) Output jitter is the 1σ value of the output switching distribution.
- 3) Systematic delay between magnetic threshold reached and output switching.
- 4) Time from applying $V_{DD} = 3.0\text{ V}$ to the sensor until the output is valid.

Specification

Table 7 Magnetic characteristics

Parameter	Symbol	T (°C)	Values			Unit	Note / Test Condition
			Min.	Typ.	Max.		
Operating point	B_{OP}	-40	0.6	2.2	3.7	mT	-
		25	0.5	2.0	3.5		
		170	0.2	1.6	3.1		
Release point	B_{RP}	-40	-3.7	-2.2	-0.6	mT	-
		25	-3.5	-2.0	-0.5		
		170	-3.1	-1.6	-0.2		
Hysteresis	B_{HYS}	-40	2.8	4.4	5.7	mT	-
		25	2.6	4.0	5.4		
		170	2.2	3.1	4.7		
Effective noise value of the magnetic switching points ¹⁾²⁾	B_{Neff}	25	-	39	-	μT	-
Temperature compensation of magnetic thresholds ²⁾	T_C	-	-	-1500	-	ppm/K	-

- 1) The magnetic noise is normal distributed and can be assumed as nearly independent to frequency without sampling noise or digital noise effects. The typical value represents the rms-value and corresponds therefore to a 1 σ probability of normal distribution. Consequently a 3 σ value corresponds to 0.3% probability of appearance.
- 2) Not subject to production test, verified by design/characterization.

Field direction definition

Positive magnetic fields are defined with the south pole of the magnet to the branded side of package.
