FAN7316 LCD Backlight Inverter Drive IC

Features

- High-Efficiency Single-Stage Power Conversion
- Wide Input Voltage Range: 4.5V to 24V
- Backlight Lamp Ballast and Soft Dimming
- Reduces Required External Components
- Precision Voltage Reference Trimmed to 2%
- N-N Half-Bridge Topology
- PWM Control at Fixed Frequency
- Analog and Burst Dimming Function
- Selectable Burst Dimming Polarity by ADIM Voltage
- Striking Frequency Depending on Normal Frequency
- Open-Lamp Protection
- Open-Lamp Regulation
- Short-Circuit Protection
- 20-Pin SOIC

Applications

- LCD TV
- LCD Monitor

Ordering Information

Part Number	Package	Operating Temperature	Packing Method
FAN7316M	20-SOIC	-25 to +85°C	RAIL
FAN7316MX	20-SOIC	-25 to +85°C	TAPE & REEL

All packages are lead free per JEDEC: J-STD-020B standard.

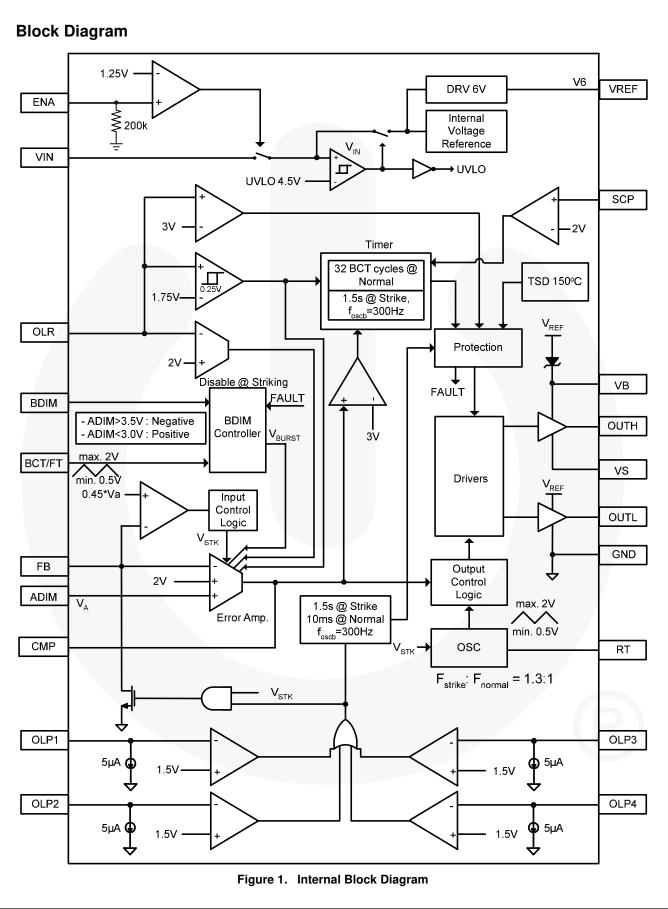

Description

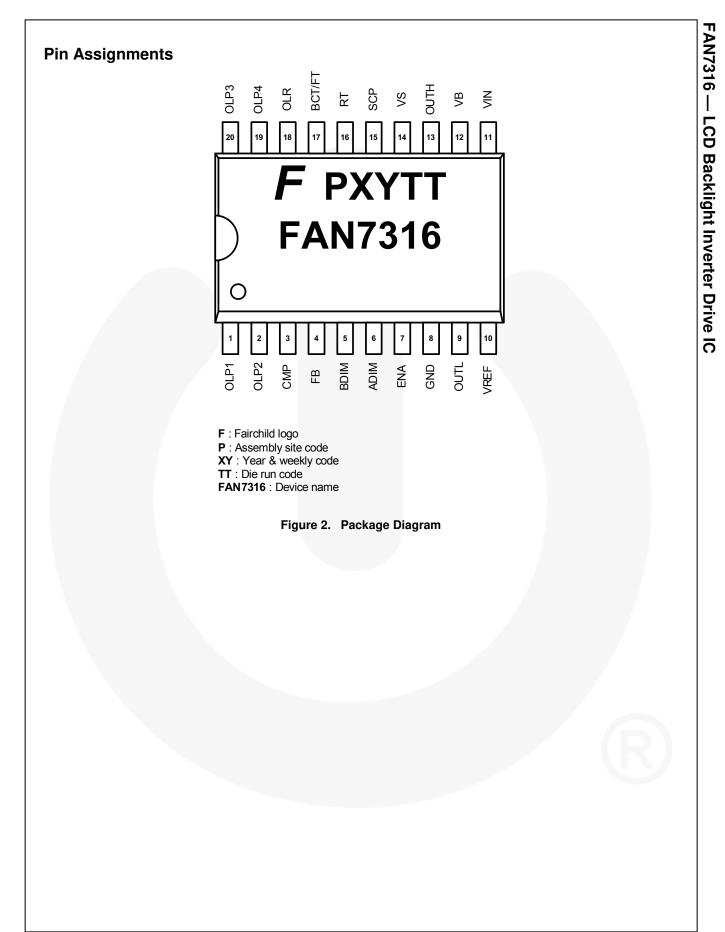

The FAN7316 is a LCD backlight inverter drive IC that controls N-N half-bridge topology. The FAN7316 can also drive push-pull topology.

The FAN7316 provides a low-cost solution by integrating the external open-lamp protection circuit. The operating voltage of the FAN7316 is wide, so the FAN7316 doesn't need an external regulator to supply the voltage to the IC. The FAN7316 has the internal bootstrap driver, so the external fast recovery diode can be avoided.

The FAN7316 provides various protections, such as open-lamp regulation, arc protection, open-lamp protection, short-circuit protection, and CMP-high protection to increase the system reliability. The FAN7316 provides analog dimming, burst dimming, and burst dimming polarity selection functions.

The FAN7316 is available in a 20-SOIC package.

Pin Definitions

Pin #	Name	Description
1	OLP1	This pin is for open-lamp protection. If OLP is lower than 1.5V at initial operation, the IC operates at striking mode for BCT 450 cycles. If OLP is lower than 1.5V in normal mode, the
2	OLP2	IC is shut down after a delay of three BCT cycles.
3	CMP	Error amplifier output. A compensation capacitor should be connected between this pin and ground.
4	FB	Error amplifier inverting input. This pin voltage is regulated at 2V or ADIM voltage.
5	BDIM	This pin is for burst dimming input. The voltage range of 0.5 to 2V at this pin controls burst mode duty cycle from 0% to 100%.
6	ADIM	This pin is for positive analog dimming input. This voltage to 2V at this pin controls the amplitude of the lamp current.
7	ENA	This pin is for turning on/off the IC.
8	GND	Ground.
9	OUTL	Low-side driver output. The output stage can deliver about 500mA source and sink current, typically.
10	VREF	6V reference voltage.
11	VIN	IC supply voltage.
12	VB	High-side floating supply. The bootstrap capacitor should be connected between this pin and VS pin, which can be fed by an internal bootstrap MOSFET.
13	OUTH	High-side driver output. The output stage can deliver about 500mA source and sink current, typically.
14	VS	High-side floating supply return. Layout care should be taken to avoid below-ground spikes on this pin.
15	SCP	This pin is for short-circuit protection. If SCP is higher than 2V, IC enters shutdown mode after a delay of 32 BCT cycles.
16	RT	This pin programs the switching frequency. The resistor should be connected between this pin and ground.
17	BCT/FT	This pin programs the burst dimming frequency. A capacitor should be connected between this pin and ground. The waveform of this pin is the triangular waveform whose amplitude is from 0.5V to 2V. This pin voltage goes up to 4V when the IC enters shutdown mode.
18	OLR	This pin is for open-lamp regulation. If the voltage at OLR reaches 2V, the IC makes this pin voltage be controlled not to exceed 2V. If OLR voltage is higher than 1.75V, the IC enters shutdown mode after delays of 451 BCT cycles in striking mode and three BCT cycles in normal mode, respectively. If this pin voltage is higher than 3V, the IC enters shutdown mode without delay.
19	OLP4	This pin is for open lamp protection. If OLP is lower than 1.5V at initial operation, the IC
20	OLP3	operates at striking mode for BCT 450 cycles. If OLP is lower than 1.5V in normal mode, the IC is shut down after a delay of three BCT cycles.

Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.

Symbol	Parameter	Min.	Max.	Unit
V _{IN}	IC Supply Voltage	4.5	24	V
V _B	High-Side Floating Supply	-0.3	33	V
Vs	High-Side Floating Supply Return	-2 ⁽³⁾	V _B -7	V
TJ	Operating Junction Temperature	-40	+150	°C
T _{STG}	Storage Temperature Range	-65	+150	°C
θ _{JA}	Thermal Resistance Junction-Air ^(1,2)		90	°C /W
PD	Power Dissipation		1.4	W

Notes:

1. Thermal resistance test board. Size: 76.2mm x 114.3mm x 1.6mm (1S0P); JEDEC standard: JESD51-2, JESD51-3.

2. Assume no ambient airflow.

Recommended Operating Ratings

The Recommended Operating Conditions table defines the conditions for actual device operation. Recommended operating conditions are specified to ensure optimal performance to the datasheet specifications. Fairchild does not recommend exceeding them or designing to absolute maximum ratings.

Symbol	Parameter	Min.	Max.	Unit
VIN	IC Supply Voltage	4.5	22	V
V _B	High-Side Floating Supply	V _S -0.3	V _S +6.5	V
Vs	High-Side Floating Supply Return	(3)	25	V
T _A	Operating Ambient Temperature	-25	+85	°C

Notes:

3. The V_S is tolerant to short negative transient spikes.

Functional Description

UVLO: The under-voltage lockout (UVLO) circuit guarantees the stable operation of the IC's control circuit by stopping and starting it as a function of the V_{IN} value. The UVLO circuit turns on the control circuit when V_{IN} exceeds 4.5V. When V_{IN} is lower than 3.9V, the IC's start-up current is less than 150µA.

ENA: Applying voltage higher than 2V to the ENA pin enables the IC. Applying voltage lower than 0.7V to the ENA pin disables the IC.

Internal Main Oscillator: The internal timing capacitor (CT), 20pF, is charged by the reference current source, which is formed by the timing resistor (RT). The RT voltage is regulated at 1.728V. The sawtooth waveform charges up to 2V. Once CT voltage is reached, the CT begins discharging down to 0.5V. Next, the CT starts charging again and a new switching cycle begins, as shown in Figure 24. The main frequency is programmed by adjusting the R_T value. The main frequency is calculated as:

$$f_{OSC} \approx \frac{2736}{R_T[K\Omega]}[KHz]$$
 (1)

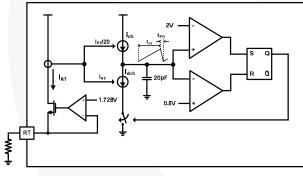

Figure 24. Main Oscillator Circuit

The striking frequency is 1.3 times as high as the main frequency.

Burst Dimming Oscillator: The burst capacitor timing (BCT) is charged by the internal reference current source. The triangular waveform charges up to 2V. Once the BCT voltage is reached, the capacitor begins discharging down to 0.5V. Next, the BCT starts charging again and a new switching cycle begins, as shown in Figure 25. The burst dimming frequency is programmed by adjusting BCT value. The burst dimming frequency is calculated as:

$$f_{OSCB} \approx \frac{3 \cdot 10^3}{BCT[nF]} [Hz]$$
(2)

To avoid visible flicker, the burst dimming frequency should be greater than 120Hz.

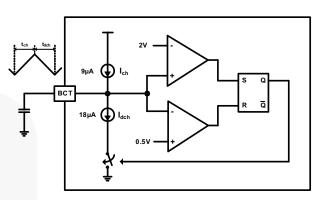

Figure 25. Burst Dimming Oscillator Circuit

Analog Dimming: There are two kinds of analog dimming polarity: positive analog dimming and negative analog dimming.

For positive analog dimming, the lamp intensity is controlled with the ADIM signal. The lamp intensity is proportional to ADIM signal; as ADIM voltage increases, the lamp intensity increases. Figure 26 shows how to implement negative analog dimming circuit and Figure 27 shows the lamp current waveform vs. DIM in positive analog dimming mode.

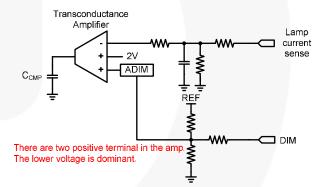

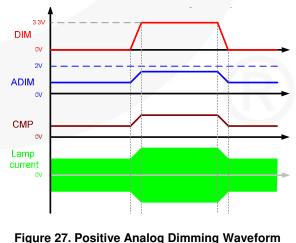

Figure 26. Positive Analog Implementation Circuit

For negative analog dimming, the lamp intensity is controlled with the external DIM signal and the resistors. The lamp intensity is inversely proportional to DIM voltage. As DIM voltage increases, the lamp intensity decreases. Figure 28 shows how to implement a negative analog dimming circuit and Figure 29 shows the lamp current waveform vs. DIM in negative analog dimming mode.

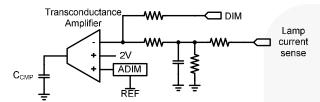

Figure 28. Negative Analog Implementation Circuit

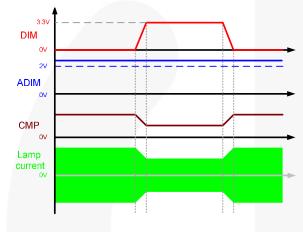

Figure 29. Negative Analog Dimming Waveform

Burst Dimming Polarity Selection: FAN7316 provides the function to select burst dimming polarity by ADIM pin voltages. If ADIM pin voltage is lower than 3V, positive burst dimming is chosen. Refer to Figure 30.

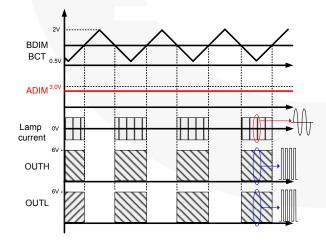

Figure 30. Positive Burst Dimming Chosen

If the ADIM pin voltage is higher than 3.5V, negative dimming polarity is chosen. Refer to Figure 31.

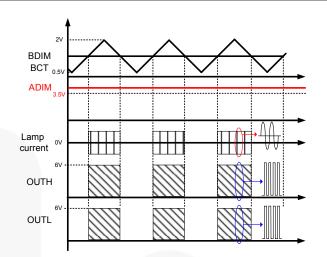

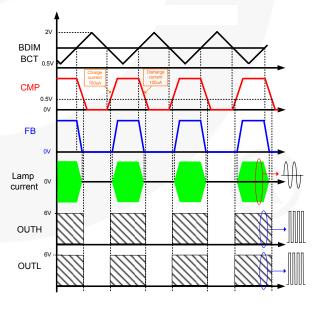

Figure 31. Negative Burst Dimming Chosen

Burst Dimming: There are also two kinds of burst dimming polarity: positive analog dimming and negative analog dimming. The lamp intensity is controlled with the BDIM voltage. By comparing the BDIM voltage with the 0.5~2V triangular waveform of burst dimming oscillator (BCT), the PWM pulse is generated. The PWM pulse controls the CMP voltage by discharging and charging the CMP capacitor.

For positive burst dimming, when BDIM voltage is higher than BCT voltage, the lamp current is turned on. So, 2V on BDIM commands full brightness. The duty cycle of the PWM pulse determines the lamp brightness. The lamp intensity is proportional to BDIM voltage. As BDIM voltage increases, the lamp intensity also increases. Figure 32 shows the lamp current waveform vs. DIM in positive analog dimming mode.

For negative burst dimming, when BDIM voltage is lower than BCT voltage, the lamp current is turned on. So, 0V on BDIM commands full brightness. The duty cycle of the PWM pulse determines the lamp brightness. The lamp intensity is inversely proportional to BDIM voltage. As BDIM voltage increases, the lamp intensity decreases. Figure 32 shows the lamp current waveform vs. DIM in negative analog dimming mode.

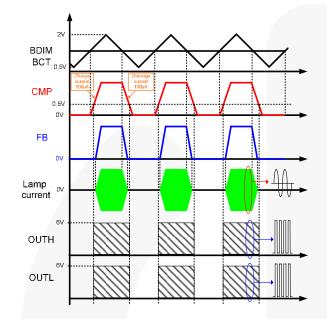

Figure 33. Positive Burst Dimming Operation

Burst dimming can be implemented by not only DC voltage, also PWM pulse as BDIM signal. Figure 34 shows how to implement burst dimming by using PWM pulse as BDIM signal.

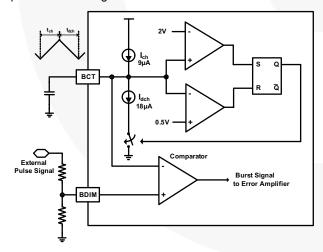

Figure 34. Burst Dimming Using an External Pulse

During striking mode, burst dimming operation is disabled to guarantee the continuous striking time. Figure 35 shows that burst dimming is disabled during striking mode.

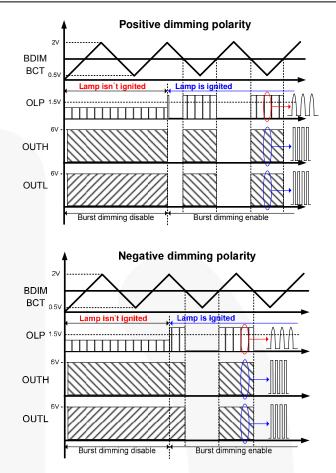

Figure 35. Burst Dimming During Striking Mode

Output Drives: FAN7316 is designed to drive high-side and low-side MOSFETs with symmetrical duty cycle. A fixed dead time of 500ns is introduced between two outputs at maximum duty cycle, as shown Figure 36.

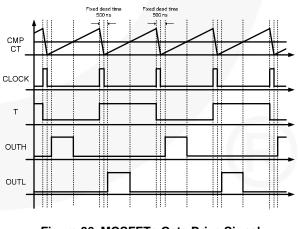

Figure 36. MOSFETs Gate Drive Signal

Bootstrap Operation: To choose the proper C_{BS} value, the external MOSFET can be seen as an equivalent capacitor. This capacitor, C_{IN} , is related to the MOSFET total gate charge as:

$$C_{IN} = \frac{Q_{GATE}}{V_{GATE}}$$
(3)

The ratio between capacitors C_{IN} and C_{BS} is proportional to the cyclical voltage loss:

$$C_{BS} >> C_{IN}$$
(4)

For example: if Q_{GATE} is 24nC and V_{GATE} is 10V, C_{IN} is 2.4nF. With $C_{\text{BS}}\text{=}100\text{nF},$ the drop is 240mV.

The bootstrap driver introduces a voltage drop due to MOSFET R_{DSON} (typical value: 100 Ω). The following equation is useful to compute the voltage drop on the bootstrap MOSFET:

$$V_{DROP} = I_{CHARGE} \bullet R_{DSON} \rightarrow V_{DROP} = \frac{Q_{GATE}}{T_{CHARGE}} \bullet R_{DSON}$$
(5)

where Q_{GATE} is the gate charge of the external MOSFET, R_{DSON} is the on resistance of the bootstrap MOSFET, and T_{CHARGE} is the charging time of the bootstrap capacitor.

For example: If Q_{GATE} is 24nC and T_{CHARGE} is 10µs, the drop on the bootstrap MOSFET is about 0.24V.

$$V_{DROP} = \frac{24nC}{10\mu s} \bullet 100\Omega = 0.24V$$
 (6)

Protections: The FAN7316 has several protections: Open-Lamp Regulation (OLR), Arc Protection, Open-Lamp Protection (OLP), Short-Circuit Protection (SCP), CMP-High Protection, and Thermal Shutdown (TSD). All protections are latch-mode protections. The latch is reset when V_{IN} falls to the UVLO voltage or ENA is pulled down to GND.

Open-Lamp Regulation: When a voltage higher than 2V is applied to the OLR pin, the IC enters regulation mode and controls CMP voltage. The IC limits the lamp voltage by decreasing CMP source current. If the OLR voltage is higher than 1.75V, CMP source current decreases from 100µA to 1.6µA. If the OLR voltage reaches at 2V, CMP source current decreases to 0µA, so CMP voltage remains constant and the lamp voltage also remains constant, as shown in Figure 37. At the same time, the counter based on BCT time starts counting 450 cycles and 32 cycles at striking mode and normal mode, respectively, then the IC enters shutdown, as shown in Figure 38 and Figure 39.

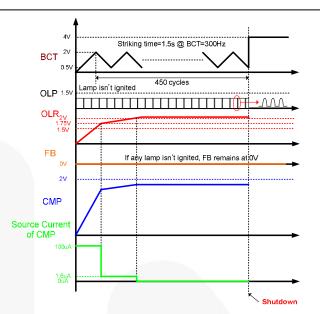

Figure 37. Open-Lamp Regulation in Striking Mode

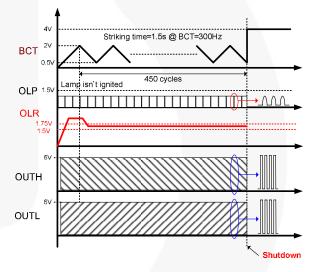

Figure 38. Open-Lamp Regulation in Striking Mode

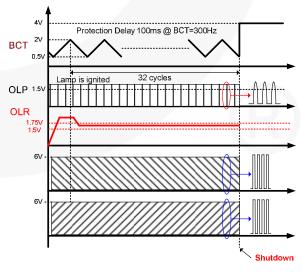

Figure 39. Open-Lamp Regulation in Normal Mode

Arc Protection: If OLR voltage is higher than 3V, the IC enters shutdown mode after a delay of two CT cycles, as shown in Figure 40.

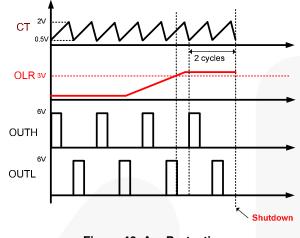

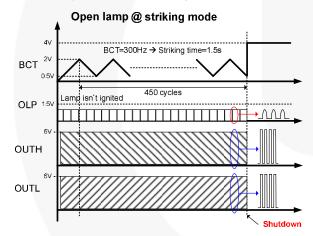

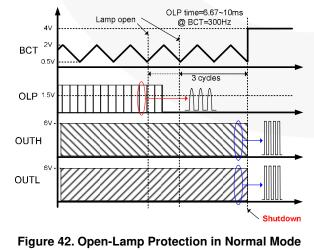

Figure 40. Arc Protection

Open-Lamp Protection: If OLP is lower than 1.5V at initial operation, the IC operates at striking mode for BCT 450 cycles, as shown in Figure 41. If OLP is lower than 1.5V at normal mode, the IC is shut down after a delay of three BCT cycles, as shown in Figure 42.

Short-Circuit Protection: If SCP is higher than 2V, the counter based on BCT time starts counting 450 cycles and 32 cycles at striking mode and normal mode, respectively, then the IC enters shutdown, as shown in Figure 43 and Figure 44.

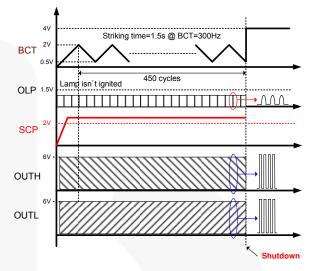

Figure 43. Short-Circuit Protection in Striking Mode

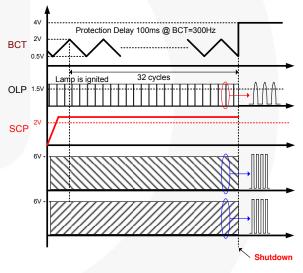

Figure 44. Short-Circuit Protection in Normal Mode

CMP-High Protection: If CMP is higher than 3V, the counter based on BCT time starts counting 450 cycles and 32 cycles at striking mode and normal mode, respectively, then the IC enters shutdown, as shown in Figure 45 and Figure 46.

CMP-High Protection: If CMP is higher than 3V, the counter based on BCT time starts counting 450 cycles and 32 cycles at striking mode and normal mode, respectively, then the IC enters shutdown, as shown in Figure 45 and Figure 46.

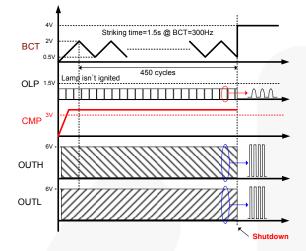

Figure 45. CMP-High Protection in Striking Mode

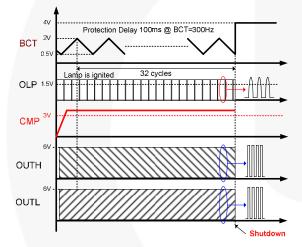

Figure 46. CMP-High Protection in Normal Mode

Thermal Shutdown: The IC provides the function to detect the abnormal over-temperature. If the IC temperature exceeds approximately 150°C, the thermal shutdown triggers.

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS. HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN, FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

PRODUCT STATUS DEFINITIONS

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

- which, (a) are intended for surgical implant into the body or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury of the user.
- 1. Life support devices or systems are devices or systems 2. A critical component in any component of a life support, device, or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

Datasheet Identification	Product Status	Definition
Advance Information	Formative or In Design	This datasheet contains the design specifications for product development. Specifications may change in any manner without notice.
Preliminary	First Production	This datasheet contains preliminary data; supplementary data will be published at a later date. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve design.
No Identification Needed	Full Production	This datasheet contains final specifications. Fairchild Semiconductor reserves the right to make changes at any time without notice to improve the design.
Obsolete	Not In Production	This datasheet contains specifications on a product that has been discontinued by Fairchild Semiconductor. The datasheet is printed for reference information only.
