

# Quad LVDS Receiver with Hysteresis

**MAX9179**

## General Description

The MAX9179 is a quad low-voltage differential signaling (LVDS) line receiver designed for applications requiring high data rates, low power dissipation, and noise immunity. The receiver accepts four LVDS input signals and translates them to 3.3V LVCMOS output levels at speeds up to 400Mbps. The receiver features built-in hysteresis, which improves noise immunity and prevents multiple switching on slow transitioning inputs.

The device supports a wide 0.038V to 2.362V common-mode input voltage range, allowing for ground potential differences and common-mode noise between the driver and the receiver. A fail-safe circuit sets the output high when the input is open, undriven and shorted, or undriven and terminated. Common enable inputs control the high-impedance outputs.

The MAX9179 has a flow-through pinout for easy PC board layout, and is pin compatible with the MAX9121 and the DS90LV048A with the additional features of high ESD tolerance and built-in hysteresis.

The MAX9179 operates from a single 3.3V supply, and is specified for operation from -40°C to +85°C. The device is offered in 16-pin TSSOP and thin QFN packages.

## Applications

- Laser Printers
- Digital Copiers
- Cell-Phone Base Stations
- Telecom Switching Equipment
- LCD Displays
- Network Switches/Routers
- Backplane Interconnect
- Clock Distribution

## Features

- ◆ Guaranteed 400Mbps Data Rate
- ◆ 50mV (typ) Hysteresis
- ◆ Overshoot/Undershoot Protection (-1.0V or V<sub>CC</sub> + 1.0V) on Enables
- ◆ IEC61000-4-2 Level 4 ESD Tolerance
- ◆ AC Specifications Guaranteed with |V<sub>IP</sub>| = 100mV
- ◆ Single 3.3V Supply
- ◆ Fail-Safe Circuit
- ◆ Flow-Through Pinout  
Simplifies PC Board Layout  
Reduces Crosstalk
- ◆ Low-Power CMOS Design
- ◆ Conforms to ANSI TIA/EIA-644 LVDS Standard
- ◆ High-Impedance Inputs when Powered Off
- ◆ Pin Compatible with the MAX9121 and the DS90LV048A
- ◆ Small Thin QFN Package Available

## Ordering Information

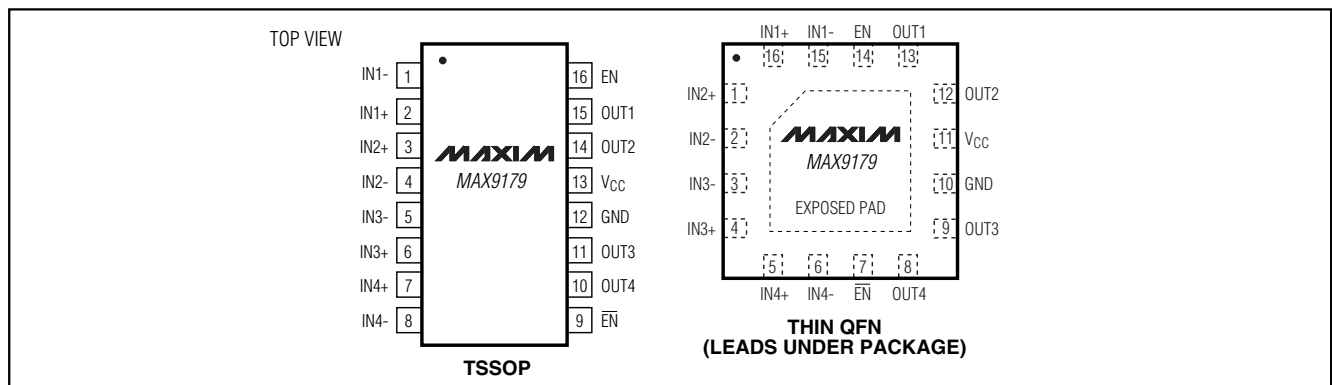

PART	TEMP RANGE	PIN-PACKAGE
MAX9179EUE	-40°C to +85°C	16 TSSOP
MAX9179ETE*	-40°C to +85°C	16 Thin QFN-EP**

\*Future product—contact factory for availability.

\*\*EP = Exposed paddle.

Z = High impedance

## Detailed Description

The LVDS is a signaling method intended for point-to-point communication over a controlled-impedance medium as defined by the ANSI TIA/EIA-644 and IEEE 1596.3 standards.

The MAX9179 is a quad LVDS line receiver with built-in hysteresis, intended for high-speed, point-to-point, low-power applications. The receiver accepts four LVDS input signals and translates them to 3.3V LVCMOS output levels at speeds up to 400Mbps over controlled-impedance media of 100Ω. The hysteresis improves noise immunity and prevents multiple switching due to noise on slow input transitions at the end of a long cable.

The receiver is capable of detecting differential signals as low as 75mV and as high as 1.2V within a 0 to 2.4V input voltage range. The 250mV to 450mV differential output of an LVDS driver is nominally centered on a 1.2V offset. This offset, coupled with the receiver's 0 to 2.4V input voltage range, allows an approximate ±1V shift in the signal (as seen by the receiver). This allows for a difference in ground references of the transmitter and the receiver, the common-mode effects of coupled noise, or both. The LVDS standards specify an input voltage range of 0 to 2.4V referenced to receiver ground.

### Hysteresis

The MAX9179 incorporates hysteresis of 50mV (typ), which rejects noise and prevents false switching during low-slew-rate transitions at the end of a long cable. The receiver typically switches at 25mV above or below  $V_{ID} = 0\text{V}$  (Figure 1). The hysteresis is designed to be symmetrical around  $V_{ID} = 0\text{V}$  for low pulse distortion (see the *Typical Operating Characteristics*).

### Input Fail-Safe

The fail-safe feature of the MAX9179 sets the output high when the differential input is:

- Open
- Undriven and shorted
- Undriven and terminated

Without a fail-safe circuit, when the input is undriven, noise at the input may switch the output and it may appear to the system that data is being sent. Open or undriven terminated input conditions can occur when a cable is disconnected or cut, or when a driver output is in high impedance. A shorted input can occur because of a cable failure.

When the input is driven with a differential signal of  $|V_{ID}| = 75\text{mV}$  to 1.2V within a voltage range of 0 to 2.4V, the fail-safe circuit is not activated. If the input is open, undriven and shorted, or undriven and terminated, an internal resistor in the fail-safe circuit pulls both inputs above  $V_{CC} - 0.3\text{V}$ , activating the fail-safe circuit and forcing the output high (Figure 2).

### Overshoot and Undershoot Voltage Protection

The MAX9179 is designed to protect the enable inputs (EN and  $\overline{\text{EN}}$ ) against latchup due to transient overshoot and undershoot voltage. If the enable input voltage goes above  $V_{CC}$  or below GND by up to 1V, an internal circuit clamps and limits input current to 1.8mA.

## Applications Information

### Power-Supply Bypassing

Bypass the  $V_{CC}$  pin with high-frequency surface-mount ceramic 0.1μF and 0.001μF capacitors in parallel as close to the device as possible, with the smaller valued capacitor closest to  $V_{CC}$ .

### Differential Traces

Input trace characteristics affect the performance of the MAX9179. Use controlled-impedance differential traces (100Ω is typical). To reduce radiated noise and ensure that noise couples as common mode, route the differential input signals within a pair close together. Reduce skew by matching the electrical length of the signal paths making up the differential pair. Excessive skew can result in a degradation of magnetic field cancellation. Maintain a constant distance between the differential traces to avoid discontinuities in differential impedance. Minimize the number of vias to further prevent impedance discontinuities.

# Quad LVDS Receiver with Hysteresis

MAX9179

## Cables and Connectors

Interconnect for LVDS typically has a controlled differential impedance of  $100\Omega$ . Use cables and connectors that have matched differential impedance to minimize impedance discontinuities. Avoid the use of unbalanced cables such as ribbon or simple coaxial cable. Balanced cables such as twisted pair offer superior signal quality and tend to generate less EMI due to magnetic field canceling effects. Balanced cables pick up noise as common mode, which is rejected by the LVDS receiver.

## Termination

The MAX9179 requires external termination resistors. The input termination resistor used on each active channel should match the differential impedance of the transmission line. Place the termination resistor as close to the MAX9179 receiver input as possible. Use 1% surface-mount resistors.

## Board Layout

Keep the LVDS input and LVCMOS output signals separated from each other to reduce crosstalk; 180 degrees of separation between LVDS inputs and LVCMOS outputs is recommended. Because there are leads on all sides, this separation requires special attention when laying out traces for the QFN package.

A four-layer printed circuit board with separate layers for power, ground, LVDS inputs, and single-ended logic signals is recommended. Separate the LVDS signals from the single-ended signals with power and ground planes for best results.

## IEC 61000-4-2 Level 4 ESD Protection

The IEC 61000-4-2 standard (Figure 7) specifies ESD tolerance for electronic systems. The IEC61000-4-2 model specifies a  $150\text{pF}$  capacitor that is discharged into the device through a  $330\Omega$  resistor. The MAX9179 LVDS inputs are rated for IEC61000-4-2 level 4 ( $\pm 8\text{kV}$  Contact Discharge and  $\pm 15\text{kV}$  Air-Gap Discharge). The Human Body Model (HBM) (Figure 8) specifies a  $100\text{pF}$  capacitor that is discharged into the device through a  $1.5\text{k}\Omega$  resistor. The IEC 61000-4-2 discharges higher peak current and more energy than the HBM due to the lower series resistance and larger capacitor.
