# BATTERY PROTECTION IC FOR 3-SERIAL TO 5-SERIAL CELL PACK

© ABLIC Inc., 2018

Rev.1.4 00

The S-8245B/D Series is a protection IC for 3-serial to 5-serial cell lithium-ion rechargeable batteries, which includes high-accuracy voltage detection circuits and delay circuits. It is suitable for protecting 3-serial to 5-serial cell lithium-ion rechargeable battery packs from overcharge, overdischarge, and overcurrent.

Connecting an NTC, it allows for the temperature detection at four different points: high temperature detection during charging, low temperature detection during charging, high temperature detection during discharging, and low temperature detection during discharging.

# Features

High-accuracy voltage detection for each cell		
Overcharge detection voltage n (n = 1 to 5):	3.550 V to 4.600 V (50 mV step)	Accuracy ±20 mV
Overcharge release voltage n (n = 1 to 5):	3.150 V to 4.600 V <sup>*1</sup>	Accuracy ±50 mV
Overdischarge detection voltage n (n = 1 to 5):	2.000 V to 3.200 V (100 mV step)	Accuracy ±80 mV
Overdischarge release voltage n (n = 1 to 5):	2.000 V to 3.400 V <sup>*2</sup>	Accuracy ±100 mV
<ul> <li>Three-level discharge overcurrent detection:</li> </ul>		
Discharge overcurrent 1 detection voltage:	0.020 V to 0.300 V (10 mV step)	Accuracy ±10 mV
Discharge overcurrent 2 detection voltage:	0.040 V to 0.500 V (20 mV step)	Accuracy $\pm 15 \text{ mV}$
Load short-circuiting detection voltage:	0.100 V to 1.000 V (25 mV step)	Accuracy ±50 mV
<ul> <li>Charge overcurrent detection:</li> </ul>		
Charge overcurrent detection voltage:	–0.300 V to –0.020 V (10 mV step)	Accuracy ±10 mV
Each delay time is settable by an external capacitor		
(Load short-circuiting detection delay time and temp	erature detection delay time are internally f	ixed)
Independent control of charge inhibition, discharge i	nhibition, and power-saving by each contro	l pin
<ul> <li>0 V battery charge function is selectable:</li> </ul>	Available, unavailable	
<ul> <li>Power-down function is selectable:</li> </ul>	Available, unavailable	
<ul> <li>CIT pin internal resistance value is selectable:</li> </ul>	831 kΩ typ., 8.31 MΩ typ.	
CO and DO pin output voltage is limited to 15 V max	k. respectively	
Switching control for 3-serial to 5-serial cell is possil	· · ·	the SEL2 pin
Temperature detection is possible at four different p		·
High temperature detection ratio during charging /		Accuracy ±0.005
Low temperature detection ratio during charging /		Accuracy ±0.005
High-withstand voltage:	Absolute maximum rating 28 V	,
Wide operation voltage range:	5 V to 24 V	
Wide operation temperature range:	Ta = -40°C to +85°C	
Low current consumption		
During operation:	20 μA max. (Ta = +25°C)	
During power-down:	$0.5 \mu\text{A}$ max. (Ta = +25°C)	
During power-saving:	$0.1 \ \mu A \ max. (Ta = +25^{\circ}C)$	
<ul> <li>Lead-free (Sn 100%), halogen-free</li> </ul>	···· -·· ······ (···· ·················	
*1. Overcharge release voltage = Overcharge detection	n voltage – Overcharge hysteresis voltage	

\*1. Overcharge release voltage = Overcharge detection voltage – Overcharge hysteresis voltage (Overcharge hysteresis voltage n (n = 1 to 5) is selectable in 0 V to 0.4 V in 50 mV step)

 \*2. Overdischarge release voltage = Overdischarge detection voltage + Overdischarge hysteresis voltage (Overdischarge hysteresis voltage n (n = 1 to 5) is selectable in 0 V to 0.7 V in 100 mV step)

# Application

Lithium-ion rechargeable battery pack

# Absolute Maximum Ratings

		Table 5							
(Ta = +25°C unless otherwise specified)									
Item	Symbol	Applied Pin	Absolute Maximum Rating	Unit					
Input voltage between VDD pin and VSS pin	V <sub>DS</sub>	VDD	$V_{\text{SS}}\!-\!0.3$ to $V_{\text{SS}}\!+\!28$	V					
Input pin voltage 1	V <sub>IN1</sub>	VC1, VC2, VC3, VC4, VC5, CCT, CDT, CIT, CIT2, CICT, SEL1, SEL2, TH, CTLC, CTLD, PSI	$V_{SS} - 0.3$ to $V_{DD} + 0.3$	v					
Input pin voltage 2	V <sub>IN2</sub>	VM, VINI	$V_{DD}$ – 28 to $V_{DD}$ + 0.3	V					
Output pin voltage 1	V <sub>OUT1</sub>	DO, PSO, VREG	$V_{\text{SS}}\!-\!0.3$ to $V_{\text{DD}}\!+\!0.3$	V					
Output pin voltage 2	V <sub>OUT2</sub>	СО	$V_{DD}$ – 28 to $V_{DD}$ + 0.3	V					
Operation ambient temperature	T <sub>opr</sub>	_	-40 to +85	°C					
Storage temperature	T <sub>stg</sub>	_	-40 to +125	°C					

Caution The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

# Thermal Resistance Value

# Test Circuits

Unless otherwise specified, for the CO pin output voltage ( $V_{CO}$ ), DO pin output voltage ( $V_{DO}$ ) and PSO pin output voltage ( $V_{PSO}$ ), "L" or "H" is judged as follows.

 $L:~[V_{CO},~V_{DO},~V_{PSO}] \leq V_{DS} \times 0.1~V$ 

 $H:~[V_{CO},~V_{DO},~V_{PSO}] > V_{DS} \times 0.1~V$ 

**Remark** V<sub>DS</sub>: Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

#### 1. Test circuit 1

#### Figure 3 Test Circuit 1

This section provides explanations of Test items using Test circuit 1. Perform each test after setting as shown in **Table 8**.

Rev.1.4\_00

#### 1.1 Overcharge detection voltage n (V<sub>CUn</sub>), overcharge release voltage n (V<sub>CLn</sub>)

When the voltage V1 is gradually increased after setting V1 = V2 = V3 = V4 = V5 =  $V_{CUn} - 0.05$  V and  $V_{CO}$  changes from "H" to "L", V1 is defined as the overcharge detection voltage 1 ( $V_{CU1}$ ). When the voltage V1 is then gradually decreased after setting V2 = V3 = V4 = V5 = 3.5 V and V15 = -5 mV and  $V_{CO}$  changes from "L" to "H", V1 is defined as the overcharge release voltage 1 ( $V_{CL1}$ ).

Overcharge detection voltage n ( $V_{CUn}$ ) and overcharge release voltage n ( $V_{CLn}$ ) (n = 2 to 5) can be determined in the same way as when n = 1.

#### 1.2 Overdischarge detection voltage n (V<sub>DLn</sub>), overdischarge release voltage n (V<sub>DUn</sub>)

When the voltage V1 is gradually decreased and  $V_{DO}$  changes from "H" to "L", V1 is defined as the overdischarge detection voltage 1 ( $V_{DL1}$ ). When the voltage V1 is then gradually increased after setting V15 = 0.1 V and  $V_{DO}$  changes from "L" to "H", V1 is defined as the overdischarge release voltage 1 ( $V_{DU1}$ ).

Overdischarge detection voltage n ( $V_{DLn}$ ) and overdischarge release voltage n ( $V_{DUn}$ ) (n = 2 to 5) can be determined in the same way as when n = 1.

#### 1.3 Discharge overcurrent 1 detection voltage (V<sub>DIOV1</sub>)

When the voltage V6 is gradually increased and  $V_{DO}$  changes from "H" to "L", V6 is defined as the discharge overcurrent 1 detection voltage ( $V_{DIOV1}$ ).

#### 1.4 Discharge overcurrent 2 detection voltage (V<sub>DIOV2</sub>)

When the voltage V6 is gradually increased after setting V10 = 0 V and SW4 to ON and  $V_{DO}$  changes from "H" to "L", V6 is defined as the discharge overcurrent 2 detection voltage ( $V_{DIOV2}$ ).

#### 1.5 Load short-circuiting detection voltage (V<sub>SHORT</sub>)

When the voltage V6 is gradually increased after setting V10 = V11 = 0 V and SW4 and SW5 to ON and  $V_{DO}$  changes from "H" to "L", V6 is defined as the load short-circuiting detection voltage (V<sub>SHORT</sub>).

#### 1. 6 Charge overcurrent detection voltage (V<sub>CIOV</sub>)

When the voltage V6 is gradually decreased and  $V_{CO}$  changes from "H" to "L", V6 is defined as the charge overcurrent detection voltage ( $V_{CIOV}$ ).

#### 1.7 CCT pin internal resistance (R<sub>CCT</sub>), CCT pin detection voltage (V<sub>CCT</sub>)

The CCT pin internal resistance ( $R_{CCT}$ ) is defined by  $R_{CCT} = V_{DS} / I_{CCT}$  under the set conditions of V1 =  $V_{CU1}$  + 0.025 V after setting V8 = 0 V and setting SW2 to ON. When the voltage V8 is then gradually increased and  $V_{CO}$  changes from "H" to "L", V8 is defined as the CCT pin detection voltage ( $V_{CCT}$ ).

#### 1.8 CDT pin internal resistance (R<sub>CDT</sub>), CDT pin detection voltage (V<sub>CDT</sub>)

The CDT pin internal resistance ( $R_{CDT}$ ) is defined by  $R_{CDT} = V_{DS} / I_{CDT}$  under the set conditions of V1 =  $V_{DL1} - 0.085$  V after setting V9 = 0 V and setting SW3 to ON. When the voltage V9 is then gradually increased and  $V_{DO}$  changes from "H" to "L", V9 is defined as the CDT pin detection voltage ( $V_{CDT}$ ).

#### 1.9 CIT pin internal resistance (R<sub>CIT</sub>), CIT pin detection voltage (V<sub>CIT</sub>)

The CIT pin internal resistance ( $R_{CIT}$ ) is defined by  $R_{CIT} = V_{DS} / I_{CIT}$  under the set conditions of V6 =  $V_{DIOV1} + 0.015$  V after setting V10 = 0 V and setting SW4 to ON. When the voltage V10 is then gradually increased and  $V_{DO}$  changes from "H" to "L", V10 is defined as the CIT pin detection voltage ( $V_{CIT}$ ).

#### 1. 10 CIT2 pin internal resistance (R<sub>CIT2</sub>), CIT2 pin detection voltage (V<sub>CIT2</sub>)

The CIT2 pin internal resistance (R<sub>CIT2</sub>) is defined by  $R_{CIT2} = V_{DS} / I_{CIT2}$  under the set conditions of V6 =  $V_{DIOV2} + 0.020$  V after setting V10 = V11 = 0 V and setting SW4 and SW5 to ON. When the voltage V11 is then gradually increased and  $V_{DO}$  changes from "H" to "L", V11 is defined as the CIT2 pin detection voltage ( $V_{CIT2}$ ).

# ABLIC Inc.

#### 1. 11 CICT pin internal resistance (R<sub>CICT</sub>), CICT pin detection voltage (V<sub>CICT</sub>)

The CICT pin internal resistance ( $R_{CICT}$ ) is defined by  $R_{CICT} = V_{DS} / I_{CICT}$  under the set conditions of V6 =  $V_{CIOV} - 0.015$  V after setting V7 = 0 V and setting SW1 to ON. When the voltage V7 is then gradually increased and  $V_{CO}$  changes from "H" to "L", V7 is defined as the CICT pin detection voltage ( $V_{CICT}$ ).

#### 1. 12 Load short-circuiting detection delay time (t<sub>SHORT</sub>)

The load short-circuiting detection delay time ( $t_{SHORT}$ ) is the time period from when the voltage V6 changes to V6 =  $V_{SHORT}$  + 0.055 V until when  $V_{DO}$  changes from "H" to "L" after setting V10 = V11 = 0 V and setting SW4 and SW5 to ON.

#### 1.13 Current consumption during operation (IOPE)

The current consumption during operation (I<sub>OPE</sub>) is I<sub>VSS</sub> when SW8 is OFF.

#### 1. 14 Current consumption during power-down (IPDN)

The current consumption during power-down ( $I_{PDN}$ ) is  $I_{VSS}$  when V1 = V2 = V3 = V4 = V5 = 1.5 V, V15 = V<sub>DS</sub> and SW8 is OFF.

#### 1. 15 Current consumption during power-saving (IPSV)

The current consumption during power-saving (I<sub>PSV</sub>) is I<sub>VSS</sub> when V18 = 0 V and SW8 is OFF.

#### 1.16 Resistance between VM pin and VDD pin ( $R_{VMD}$ )

The resistance between VM pin and VDD pin ( $R_{VMD}$ ) is defined by  $R_{VMD} = V_{DS} / I_{VM}$  when setting V1 = V2 = V3 = V4 = V5 = 1.5 V.

#### 1. 17 Resistance between VM pin and VSS pin (R<sub>VMS</sub>)

The resistance between VM pin and VSS pin (R<sub>VMS</sub>) is defined by R<sub>VMS</sub> = V15 / I<sub>VM</sub> when setting V6 = V<sub>DIOV1</sub> + 0.015 V and V15 = 2.0 V.

#### 1. 18 CO pin source current (I<sub>COH</sub>)

The CO pin source current ( $I_{COH}$ ) is  $I_{CO}$  when V14 =  $V_{COH} - 0.5$  V, SW8 is OFF, and SW9 is ON.

#### 1. 19 CO pin leakage current (I<sub>COL</sub>)

The CO pin leakage current ( $I_{COL}$ ) is  $I_{CO}$  when V1 = V2 = V3 = V4 = V5 = 5.6 V, V14 = 0 V, SW8 is OFF, and SW9 is ON.

#### 1. 20 DO pin source current (I<sub>DOH</sub>)

The DO pin source current ( $I_{DOH}$ ) is  $I_{DO}$  when V13 =  $V_{DOH} - 0.5$  V and SW7 is ON.

#### 1. 21 DO pin sink current (I<sub>DOL</sub>)

The DO pin sink current ( $I_{DOL}$ ) is  $I_{DO}$  when V1 = V2 = V3 = V4 = V5 = 1.9 V, V13 = 0.5 V, and SW7 is ON.

#### 1. 22 PSO pin source current (I<sub>PSOH</sub>)

The PSO pin source current ( $I_{PSOH}$ ) is  $I_{PSO}$  when V18 = 0 V, V12 =  $V_{DS} - 0.5$  V, and SW6 is ON.

#### 1. 23 PSO pin sink current (I<sub>PSOL</sub>)

The PSO pin sink current ( $I_{PSOL}$ ) is  $I_{PSO}$  when V12 = 0.5 V and SW6 is ON.

# ABLIC Inc.

#### 1. 24 0 V battery charge starting charger voltage (V<sub>0CHA</sub>) (0 V battery charge function "available")

When the voltage V15 is gradually decreased after setting V1 = V2 = V3 = V4 = V5 = 0 V and V<sub>CO</sub> is "H", the absolute value of V15 is defined as the 0 V battery charge starting charger voltage ( $V_{0CHA}$ ).

#### 1. 25 0 V battery charge inhibition battery voltage n (VoINHn) (0 V battery charge function "unavailable")

When the voltage V1 is gradually decreased and  $V_{CO}$  changes from "H" to "L", V1 is defined as the 0 V battery charge inhibition battery voltage 1 ( $V_{0INH1}$ ).

0 V battery charge inhibition battery voltage n ( $V_{0INHn}$ ) (n = 2 to 5) can be determined in the same way as when n = 1.

#### 1. 26 CTLC pin reverse voltage (V<sub>CTLC</sub>)

Rev.1.4\_00

When the voltage V16 is gradually decreased and  $V_{CO}$  changes from "H" to "L", V16 is defined as the CTLC pin reverse voltage ( $V_{CTLC}$ ).

#### 1. 27 CTLD pin reverse voltage (V<sub>CTLD</sub>)

When the voltage V17 is gradually decreased and  $V_{DO}$  changes from "H" to "L", V17 is defined as the CTLD pin reverse voltage ( $V_{CTLD}$ ).

#### 1. 28 PSI pin reverse voltage (V<sub>PSI</sub>)

When the voltage V18 is gradually decreased and  $V_{PSO}$  changes from "L" to "H", V18 is defined as the PSI pin reverse voltage ( $V_{PSI}$ ).

#### 1. 29 CTLC pin response delay time (t<sub>CTLC</sub>)

The CTLC pin response delay time ( $t_{CTLC}$ ) is the time period from when the voltage V16 changes to V16 = 0 V until when V<sub>CO</sub> changes from "H" to "L".

#### 1. 30 CTLD pin response delay time (t<sub>CTLD</sub>)

The CTLD pin response delay time ( $t_{CTLD}$ ) is the time period from when the voltage V17 changes to V17 = 0 V until when V<sub>DO</sub> changes from "H" to "L".

#### 1. 31 PSI pin response delay time (t<sub>PSI</sub>)

The PSI pin response delay time ( $t_{PSI}$ ) is the time period from when the voltage V18 changes to V18 = 0 V until when V<sub>PSO</sub> changes from "L" to "H".

#### 1. 32 CTLC pin current "H" (I<sub>CTLCH</sub>), CTLC pin current "L" (I<sub>CTLCL</sub>)

The CTLC pin current "H" ( $I_{CTLCH}$ ) is  $I_{CTLC}$  when V16 = V<sub>DS</sub>. The CTLC pin current "L" ( $I_{CTLCL}$ ) is  $I_{CTLC}$  when V16 = 0 V.

#### 1. 33 CTLD pin current "H" (I<sub>CTLDH</sub>), CTLD pin current "L" (I<sub>CTLDL</sub>)

The CTLD pin current "H" ( $I_{CTLDH}$ ) is  $I_{CTLD}$  when V17 = V<sub>DS</sub>. The CTLD pin current "L" ( $I_{CTLDL}$ ) is  $I_{CTLD}$  when V17 = 0 V.

#### 1. 34 PSI pin current "H" (IPSIH), PSI pin current "L" (IPSIL)

The PSI pin current "H" ( $I_{PSIH}$ ) is  $I_{PSI}$  when V18 = V<sub>DS</sub>. The PSI pin current "L" ( $I_{PSIL}$ ) is  $I_{PSI}$  when V18 = 0 V.

Rev.1.4\_00

#### 2. Test circuit 2

Figure 4 Test Circuit 2

This section provides explanations of Test items using Test circuit 2. Perform each test after setting as shown in **Table 9**.

Table 9 In	nitial Setting	of Test	Circuit 2
------------	----------------	---------	-----------

V1	V2	V3	V4	V5	V6	V7 <sup>*1</sup>
3.5 V	0 V	2.5 V				

\*1. V7 is an absolute value.

#### 2.1 Output voltage for temperature detection (VREG)

The maximum voltage between the VDD pin and VREG pin is defined as the output voltage for temperature detection ( $V_{REG}$ ).

#### 2. 2 High temperature detection ratio during charging (r<sub>THCH</sub>)

When the voltage V7 is gradually decreased after setting V6 = -0.03 V and V<sub>CO</sub> changes from "H" to "L" and V<sub>DO</sub> changes from "H" to "L", the high temperature detection ratio during charging (r<sub>THCH</sub>) is defined by (V<sub>REG</sub> - V7) / V<sub>REG</sub>.

#### 2. 3 Low temperature detection ratio during charging (rTHCL)

When the voltage V7 is gradually increased after setting V6 = -0.03 V and V<sub>CO</sub> changes from "H" to "L" and V<sub>DO</sub> changes from "H" to "L", the low temperature detection ratio during charging ( $r_{THCL}$ ) is defined by (V<sub>REG</sub> - V7) / V<sub>REG</sub>.

#### 2.4 High temperature detection ratio during discharging (r<sub>THDH</sub>)

When the voltage V7 is gradually decreased and  $V_{CO}$  changes from "H" to "L" and  $V_{DO}$  changes from "H" to "L", the high temperature detection ratio during discharging ( $r_{THDH}$ ) is defined by ( $V_{REG} - V7$ ) /  $V_{REG}$ .

#### 2.5 Low temperature detection ratio during discharging (r<sub>THDL</sub>)

When the voltage V7 is gradually increased and  $V_{CO}$  changes from "H" to "L" and  $V_{DO}$  changes from "H" to "L", the low temperature detection ratio during discharging ( $r_{THDL}$ ) is defined by ( $V_{REG} - V7$ ) /  $V_{REG}$ .

#### 2. 6 Charge-discharge discriminating voltage (V<sub>CHG</sub>)

When the voltage V6 is gradually decreased after setting  $(1 - r_{THDH}) \times V_{REG} < V7 < (1 - r_{THCH}) \times V_{REG}$  and  $V_{CO}$  changes from "H" to "L" and  $V_{DO}$  changes from "H" to "L", V6 is defined as the charge-discharge discriminating voltage ( $V_{CHG}$ ).

#### 2.7 Temperature detection delay time (t<sub>TH</sub>)

The temperature detection delay time ( $t_{TH}$ ) is the time period from when the voltage V7 changes to 0 V until when  $V_{CO}$  changes from "H" to "L" and  $V_{DO}$  changes from "H" to "L".

# Operation

Remark Refer to "■ Connection Examples of Battery Protection IC".

#### 1. Normal status

The status when the CO pin output voltage ( $V_{CO}$ ) = "H", DO pin output voltage ( $V_{DO}$ ) = "H" and PSO pin output voltage ( $V_{PSO}$ ) = "L" is the normal status.

All the conditions mentioned below should be satisfied for returning to normal status.

- The voltage of each of the batteries is in the range from the overcharge detection voltage n (V<sub>CUn</sub>) to overdischarge detection voltage n (V<sub>DLn</sub>).
- The VINI pin voltage is in the range of the charge overcurrent detection voltage (V<sub>CIOV</sub>) to the discharge overcurrent 1 detection voltage (V<sub>DIOV1</sub>).
- The CTLC pin voltage, CTLD pin voltage, and PSI pin voltage are higher than the CTLC pin reverse voltage (V<sub>CTLC</sub>), CTLD pin reverse voltage (V<sub>CTLD</sub>), and PSI pin reverse voltage (V<sub>PSI</sub>), respectively.
- Either (1) or (2) below is satisfied for the TH pin voltage (V<sub>TH</sub>).
  - (1) When  $V_{VM} \le V_{CHG}$ :  $(1 r_{THCH}) \times V_{REG} < V_{TH} < (1 r_{THCL}) \times V_{REG}$ (2) When  $V_{VM} > V_{CHG}$ :  $(1 - r_{THDH}) \times V_{REG} < V_{TH} < (1 - r_{THDL}) \times V_{REG}$
- Caution After a battery is connected, there may be cases when discharging cannot be performed. In this case, the S-8245B/D Series returns to the normal status when any of the following conditions is satisfied.
  - (1) Connecting a charger
  - (2) Shorting between the VM pin and the VSS pin
  - (3) Changing the PSI pin voltage to be  $V_{\text{DS}} \rightarrow 0 \; V \rightarrow V_{\text{DS}}$
- Remark V<sub>VM</sub>: VM pin voltage
  - V<sub>CHG</sub>: Charge-discharge discriminating voltage
  - r<sub>THCH</sub>: High temperature detection ratio during charging
  - r<sub>THCL</sub>: Low temperature detection ratio during charging
  - r<sub>THDH</sub>: High temperature detection ratio during discharging
  - r<sub>THDL</sub>: Low temperature detection ratio during discharging
  - V<sub>REG</sub>: Output voltage for temperature detection
  - $V_{DS}$ : Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

#### 2. Overcharge status

When the voltage of any of the batteries exceeds the overcharge detection voltage n ( $V_{CUn}$ ) and the status continues for the overcharge detection delay time  $(t_{CU})^{*1}$  or longer, the CO pin changes to high impedance. This is the overcharge status. The CO pin is pulled down to EB– by an external resistor so that the charge control FET is turned off to stop charging.

The overcharge status is released if either condition mentioned below is satisfied.

- (1)  $V_{VM} < 0$  V, and voltage of battery  $\leq V_{CLn}$
- (2)  $V_{VM} \ge 0$  V, and voltage of all batteries  $\le V_{CUn}$

#### \*1. Refer to "6. Delay time setting" for details.

Remark	V <sub>VM</sub> :	VM pin voltage
	V <sub>DS</sub> :	Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)
	V <sub>CUn</sub> :	Overcharge detection voltage n (n = 1 to 5)
	V <sub>CLn</sub> :	Overcharge release voltage n (n = 1 to 5)

#### 3. Overdischarge status

Rev.1.4\_00

When the voltage of any of the batteries falls below the overdischarge detection voltage n ( $V_{DLn}$ ) and the status continues for the overdischarge detection delay time ( $t_{DL}$ )<sup>\*1</sup> or longer, the DO pin changes to the  $V_{SS}$  level. This is the overdischarge status. The discharge control FET is turned off to stop discharging.

The overdischarge status is released if either condition mentioned below is satisfied.

- (1)  $V_{VM} \le V_{CHG}$ , and voltage of all batteries  $\ge V_{DLn}$
- (2)  $V_{VM} > V_{CHG},$  and voltage of battery  $\geq V_{DUn}$

#### \*1. Refer to "6. Delay time setting" for details.

- Remark V<sub>VM</sub>: VM pin voltage
  - V<sub>CHG</sub>: Charge-discharge discriminating voltage
  - $V_{DLn}$ : Overdischarge detection voltage n (n = 1 to 5)
  - $V_{DUn}$ : Overdischarge release voltage n (n = 1 to 5)

#### 3.1 With power-down function

When S-8245B/D Series reaches the overdischarge status, the VM pin is pulled up to the  $V_{DD}$  level by a resistance between VM pin and VDD pin ( $R_{VMD}$ ). If the voltage difference between the VDD pin and the VM pin decreases to 1.0 V typ. or lower, the power-down function starts to operate and most operations in the S-8245B/D Series halt. In this case, the CO pin changes to high impedance, and the PSO pin changes to the  $V_{DD}$  level.

# The power-down function is released when the VM pin voltage changes to 0.7 V typ. or lower.

#### 4. Discharge overcurrent status

When the discharge current increases to a certain value or more, the VINI pin voltage increases to the level of discharge overcurrent 1 detection voltage ( $V_{DIOV1}$ ) or higher. If the status continues for the discharge overcurrent 1 detection delay time ( $t_{DIOV1}$ )<sup>\*1</sup> or longer, the DO pin changes to the  $V_{SS}$  level. This is the discharge overcurrent status. The discharge control FET is turned off to stop discharging. The VM pin is pulled down to the  $V_{SS}$  level by resistance between VM pin and VSS pin ( $R_{VMS}$ ).

Discharge overcurrent is detected at the following three levels:  $V_{DIOV1}$ ,  $V_{DIOV2}$ , and  $V_{SHORT}$ . When discharge overcurrent 2 detection voltage ( $V_{DIOV2}$ ) and load short-circuiting detection voltage ( $V_{SHORT}$ ) are detected, the same operations as  $V_{DIOV1}$  detection are performed.

The discharge overcurrent status is released if the following conditions are satisfied.

- S-8245B Series:  $V_{VM} \le V_{DS}$  / 2 typ.
- S-8245D Series:  $V_{VM} \le V_{DS}$  / 4 typ.

\*1. Refer to "6. Delay time setting" for details.

RemarkVVM:VM pin voltageVDS:Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

#### 5. Charge overcurrent status

When the charge current increases to a certain value or more, the VINI pin voltage decreases to the level of charge overcurrent detection voltage ( $V_{CIOV}$ ) or lower. If the status continues for the charge overcurrent detection delay time ( $t_{CIOV}$ )<sup>\*1</sup> or longer, the CO pin changes to high impedance. This is the charge overcurrent status. The charge control FET is turned off to stop charging. The VM pin is pulled up to the  $V_{DD}$  level by resistance between VM pin and VDD pin ( $R_{VMD}$ ).

The charge overcurrent status is released if  $V_{VM} \ge 0$  V typ.

#### \*1. Refer to "6. Delay time setting" for details.

RemarkVVM:VM pin voltageVDS:Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

# ABLIC Inc.

#### 6. Delay time setting

Users are able to set delay time for the period from when the S-8245B/D Series detects change in the voltage of any of the batteries or the VINI pin until when it outputs to the CO pin or the DO pin. Each delay time is determined by a resistor in the S-8245B/D Series and an external capacitor.

In the overchage detection, when the voltage of any of the batteries exceeds overcharge detection voltage n ( $V_{CUn}$ ), the S-8245B/D Series starts charging to the CCT pin's capacitor ( $C_{CCT}$ ) via the CCT pin internal resistance ( $R_{CCT}$ ). After a certain period, the CO pin changes to high impedance when the CCT pin reaches the CCT pin detection voltage ( $V_{CCT}$ ). This period is overcharge detection delay time ( $t_{CU}$ ).

 $t_{CU}$  is calculated using the following equation.

$$\begin{split} t_{\text{CU}}\left[s\right] &= -\text{ln}\left(1 - V_{\text{CCT}} \mid V_{\text{DS}}\right) \times C_{\text{CCT}}\left[\mu\text{F}\right] \times R_{\text{CCT}}\left[M\Omega\right] \\ &= -\text{ln}\left(1 - 0.7 \text{ typ.}\right) \times C_{\text{CCT}}\left[\mu\text{F}\right] \times 8.31 \left[M\Omega\right] \text{ typ.} \\ &= 10.0 \left[M\Omega\right] \text{ typ.} \times C_{\text{CCT}}\left[\mu\text{F}\right] \end{split}$$

Overdischarge detection delay time ( $t_{DL}$ ), discharge overcurrent 1 detection delay time ( $t_{DIOV1}$ ), discharge overcurrent 2 detection delay time ( $t_{DIOV2}$ ) and charge overcurrent detection delay time ( $t_{CIOV}$ ) are calculated using the following equations as well.

 $t_{\text{DL}} [\text{ms}] = -\text{ln} (1 - V_{\text{CDT}} / V_{\text{DS}}) \times C_{\text{CDT}} [\mu\text{F}] \times R_{\text{CDT}} [\text{k}\Omega]$   $t_{\text{DIOV1}} [\text{ms}] = -\text{ln} (1 - V_{\text{CIT}} / V_{\text{DS}}) \times C_{\text{CIT}} [\mu\text{F}] \times R_{\text{CIT}} [\text{k}\Omega]$   $t_{\text{DIOV2}} [\text{ms}] = -\text{ln} (1 - V_{\text{CIT2}} / V_{\text{DS}}) \times C_{\text{CIT2}} [\mu\text{F}] \times R_{\text{CIT2}} [\text{k}\Omega]$   $t_{\text{CIOV}} [\text{ms}] = -\text{ln} (1 - V_{\text{CICT}} / V_{\text{DS}}) \times C_{\text{CICT}} [\mu\text{F}] \times R_{\text{CICT}} [\text{k}\Omega]$ 

When  $C_{CCT} = C_{CDT} = C_{CIT} = C_{CIT2} = C_{CICT} = 0.1 [\mu F]$ , each delay time is calculated as follows.

 $t_{CU} [s] = 10.0 [M\Omega] typ. \times 0.1 [\mu F] = 1.0 [s] typ. \\ t_{DL} [ms] = 1000 [k\Omega] typ. \times 0.1 [\mu F] = 100 [ms] typ. \\ t_{DIOV1} [ms] = 1000 [k\Omega] typ. \times 0.1 [\mu F] = 100 [ms] typ. (when R_{CIT} = 831 k\Omega typ.) \\ t_{DIOV1} [ms] = 10.0 [M\Omega] typ. \times 0.1 [\mu F] = 1.0 [s] typ. (when R_{CIT} = 8.31 M\Omega typ.) \\ t_{DIOV2} [ms] = 200 [k\Omega] typ. \times 0.1 [\mu F] = 20 [ms] typ. \\ t_{CIOV} [ms] = 200 [k\Omega] typ. \times 0.1 [\mu F] = 20 [ms] typ.$ 

Load short-circuiting detection delay time (t<sub>SHORT</sub>) is fixed internally.

**Remark** V<sub>DS</sub>: Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

#### 7. 0 V Battery charge function

Regarding how to charge a self-discharged battery (0 V battery), users are able to select either function mentioned below.

- (1) 0 V battery charge function "available"
  - A 0 V battery is charged when charger voltage is higher than  $V_{0CHA}$ .
- (2) 0 V battery charge function "unavailable"

A 0 V battery is not charged when the voltage of any of the batteries is  $V_{0INHn}$  or lower.

Caution When the VDD pin voltage is lower than the minimum value of operation voltage between the VDD pin and VSS pin (V<sub>DSOP</sub>), the S-8245B/D Series' operation is not assured.

 Remark
 V<sub>0CHA</sub>:
 0 V battery charge starting charger voltage

 V<sub>0INHn</sub>:
 0 V battery charge inhibition battery voltage n (n = 1 to 5)

# ABLIC Inc.

### 8. SEL1 pin and SEL2 pin

Switching control for 3-serial to 5-serial cell is possible by inputting voltage to the SEL1 pin and the SEL2 pin. Be sure to use the SEL1 pin and the SEL2 pin at the "H" or "L" level.

SEL1 Pin	SEL2 Pin	Setting
"L"	"L"	5-serial cell
"L"	"H"	4-serial cell
"H"	"L"	3-serial cell
"H"	"H"	Setting inhibited

Table 10	Settings of SEL1 Pin and SEL2 Pin
----------	-----------------------------------

 $\label{eq:selectropy} \begin{array}{ll} \mbox{Remark} & \mbox{"H" is the status when } V_{SEL1} \geq V_{SEL1H}, \ V_{SEL2} \geq V_{SEL2H}, \ \mbox{and "L" is the status when } V_{SEL1} \leq V_{SEL1L}, \ V_{SEL2} \leq V_{SEL2L}. \end{array}$ 

V <sub>SEL1H</sub> :	SEL1 pin voltage "H"
V <sub>SEL2H</sub> :	SEL2 pin voltage "H"
V <sub>SEL1L</sub> :	SEL1 pin voltage "L"
V <sub>SEL2L</sub> :	SEL2 pin voltage "L"

# 9. CTLC pin and CTLD pin

The CTLC pin controls the CO pin, and the CTLD pin controls the DO pin. Thus it is possible for users to control the CO pin and the DO pin respectively. These controls precede the battery protection circuit.

Table 11 Status Set by CTLC Pin

CTLC Pin	CO Pin
$V_{SS}$ level $\leq$ CTLC pin voltage $< V_{CTLC}$	High impedance
$V_{CTLC} \leq CTLC$ pin voltage $\leq V_{DD}$ level	"H"

Remark V<sub>CTLC</sub>: CTLC pin reverse voltage

Table 12 Status Set by CTLD	Pin
-----------------------------	-----

CTLD Pin	DO Pin
$V_{SS}$ level $\leq$ CTLD pin voltage $< V_{CTLD}$	V <sub>SS</sub> level
$V_{CTLD} \le CTLD$ pin voltage $\le V_{DD}$ level	"H"

**Remark** V<sub>CTLD</sub>: CTLD pin reverse voltage

#### 10. PSI pin

When the PSI pin is activated, the power-saving function starts to operate and most operations halt. In this case, the CO pin changes to high impedance, DO pin changes to the  $V_{SS}$  level, and the PSO pin changes to the  $V_{DD}$  level.

PSI Pin	CO Pin	DO Pin	PSO Pin
$V_{PSI} < PSI$ pin voltage $\leq V_{DD}$ level	"H"	"H"	V <sub>SS</sub> level
$V_{SS}$ level $\leq$ PSI pin voltage $\leq$ $V_{PSI}$	High impedance	V <sub>SS</sub> level	V <sub>DD</sub> level

Table 13	Status	Set h	PSI Pin
	้อเลเนอ	Secus	FOIFIII

**Remark** V<sub>PSI</sub>: PSI pin reverse voltage

The S-8245B/D Series is initialized and the power-saving function is released by deactivating the PSI pin. As a result, each detection operation is carried out after returning to the normal status.

#### 11. Temperature detection

Serially connect an NTC and a low temperature-dependent resistor ( $R_{TH}$ ) between the VDD pin and the VREG pin, and then connect their middle point to the TH pin. It allows for temperature detection at four different points: high temperature detection during charging, low temperature detection during charging, low temperature detection during discharging.

When the temperature rises, according to the NTC temperature characteristics, the resistance ( $R_{NTC}$ ) decreases, and the ratio between  $R_{NTC}$  and  $R_{TH}$  changes, and then the TH pin voltage ( $V_{TH}$ ) increases.

When the temperature falls, according to the NTC temperature characteristics, the resistance ( $R_{NTC}$ ) increases, and the ratio between  $R_{NTC}$  and  $R_{TH}$  changes, and then the TH pin voltage ( $V_{TH}$ ) decreases.

The temperature detection during charging and temperature detection during discharging switch by comparing the VM pin voltage ( $V_{VM}$ ) and charge-discharge discriminating voltage ( $V_{CHG}$ ).

If the relation between  $R_{NTC}$ ,  $R_{TH}$ , and  $V_{VM}$  satisfies the itemized condition in **Table 14** in each temperature detection, and each status continues for the temperature detection delay time ( $t_{TH}$ ) or longer, the CO pin changes to high impedance, and the DO pin changes to the  $V_{SS}$  level. This is the temperature protection status.

If the itemized condition in **Table 14** is not satisfied in each temperature detection, and each status continues for  $t_{TH}$  or longer, the temperature protection status is released.

Item	TH Pin	VM Pin	CO Pin	DO Pin
High temperature detection during charging	$r_{THCH} \le R_{TH} / (R_{NTC} + R_{TH})$	$V_{VM} \leq V_{CHG}$		
Low temperature detection during charging	$r_{THCL} \ge R_{TH} / (R_{NTC} + R_{TH})$	$V_{VM} \leq V_{CHG}$	Lligh impedance	
High temperature detection during discharging	$r_{THDH} \le R_{TH} / (R_{NTC} + R_{TH})$	$V_{VM} > V_{CHG}$	High impedance	V <sub>SS</sub> level
Low temperature detection during discharging	$r_{THDL} \ge R_{TH} / (R_{NTC} + R_{TH})$	$V_{VM} > V_{CHG}$		

Table 14 Conditions for Each Temperature Detection

Remark r<sub>THCH</sub>: High temperature detection ratio during charging

r<sub>THCL</sub>: Low temperature detection ratio during charging

r<sub>THDH</sub>: High temperature detection ratio during discharging

 $r_{THDL}$ : Low temperature detection ratio during discharging

The detection temperature can be set according to the NTC and  $R_{TH}$  characteristics. For example, if  $R_{NTC}^{*1}$  and  $R_{TH}$  (10 k $\Omega$ ) are connected to the S-8245BAA, each detection temperature is as follows.

Table 15			
Item	Temperature Detection Ratio	R <sub>NTC</sub>	Detection Temperature
Temperature for high temperature detection during charging	r <sub>THCH</sub> = 0.670	4.9 kΩ	45°C
Temperature for low temperature detection during charging	r <sub>THCL</sub> = 0.270	27.0 kΩ	0°C
Temperature for high temperature detection during discharging	r <sub>THDH</sub> = 0.795	2.6 kΩ	65°C
Temperature for low temperature detection during discharging	r <sub>THDL</sub> = 0.190	42.6 kΩ	-10°C

\*1. The calculation method for  $R_{NTC}$  is as follows.

$$\begin{split} r_{THCL} &= R_{TH} / (R_{NTC} + R_{TH}) \\ R_{NTC} &= R_{TH} / r_{THCL} - R_{TH} \\ &= 10 \ k\Omega / 0.270 - 10 \ k\Omega \\ &= 27.0 \ k\Omega \end{split}$$

Rev.1.4\_00

When low temperature during charging is detected,  $R_{NTC}$  = 27.0 k $\Omega$ , so detection temperature = 0°C according to the  $R_{NTC}$  characteristics shown in **Figure 5**.

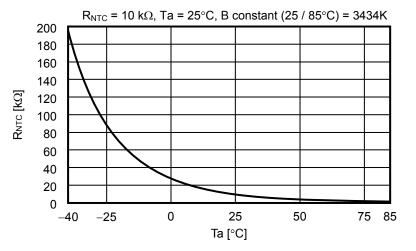

Figure 5 Example of R<sub>NTC</sub> Characteristics

**Remark** Temperature detection is carried out intermittently for 512 ms typ. per cycle, of which 1 ms typ. is the detection operation period.

The VREG pin voltage is output only during detection operation. During other periods, the VREG pin is at the  $V_{DD}$  level.

Regarding details of intermittent operation, refer to "4. Temperature detection (High temperature detection during charging)" in "■ Timing Charts".

 Table 16
 Constants for External Components

\*1.  $R_{VDD} \times C_{VDD} = 100 \ \mu\text{F} \bullet \Omega$  is recommended. Set filter constants to satisfy  $R_{VC1} \times C_{VC1} = R_{VC2} \times C_{VC2} = R_{VC3} \times C_{VC3} = R_{VC4} \times C_{VC4} = R_{VC5} \times C_{VC5} = R_{VDD} \times C_{VDD}$ .

Caution 1. The above constants may be changed without notice.

- 2. Sufficient evaluation of transient power supply fluctuation and overcurrent protection function with the actual application is needed to determine the proper constants when setting the filter constants between the VDD pin and VSS pin. Contact our sales office if setting the constants between the VDD pin and VSS pin to anything other than the recommended values.
- 3. It has not been confirmed whether the operation is normal or not in circuits other than the connection examples. In addition, the connection examples and the constants do not guarantee proper operation. Perform thorough evaluation using the actual application to set the constants.

# Precautions

- The application conditions for the input voltage, output voltage, and load current should not exceed the power dissipation.
- Batteries can be connected in any order; however, there may be cases when discharging cannot be performed after a battery is connected. In this case, the S-8245B/D Series returns to the normal status when any of the following conditions is satisfied.
  - (1) Connecting a charger
  - (2) Shorting between the VM pin and the VSS pin
  - (3) Changing the PSI pin voltage to be  $V_{DS} \rightarrow 0 \; V \rightarrow V_{DS}$

**Remark** V<sub>DS</sub>: Input voltage between the VDD pin and VSS pin (V1 + V2 + V3 + V4 + V5)

- If an overcharged battery and an overdischarged battery intermix, the S-8245B/D Series will change to the overcharge and overdischarge statuses. Therefore, in this case, both charging and discharging are impossible.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- ABLIC Inc. claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

# **Disclaimers (Handling Precautions)**

- 1. All the information described herein (product data, specifications, figures, tables, programs, algorithms and application circuit examples, etc.) is current as of publishing date of this document and is subject to change without notice.
- The circuit examples and the usages described herein are for reference only, and do not guarantee the success of any specific mass-production design.
   ABLIC Inc. is not liable for any losses, damages, claims or demands caused by the reasons other than the products described herein (hereinafter "the products") or infringement of third-party intellectual property right and any other right due to the use of the information described herein.
- 3. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by the incorrect information described herein.
- 4. Be careful to use the products within their ranges described herein. Pay special attention for use to the absolute maximum ratings, operation voltage range and electrical characteristics, etc. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by failures and / or accidents, etc. due to the use of the products outside their specified ranges.
- 5. Before using the products, confirm their applications, and the laws and regulations of the region or country where they are used and verify suitability, safety and other factors for the intended use.
- 6. When exporting the products, comply with the Foreign Exchange and Foreign Trade Act and all other export-related laws, and follow the required procedures.
- 7. The products are strictly prohibited from using, providing or exporting for the purposes of the development of weapons of mass destruction or military use. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by any provision or export to the person or entity who intends to develop, manufacture, use or store nuclear, biological or chemical weapons or missiles, or use any other military purposes.
- 8. The products are not designed to be used as part of any device or equipment that may affect the human body, human life, or assets (such as medical equipment, disaster prevention systems, security systems, combustion control systems, infrastructure control systems, vehicle equipment, traffic systems, in-vehicle equipment, aviation equipment, aerospace equipment, and nuclear-related equipment), excluding when specified for in-vehicle use or other uses by ABLIC, Inc. Do not apply the products to the above listed devices and equipments. ABLIC Inc. is not liable for any losses, damages, claims or demands caused by unauthorized or unspecified use of the products.
- 9. In general, semiconductor products may fail or malfunction with some probability. The user of the products should therefore take responsibility to give thorough consideration to safety design including redundancy, fire spread prevention measures, and malfunction prevention to prevent accidents causing injury or death, fires and social damage, etc. that may ensue from the products' failure or malfunction.

The entire system in which the products are used must be sufficiently evaluated and judged whether the products are allowed to apply for the system on customer's own responsibility.

- 10. The products are not designed to be radiation-proof. The necessary radiation measures should be taken in the product design by the customer depending on the intended use.
- 11. The products do not affect human health under normal use. However, they contain chemical substances and heavy metals and should therefore not be put in the mouth. The fracture surfaces of wafers and chips may be sharp. Be careful when handling these with the bare hands to prevent injuries, etc.
- 12. When disposing of the products, comply with the laws and ordinances of the country or region where they are used.
- 13. The information described herein contains copyright information and know-how of ABLIC Inc. The information described herein does not convey any license under any intellectual property rights or any other rights belonging to ABLIC Inc. or a third party. Reproduction or copying of the information from this document or any part of this document described herein for the purpose of disclosing it to a third-party is strictly prohibited without the express permission of ABLIC Inc.
- 14. For more details on the information described herein or any other questions, please contact ABLIC Inc.'s sales representative.
- 15. This Disclaimers have been delivered in a text using the Japanese language, which text, despite any translations into the English language and the Chinese language, shall be controlling.
