TIMING DIAGRAMS
READ CYCLE (1) (Address controlled, CS#=OE#=V_{IL}, WE#=V_{IH}, UB# or/and LB#=V_{IL})

READ CYCLE (2) (WE#=V_{IH})

NOTES (READ CYCLE)

- t_{HZ} , t_{BHZ} and t_{OHZ} are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
- Do not Access device with cycle timing shorter than t_{RC} for continuous periods > 10us.

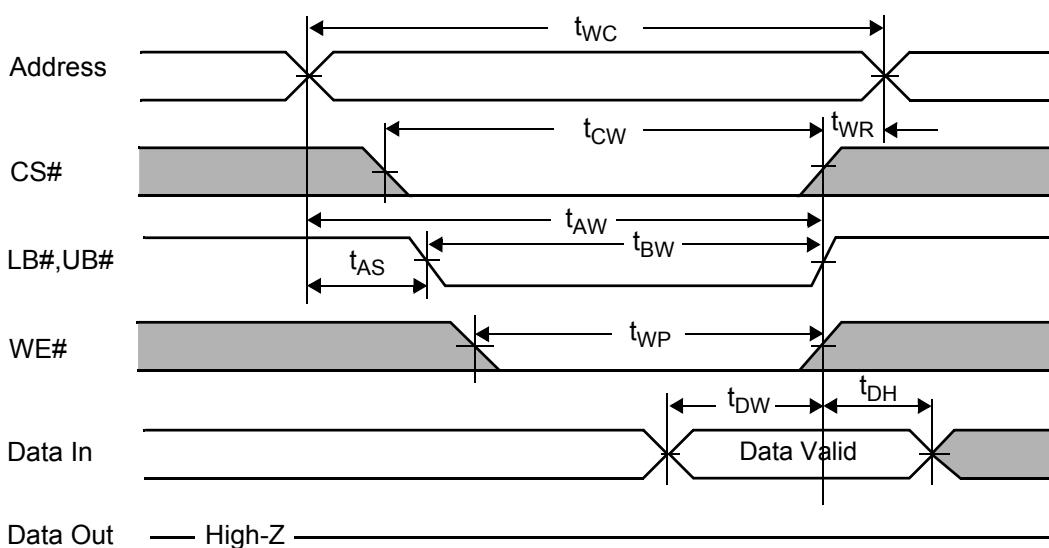

WRITE CYCLE (1) (WE# controlled)

WRITE CYCLE (2) (CS# controlled)

WRITE CYCLE (3) (UB#/LB# controlled)

NOTES (WRITE CYCLE)

1. A write occurs during the overlap(t_{WP}) of low CS#, low WE# and low UB# or LB#. A write begins at the last transition among low CS# and low WE# with asserting UB# or LB# low for single byte operation or simultaneously asserting UB# and LB# low for word operation. A write ends at the earliest transition among high CS# and high WE#. The t_{WP} is measured from the beginning of write to the end of write.
2. t_{CW} is measured from CS# going low to end of write.
3. t_{AS} is measured from the address valid to the beginning of write.
4. t_{WR} is measured from the end of write to the address change. t_{WR} applied in case a write ends as CS# or WE# going high.
5. Do not access device with cycle timing shorter than t_{WC} for continuous periods > 10us.

TIMING WAVEFORM OF POWER UP

NOTE (POWER UP)

1. After V_{CC} reaches $V_{CC(Min.)}$, wait 200us with CS# high. Then you get into the normal operation.
