SDLS169 – JANUARY 1981 – REVISED MARCH 1988

- Two's-Complement Multiplication
- Magnitude Only Multiplication
- Cascadable for Any Number of Bits
- 8-Bit Parallel Multiplicand Data Input
- Serial Multiplier Data Input
- Serial Data Output for Multiplication Product
- 40 MHz Typical Maximum Clock Frequency

## description

The 'LS384 is an 8-bit by 1-bit sequential logic element that performs digital multiplication of two numbers represented in two's-complement form to produce a two's-complement product without external correction by using Booth's algorithm internally. The device accepts an 8-bit multiplicand (X input) and stores this data in eight internal latches. These X latches are controlled via the clear input. When the clear input is low, all internal flip-flops are cleared and the X latches are opened to accept new multiplicand data. When the clear input is high, the latches are closed and are insensitive to X input changes.

The multiplier word data is passed by the Y input in a serial bit stream, least significant bit first. The product is clocked out the PROD output, least significant bit first.

The multiplication of an m-bit multiplicand by an n-bit multiplier results in an (m + n)-bit product. The 'LS384 must be clocked for m + n clock cycles to produce this two's complement product. The n-bit multiplier (Y-input) sign bit data must be extended for the remaining m bits to complete the multiplication cycle.

The device also contains a K input so that devices can be cascaded for longer length X words. The PROD output of one device is connected to the K input of the succeeding device when cascading. The mode input is used to indicate which device contains the most significant bit. The mode input is wired high or low depending on the position of the 8-bit slice in the total X word length. The device with the most significant bit is wired low and all lower order bit packages are wired high.

The SN54LS384 will be characterized for operation over the full military temperature range from  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ . The SN74LS384 will be characterized for operation from  $0^{\circ}\text{C}$  to  $70^{\circ}\text{C}$ .

FUNCTION TABLE

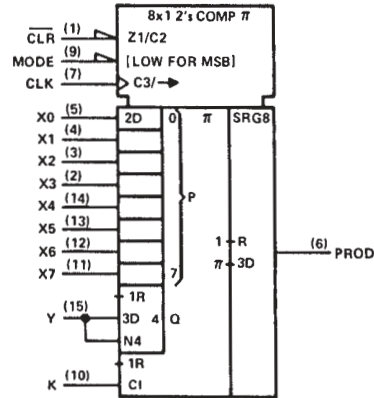

INPUTS				INTERNAL $Y_{-1}$	OUTPUT PROD	FUNCTION
CLR	CLK	$X_i$	Y			
L	X	Data	X	L	L	Load new multiplicand and clear internal sum and carry registers
H	↑	X	L	L	Output per	Shift sum register
H	↑	X	L	H		Add multiplicand to sum register and shift
H	↑	X	H	L	Booth's algorithm	Subtract multiplicand from sum register and shift
H	↑	X	H	H		Shift sum register

H = high-level, L = low-level, X = irrelevant, ↑ = low-to-high-level transition

### schematics of inputs and outputs

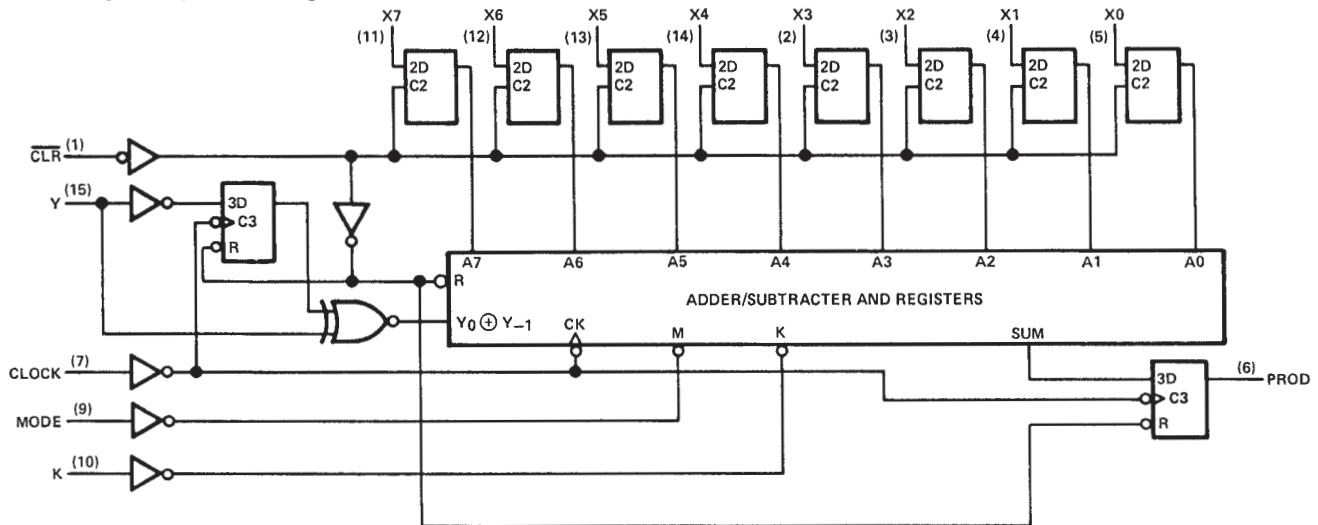

### logic symbol†

† This symbol is in accordance with ANSI/IEEE Std. 91-1984 and IEC Publication 617-12.

Pin numbers shown are for J and N packages.

### logic diagram (positive logic)

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)

Supply voltage, $V_{CC}$ (see Note 1)	7 V
Input voltage (see Note 2)	5.5 V
Operating free-air temperature range: SN54LS384	-55°C to 125°C
SN74LS384	0°C to 70°C
Storage temperature range	-65°C to 150°C

- NOTES: 1. Voltage values are with respect to network ground terminal.  
2. Input voltages must be zero or positive with respect to network ground terminal.
