CIPOS™ Maxi IM828

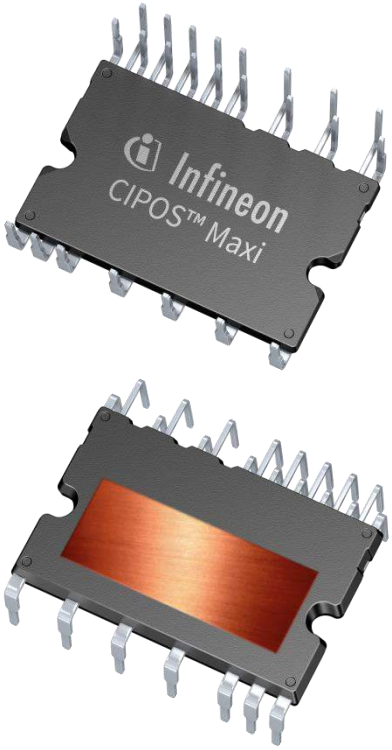
IM828-XCC

Description

The CIPOS™ Maxi IM828 product group offers the chance for integrating various power and control components to increase reliability, optimize PCB size and system costs. It is designed to operate as high-performance inverter for demanding motor drive applications and active power factor correction. The product concept is specially adapted to power applications, which need good thermal performance and electrical isolation as well as EMI save control and overload protection. Three phase inverter with 1200V CoolSiC™ MOSFETs are combined with an optimized 6-channel SOI gate driver for excellent electrical performance. The bodydiodes of CoolSiC™ MOSFETs can be used as free-wheeling diode, and turning on the MOSFET during bodydiode conduction (synchronous rectification) can be used to reduce losses further.

Features

- Fully isolated Dual In-Line molded module
- 1200V CoolSiC™ MOSFETs
- Rugged 1200V SOI gate driver technology with stability against transient and negative voltage
- Allowable negative VS potential up to -11 V for signal transmission at VBS = 15 V
- Integrated bootstrap functionality
- Over current shutdown
- Built-in NTC thermistor for temperature monitor
- Under-voltage lockout at all channels
- Low side source pins accessible for phase current monitoring (open source)
- Anti cross-conduction prevention
- All of 6 switches turn off during protection
- Programmable fault clear timing and enable input
- Lead-free terminal plating; RoHS compliant



Potential applications

Fan drives and active power factor correction and high-performance motor drives

Product validation

Qualified for industrial applications according to the relevant tests of JEDEC47/20/22.

Table 2 Pin assignment

Pin number	Pin name	Pin description
1	VS(U)	U-phase high side floating IC supply offset voltage
2	VB(U)	U-phase high side floating IC supply voltage
3	VS(V)	V-phase high side floating IC supply offset voltage
4	VB(V)	V-phase high side floating IC supply voltage
5	VS(W)	W-phase high side floating IC supply offset voltage
6	VB(W)	W-phase high side floating IC supply voltage
7	HIN(U)	U-phase high side gate driver input
8	HIN(V)	V-phase high side gate driver input
9	HIN(W)	W-phase high side gate driver input
10	LIN(U)	U-phase low side gate driver input
11	LIN(V)	V-phase low side gate driver input
12	LIN(W)	W-phase low side gate driver input
13	VDD	Low side control supply
14	RFE	Programmable fault clear time, fault output, enable input
15	ITRIP	Over current shutdown input

Pin configuration

Pin number	Pin name	Pin description
16	VSS	Low side control negative supply
17	VTH	Thermistor therminal
18	NW	W-phase low side source
19	NV	V-phase low side source
20	NU	U-phase low side source
21	W	Motor W-phase output
22	V	Motor V-phase output
23	U	Motor U-phase output
24	P	Positive bus input voltage

2.2 Pin description

HIN (U, V, W) and LIN (U, V, W) (Low side and high side control pins, Pin 7 - 12)

These pins are positive logic and they are responsible for the control of the integrated MOSFETs. The schmitt-trigger input thresholds of them are such to guarantee LSTTL and CMOS compatibility down to 3.3 V controller outputs. Pull-down resistor of about 5 kΩ is internally provided to pre-bias inputs during supply start-up. Input schmitt-trigger and noise filter provide beneficial noise rejection to short input pulses.

The noise filter suppresses control pulses which are below the filter time $t_{FIL,IN}$. The filter acts according to Figure 4.

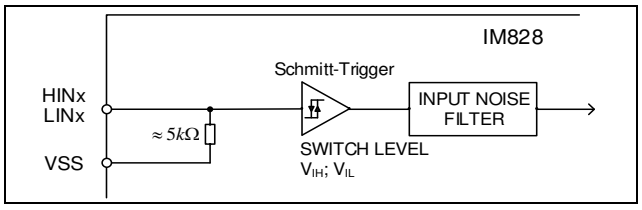

Figure 3 Input pin structure

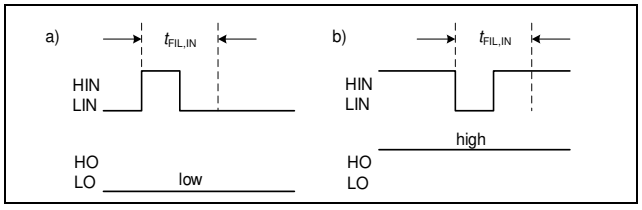

Figure 4 Input filter timing diagram

It is not recommended for proper work to provide input pulse-width lower than 1 µs.

The integrated gate driver provides additionally a shoot through prevention capability which avoids the simultaneous on-state of two gate drivers of the same leg (i.e. HO1 and LO1, HO2 and LO2, HO3 and LO3). When two inputs of a same leg are activated, only former activated one is activated so that the leg is kept steadily in a safe state.

A minimum deadtime insertion of typically 300 ns is also provided by driver IC, in order to reduce cross-conduction of the external power switches.

RFE (Fault / Fault clear time / Enable, Pin 14)

The RFE pin conbines three functions in one pin: programmable fault clear time by RC-network, fault-out and enable input.

The programmable fault-clear time can be adjusted by RC network, which is external pull-up resistor and capacitor. For example, typical value is about 1ms at 1 MΩ and 2 nF.

The fault-out indicates a module failure in case of under voltage at pin VDD or in case of triggered over current detection at ITRIP.

The microcontroller can pull this pin low to disable the IPM functionality. This is enable function.

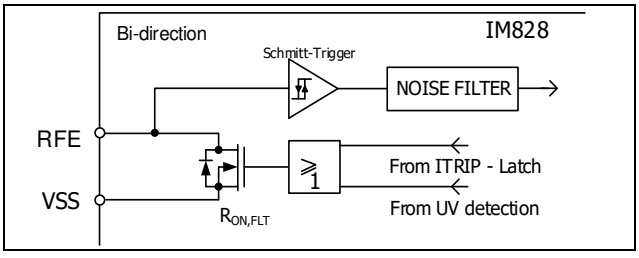

Figure 5 Internal circuit at pin RFE

Pin configuration

VTH (Thermistor, Pin 17)

The VTH pin provides direct access to the NTC, which is referenced to VSS. An external pull-up resistor connected to +5 V ensures that the resulting voltage can be directly connected to the microcontroller.

ITRIP (Over current detection function, Pin 15)

IM828 provides an over current detection function by connecting the ITRIP input with the MOSFET drain current feedback. The ITRIP comparator threshold (typ. 0.5 V) is referenced to VSS ground. An input noise filter (t_{ITRIP} = typ. 500 ns) prevents the driver to detect false over-current events.

Over current detection generates a shutdown of all outputs of the gate driver after the shutdown propagation delay of typically 1µs.

Fault-clear time is set to typical 1.1ms at R_{RCIN} = 1 MΩ and C_{RCIN} = 2 nF.

VDD, VSS (Low side control supply and reference, Pin 13, 16)

VDD is the control supply and it provides power both to input logic and to output power stage. Input logic is referenced to VSS ground.

The under-voltage circuit enables the device to operate at power on when a supply voltage of at least a typical voltage of V_{DDUV+} = 12.2 V is present.

The IC shuts down all the gate drivers power outputs, when the VDD supply voltage is below V_{DDUV-} = 11.2 V. This prevents the external power switches from critically low gate voltage levels during on-state and therefore from excessive power dissipation.

VB (U, V, W) and VS (U, V, W) (High side supplies, Pin 1 - 6)

VB to VS is the high side supply voltage. The high side circuit can float with respect to VSS following the external high side power device source voltage.

Due to the low power consumption, the floating driver stage is supplied by integrated bootstrap circuit.

The under-voltage detection operates with a rising supply threshold of typical V_{BSUV+} = 11.2 V and a falling threshold of V_{BSUV-} = 10.2 V.

VS (U, V, W) provide a high robustness against negative voltage in respect of VSS of -50 V transiently. This ensures very stable designs even under rough conditions.

NW, NV, NU (Low side source, Pin 18 - 20)

The low side sources are available for current measurements of each phase leg. It is recommended to keep the connection to pin VSS as short as possible in order to avoid unnecessary inductive voltage drops.

W, V, U (High side source and low side drain, Pin 21 - 23)

These pins are motor U, V, W input pins.

P (Positive bus input voltage, Pin 24)

The high side MOSFETs are connected to the bus voltage. It is noted that the bus voltage does not exceed 900 V.

3 Absolute maximum ratings

(V_{DD} = 15 V and T_J = 25°C, if not stated otherwise)

3.1 Module section

Description	Symbol	Condition	Value	Unit
Storage temperature range	T_{STG}		-40 ~ 125	°C
Operating case temperature	T_C	Refer to Figure 7	-40 ~ 125	°C
Operating junction temperature	T_J		-40 ~150	°C
Isolation test voltage	V_{ISO}	1min, RMS, f = 60Hz	2500	V

3.2 Inverter section

Description	Symbol	Condition	Value	Unit
Max. blocking voltage	V_{DSS}		1200	V
DC link supply voltage of P-N	V_{PN}	Applied between P-N	900	V
DC link supply voltage (surge) of P-N	$V_{PN(surge)}$	Applied between P-N	1000	V
DC drain current[1]	I_D	T_C = 25°C, T_J < 150°C	±35	A
		T_C = 80°C, T_J < 150°C	±20	
Pulse drain current[2]	I_{DP}		±60	A
Power dissipation per MOSFET	P_{tot}		86	W
Short circuit withstand time[3]	t_{SC}	V_{DC} ≤ 800 V, T_J ≤ 150°C	3	µs

3.3 Control section

Description	Symbol	Condition	Value	Unit
High Side offset voltage	V_S		1200	V
Repetitive peak reverse voltage of bootstrap diode	V_{RRM}		1200	V
Module control supply voltage	V_{DD}		-1 ~ 20	V
High side floating supply voltage (V_B reference to V_S)	V_{BS}		-1 ~ 20	V
Input voltage (LIN, HIN, ITRIP, RFE)	V_{IN}		-1 ~ V_{DD} + 0.3	V

[1] Pulse width and period are limited by junction temperature.
[2] Verified by design, t_p limited by T_{jmax}
[3] Verified by design for single short circuit event.

4 Thermal characteirstics

Description	Symbol	Condition	Value			Unit
			Min.	Typ.	Max.	
Single MOSFET thermal resistance, junction-case	R_{thJC}	-	-	-	1.45	K/W

5 Recommended operation conditions

All voltages are absolute voltages referenced to V_{SS} -potential unless otherwise specified.

Description	Symbol	Value			Unit
		Min.	Typ.	Max.	
DC link supply voltage of P-N	V_{PN}	350	600	800	V
Low side supply voltage	V_{DD}	13.5	15	18.5	V
High side floating supply voltage (V_B vs. V_S)	V_{BS}	12.5	-	18.5	V
Logic input voltages LIN, HIN, ITRIP, RFE	V_{IN}	0	-	5	V
PWM carrier frequency at V_{DD} = 15 V	F_{PWM}	-	-	80	kHz
External dead time between HIN & LIN	DT	0.5	-	-	µs
Voltage between VSS - N (including surge)	V_{COMP}	-5	-	5	V
Minimum input pulse width	$PW_{IN(ON)}$ $PW_{IN(OFF)}$	1	-	-	µs
Control supply variation	$\Delta V_{BS,}$ ΔV_{DD}	-1 -1	- -	1 1	V/µs

6 Static parameters

(V_{DD} = 15 V and T_J = 25°C, if not stated otherwise)

12 Application guide

12.1 Typical application schematic

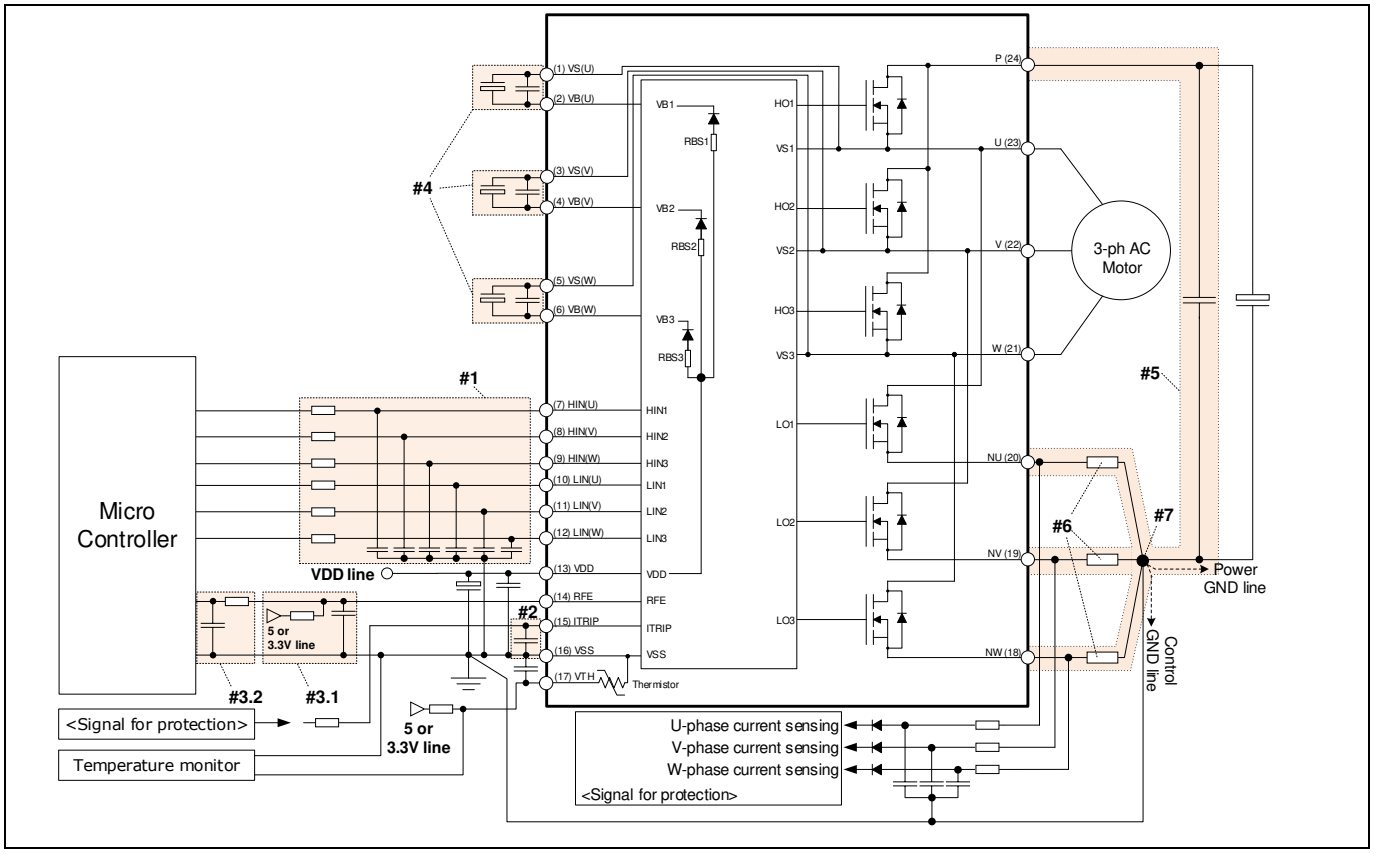

Figure 11 Typical application circuit

1. Input circuit
   - To reduce input signal noise by high speed switching, the R_{IN} and C_{IN} filter circuit should be mounted. (100 Ω, 1 nF)
   - C_{IN} should be placed as close to V_{SS} pin as possible.
2. Itrip circuit
   - To prevent protection function errors, C_{ITRIP} should be placed as close to Itrip and V_{SS} pins as possible.
3. RFE circuit

   3.1 Pull-up resistor (R_{RFE}) and pull-down capacitor (C_{RFE})
   - RFE output is an open drain output. This signal line should be pulled up to the positive side of the 5 V / 3.3 V control power supply voltage (V_{CTR}) with a proper resistor R_{FE}.
   - The fault-clear time is adjusted by RC network of R_{RFE} and C_{RFE} and pull-up voltage.
     - $t_{FLTCLR} = -R_{RFE} \cdot C_{RFE} \cdot \ln(1- V_{RFE,TH+}/V_{CTR})$ + internal fault-clear time 160 µs
     - $t_{FLTCLR} = -1\ M\Omega \times 2\ nF \times \ln(1 - 1.9 / 5\ V) + 160\mu s \cong 1.1ms$ at $R_{RFE} = 1\ M\Omega$, $C_{RFE} = 2\ nF$ and $V_{CTR} = 5\ V$
     - A pull-up resistor is limited to max. 2 MΩ
     - In case of V_{CTR} is higher than 5 V, the R_{RFE} needs to be at least 200 kΩ to limit the IC power dissipation

   3.2 RC filter
   - It is recommended that RC filter be placed as close to the controller as possible.
4. VB-VS circuit
   - Capacitor for Low side floating supply voltage should be placed as close to VB and VS pins as possible.
5. Snubber capacitor
   - The wiring between IM828 and snubber capacitor including shunt resistor should be as short as possible.
6. Shunt resistor
   - The shunt resistor of SMD type should be used for reducing its stray inductance.
7. Ground pattern
   - Ground pattern should be separated at only one point of shunt resistor as short as possible.

12.2 Performance charts

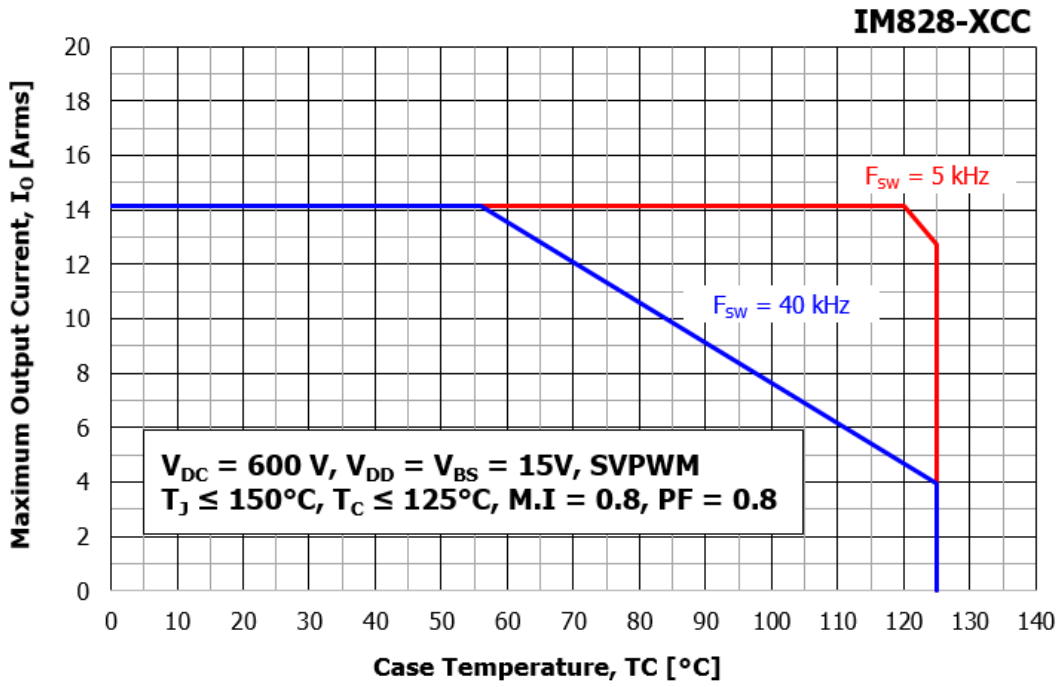

Figure 12 Operating current SOA[1] (Based on multi-chip heating R_{thJC})

[1]This operating current SOA is just reference information based on simulation results. It can be changed by each user's actual operating conditions.
