AS1904, AS1905, AS1906
Ultra Low-Power µP Supervisory Circuit

Data Sheet

World's Lowest Power Consumption!

1 General Description

The AS1904/5/6 family is an ultra low-power supervisory circuit device.

The device can be used to monitor the supply voltage of digital systems and microprocessors and initiate a reset when the voltage goes below a predefined threshold. The duration of the reset is 5/20/100/500ms (typ.) after the supply voltage has risen above the threshold.

The device exhibits excellent reliability and can reduce application costs by eliminating all external components.

The device is available with different output drivers:

- The AS1904 has a push-pull driver with an active low reset.
- The AS1905 uses the same output stage as the AS1904, but has an active high reset.
- The AS1906 has an open drain output with active low reset.

All devices operate down to a voltage of 1V.

The reset thresholds are factory-trimmable between 2.2V and 3.08V in steps of approximately 100mV.

Each device of the AS1904/5/6 family is offered with four time-out periods of 5/20/100/500ms.

The extremely low current consumption of only 150nA (typ) at 3.3V makes the device ideal for use in portable applications.

All devices are available in a 3-pin SOT23 package.

2 Key Features

- Low 150nA (typical) Supply Current
- Precision Monitoring of 2.5-, 3-, and 3.3V-Power Supplies
- Supply Voltage Range 1.0 to 3.6V
- Reset Threshold Available from 2.2 to 3.1V
- Available in three Versions
  - AS1904 Push-Pull RESETN
  - AS1905 Push-Pull RESET
  - AS1906 Open Drain RESETN
- 4 Time-Out Periods Ranging from 5 to 500ms
- Detection Voltage Accuracy: ±1.5%
- Temperature Range: -40 to +85°C
- SOT23-3 Package
- Superior Upgrade to austriamicrosystems AS1901/2/3 Device Family

3 Applications

The devices are ideal for computers, intelligent instruments, controllers, critical microprocessor and micro-controller, power monitoring and portable/battery-powered equipment.

Pin Descriptions

Table 1. Pin Descriptions

Pin Number		Pin Name	Description
AS1904/AS1906	**AS1905**		
1	1	GND	Ground
2	-	RESETN	Active-low reset output. RESETN remains low while VDD is below the reset threshold and for tTP after VDD rises above the reset threshold. RESETN is open-drain on the AS1906 and push-pull on the AS1904.
-	2	RESET	Active-high reset output. RESET remains high while VDD is below the reset threshold and for tTP after VDD rises above the reset threshold.
3	3	VDD	Supply voltage.

5 Absolute Maximum Ratings

Stresses beyond those listed in Table 2 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings ⟨T_A = 25°C Unless Otherwise Noted)

Parameter	Limits	Units	Notes
V_{DD} to GND	-0.3 to +5	V	
RESET/RESETN to GND	-0.3 to V_{DD} + 0.3	V	
Input Current (V_{DD})	20	mA	
Output Current (RESET, RESETN)	20	mA	
Rate of Rise (V_{DD})	100	V/µs	
Operating Temperature Range (T_A)	-40 to +85	°C	
Storage Temperature Range	-65 to +150	°C	
Package-Body Peak Temperature	+260	°C	The reflow peak soldering temperature (body temperature) specified is in accordance with *IPC/JEDEC J-STD-020C "Moisture/Reflow Sensitivity Classification for non-hermetic Solid State Surface Mount Devices"*

8 Detailed Description

Interfacing to Microprocessors with Bi-Directional Reset Pins

The device has an open drain RESETN output, which enables easy interfacing to microprocessors (µP) with bi-directional reset pins, such as the Motorola 68HC11. The RESETN pin of the microcontroller (µC) can be connected directly to the µP supervisor's RESETN output with a single pull-up resistor (see Figure 1 on page 1).

Negative-Going VDD Transients

The device is optimized to ignore short-duration, negative-going V_{DD} transients (glitches) in order to avoid incorrect resets.

In the graph Maximum Transient Duration vs. Reset Threshold Overdrive (page 6) , the conditions are shown, for which the reset pulses are not generated. In the graph the maximum pulse width that a negative V_{DD} transient may have when a reset signal is generated. As the amplitude of the transient increases, the maximum allowable pulse width decreases.
