

### Description

The ICS651 is a low skew, single input to four output, clock buffer. Part of ICS' ClockBlocks™ family, this is a low skew, small clock buffer.

ICS makes many non-PLL and PLL based low skew output devices as well as Zero Delay Buffers to synchronize clocks. Contact us for all of your clocking needs.

## Pin Assignment

## Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	ICLK	Input	Clock Input. 3.3 V tolerant input.
2	Q1	Output	Clock Output 1.
3	Q2	Output	Clock Output 2.
4	Q3	Output	Clock Output 3.
5	Q4	Output	Clock Output 4.
6	GND	Power	Connect to ground.
7	VDD	Power	Connect to +1.8 V or +2.5 V.
8	OE	Input	Output Enable. Tri-states outputs when low. Connect to VDD for normal operation.

## External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01  $\mu$ F should be connected between VDD on pin 7 and GND on pin 6, as close to the device as possible. A 33  $\Omega$  series terminating resistor may be used on each clock output if the trace is longer than 1 inch.

To achieve the low output skew that the ICS651 is capable of, careful attention must be paid to board layout. Essentially, all four outputs must have identical terminations, identical loads and identical trace geometries. If they do not, the output skew will be degraded. For example, using a 30 $\Omega$  series termination on one output (with 33 $\Omega$  on the others) will cause at least 15 ps of skew.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the ICS651. These ratings, which are standard values for ICS commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
