

DESCRIPTION

The MP3307 is a non-synchronous WLED step-up LED driver with 2.7V-to-5.5V input range. It uses peak-current mode to regulate the LED current sensed through an external, low-side resistor.

The MP3307 features up to 2.2MHz programmable switching frequency which is easy to avoid the noise interference and easy to optimize efficiency and reduce the output filter components size. To extend the dimming range, it supports both analog and PWM dimming mode with separate input.

MP3307 has LED open protection, output over-voltage protection, cycle-by-cycle current limit protection, and thermal shutdown protection.

MP3307 is available in TSOT23-8 package which is good to use in Video displays.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	2.7 – 5.5	V
Output Voltage	V_{LED}	<24	V
LED String		1	string
LED Current	I_{LED}	40	mA

FEATURES

- 2.7V-to-5.5V Input Voltage
- Analog Dimming with >20kHz input signal
- Direct PWM dimming mode with 100Hz to 2kHz input signal
- Up to 2.2MHz Programmable Switching Frequency
- Low 200mV Feedback Voltage with $\pm 1\%$ Accuracy at Room Temperature
- 24V Open-Load Protection Threshold
- UVLO, Thermal Shutdown
- Cycle by Cycle Over Current Protection
- Available in a TSOT23-8 Package

APPLICATIONS

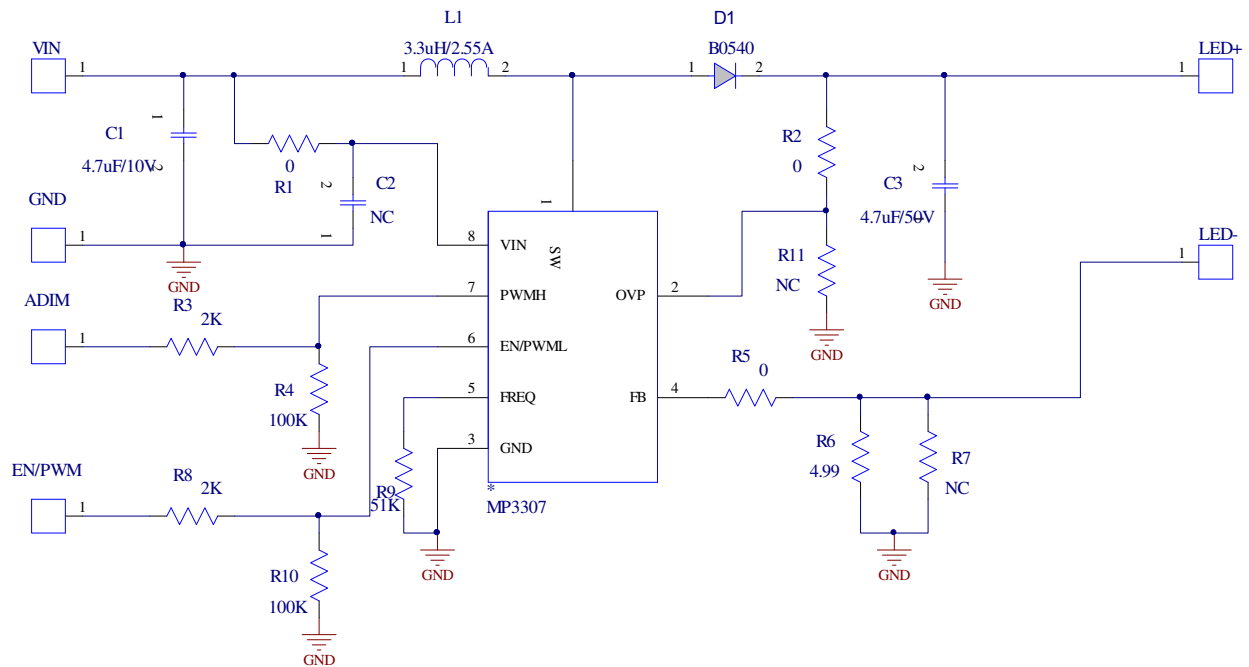

- Video Displays
- In-Car LCD Infotainment
- Tablets

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

EVB TEST RESULTS

Performance waveforms are tested on the evaluation board.

$V_{IN} = 3.6V$, $3s \times 4p$ LEDs, $L = 3.3\mu H$, $f_s = 2.2MHz$, $T_A = 25^\circ C$

PRINTED CIRCUIT BOARD LAYOUT

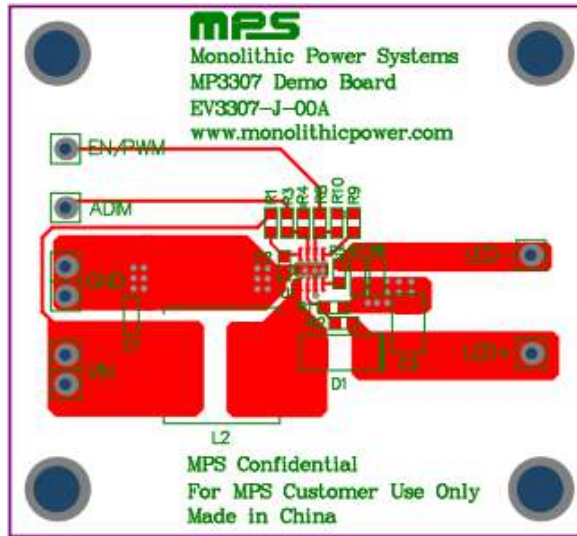

Figure 1—Top Layer

Figure 2—Bottom Layer

QUICK START GUIDE

1. Connect the positive and negative terminals of the load panel to the LED+ and LED- pins on the EV board, respectively.
2. Connect the positive and negative terminals of the power supply (2.7V ~ 5.5V) to the VIN and GND pins on the EV board, respectively.
3. Drive EN/PWML pin high (5V) to enable the chip. Apply 200Hz~2kHz PWM signal to EN/PWML for PWM dimming.
4. Drive PWMH pin with >20kHz pulse signal for PWM input analog dimming. If PWM input analog dimming is reserved, apply PWMH pin high (5V) to set up Chip.
5. Set current by R4 and R7.
6. If you set R2 as 0, OVP point is settled as 24V by internal resistor divider.
