

LP503x 36-, 30-Channel 12-Bit PWM Ultra-low Quiescent Current I²C RGB LED Drivers

1 Features

- Operating Voltage Range:
 - V_{CC} Range: 2.7 V to 5.5 V
 - EN, SDA, and SCL Pins Compatible With 1.8-V, 3.3-V, and 5-V Power Rails
 - Output Maximum Voltage: 6 V
- 36 Constant-Current Sinks With High Precision
 - 25.5 mA Maximum per Channel When V_{CC} in Full Range
 - 35 mA Maximum per Channel When V_{CC} ≥ 3.3 V
 - Device-to-Device Error ±5%; Channel-to-Channel Error ±5%
- Ultralow Quiescent Current:
 - Shutdown Mode: 1 μA (Maximum) When EN Low
 - Power Saving Mode: 12 μA (Maximum) When EN High and All LEDs Off for > 30 ms
- Integrated 12-Bit, 29-kHz PWM Generator for Each Channel:
 - Independent Color-Mixing Register Per Channel
 - Independent Brightness-Control Register Per RGB LED Module
 - Optional Logarithmic- or Linear-Scale Brightness Control
 - Integrated 3-Phase-Shifting PWM Scheme
- 3 Programmable Banks (R, G, B) for Easy Software Control of Each Color
- 2 External Hardware Address Pins Allow Connecting up to 4 Devices
- Broadcast Slave Address Allows Configuring Multiple Devices Simultaneously
- Auto-Increment Allows Writing or Reading Consecutive Registers Within One Transmission
- Up to 400-kHz Fast-Mode I²C Speed

2 Applications

LED Lighting, Indicator Lights, and Fun Lights for:

- Smart Speaker
- Smart Home Appliances
- Video Doorbell
- Electric Smart Lock
- Smoke Detector
- Set-Top Box
- Smart Router
- Handheld Devices

3 Description

Efficient and high-performance LED response effects, such as blinking, breathing, and chasing, are critical to improving end-user experience in many human machine interface (HMI) applications.

The LP503x device is a 30- or 36-channel constant-current-sink LED driver. The LP503x has a 29 kHz, 12-Bit PWM generator for each channel, as well as channel/module independent color mixing and *intensity control*, formerly called brightness control registers to enable vivid LED effects with zero audible noise. Users can benefit from the device's ultra-low shutdown I_q Power Saving Mode, while designers will appreciate the incredibly straightforward software coding of the LP503x's three programmable R G B banks.

Device Information⁽¹⁾

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (December 2018) to Revision B	Page
• Changed max standby current from 10uA to 12uA	8
• Changed power-save mode current from 10uA to 12uA	8
• Changed from LED3 to LED11	28

Changes from Original (September 2018) to Revision A	Page
• First release of production-data data sheet	1

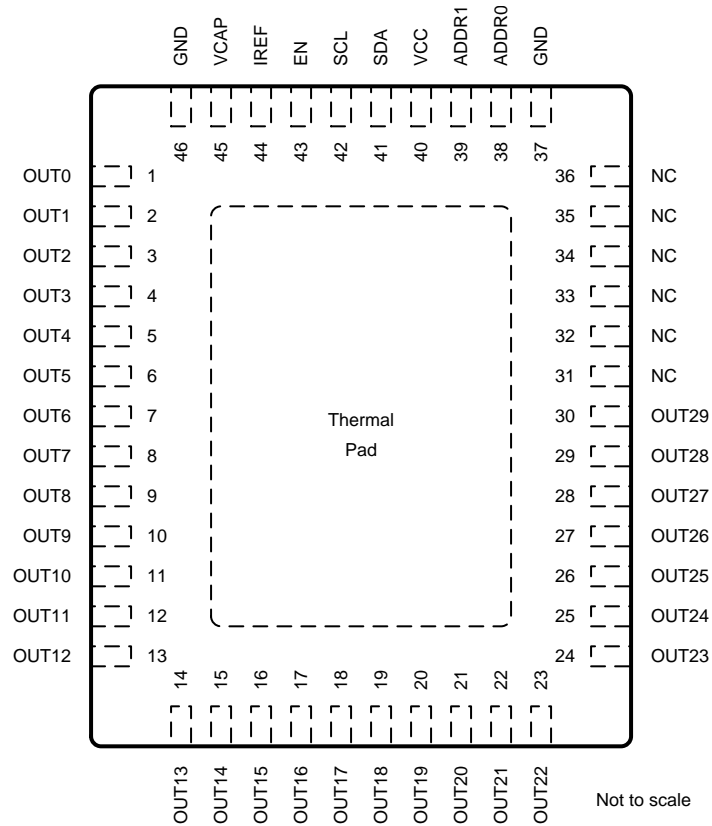

5 Description (continued)

The LP503x device controls each LED output with a 12-bit PWM resolution at 29-kHz switching frequency. This control helps get an *intensity* that decreases smoothly and stops audible noise. Having different color-mixing and intensity-control registers makes writing the software code straightforward. When targeting fade-in, fade-out type breathing effects, the global R, G, B bank control reduces the microcontroller loading significantly. The LP503x device also implements a PWM phase-shifting function to help reduce the input power budget when LEDs turn on simultaneously.

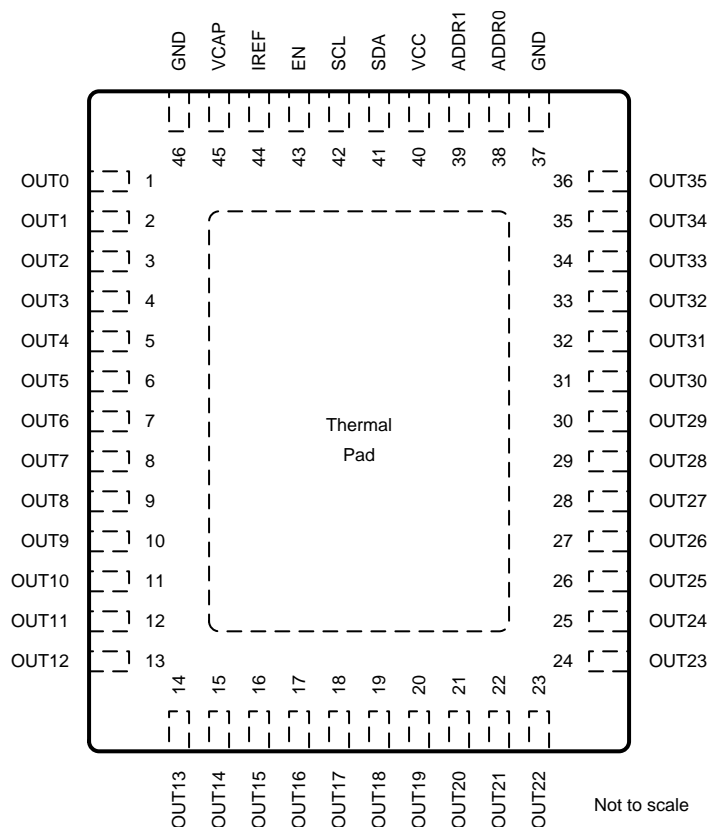

The LP503x device has an automatic power-saving mode to get the ultra-low quiescent current. When channels are all off for 30 ms, the device total power consumption is down to 10 μ A, making the LP503x device a possible alternative for battery-powered end equipment.

SCL	42	42	I	I ² C bus clock line. If not used, this pin must be connected to GND or VCC.
SDA	41	41	I/O	I ² C bus data line. If not used, this pin must be connected to GND or VCC.
VCAP	45	45	—	Internal LDO output pin, this pin must be connected to a 1-μF capacitor to GND.
VCC	40	40	I	Input power.
GND	37	37	—	The ground pin for the device.
GND	46	46	—	The ground pin for the device.
Thermal pad	GND	GND	—	Exposed thermal pad also serves as a ground for the device.

7 Specifications

7.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
Voltage on EN, IREF, OUTx, SCL, SDA, VCC	-0.3	6	V
Voltage on ADDR _x	-0.3	VCC+0.3	V
Voltage on VCAP	-0.3	2	V
Continuous power dissipation	Internally limited		
Junction temperature, T _{J-MAX}	-40	125	°C
Storage temperature, T _{stg}	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±4000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1500 V may actually have higher performance.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±500 V may actually have higher performance.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Input voltage on VCC	2.7	5.5	V
Voltage on OUT _x	0	5.5	V
Voltage on ADDR _x , EN, SDA, SCL	0	5.5	V
Operating ambient temperature, T _A	-40	85	°C

7.4 Thermal Information

8 Detailed Description

8.1 Overview

The LP503x device is a 30- or 36-channel constant-current-sink LED driver. The LP503x device includes all necessary power rails, an on-chip oscillator, and a two-wire serial I²C interface. The maximum constant-current value of all channels is set by a single external resistor. Two hardware address pins allow up to four devices on the same bus. An automatic power-saving mode is implemented to keep the total current consumption under 10 μ A, which makes the LP503x device a potential choice for battery-powered end-equipment.

The LP503x device is optimized for RGB LEDs regarding both live effects and software efforts. The LP503x device controls each LED output with 12-bit PWM resolution at 29-kHz switching frequency, which helps achieve a smooth dimming effect and eliminates audible noise. The independent color-mixing and intensity-control registers make the software coding straightforward. When targeting a fade-in, fade-out type breathing effect, the global RGB bank control reduces the microcontroller loading significantly. The LP503x device also implements a PWM phase-shifting function to help reduce the input power budget when LEDs turn on simultaneously.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Each Channel PWM Control

Most traditional LED drivers are designed for the single-color LEDs, in which the high resolution PWM generator is used for intensity control only. However, for RGB LEDs, both the color mixing and intensity control should be addressed to achieve the target effect. With the traditional solution, the users must handle the color mixing and intensity control simultaneously with a single PWM register. Several undesired effects occur: the limited dimming steps, the complex software design, and the color distortion when using a logarithmic scale control.

The LP503x device is designed with independent color mixing and intensity control, which makes the RGB LED effects fancy and the control experience straightforward. With the inputs of the color-mixing register and the intensity-control register, the final PWM generator output for each channel is 12-bit resolution and 29-kHz dimming frequency, which helps achieve a smooth dimming effect and eliminates audible noise. See [Figure 9](#).

Feature Description (continued)

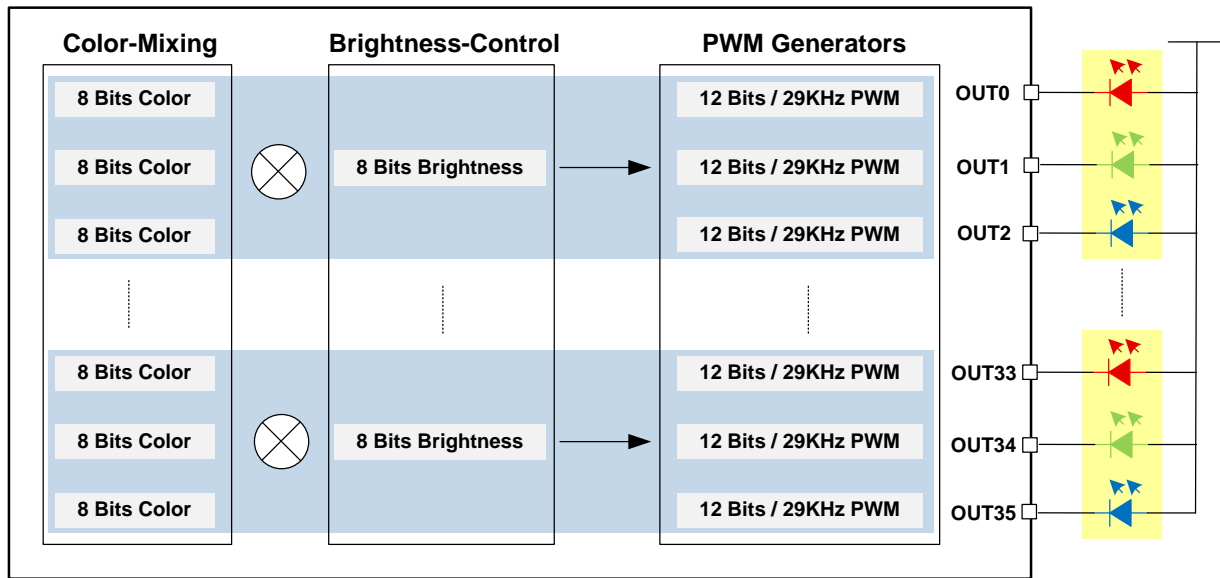

Figure 9. PWM Control Scheme for Each Channel

8.3.1.1 Independent Color Mixing Per RGB LED Module

Each output channel has its own individual 8-bit color-setting register (OUT_x_COLOR). The device allows every RGB LED module to achieve >16 million (256 × 256 × 256) color-mixing.

8.3.1.2 Independent Intensity Control Per RGB LED Module

When color is fixed, the independent intensity-control is used to achieve accurate and flexible dimming control for every RGB LED module.

8.3.1.2.1 Intensity-Control Register Configuration

Every three consecutive output channels are assigned to their respective intensity-control register (LED_x_BRIGHTNESS). For example, OUT₀, OUT₁, and OUT₂ are assigned to LED₀_BRIGHTNESS, so it is recommended to connect the RGB LEDs in the sequence as shown in Table 1. The LP503x device allows 256-step intensity control for each RGB LED module, which helps achieve a smooth dimming effect.

Keeping FFh (default value) in the LED₀_BRIGHTNESS register results in 100% dimming duty cycle. With this setting, the users can just configure the color mixing register by channel to achieve the target dimming effect in a single-color LED application.

8.3.1.2.2 Logarithmic- or Linear-Scale Intensity Control

For human-eye-friendly visual performance, a logarithmic-scale dimming curve is usually implemented in LED drivers. However, for RGB LEDs, if using a single register to achieve both color mixing and intensity control, color distortion can be observed easily when using a logarithmic scale. The LP503x device, with independent color-mixing and intensity-control registers, implements the logarithmic scale dimming control inside the intensity control function, which solves the color distortion issue effectively. See Figure 10. Also, the LP503x device allows users to configure the dimming scale either logarithmically or linearly through the global Log_Scale_EN register bit. If a special dimming curve is desired, using the linear scale with software correction is the most flexible approach. See Figure 11.

Feature Description (continued)

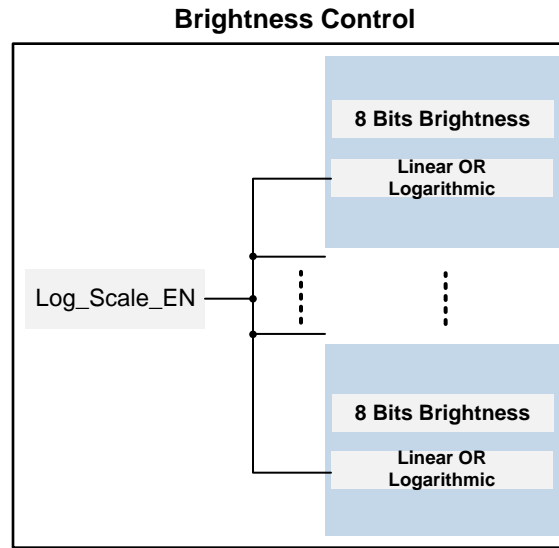

Figure 10. Logarithmic or Linear Scale Intensity Control

Figure 11. Logarithmic vs Linear Dimming Curve

8.3.1.3 12-Bit, 29-kHz PWM Generator Per Channel

8.3.1.3.1 PWM Generator

With the inputs of the color mixing and the intensity control, the final output PWM duty cycle is defined as the product obtained by multiplying the color-mixing register value by the related intensity-control register value. The final output PWM duty cycle has 12 bits of control accuracy, which is achieved by a 9 bits of pure PWM resolution and 3 bits of dithering digital control. For 3-bit dithering, every eighth pulse is made 1 LSB longer to increase the average value by 1 / 8th. The LP503x device allows the users to enable or disable the dithering function through the PWM_Dithering_EN register. When enabled (default), the output PWM duty-cycle accuracy is 12 bits. When disabled, the output PWM duty-cycle accuracy is 9 bits.

To eliminate the audible noise due to the PWM switching, the LP503x device sets the PWM switching frequency at 29-kHz, above the 20-kHz human hearing range.

Feature Description (continued)

8.3.1.4 PWM Phase-Shifting

A PWM phase-shifting scheme allows delaying the time when each LED driver is active. When the LED drivers are not activated simultaneously, the peak load current from the pre-stage power supply is significantly decreased. The scheme also reduces input-current ripple and ceramic-capacitor audible ringing. LED drivers are grouped into three different phases.

- Phase 1—the rising edge of the PWM pulse is fixed. The falling edge of the pulse is changed when the duty cycle changes. Phase 1 is applied to LED0, LED3, ..., LED[3 × (n – 1)].
- Phase 2—the middle point of the PWM pulse is fixed. The pulse spreads in both directions when the PWM duty cycle is increased. Phase 2 is applied to LED1, LED4, ..., LED[3 × (n – 1) + 1].
- Phase 3—the falling edge of the PWM pulse is fixed. The rising edge of the pulse is changed when the duty cycle changes. Phase 3 is applied to LED2, LED5, ..., LED[3 × (n – 1) + 2].
- For LP5030, n = 10. For LP5036, n = 12.

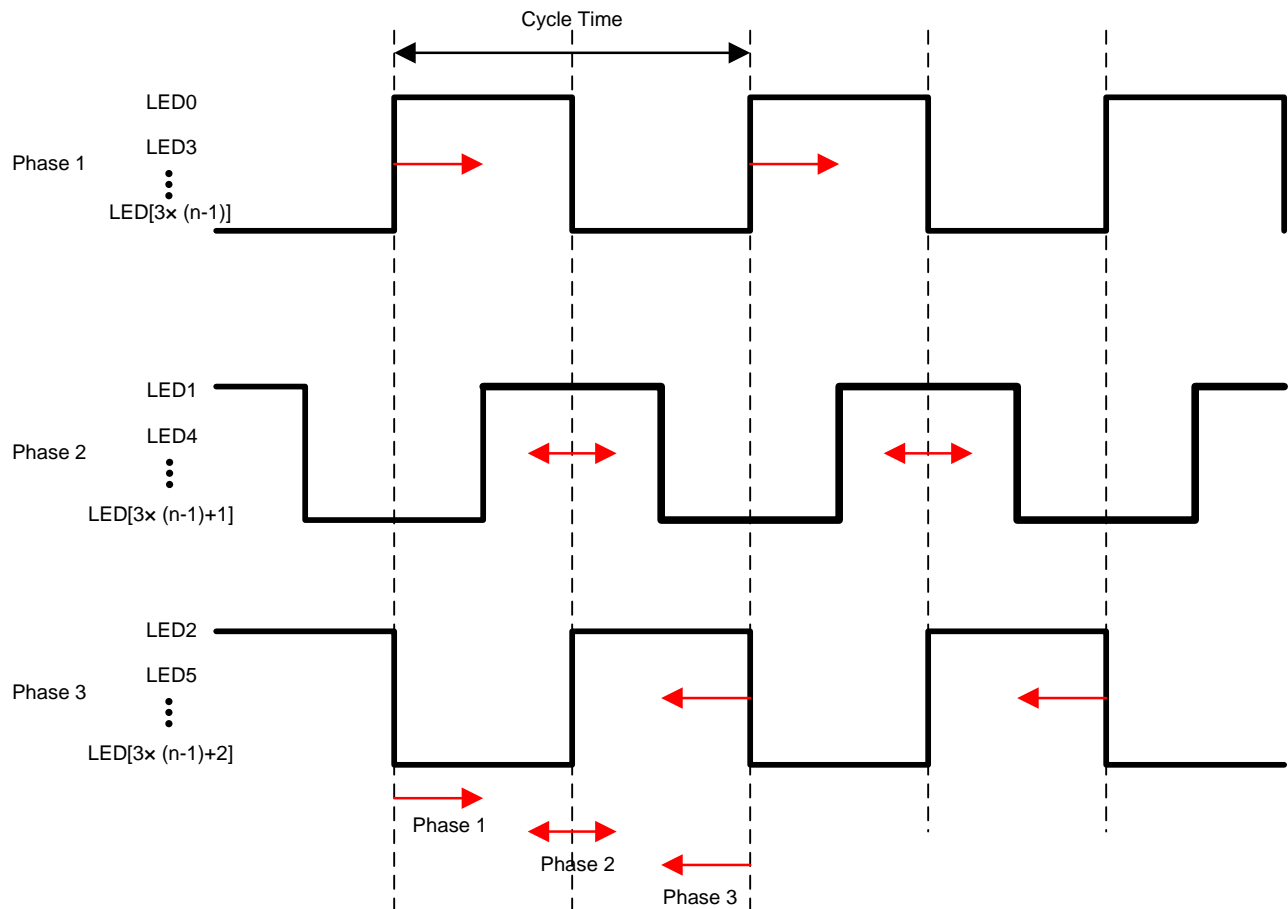

Figure 12. PWM Phase-Shifting

8.3.2 LED Bank Control

For most LED-animation effects, like blinking and breathing, all the RGB LEDs have the same lighting pattern. Instead of controlling the individual LED separately, which occupies the microcontroller resources heavily, the LP503x device provides an easy coding approach, the LED bank control.

Feature Description (continued)

Each channel can be configured as either independent control or bank control through the LEDx_Bank_EN register. When LEDx_Bank_EN = 0 (default), the LED is controlled independently by the related color-mixing and intensity-control registers. When LEDx_Bank_EN = 1, the LP503x device drives the LED in LED bank-control mode. The LED bank has its own independent PWM control scheme, which is the same structure as the PWM scheme of each channel. See [Each Channel PWM Control](#) for more details. When a channel configured as LED bank-control mode, the related color mixing and intensity control is governed by the bank control registers (BANK_A_COLOR, BANK_B_COLOR, BANK_C_COLOR, and BANK_BRIGHTNESS) regardless of the inputs on its own color-mixing and intensity-control registers.

(1) For LP5036 only.

With the bank control configuration, the LP503x device enables users to achieve smooth and live LED effects globally with an ultra-simple software effort. [Figure 14](#) shows an example using LED0 as an independent RGB indicator and others with group breathing effect.

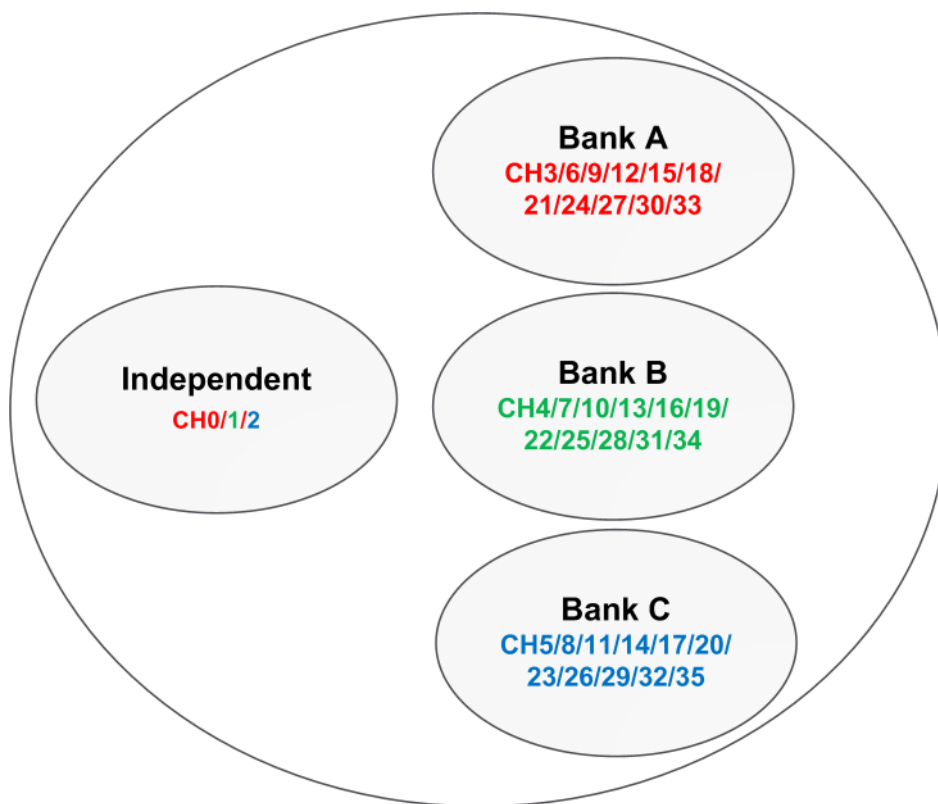

Figure 14. Bank PWM Control Example

8.3.3 Current Range Setting

The maximum constant-current value of all 30 or 36 channels is set by a single external resistor, R_{IREF} . The value of R_{IREF} can be calculated by [Equation 1](#).

$$R_{IREF} = K_{IREF} \times \frac{V_{IREF}}{I_{SET}}$$

where:

- $K_{IREF} = 105$
 - $V_{IREF} = 0.7 \text{ V}$
- (1)

With the IREF pin floating, the output current is close to zero. With the IREF pin shorted to GND, the LP503x device provides internal current-limit protection, and the output-channel maximum current is limited to I_{LIM} .

The LP503x device supports two levels of maximum output current, I_{MAX} .

- When V_{CC} is in the range from 2.7 V to 5.5 V, and the Max_Current_Option (bit) = 0, $I_{MAX} = 25.5 \text{ mA}$.
- When V_{CC} is in the range from 3.3 V to 5.5 V, and the Max_Current_Option (bit) = 1, $I_{MAX} = 35 \text{ mA}$.

8.3.4 Automatic Power-Save Mode

When all the LED outputs are inactive, the LP503x device is able to enter power-save mode automatically, thus lowering idle-current consumption down to 12 μA (maximum). Automatic power-save mode is enabled when register bit Power_Save_EN = 1 (default) and all the LEDs are off for a duration of >30 ms. Almost all analog blocks are powered down in power-save mode. If any I²C command to the device occurs, the LP503x device returns to NORMAL mode.

8.3.5 Protection Features

8.3.5.1 Thermal Shutdown

The LP503x device implements a thermal shutdown mechanism to protect the device from damage due to overheating. When the junction temperature rises to 160°C (typical), the device switches into shutdown mode. The LP503x device releases thermal shutdown when the junction temperature of the device is reduced to 145°C (typical).

8.3.5.2 UVLO

The LP503x device has an internal comparator that monitors the voltage at V_{CC} . When V_{CC} is below V_{UVF} , reset is active and the LP503x device is in the INITIALIZATION state.

8.4 Device Functional Modes

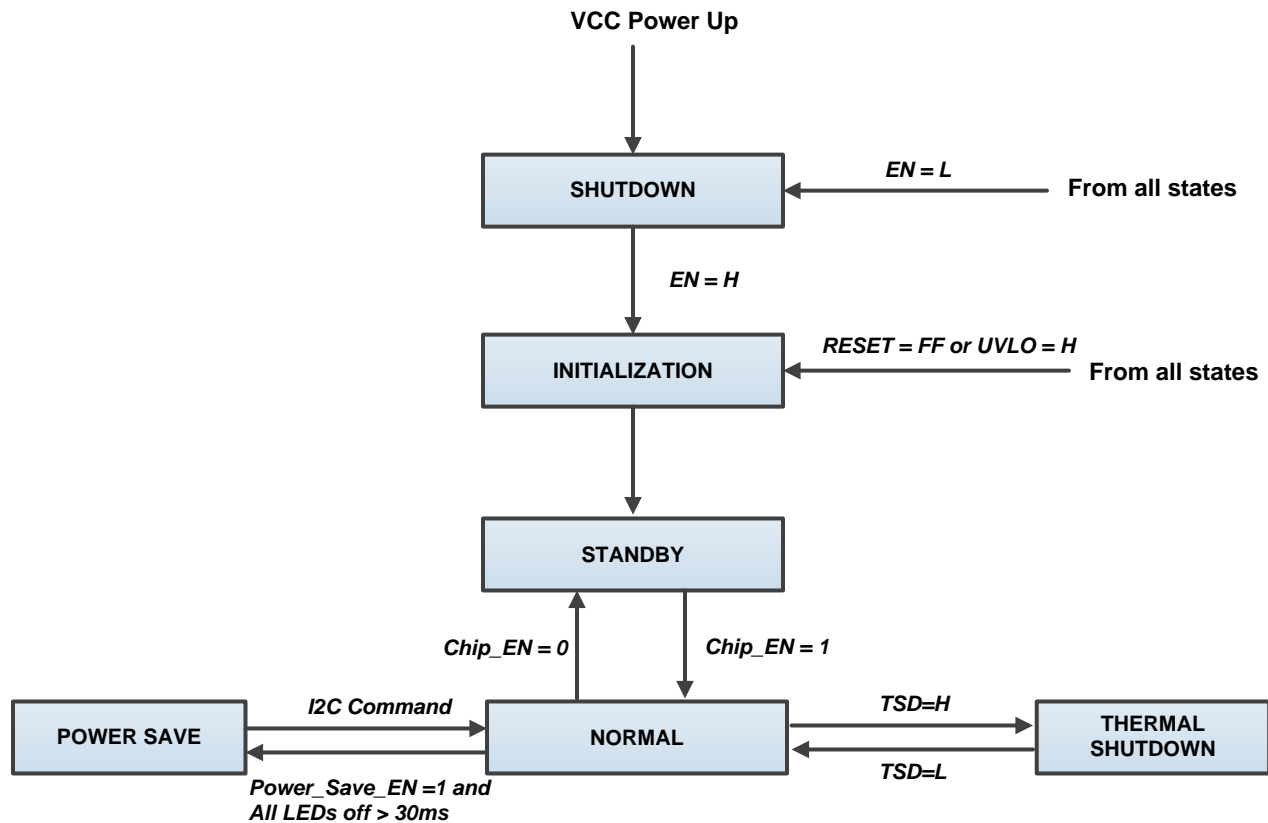

Figure 15. Functional Modes

- **INITIALIZATION:** The device enters into INITIALIZATION mode when EN = H. In this mode, all the registers are reset. Entry can also be from any state, if the RESET (register) = FFh or UVLO is active.
- **NORMAL:** The device enters the NORMAL mode when Chip_EN (register) = 1. I_{CC} is 10 mA (typical).
- **POWER SAVE:** The device automatically enters the POWER SAVE mode when Power_Save_EN (register) = 1 and all the LEDs are off for a duration of >30 ms. In POWER SAVE mode, analog blocks are disabled to minimize power consumption, but the registers retain the data and keep it available via I²C. I_{CC} is 12 μ A (maximum). In case of any I²C command to this device, it goes back to the NORMAL mode.
- **SHUTDOWN:** The device enters into SHUTDOWN mode from all states on V_{CC} power up or when EN = L. I_{CC} is < 1 μ A (max).
- **STANDBY:** The device enters the STANDBY mode when Chip_EN (register bit) = 0. In this mode, all the OUTx are shut down, but the registers retain the data and keep it available via I²C. STANDBY is the low-power-consumption mode, when all circuit functions are disabled. I_{CC} is 10 μ A (maximum).
- **THERMAL SHUTDOWN:** The device automatically enters the THERMAL SHUTDOWN mode when the junction temperature exceeds 160°C (typical). In this mode, all the OUTx outputs are shut down. If the junction temperature decreases below 145°C (typical), the device returns to the NORMAL mode.

8.5 Programming

8.5.1 I²C Interface

The I²C-compatible two-wire serial interface provides access to the programmable functions and registers on the device. This protocol uses a two-wire interface for bidirectional communications between the devices connected to the bus. The two interface lines are the serial data line (SDA) and the serial clock line (SCL). Every device on the bus is assigned a unique address and acts as either a master or a slave depending on whether it generates or receives the serial clock, SCL. The SCL and SDA lines should each have a pullup resistor placed somewhere on the line and remain HIGH even when the bus is idle.

8.5.1.1 Data Validity

The data on SDA line must be stable during the HIGH period of the clock signal (SCL). In other words, the state of the data line can only be changed when the clock signal is LOW.

Figure 16. Data Validity

8.5.1.2 Start and Stop Conditions

START and STOP conditions classify the beginning and the end of the data transfer session. A START condition is defined as the SDA signal transitioning from HIGH to LOW while the SCL line is HIGH. A STOP condition is defined as the SDA transitioning from LOW to HIGH while SCL is HIGH. The bus master always generates START and STOP conditions. The bus is considered to be busy after a START condition and free after a STOP condition. During data transmission, the bus master can generate repeated START conditions. First START and repeated START conditions are functionally equivalent.

Figure 17. Start and Stop Conditions

8.5.1.3 Transferring Data

Every byte put on the SDA line must be eight bits long, with the most-significant bit (MSB) being transferred first. Each byte of data must be followed by an acknowledge bit. The acknowledge-related clock pulse is generated by the master. The master releases the SDA line (HIGH) during the acknowledge clock pulse. The device pulls down the SDA line during the 9th clock pulse, signifying an acknowledge. The device generates an acknowledge after each byte has been received.

Programming (continued)

There is one exception to the acknowledge-after-every-byte rule. When the master is the receiver, it must indicate to the transmitter an end of data by not acknowledging (negative acknowledge) the last byte clocked out of the slave. This negative acknowledge still includes the acknowledge clock pulse (generated by the master), but the SDA line is not pulled down.

After the START condition, the bus master sends a chip address. This address is seven bits long followed by an eighth bit, which is a data direction bit (READ or WRITE). For the eighth bit, a 0 indicates a WRITE, and a 1 indicates a READ. The second byte selects the register to which the data is written. The third byte contains data to write to the selected register.

Figure 18. Acknowledge and Not Acknowledge on I²C Bus

8.5.1.4 I²C Slave Addressing

The device slave address is defined by connecting GND or VCC to the ADDR0 and ADDR1 pins. A total of four independent slave addresses can be realized by combinations when GND or VCC is connected to the ADDR0 and ADDR1 pins (see Table 2 and Table 3).

The device responds to a broadcast slave address regardless of the setting of the ADDR0 and ADDR1 pins. Global writes to the broadcast address can be used for configuring all devices simultaneously. The device supports global read using a broadcast address; however, the data read is only valid if all devices on the I²C bus contain the same value in the addressed register.

Table 2. Slave-Address Combinations

ADDR1	ADDR0	SLAVE ADDRESS	
		INDEPENDENT	BROADCAST
GND	GND	011 0000	001 1100
GND	VCC	011 0001	
VCC	GND	011 0010	
VCC	VCC	011 0011	

Table 3. Chip Address

	SLAVE ADDRESS							R/W
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Independent	0	1	1	0	0	ADDR1	ADDR0	1 or 0

Table 3. Chip Address (continued)

	SLAVE ADDRESS							R/ \overline{W}
	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Broadcast	0	0	1	1	1	0	0	1 or 0

8.5.1.5 Control-Register Write Cycle

- The master device generates a start condition.
- The master device sends the slave address (7 bits) and the data direction bit ($R/\overline{W} = 0$).
- The slave device sends an acknowledge signal if the slave address is correct.
- The master device sends the control register address (8 bits).
- The slave device sends an acknowledge signal.
- The master device sends the data byte to be written to the addressed register.
- The slave device sends an acknowledge signal.
- If the master device sends further data bytes, the control register address of the slave is incremented by 1 after the acknowledge signal. To reduce program load time, the device supports address auto incrementation. The register address is incremented after each 8 data bits.
- The write cycle ends when the master device creates a stop condition.

Figure 19. Write Cycle

8.5.1.6 Control-Register Read Cycle

- The master device generates a start condition.
- The master device sends the slave address (7 bits) and the data direction bit ($R/\overline{W} = 0$).
- The slave device sends an acknowledge signal if the slave address is correct.
- The master device sends the control register address (8 bits).
- The slave device sends an acknowledge signal.
- The master device generates a repeated-start condition.
- The master device sends the slave address (7 bits) and the data direction bit ($R/\overline{W} = 1$).
- The slave device sends an acknowledge signal if the slave address is correct.
- The slave device sends the data byte from the addressed register.
- If the master device sends an acknowledge signal, the control-register address is incremented by 1. The slave device sends the data byte from the addressed register. To reduce program load time, the device supports address auto incrementation. The register address is incremented after each 8 data bits.
- The read cycle ends when the master device does not generate an acknowledge signal after a data byte and generates a stop condition.

Figure 20. Read Cycle

8.5.1.7 Auto-Increment Feature

The auto-increment feature allows writing or reading several consecutive registers within one transmission. For example, when an 8-bit word is sent to the device, the internal address index counter is incremented by 1, and the next register is written. The auto-increment feature is enabled by default and can be disabled by setting the Auto_Incr_EN bit = 0 in the DEVICE_CONFIG1 register. The auto-increment feature is applied for the full register address from 0h to FFh.

8.6 Register Maps

Table 4 lists the memory-mapped registers of the device.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The LP503x device is a 30- or 36-channel constant-current-sink LED driver. The LP503x device improves the user experience in color mixing and intensity control, for both live effects and coding effort. The optimized performance for RGB LEDs makes it a perfect fit for human-machine interaction applications.

9.2 Typical Application

The LP503x design supports up to four devices in parallel with different configurations on the ADDR0 and ADDR1 pins.

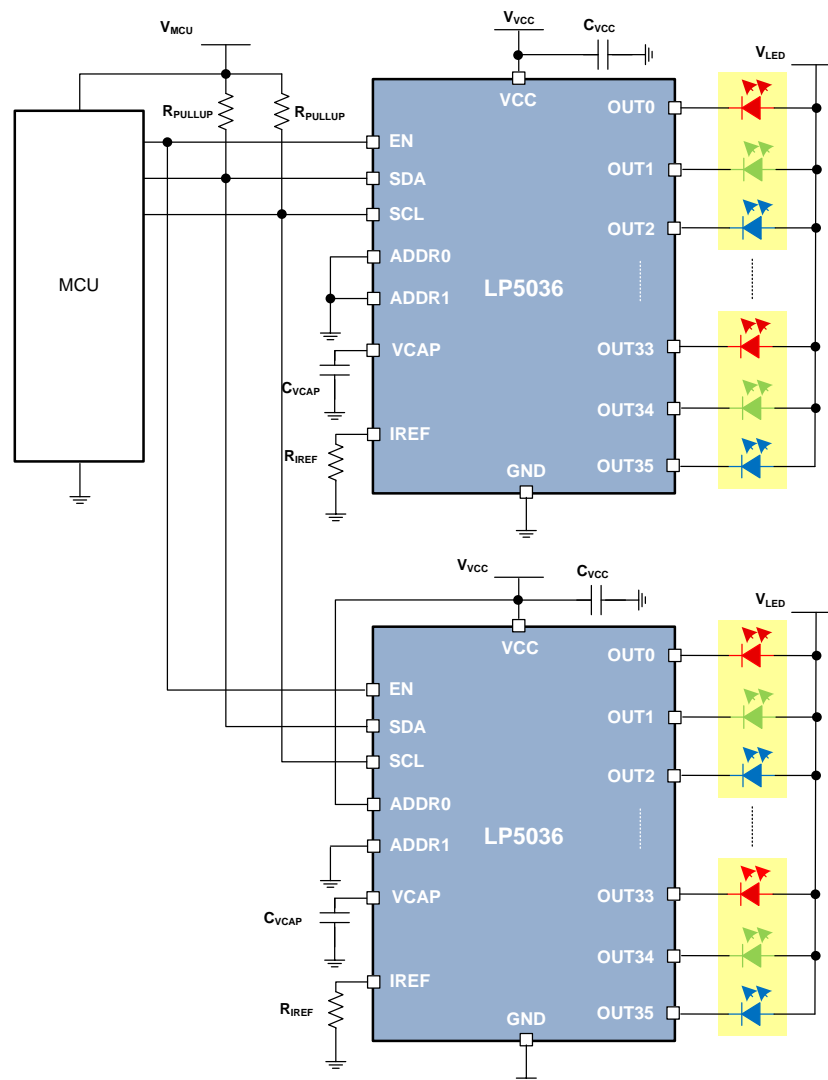

Figure 78. Driving Dual LP5036 Application Example

Typical Application (continued)

9.2.1 Design Requirements

Set the LED current to 15 mA using the R_{IREF} resistor.

9.2.2 Detailed Design Procedure

The LP503x device scales up the reference current (I_{REF}) set by the external resistor (R_{IREF}) to sink the output current (I_{OUT}) at each output port. can be used to calculate the target output current I_{MAX_SET} :

$$R_{IREF} = \frac{K_{IREF} \times V_{IREF}}{I_{(MAX_SET)}} = 105 \times 0.7 \div 0.015 = 4900 \Omega$$

The SCL and SDA lines must each have a pullup resistor placed somewhere on the line (the pullup resistors are normally located on the bus master). In typical applications, values of 1.8 k Ω to 4.7 k Ω are used, depending on the bus capacitance, I/O voltage, and the desired communication speed. Selecting a smaller value increases the pullup speed, but slows the pulldown speed. If they want pull up quickly select the samller one but it will impact the pull down speed.

VCAP is the internal LDO output pin. This pin must be connected through a 1- μ F capacitor to GND. Put the capacitor as close to the device as possible.

TI recommends having a 1- μ F capacitor between VCC and GND to ensure proper operation. Put the capacitor as close to the device as possible.

9.2.3 Application Curves

The test condition for is that the testing is under bank control, using the following register values: 0x02 (0xFF), 0x04 (0xF0), 0x05 (0xF0), 0x06 (0xF0). The test condition for is that the testing is under bank control, using the following register values: 0x02 (0xFF), 0x04 (0x0F), 0x05 (0x0F), 0x06 (0x0F).

Figure 79. Current Waveform of OUT0, OUT1, OUT2 and OUT3

Figure 80. Current Waveform of OUT0, OUT1, OUT2 and OUT3

10 Power Supply Recommendations

The device is designed to operate from a V_{VCC} input-voltage supply range between 2.7 V and 5.5 V. This input supply must be well-regulated and able to withstand maximum input current and maintain stable voltage without voltage drop even in a load-transition condition (start-up or rapid intensity change). The resistance of the input supply rail must be low enough that the input-current transient does not cause a drop below the 2.7-V level in the LP503x V_{VCC} supply voltage.

11 Layout

11.1 Layout Guidelines

To prevent thermal shutdown, the junction temperature, T_J , must be less than $T_{(TSD)}$. If the voltage drop across the output channels is high, the device power dissipation can be large. The LP503x device has very good thermal performance because of the thermal pad design; however, the PCB layout is also very important to ensure that the device has good thermal performance. Good PCB design can optimize heat transfer, which is essential for the long-term reliability of the device.

Use the following guidelines when designing the device layout:

- Put the $C_{V_{CAP}}$, $C_{V_{CC}}$ and $R_{I_{REF}}$ as close as possible to the device. Also, TI recommends placing the ground plane as shown in [Figure 81](#) and [Figure 82](#).
- Maximize the copper coverage on the PCB to increase the thermal conductivity of the board. The major heat flow path from the package to the ambient is through copper on the PCB. Maximum copper density is extremely important when no heat sinks are attached to the PCB on the other side from the package.
- Add as many thermal vias as possible directly under the package ground pad to maximize the thermal conductivity of the board.
- Use either plated-shut or plugged and capped vias for all the thermal vias on both sides of the board to prevent solder voids. To ensure reliability and performance, the solder coverage must be at least 85%.

12.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.3 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

12.6 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated device. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LP5030RJVR	ACTIVE	VQFN	RJV	46	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	LP5030	Samples
LP5036RJVR	ACTIVE	VQFN	RJV	46	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	LP5036	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided.
