

## Features

- Single-voltage Operation
  - 5V Read
  - 5V Reprogramming
- Fast Read Access Time – 70 ns
- Internal Erase/Program Control
- Sector Architecture
  - One 8K Word (16K Bytes) Boot Block with Programming Lockout
  - Two 4K Word (8K Bytes) Parameter Blocks
  - One 112K Word (224K bytes) Main Memory Array Block
- Fast Sector Erase Time – 10 seconds
- Byte-by-byte or Word-by-word Programming – 50  $\mu$ s
- Hardware Data Protection
- Data Polling for End of Program Detection
- Low Power Dissipation
  - 50 mA Active Current
  - 100  $\mu$ A CMOS Standby Current
- Typical 10,000 Write Cycles

## Description

The AT49F2048A is a 5-volt-only, 2-megabit Flash memory organized as 262,144 words of 8 bits each or 128K words of 16 bits each. Manufactured with Atmel's

(continued)

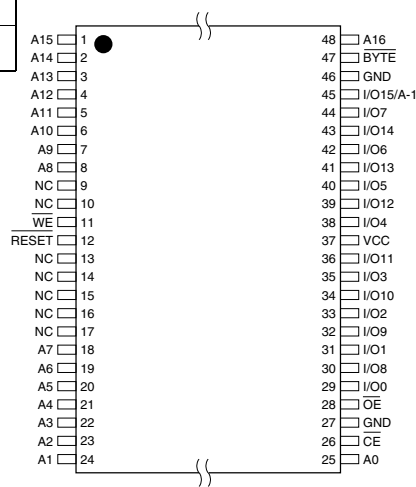

## Pin Configurations

Pin Name	Function
A0 - A16	Addresses
$\overline{CE}$	Chip Enable
$\overline{OE}$	Output Enable
$\overline{WE}$	Write Enable
$\overline{RESET}$	Reset
I/O0 - I/O14	Data Inputs/Outputs
I/O15 (A-1)	I/O15 (Data Input/Output, Word Mode) A-1 (LSB Address Input, Byte Mode)
BYTE	Selects Byte or Word Mode
NC	No Connect

SOIC (SOP)

TSOP Top View  
Type 1

Note: "•" denotes a white dot marked on the package.

**AT49F2048A**

advanced nonvolatile CMOS technology, the device offers access times to 70 ns with power dissipation of just 275 mW. When deselected, the CMOS standby current is less than 100  $\mu$ A.

To allow for simple in-system reprogrammability, the AT49F2048A does not require high input voltages for programming. Five-volt-only commands determine the read and programming operation of the device. Reading data out of the device is similar to reading from an EPROM; it has standard  $\overline{CE}$ ,  $\overline{OE}$  and  $\overline{WE}$  inputs to avoid bus connection. Reprogramming the AT49F2048A is performed by first erasing a block of data and then programming on a byte-by-byte or word-by-word basis.

The device is erased by executing the Erase command sequence; the device internally controls the erase operation. The memory is divided into four blocks for erase operations. There are two 4K word parameter block sections: the boot block and the main memory array block. The

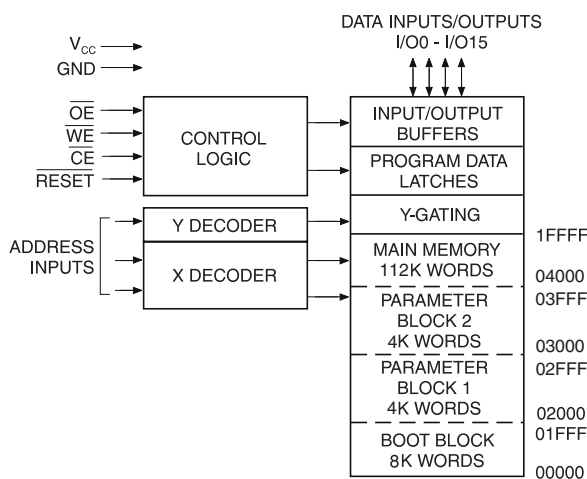

typical number of program and erase cycles is in excess of 10,000 cycles.

The optional 8K word boot block section includes a reprogramming lockout feature to provide data integrity. This feature is enabled by a command sequence. Once the boot block programming lockout feature is enabled, the data in the boot block cannot be changed when input levels of 5.5 volts or less are used. The boot sector is designed to contain user secure code.

The  $\overline{BYTE}$  pin controls whether the device data I/O pins operate in the byte or word configuration. If the  $\overline{BYTE}$  pin is set at a logic "1" or left open, the device is in word configuration; I/O0 - I/O15 are active and controlled by  $\overline{CE}$  and  $\overline{OE}$ .

If the  $\overline{BYTE}$  pin is set at logic "0", the device is in byte configuration, and only data I/O pins I/O0 - I/O7 are active and controlled by  $\overline{CE}$  and  $\overline{OE}$ . The data I/O pins I/O8 - I/O14 are tri-stated and the I/O15 pin is used as an input for the LSB (A-1) address function.

## Block Diagram

## Device Operation

**READ:** The AT49F2048A is accessed like an EPROM. When  $\overline{CE}$  and  $\overline{OE}$  are low and  $\overline{WE}$  is high, the data stored at the memory location determined by the address pins is asserted on the outputs. The outputs are put in the high-impedance state whenever  $\overline{CE}$  or  $\overline{OE}$  is high. This dual line control gives designers flexibility in preventing bus contention.

**COMMAND SEQUENCES:** When the device is first powered on, it will be reset to the read or standby mode, depending upon the state of the control line inputs. In order to perform other device functions, a series of command sequences are entered into the device. The command sequences are shown in the Command Definitions table (I/O8 - I/O15 are don't care inputs for the command codes).

The command sequences are written by applying a low pulse on the  $\overline{WE}$  or  $\overline{CE}$  input with  $\overline{CE}$  or  $\overline{WE}$  low (respectively) and  $\overline{OE}$  high. The address is latched on the falling edge of  $\overline{CE}$  or  $\overline{WE}$ , whichever occurs last. The data is latched by the first rising edge of  $\overline{CE}$  or  $\overline{WE}$ . Standard microprocessor write timings are used. The address locations used in the command sequences are not affected by entering the command sequences.

**RESET:** A  $\overline{RESET}$  input pin is provided to ease some system applications. When  $\overline{RESET}$  is at a logic high level, the device is in its standard operating mode. A low level on the  $\overline{RESET}$  input halts the present device operation and puts the outputs of the device in a high impedance state. When a high level is reasserted on the  $\overline{RESET}$  pin, the device

returns to the read or standby mode, depending upon the state of the control inputs. By applying a  $12V \pm 0.5V$  input signal to the  $\overline{\text{RESET}}$  pin, the boot block array can be reprogrammed even if the boot block program lockout feature has been enabled (see Boot Block Programming Lockout Override section).

**ERASURE:** Before a byte or word can be reprogrammed, it must be erased. The erased state of the memory bits is a logic “1”. The entire device can be erased at one time by using a 6-byte software code.

After the software chip erase has been initiated, the device will internally time the erase operation so that no external clocks are required. The maximum time needed to erase the whole chip is  $t_{EC}$ .

**CHIP ERASE:** The entire device can be erased at one time by using the 6-byte chip erase software code. After the chip erase has been initiated, the device will internally time the erase operation so that no external clocks are required. The maximum time to erase the chip is  $t_{EC}$ .

If the boot block lockout has been enabled, the chip erase will not erase the data in the boot block; it will erase the main memory block and the parameter blocks only. After the chip erase, the device will return to the read or standby mode.

**SECTOR ERASE:** As an alternative to a full chip erase, the device is organized into four sectors that can be individually erased. There are two 4K word parameter block sections: one boot block, and the main memory array block. The Sector Erase command is a six-bus cycle operation. The sector address is latched on the falling  $\overline{\text{WE}}$  edge of the sixth cycle while the 30H data input command is latched at the rising edge of  $\overline{\text{WE}}$ . The sector erase starts after the rising edge of  $\overline{\text{WE}}$  of the sixth cycle. The erase operation is internally controlled; it will automatically time to completion. Whenever the main memory block is erased and reprogrammed, the two parameter blocks should be erased and reprogrammed before the main memory block is erased again. Whenever a parameter block is erased and reprogrammed, the other parameter block should be erased and reprogrammed before the first parameter block is erased again. Whenever the boot block is erased and reprogrammed, the main memory block and the parameter blocks should be erased and reprogrammed before the boot block is erased again.

**BYTE/WORD PROGRAMMING:** Once a memory block is erased, it is programmed (to a logic “0”) on a byte-by-byte or word-by-word basis. Programming is accomplished via the internal device command register and is a four-bus cycle operation. The device will automatically generate the required internal program pulses.

Any commands written to the chip during the embedded programming cycle will be ignored. If a hardware reset happens during programming, the data at the location being

programmed will be corrupted. Please note that a data “0” cannot be programmed back to a “1”; only erase operations can convert “0”s to “1”s. Programming is completed after the specified  $t_{BP}$  cycle time. The  $\overline{\text{Data Polling}}$  feature may also be used to indicate the end of a program cycle.

**BOOT BLOCK PROGRAMMING LOCKOUT:** The device has one designated block that has a programming lockout feature. This feature prevents programming of data in the designated block once the feature has been enabled. The size of the block is 8K words. This block, referred to as the boot block, can contain secure code that is used to bring up the system. Enabling the lockout feature will allow the boot code to stay in the device while data in the rest of the device is updated. This feature does not have to be activated; the boot block’s usage as a write-protected region is optional to the user. The address range of the boot block is 00000H to 01FFFH.

Once the feature is enabled, the data in the boot block can no longer be erased or programmed when input levels of 5.5V or less are used. Data in the main memory block can still be changed through the regular programming method. To activate the lockout feature, a series of six program commands to specific addresses with specific data must be performed. Please refer to the Command Definitions table.

**BOOT BLOCK LOCKOUT DETECTION:** A software method is available to determine if programming of the boot block section is locked out. When the device is in the software product identification mode (see Software Product Identification Entry and Exit sections) a read from address location 00002H will show if programming the boot block is locked out. If the data on I/O0 is low, the boot block can be programmed; if the data on I/O0 is high, the program lockout feature has been enabled and the block cannot be programmed. The software product identification exit code should be used to return to standard operation.

**BOOT BLOCK PROGRAMMING LOCKOUT OVERRIDE:** The user can override the boot block programming lockout by taking the  $\overline{\text{RESET}}$  pin to 12 volts during the entire chip erase, sector erase or word programming operation. When the  $\overline{\text{RESET}}$  pin is brought back to TTL levels, the boot block programming lockout feature is again active.

**PRODUCT IDENTIFICATION:** The product identification mode identifies the device and manufacturer as Atmel. It may be accessed by hardware or software operation. The hardware operation mode can be used by an external programmer to identify the correct programming algorithm for the Atmel product.

For details, see “Operating Modes” on page 5 (for hardware operation) or “Software Product Identification Entry/Exit” on page 10. The manufacturer and device codes are the same for both modes.

**DATA POLLING:** The AT49F2048A features  $\overline{\text{Data Polling}}$  to indicate the end of a program cycle. During a program

cycle, an attempted read of the last byte loaded will result in the complement of the loaded data on I/O7. Once the program cycle has been completed, true data is valid on all outputs and the next cycle may begin. During a chip or sector erase operation, an attempt to read the device will give a “0” on I/O7. Once the program or erase cycle has completed, true data will be read from the device. Data Polling may begin at any time during the program cycle.

**TOGGLE BIT:** In addition to Data Polling, the AT49F2048A provides another method for determining the end of a program or erase cycle. During a program or erase operation, successive attempts to read data from the device will result in I/O6 toggling between one and zero. Once the program

cycle has completed, I/O6 will stop toggling and valid data will be read. Examining the toggle bit may begin at any time during a program cycle.

**HARDWARE DATA PROTECTION:** Hardware features protect against inadvertent programs to the AT49F2048A in the following ways: (a) V<sub>CC</sub> sense: if V<sub>CC</sub> is below 3.8V (typical), the program function is inhibited. (b) V<sub>CC</sub> power-on delay: once V<sub>CC</sub> has reached the V<sub>CC</sub> sense level, the device will automatically time-out 10 ms (typical) before programming. (c) Program inhibit: holding any one of OE low, CE high or WE high inhibits program cycles. (d) Noise filter: pulses of less than 15 ns (typical) on the WE or CE inputs will not initiate a program cycle.

## Command Definition (in Hex)<sup>(1)</sup>

Command Sequence	Bus Cycles	1st Bus Cycle		2nd Bus Cycle		3rd Bus Cycle		4th Bus Cycle		5th Bus Cycle		6th Bus Cycle	
		Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data	Addr	Data
Read	1	Addr	D <sub>OUT</sub>										
Chip Erase	6	5555	AA	2AAA	55	5555	80	5555	AA	2AAA	55	5555	10
Sector Erase	6	5555	AA	2AAA	55	5555	80	5555	AA	2AAA	55	SA <sup>(4)</sup>	30
Word Program	4	5555	AA	2AAA	55	5555	A0	Addr	D <sub>IN</sub>				
Boot Block Lockout <sup>(2)</sup>	6	5555	AA	2AAA	55	5555	80	5555	AA	2AAA	55	5555	40
Product ID Entry	3	5555	AA	2AAA	55	5555	90						
Product ID Exit <sup>(3)</sup>	3	5555	AA	2AAA	55	5555	F0						
Product ID Exit <sup>(3)</sup>	1	xxxx	F0										

- Notes:
- The DATA FORMAT in each bus cycle is as follows: I/O15 - I/O8 (Don't Care); I/O7 - I/O0 (Hex). The ADDRESS FORMAT in each bus cycle is as follows: A15 - A0 (Hex), A-1 and A15 - A16 (Don't Care).
  - The 8K word boot sector has the address range 00000H to 01FFFH.
  - Either one of the Product ID Exit commands can be used.
  - SA = sector addresses: (A16-A0)  
SA = 01XXX for BOOT BLOCK  
SA = 02XXX for PARAMETER BLOCK 1  
SA = 03XXX for PARAMETER BLOCK 2  
SA = 1FXXX for MAIN MEMORY ARRAY

## Absolute Maximum Ratings\*

Temperature under Bias .....	-55°C to +125°C
Storage Temperature .....	-65°C to +150°C
All Input Voltages (including NC Pins) with Respect to Ground .....	-0.6V to +6.25V
All Output Voltages with Respect to Ground .....	-0.6V to V <sub>CC</sub> + 0.6V
Voltage on $\overline{OE}$ with Respect to Ground .....	-0.6V to +13.5V

\*NOTICE: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## DC and AC Operating Range

		AT49F2048A-70	AT49F2048A-90

- Notes:
- X can be V<sub>IL</sub> or V<sub>IH</sub>.
  - Refer to AC programming waveforms.
  - V<sub>H</sub> = 12.0V ± 0.5V.
  - Manufacturer Code: 001FH, Device Code: 0082H
  - See details under Software Product Identification Entry/Exit.

## DC Characteristics

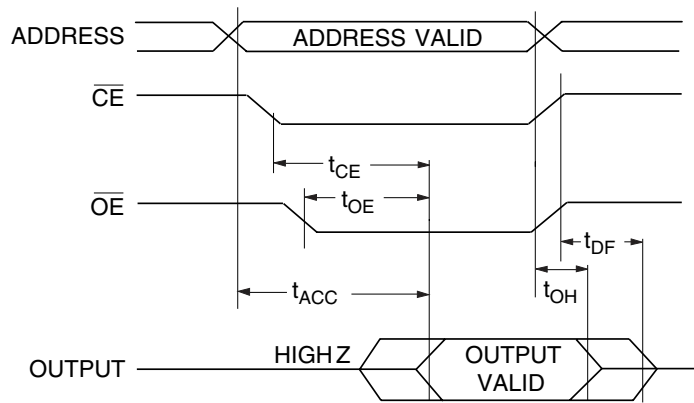

Symbol	Parameter	Condition	Min	Max	Units
I <sub>LI</sub>	Input Load Current	V <sub>IN</sub> = 0V to V <sub>CC</sub>		10.0	μA
I <sub>LO</sub>	Output Leakage Current	V <sub>I/O</sub> = 0V to V <sub>CC</sub>		10.0	μA
I <sub>SB1</sub>	V <sub>CC</sub> Standby Current CMOS	$\overline{CE}$ = V <sub>CC</sub> - 0.3V to V <sub>CC</sub>		100.0	μA
I <sub>SB2</sub>	V <sub>CC</sub> Standby Current TTL	$\overline{CE}$ = 2.0V to V <sub>CC</sub>		3.0	mA
I <sub>CC</sub> <sup>(1)</sup>	V <sub>CC</sub> Active Current	f = 5 MHz; I <sub>OUT</sub> = 0 mA		50.0	mA
V <sub>IL</sub>	Input Low Voltage			0.8	V
V <sub>IH</sub>	Input High Voltage		2.0		V
V <sub>OL</sub>	Output Low Voltage	I <sub>OL</sub> = 2.1 mA		0.45	V
V <sub>OH1</sub>	Output High Voltage	I <sub>OH</sub> = -400 μA	2.4		V
V <sub>OH2</sub>	Output High Voltage CMOS	I <sub>OH</sub> = -100 μA; V <sub>CC</sub> = 4.5V	4.2		V

- Note: 1. In the erase mode, I<sub>CC</sub> is 90 mA.

## AC Read Characteristics

Symbol	Parameter	AT49F2048A-70		AT49F2048A-90		Units
		Min	Max	Min	Max	
$t_{ACC}$	Address to Output Delay		70		90	ns
$t_{CE}^{(1)}$	$\overline{CE}$ to Output Delay		70		90	ns
$t_{OE}^{(2)}$	$\overline{OE}$ to Output Delay		30	0	30	ns
$t_{DF}^{(3)(4)}$	$\overline{CE}$ or $\overline{OE}$ to Output Float	0	25	0	25	ns
$t_{OH}$	Output Hold from $\overline{OE}$ , $\overline{CE}$ or Address, whichever occurred first	0		0		ns

## AC Read Waveforms<sup>(1)(2)(3)(4)</sup>

- Notes:
- $\overline{CE}$  may be delayed up to  $t_{ACC} - t_{CE}$  after the address transition without impact on  $t_{ACC}$ .
  - $\overline{OE}$  may be delayed up to  $t_{CE} - t_{OE}$  after the falling edge of  $\overline{CE}$  without impact on  $t_{CE}$  or by  $t_{ACC} - t_{OE}$  after an address change without impact on  $t_{ACC}$ .
  - $t_{DF}$  is specified from  $\overline{OE}$  or  $\overline{CE}$ , whichever occurs first (CL = 5 pF).
  - This parameter is characterized and is not 100% tested.

## Input Test Waveforms and Measurement Level

$$t_R, t_F < 5 \text{ ns}$$

## Output Test Load

## Pin Capacitance

(f = 1 MHz, T = 25°C)<sup>(1)</sup>

	Typ	Max	Units	Conditions
$C_{IN}$	4	6	pF	$V_{IN} = 0V$
$C_{OUT}$	8	12	pF	$V_{OUT} = 0V$

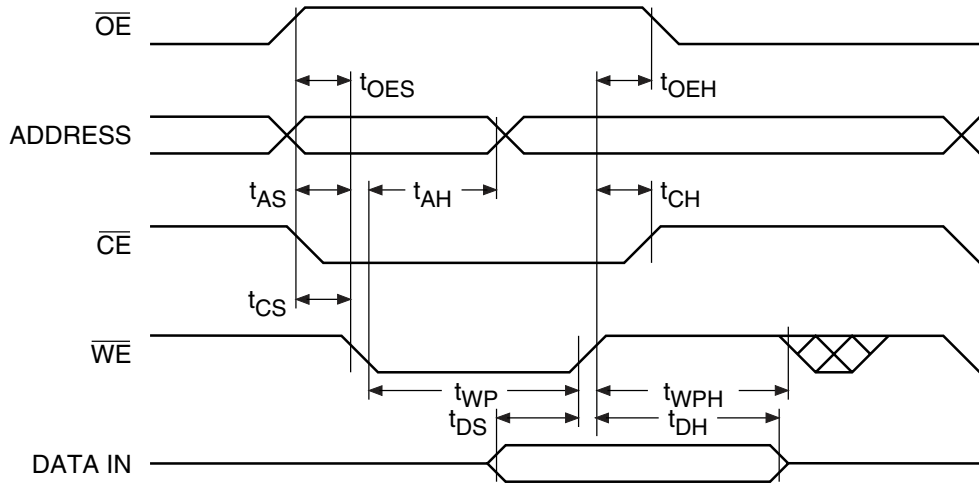

- Note: 1. This parameter is characterized and is not 100% tested.

**AC Word Load Characteristics**

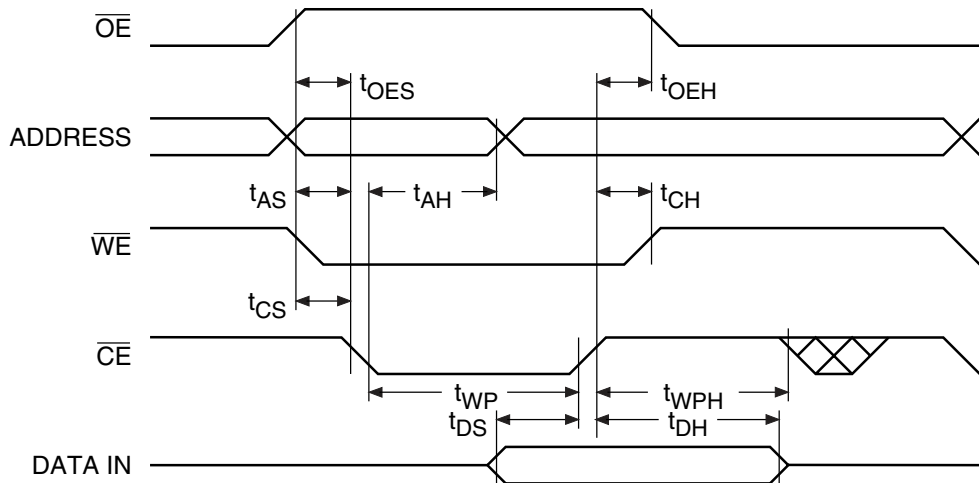

Symbol	Parameter	Min	Max	Units
$t_{AS}, t_{OES}$	Address, $\overline{OE}$ Setup Time	0		ns
$t_{AH}$	Address Hold Time	50		ns
$t_{CS}$	Chip Select Setup Time	0		ns
$t_{CH}$	Chip Select Hold Time	0		ns
$t_{WP}$	Write Pulse Width ( $\overline{WE}$ or $\overline{CE}$ )	50		ns
$t_{DS}$	Data Setup Time	50		ns
$t_{DH}, t_{OEH}$	Data, $\overline{OE}$ Hold Time	0		ns
$t_{WPH}$	Write Pulse Width High	40		ns

**AC Byte/Word Load Waveforms**

**$\overline{WE}$  Controlled**

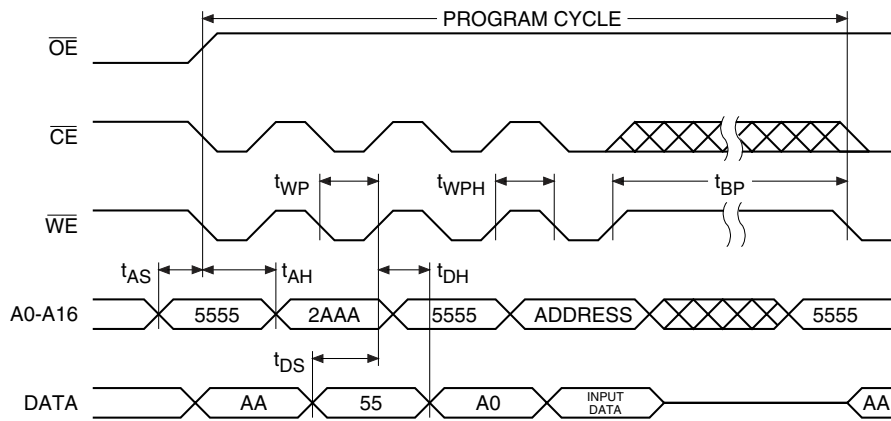

**$\overline{CE}$  Controlled**

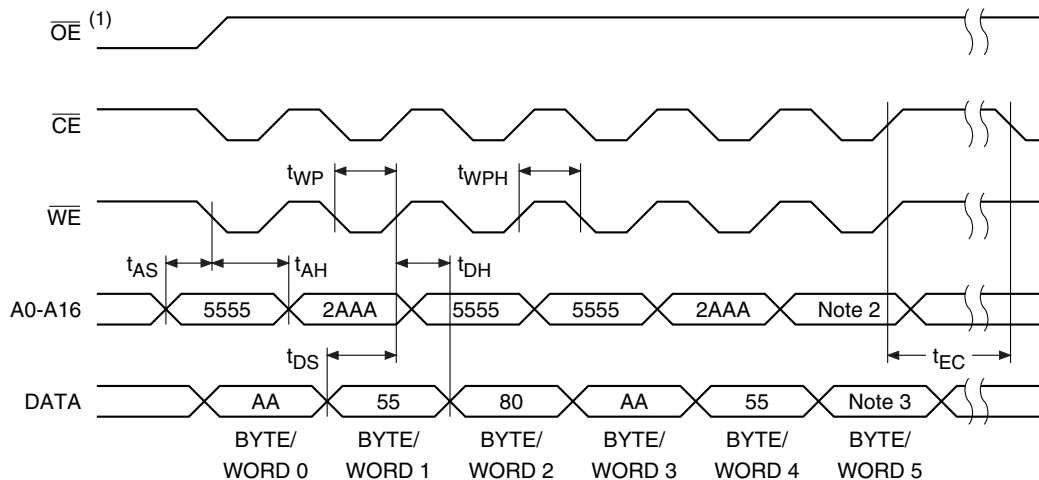

## Program Cycle Characteristics

Symbol	Parameter	Min	Max	Units
$t_{BP}$	Byte/Word Programming Time		50	$\mu$ s
$t_{AS}$	Address Setup Time	0		ns
$t_{AH}$	Address Hold Time	50		ns
$t_{DS}$	Data Setup Time	50		ns
$t_{DH}$	Data Hold Time	0		ns
$t_{WP}$	Write Pulse Width	50		ns
$t_{WPH}$	Write Pulse Width High	40		ns
$t_{EC}$	Erase Cycle Time		5	seconds

## Program Cycle Waveforms

## Sector or Chip Erase Cycle Waveforms

- Notes:
- $\overline{OE}$  must be high only when  $\overline{WE}$  and  $\overline{CE}$  are both low.
  - For chip erase, the address should be 5555. For sector erase, the address depends on what sector is to be erased. (See note 4 under Command Definitions.)
  - For chip erase, the data should be 10H, and for sector erase, the data should be 30H.

## Data Polling Characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Typ	Max	Units
$t_{DH}$	Data Hold Time	10			ns
$t_{OE\overline{H}}$	$\overline{OE}$ Hold Time	10			ns
$t_{OE}$	$\overline{OE}$ to Output Delay <sup>(2)</sup>				ns
$t_{WR}$	Write Recovery Time	0			ns

- Notes: 1. These parameters are characterized and not 100% tested.  
 2. See  $t_{OE}$  spec in "AC Read Characteristics" on page 6.

## Data Polling Waveforms

## Toggle Bit Characteristics<sup>(1)</sup>

Symbol	Parameter	Min	Typ	Max	Units
$t_{DH}$	Data Hold Time	10			ns
$t_{OE\overline{H}}$	$\overline{OE}$ Hold Time	10			ns
$t_{OE}$	$\overline{OE}$ to Output Delay <sup>(2)</sup>				ns
$t_{OEHP}$	$\overline{OE}$ High Pulse	150			ns
$t_{WR}$	Write Recovery Time	0			ns

- Notes: 1. These parameters are characterized and not 100% tested.  
 2. See  $t_{OE}$  spec in "AC Read Characteristics" on page 6.

## Toggle Bit Waveforms<sup>(1)(2)(3)</sup>

- Notes: 1. Toggling either  $\overline{OE}$  or  $\overline{CE}$  or both  $\overline{OE}$  and  $\overline{CE}$  will operate toggle bit. The  $t_{OEHP}$  specification must be met by the toggling input(s).  
 2. Beginning and ending state of I/O6 will vary.  
 3. Any address location may be used but the address should not vary.

## Software Product Identification Entry<sup>(1)</sup>

## Boot Block Lockout Enable Algorithm<sup>(1)</sup>

## Software Product Identification Exit<sup>(1)(6)</sup>

- Notes:
1. Data Format: I/O15 - I/O8 (Don't Care); I/O7 - I/O0 (Hex)  
Address Format: A15 - A0 (Hex); A-1 and A15 - A16 (Don't Care).
  2. Boot Block Lockout feature enabled.

- Notes:
1. Data Format: I/O15 - I/O8 (Don't Care); I/O7 - I/O0 (Hex)  
Address Format: A15 - A0 (Hex); A-1 and A15 - A16 (Don't Care).
  2. A1 - A16 =  $V_{IL}$ .  
Manufacturer Code is read for A0 =  $V_{IL}$ ;  
Device Code is read for A0 =  $V_{IH}$ .
  3. The device does not remain in identification mode if powered down.
  4. The device returns to standard operation mode.
  5. Manufacturer Code: 001FH  
Device Code: 0082H
  6. Either one of the Product ID Exit commands can be used.

## Ordering Information

t <sub>ACC</sub> (ns)	I <sub>CC</sub> (mA)		Ordering Code	Package	Operation Range
