Low Power Bluetooth Module (supporting CSRmesh)

ABBTM-NVC-MDCS71-MESH

Pb | **RoHS/RoHS II compliant**

Moisture Sensitivity Level (MSL) – Level 3

FEATURES:

- Single mode Bluetooth v4.1 low energy
- 4dBm maximum TX power/ -92.5dBm RX sensitivity, RSSI monitoring for proximity applications
- Support CSRmesh.
- UART/I²C master/SPI master interfaces
- 9 digital PIOs/3 analog IOs
- 10bit ADC IOs
- Wakeup interrupt and watchdog timer
- SMT pads for easy and reliable PCB mounting, Internal chip antenna
- 19.50x12.50x2.4mm
- FCC ID: OC3BM1871*
- QDID: B020997*

*Note: ABBTM-NVC-MDCS71-MESH crosses to NovaComm P/N: NVC-MDCS71. BQB/FCC certification documentation is under P/N: NVC-MDCS71.

APPLICATIONS:

Typical Bluetooth low energy applications:
- IoT applications
- Smart Home applications

GENERAL DESCRIPTION

ABBTM-NVC-MDCS71-MESH is a single-mode Bluetooth v4.1 low power module based on CSR's CSR1010. By integrating CSRmesh and Novacomm's proprietary technologies into the single module, it provides a simple solution for building intelligent network so devices can communicate with each other directly.

CSRmesh supports different device models. Current firmware combines light model (e.g. LED lights) and data model together. It allows the module to be used in a color LED light, or as a network endpoint to transmit data to each other. The module uses an ASCII command interface over its 2 wire UART port. The command details can be found in the Software Interface for Mesh Application Manual.

Current firmware allows the module to scan for data packets from nearby devices and relay the data if needed. It consumes approximately 20mA @3V, so it is suitable for applications with power supply connected. If low power consumption operation mode is needed, please contact Abracon for custom firmware.

➢ PHYSICAL INTERFACES

Power Supply

The module integrates internal regulators. It can be easily powered up by connecting a 3V coin battery with a >100uF capacitor at pin VDD_BAT.

Figure 2. Capacitor at pin VDD_BAT

Internal Antenna

The module integrates an on-board chip antenna. There's no need to use external antenna on customer's PCB. Please take precaution to leave ample clearance for the antenna (See Figure 6).

PIO

9 PIOs are provided (4 are multiplexed with SPI debug interface). They are powered from VDD_PIO.

PIO lines are software-configurable as weak pull-up, weak pull-down, strong pull-up or strong pull-down.

Note: At reset all PIO lines are inputs with weak pull-downs. Any of the PIO lines can be configured as interrupt request lines or as wake-up lines from sleep modes.

AIO

3 AIOs are provided. They can be connected to internal 10 bits ADC. Depending on the software, they can be used to read or output a voltage between 0V to 1.3V. Each of them can be also used as a digital output with special firmware.

PWM

PIO3, PIO4, PIO9, PIO10 can be driven by internal PWM module. The PWM module also works while the module is sleep. Therefore it can be used as a LED flasher. These functions are controlled by special firmwares.

UART

This module has a standard UART interface which provides a simple mechanism for communicating with other serial devices using the RS232 protocol.

The UART CTS and RTS signals can be assigned to any PIO pin by the on-chip firmware.

Possible UART Settings

Parameter		Possible Values
Baud Rate	Minimum	1200 baud (≤2%Error)
		9600 baud (≤1%Error)
	Maximum	2M baud (≤1%Error)
Flow Control		RTS/CTS or None
Parity		None, Odd or Even
Number of Stop Bits		1 or 2
Bits per Byte		8

▷ PHYSICAL INTERFACES

I²C Master

The module can act as an I²C master when configured by software. Any two PIOs can be configured as I2C_SCL and I2C_SDA.

SPI Master

The module can act as an SPI master (mode 0) when configured by software. Any four PIOs can be configured as SPI_CLK, SPI_CS#, SPI_DIN and SPI_DOUT. The clock rate of the software SPI is around 470kHz.

SPI Debug

The SPI Debug interface is chosen when SPI_PIO_SEL is high. The interface is used to program and debug the module. So always place test points or header on PCB for this interface and SPI_PIO_SEL.

▷ SOFTWARE STACK

ABBTM-NVC-MDCS71-MESH is a single mode Bluetooth 4.1 module. It integrates CSRmesh and Novacomm's proprietary control interface together so users can access mesh functions easily via the UART interface of the module.

▷ LAYOUT AND SOLDERING

Soldering Recommendations

ABBTM-NVC-MDCS71 is compatible with industrial standard reflow profile for Pb-free solders. The reflow profile used is dependent on the thermal mass of the entire populated PCB, heat transfer efficiency of the oven and particular type of solder paste used. Please refer to the datasheet of the particular solder paste for profile configurations.

The following are recommended for soldering the module to ensure reliable solder joint and operation of the module after soldering. Since the profile used is process and layout dependent, the optimum profile should be studied case by case. Thus following recommendation should be taken as reference only.

- Refer to technical documentations of particular solder paste for profile configurations

- Avoid using more than one flow.

- Reliability of the solder joint and self-alignment of the component are dependent on the solder volume. Minimum of 150μm stencil thickness is recommended.

- Aperture size of the stencil should be 1:1 with the pad size.

- A low residue, "no clean" solder paste should be used due to low mounted height of the component.
▷ REFLOW PROFILE

Figure 5. Typical Lead-Free Reflow Solder Profile for ABBTM-NVC-MDCS71

Key features of the profile:

- Initial Ramp = 1-2.5°C/sec to 175°C ±25°C equilibrium

- Equilibrium time = 60 to 180 seconds

- Ramp to Maximum temperature (250°C) = 3°C/sec max.

- Time above liquidus temperature (217°C): 45-90 seconds

- Device absolute maximum reflow temperature: 255°C

▷ **PHYSICAL INTERFACES**

Layout Guideline

It is strongly recommended to use good layout practices to ensure proper operation of the module. Placing copper or any metal near antenna deteriorates its operation by having effect on the matching properties. Metal shield around the antenna will prevent the radiation and thus metal case should not be used with the module. Use grounding vias separated maximum 3 mm apart at the edge of grounding areas to prevent RF penetrating inside the PCB and causing an unintentional resonator. Use GND vias all around the PCB edges. Figure 4 illustrates recommended PCB design around the antenna of ABBTM-NVC-MDCS71 when the module is placed at the edge of a PCB.

Do not place copper on the top layer under the module, as shown in Figure 6. The module has vias on the area shown, which can cause short circuit if there is copper underneath. Any metal placed closer than 20 mm in any direction from the antenna changes the matching properties and thus will considerably deteriorate the RF performance of the module.
