

High Speed Ultrasound Beamforming Source Driver

Features

- ▶ Multiple-level ultrasound pulser
- ▶ Fast switching current source for push-pull topology
- ▶ 250MHz maximum frequency, 4.0ns input to output delay
- ▶ 15 independent programmable output level registers
- ▶ Pulse amplitude modulation (PAM) with 8-bit resolution
- ▶ 8-bit apodization DAC for peak output current via SPI
- ▶ Very low second order harmonic distortion
- ▶ Picoseconds time-jitter from input to output
- ▶ Fast SPI write and read-back of level & DAC registers
- ▶ +5.0V power supply, 2.5V CMOS logic interface
- ▶ Drives DN2625 MOSFETs output up to 230V_{P-P}
- ▶ Programmable aperture windowing

Applications

- ▶ Medical imaging ultrasound beamforming transmitter
- ▶ Dynamic focusing B-scan CW PW Doppler & FM chirp
- ▶ Ultrasonic phase array focusing transmitter
- ▶ Piezoelectric & MEMS transducer waveform drivers
- ▶ High speed arbitrary waveform generator
- ▶ High resolution NDT phase array ultrasound pulser

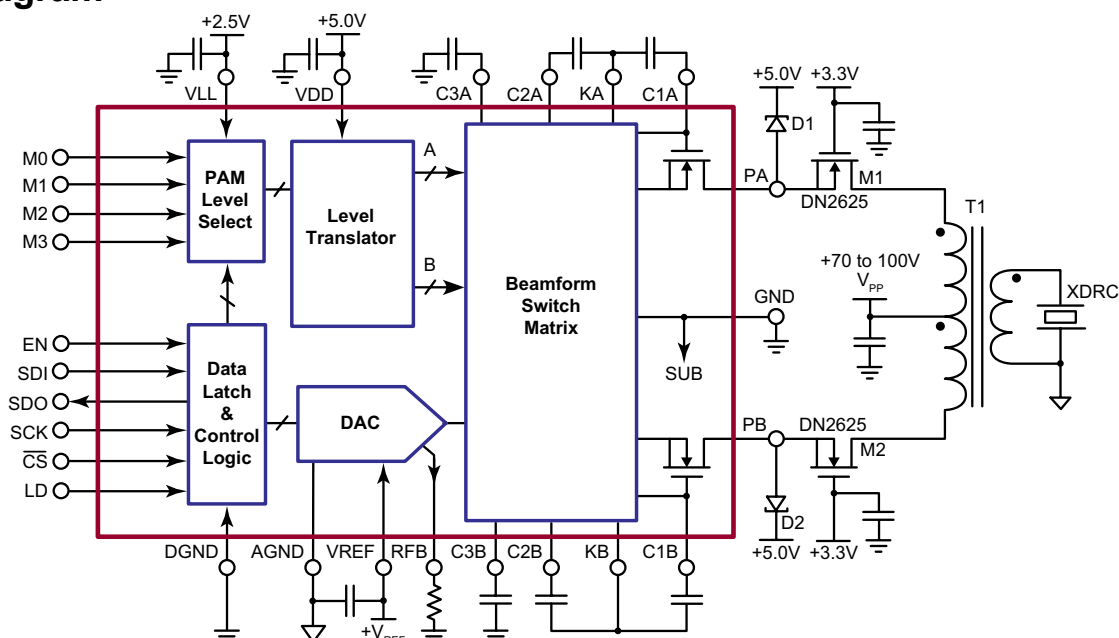

General Description

The MD2134 is a high-speed source driver for use in a pulsed current waveform generator. This programmable, fast, arbitrary current level driver is designed for medical ultrasound imaging beamforming applications. It also can be used in HIFU, NDT ultrasound and other instrument applications.

The MD2134 consists of CMOS digital logic input circuits, an eight-bit current DAC for aperture weighting amplitude control, and a programmable 15-level pulse amplitude modulation (PAM) current-source that does not include a zero level. The fast current sources are constructed with current-switch array, controlled by the LV0~LV15 level-register as the waveform data points. Four logic inputs M[3:0] are used for transmit data level selecting, as well as the transmitting timing control pins. Each level can be programmed to a resolution of +/-127 including zero (8-bit) in addition to an 8-bit SPI apodization DAC. The outputs PA and PB are controlled by M[3:0] pins directly, as well as the polarity-flip bit S1 in the SPI register. The high-speed SPI interface will achieve per-scan-line fast data updating for dynamically changing delay time, weighting and waveforms.

The MD2134 outputs are designed to drive two very low-threshold, high-voltage depletion N-MOSFETs, such as Supertex's DN2625s, as source drivers. The two DN2625 drains are connected to a center-tap RF pulse transformer. The transformer's secondary output connects to a cable and piezoelectric or capacitive transducer as a load with a good impedance match.

Block Diagram

Ordering Information

Part Number	Package	Packing
MD2134K7-G	40-Lead (5x5) QFN	490/ Tray

Pin Configuration

Absolute Maximum Ratings

Parameter	Value
V _{LL} , Logic supply	-0.5V to +3.5V
V _{DD} , Positive supply	-0.5V to +6V
V _{PA} , V _{PB} Driver outputs	-0.5V to +6V
V _{SUB} , Ground	0V
Operating temperature	0°C to +70°C
Storage temperature	-65°C to +150°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

Package Marking

L = Lot Number
 YY = Year Sealed
 WW = Week Sealed
 A = Assembler ID
 C = Country of Origin
 — = "Green" Packaging

Package may or may not include the following marks: Si or

40-Lead QFN (K7)

Typical Thermal Resistance

Package	θ_{ja}
40-Lead QFN	26°C/W

Operating Supply Voltages

(Over operating conditions unless otherwise specified, V_{LL} = +2.5V, V_{DD} = +5V, V_{REF} = 2.5V, R_{FB} = 71.1kΩ, T_A = 25°C, DAC = 0)

Sym	Parameter	Min	Typ	Max	Units	Conditions
V _{LL}	Logic supply	2.25	-	2.75	V	T _A = 0 to 70°C

Serial Port Interface (SPI) Read Write Timing for Control Register

Tx Output Timing Diagram

PA and PB Output Current Equations

The in-phase PA and 180° PB output sinking current magnitudes I_A and I_B can be calculated by the following equations.

$$I_A = \frac{48 \cdot V_{REF} \cdot DAC \cdot (2^6 - 1) \cdot \frac{LAX}{127}}{9 \cdot R_{FB}}$$

$$I_B = \frac{48 \cdot V_{REF} \cdot DAC \cdot (2^6 - 1) \cdot \frac{LBX}{127}}{9 \cdot R_{FB}}$$

Where the V_{REF} is the voltage reference, DAC is the decimal value of the data in the DAC register, R_{FB} is the setting resistor value in ohms, LAX or LBX is the decimal value of the data in the level register.

The values of the results from the equations represent the magnitude of the output current. The current flow into the port PA or PB is controlled by M0, M1, M2 or M3 are turned on. Note that the maximum full scale peak current at PA or PB port only can be obtained at DAC = 255, $V_{REF} = 2.5V$, $R_{FB} = 71.1k\Omega$, $LAX[6:0] = 127$ for PA or $LBX[6:0] = 127$ for PB.

Pin Description

Pin	Name	Description
1	KA	Kelvin connection A
2	GND	High current output ground
3	C1A	Bypass cap to KA, 10nF low ESR X7R ceramic cap.
4	GND	High current output ground
5	VDD	Supplies voltage of the gate driver and internal analog circuit.
6	C3A	Bypass cap to GND of Pin #7, 10nF low ESR X7R ceramic cap.
7	GND	High current output ground
8	VLL	Supply voltage of logic circuit.
9	DGND	Digital logic ground.
10	SCK	Serial clock input.
11	SDI	Serial data input.
12	M3	Control logic for selecting output current level. See “Fast Output Current Level Control Pin Description”
13	M2	Control logic for selecting output current level. See “Fast Output Current Level Control Pin Description”
14	M1	Control logic for selecting output current level. See “Fast Output Current Level Control Pin Description”
15	M0	Control logic for selecting output current level. See “Fast Output Current Level Control Pin Description”
16	VDD	Supplies voltage of the gate driver and internal analog circuit.
17	AGND	Analog reference ground.
18	SDO	Serial data output.
19	CS	Serial chip select, active low, and buffer register loading clock on rising edge.
20	LD	DAC data register loading clock on rising edge.
21	EN	Enable, EN = Low, PA = PB = Hi-Z and all internal registers freeze until next clock rising edge.
22	VREF	External reference voltage input.
23	RFB	Resistor to GND, 71.1kΩ 0.1% for the best accuracy.
24	GND	High current output ground.
25	C3B	Bypass cap to GND of Pin #24, 10nF low ESR X7R ceramic cap.
26	VDD	Supplies voltage of the gate driver and internal analog circuit.
27	GND	High current output ground.
28	C1B	Bypass cap to KB, 10nF low ESR X7R ceramic cap.
29	GND	High current output ground.
30	KB	Kelvin connection B.
31	C2B	Bypass cap to KB, 10nF low ESR X7R ceramic cap.
32	PB	Current sinking source driver output B, external Schottky diode to VDD.
33	PB	Current sinking source driver output B, external Schottky diode to VDD.
34	PB	Current sinking source driver output B, external Schottky diode to VDD.
35	VSUB	Substrate voltage must connect to the lowest potential of the IC, the ground.
36	VSUB	Substrate voltage must connect to the lowest potential of the IC, the ground.
37	PA	Current sinking source driver output A, external Schottky diode to VDD.
38	PA	Current sinking source driver output A, external Schottky diode to VDD.
39	PA	Current sinking source driver output A, external Schottky diode to VDD.
40	C2A	Bypass cap to KA, 10nF low ESR X7R ceramic cap.

Notes:

1. Pin # 35 & #36 are V_{SUB} connected to the center thermal pad internally in the package.
2. All bypass capacitors need be very close to the pins
