

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

NOTES FOR CMOS DEVICES

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

Windows and Windows NT are either registered trademarks or trademarks of Microsoft Corporation in the United States and/or other countries.

PC/AT is a trademark of International Business Machines Corporation.

HP9000 series 700 and HP-UX are trademarks of Hewlett-Packard Company.

SPARCstation is a trademark of SPARC International, Inc.

Solaris and SunOS are trademarks of Sun Microsystems, Inc.

SuperFlash is a registered trademark of Silicon Storage Technology, Inc. in several countries including the United States and Japan.

Caution: This product uses SuperFlash® technology licensed from Silicon Storage Technology, Inc.

• **The information in this document is current as of December, 2005. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

• No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.

• NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.

• Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

• While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.

• NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.

(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

INTRODUCTION

Readers This manual is intended for user engineers who wish to understand the functions of the 78K0/KF1+ and design and develop application systems and programs for these devices.

The target products are as follows.

78K0/KF1+: μ PD78F0148H, 78F0148H(A), 78F0148H(A1), 78F0148HD

Purpose This manual is intended to give users an understanding of the functions described in the **Organization** below.

Organization The 78K0/KF1+ manual is separated into two parts: this manual and the instructions edition (common to the 78K/0 Series).

- Pin functions
- Internal block functions
- Interrupts
- Other on-chip peripheral functions
- Electrical specifications
- CPU functions
- Instruction set
- Explanation of each instruction

How to Read This Manual It is assumed that the readers of this manual have general knowledge of electrical engineering, logic circuits, and microcontrollers.

- When using this manual as the manual for (A) grade products and (A1) grade products:
 - Only the quality grade differs between standard products and (A), (A1) grade products. Read the part number as follows.
 - μ PD780148H → μ PD780148H(A), 780148H(A1)
- To gain a general understanding of functions:
 - Read this manual in the order of the **CONTENTS**. The mark <R> shows major revised points. The revised points can be easily searched by copying an "<R>" in the PDF file and specifying it in the "Find what:" field.
- How to interpret the register format:
 - For a bit number enclosed in brackets, the bit name is defined as a reserved word in the RA78K0, and is defined as an sfr variable by #pragma sfr directive in the CC78K0.
- To check the details of a register when you know the register name:
 - Refer to **APPENDIX C REGISTER INDEX**.
- To know details of the 78K/0 Series instructions:
 - Refer to the separate document **78K/0 Series Instructions User's Manual (U12326E)**.

Caution Examples in this manual employ the “standard” quality grade for general electronics. When using examples in this manual for the “special” quality grade, review the quality grade of each part and/or circuit actually used.

Conventions

Data significance: Higher digits on the left and lower digits on the right
 Active low representations: \overline{xxx} (overscore over pin and signal name)
Note: Footnote for item marked with **Note** in the text.
Caution: Information requiring particular attention
Remark: Supplementary information
 Numerical representations: Binary ...xxxx or xxxxB
 Decimal ...xxxx
 Hexadecimal ...xxxxH

Differences Between 78K0/KF1+ and 78K0/KF1

Series Name		78K0/KF1+	78K0/KF1
Item			
Mask ROM version		None	Available
Flash memory version	Power supply	Single power supply	Two power supplies
	Self-programming function	Available	None
	Option byte	Internal oscillator can be stopped/cannot be stopped selectable	None
Version with on-chip debug function		Available (μ PD78F0148HD)	None
Regulator		None	Available
Power-on clear function		2.1 V \pm 0.1 V (fixed)	2.85 V \pm 0.15 V or 3.5 V \pm 0.2 V selectable
Minimum instruction execution time		0.125 μ s (at 16 MHz operation)	0.166 μ s (at 12 MHz operation)

7.4.6	One-shot pulse output operation.....	183
7.5	Cautions for 16-Bit Timer/Event Counters 00 and 01	188
CHAPTER 8	8-BIT TIMER/EVENT COUNTERS 50 AND 51.....	191
8.1	Functions of 8-Bit Timer/Event Counters 50 and 51.....	191
8.2	Configuration of 8-Bit Timer/Event Counters 50 and 51	193
8.3	Registers Controlling 8-Bit Timer/Event Counters 50 and 51	195
8.4	Operations of 8-Bit Timer/Event Counters 50 and 51	200
8.4.1	Operation as interval timer.....	200
8.4.2	Operation as external event counter.....	202
8.4.3	Square-wave output operation.....	203
8.4.4	PWM output operation	204
8.5	Cautions for 8-Bit Timer/Event Counters 50 and 51	208
CHAPTER 9	8-BIT TIMERS H0 AND H1	209
9.1	Functions of 8-Bit Timers H0 and H1	209
9.2	Configuration of 8-Bit Timers H0 and H1.....	209
9.3	Registers Controlling 8-Bit Timers H0 and H1	213
9.4	Operation of 8-Bit Timers H0 and H1	219
9.4.1	Operation as interval timer/square-wave output	219
9.4.2	Operation as PWM output mode.....	222
9.4.3	Carrier generator mode operation (8-bit timer H1 only)	228
CHAPTER 10	WATCH TIMER.....	235
10.1	Functions of Watch Timer	235
10.2	Configuration of Watch Timer.....	237

10.3 Register Controlling Watch Timer	237
10.4 Watch Timer Operations	239
10.4.1 Watch timer operation	239
10.4.2 Interval timer operation	240
10.5 Cautions for Watch Timer	241
CHAPTER 11 WATCHDOG TIMER	242
11.1 Functions of Watchdog Timer	242
11.2 Configuration of Watchdog Timer	244
11.3 Registers Controlling Watchdog Timer	245
11.4 Operation of Watchdog Timer	248
11.4.1 Watchdog timer operation when “Internal oscillator cannot be stopped” is selected by option byte	248
11.4.2 Watchdog timer operation when “Internal oscillator can be stopped by software” is selected by option byte	249
11.4.3 Watchdog timer operation in STOP mode (when “Internal oscillator can be stopped by software” is selected by option byte)	250
11.4.4 Watchdog timer operation in HALT mode (when “Internal oscillator can be stopped by software” is selected by option byte)	252
CHAPTER 12 CLOCK OUTPUT/BUZZER OUTPUT CONTROLLER	253
12.1 Functions of Clock Output/Buzzer Output Controller	253
12.2 Configuration of Clock Output/Buzzer Output Controller	254
12.3 Register Controlling Clock Output/Buzzer Output Controller	254
12.4 Clock Output/Buzzer Output Controller Operations	256
12.4.1 Clock output operation	256
12.4.2 Operation as buzzer output	256
CHAPTER 13 A/D CONVERTER	257
13.1 Functions of A/D Converter	257
13.2 Configuration of A/D Converter	258
13.3 Registers Used in A/D Converter	260
13.4 A/D Converter Operations	265
13.4.1 Basic operations of A/D converter	265
13.4.2 Input voltage and conversion results	267
13.4.3 A/D converter operation mode	268
13.5 How to Read A/D Converter Characteristics Table	271
13.6 Cautions for A/D Converter	273
CHAPTER 14 SERIAL INTERFACE UART0	278
14.1 Functions of Serial Interface UART0	278
14.2 Configuration of Serial Interface UART0	279
14.3 Registers Controlling Serial Interface UART0	282
14.4 Operation of Serial Interface UART0	287
14.4.1 Operation stop mode	287
14.4.2 Asynchronous serial interface (UART) mode	288
14.4.3 Dedicated baud rate generator	294

CHAPTER 15 SERIAL INTERFACE UART6	299
15.1 Functions of Serial Interface UART6.....	299
15.2 Configuration of Serial Interface UART6	303
15.3 Registers Controlling Serial Interface UART6.....	306
15.4 Operation of Serial Interface UART6	315
15.4.1 Operation stop mode	315
15.4.2 Asynchronous serial interface (UART) mode.....	316
15.4.3 Dedicated baud rate generator	330
CHAPTER 16 SERIAL INTERFACES CSI10 AND CSI11.....	337
16.1 Functions of Serial Interfaces CSI10 and CSI11	337
16.2 Configuration of Serial Interfaces CSI10 and CSI11	338
16.3 Registers Controlling Serial Interfaces CSI10 and CSI11	340
16.4 Operation of Serial Interfaces CSI10 and CSI11	346
16.4.1 Operation stop mode	346
16.4.2 3-wire serial I/O mode.....	347
CHAPTER 17 SERIAL INTERFACE CSIA0.....	357
17.1 Functions of Serial Interface CSIA0	357
17.2 Configuration of Serial Interface CSIA0.....	358
17.3 Registers Controlling Serial Interface CSIA0	360
17.4 Operation of Serial Interface CSIA0	369
17.4.1 Operation stop mode	369
17.4.2 3-wire serial I/O mode.....	370
17.4.3 3-wire serial I/O mode with automatic transmit/receive function	375
CHAPTER 18 MULTIPLIER/DIVIDER.....	397
18.1 Functions of Multiplier/Divider	397
18.2 Configuration of Multiplier/Divider.....	397
18.3 Register Controlling Multiplier/Divider	401
18.4 Operations of Multiplier/Divider.....	402
18.4.1 Multiplication operation	402
18.4.2 Division operation	404
CHAPTER 19 INTERRUPT FUNCTIONS	406
19.1 Interrupt Function Types	406
19.2 Interrupt Sources and Configuration	406
19.3 Registers Controlling Interrupt Functions.....	410
19.4 Interrupt Servicing Operations	418
19.4.1 Maskable interrupt acknowledgment	418
19.4.2 Software interrupt request acknowledgment.....	420
19.4.3 Multiple interrupt servicing	421
19.4.4 Interrupt request hold.....	424
CHAPTER 20 KEY INTERRUPT FUNCTION	425
20.1 Functions of Key Interrupt	425
20.2 Configuration of Key Interrupt.....	425
20.3 Register Controlling Key Interrupt	426

CHAPTER 21 STANDBY FUNCTION	427
21.1 Standby Function and Configuration	427
21.1.1 Standby function.....	427
21.1.2 Registers controlling standby function.....	429
21.2 Standby Function Operation	431
21.2.1 HALT mode.....	431
21.2.2 STOP mode.....	436
CHAPTER 22 RESET FUNCTION	440
22.1 Register for Confirming Reset Source	447
CHAPTER 23 CLOCK MONITOR	448
23.1 Functions of Clock Monitor	448
23.2 Configuration of Clock Monitor	448
23.3 Registers Controlling Clock Monitor	449
23.4 Operation of Clock Monitor	450
CHAPTER 24 POWER-ON-CLEAR CIRCUIT	455
24.1 Functions of Power-on-Clear Circuit	455
24.2 Configuration of Power-on-Clear Circuit	456
24.3 Operation of Power-on-Clear Circuit	456
24.4 Cautions for Power-on-Clear Circuit	457
CHAPTER 25 LOW-VOLTAGE DETECTOR	459
25.1 Functions of Low-Voltage Detector	459
25.2 Configuration of Low-Voltage Detector	459
25.3 Registers Controlling Low-Voltage Detector	460
25.4 Operation of Low-Voltage Detector	462
25.5 Cautions for Low-Voltage Detector	466
CHAPTER 26 OPTION BYTE	469
26.1 Functions of Option Bytes	469
26.2 Format of Option Byte	470
CHAPTER 27 FLASH MEMORY	472
27.1 Internal Memory Size Switching Register	473
27.2 Internal Expansion RAM Size Switching Register	474
27.3 Writing with Flash Programmer	475
27.4 Programming Environment	479
27.5 Communication Mode	479
27.6 Connection of Pins on Board	482
27.6.1 FLMD0 pin.....	482
27.6.2 FLMD1 pin.....	482
27.6.3 Serial interface pins.....	483
27.6.4 $\overline{\text{RESET}}$ pin.....	485
27.6.5 Port pins.....	485
27.6.6 Other signal pins.....	485
27.6.7 Power supply.....	485
27.7 Programming Method	486

27.7.1	Controlling flash memory	486
27.7.2	Flash memory programming mode	487
27.7.3	Selecting communication mode	488
27.7.4	Communication commands	489
27.8	Flash Memory Programming by Self-Writing	490
27.8.1	Registers used for self-programming function	491
27.9	Boot Swap Function.....	495
27.9.1	Outline of boot swap function.....	495
27.9.2	Memory map and boot area.....	496
CHAPTER 28	ON-CHIP DEBUG FUNCTION (μPD78F0148HD ONLY).....	498
28.1	On-Chip Debug Security ID	499
CHAPTER 29	INSTRUCTION SET.....	500
29.1	Conventions Used in Operation List.....	500
29.1.1	Operand identifiers and specification methods	500
29.1.2	Description of operation column	501
29.1.3	Description of flag operation column.....	501
29.2	Operation List.....	502
29.3	Instructions Listed by Addressing Type.....	510
CHAPTER 30	ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS, (A) GRADE PRODUCTS).....	513
CHAPTER 31	ELECTRICAL SPECIFICATIONS ((A1) GRADE PRODUCTS).....	536
CHAPTER 32	PACKAGE DRAWINGS	554
CHAPTER 33	RECOMMENDED SOLDERING CONDITIONS.....	556
CHAPTER 34	CAUTIONS FOR WAIT.....	558
34.1	Cautions for Wait.....	558
34.2	Peripheral Hardware That Generates Wait	559
34.3	Example of Wait Occurrence.....	560
APPENDIX A	DEVELOPMENT TOOLS.....	561
A.1	Software Package.....	564
A.2	Language Processing Software.....	564
A.3	Control Software	565
A.4	Flash Memory Writing Tools	565
A.5	Debugging Tools (Hardware)	566
A.5.1	When using in-circuit emulator QB-78K0KX1H.....	566
A.5.2	When using on-chip debug emulator QB-78K0MINI	567
A.6	Debugging Tools (Software)	567
APPENDIX B	NOTES ON TARGET SYSTEM DESIGN	568
APPENDIX C	REGISTER INDEX	570
C.1	Register Index (In Alphabetical Order with Respect to Register Names)	570
C.2	Register Index (In Alphabetical Order with Respect to Register Symbol)	574

APPENDIX D LIST OF CAUTIONS..... 578

APPENDIX E REVISION HISTORY 604

E.1 Major Revisions in This Edition..... 604

E.2 Revision History up to Previous Edition 604

CHAPTER 1 OUTLINE

1.1 Features

- Minimum instruction execution time can be changed from high speed (0.125 μ s: @ 16 MHz operation with high-speed system clock) to ultra low-speed (122 μ s: @ 32.768 kHz operation with subsystem clock)
- General-purpose register: 8 bits \times 32 registers (8 bits \times 8 registers \times 4 banks)
- ROM, RAM capacities

Part Number \ Item	Program Memory (ROM)		Data Memory	
			Internal High-Speed RAM	Internal Expansion RAM
μ PD78F0148H, 78F0148HD	Flash memory	60 KB ^{Note}	1024 bytes	1024 bytes ^{Note}

Note The internal flash memory and internal expansion RAM capacities can be changed using the internal memory size switching register (IMS) and the internal expansion RAM size switching register (IXS).

- On-chip single-power-supply flash memory
- Self-programming (with boot swap function)
- On-chip debug function (μ PD78F0148HD only)
- Buffer RAM: 32 bytes (can be used for transfer in the 3-wire serial I/O mode with automatic transmit/receive function)
- External memory expansion space: 64 KB (on-chip external bus interface function^{Note 1})
- On-chip power-on-clear (POC) circuit and low-voltage detector (LVI)
- Short startup is possible via the CPU default start using the internal oscillator
- On-chip clock monitor function using the internal oscillator
- On-chip watchdog timer (operable with internal oscillation clock)
- On-chip multiplier/divider
- On-chip key interrupt function
- On-chip clock output/buzzer output controller
- I/O ports: 67 (N-ch open drain: 4)
- Timer: 8 channels
- Serial interface: 4 channels
(UART (LIN (Local Interconnect Network)-bus supported): 1 channel, CSI: 1 channel, CSI/UART^{Note 2}: 1 channel, CSI with automatic transmission/reception: 1 channel)
- 10-bit resolution A/D converter: 8 channels
- <R> ○ Supply voltage:
 - Standard products and (A) grade products:
 $V_{DD} = 2.5$ to 5.5 V (with internal oscillation clock or subsystem clock: $V_{DD} = 2.0$ to 5.5 V^{Note 3})
 - (A1) grade products:
 $V_{DD} = 2.7$ to 5.5 V (with internal oscillation clock: $V_{DD} = 2.0$ to 5.5 V^{Note 3})
- <R> ○ Operating ambient temperature:
 - Standard products and (A) grade products: $T_A = -40$ to $+85^\circ\text{C}$
 - (A1) grade products: $T_A = -40$ to $+110^\circ\text{C}$
- <R> **Notes**
 1. The external bus interface function cannot be used in (A1) grade products.
 2. Select either of the functions of these alternate-function pins.
 3. Use the product in a voltage range of 2.2 to 5.5 V because the detection voltage (V_{POC}) of the power-on-clear (POC) circuit is 2.1 V ± 0.1 V.

1.2 Applications

- Automotive equipment
 - System control for body electricals (power windows, keyless entry reception, etc.)
 - Sub-microcontrollers for control
- Home audio, car audio
- AV equipment
- PC peripheral equipment (keyboards, etc.)
- Household electrical appliances
 - Outdoor air conditioner units
 - Microwave ovens, electric rice cookers
- Industrial equipment
 - Pumps
 - Vending machines
 - FA (Factory Automation)

<R> 1.3 Ordering Information

- Flash memory version

Part Number	Package	Quality Grade
μ PD78F0148HGK-9EU	80-pin plastic TQFP (fine pitch) (12 × 12)	Standard
μ PD78F0148HGC-8BT	80-pin plastic QFP (14 × 14)	Standard
μ PD78F0148HGK-9EU-A	80-pin plastic TQFP (fine pitch) (12 × 12)	Standard
μ PD78F0148HGC-8BT-A	80-pin plastic QFP (14 × 14)	Standard
μ PD78F0148HDGK-9EU ^{Note}	80-pin plastic TQFP (fine pitch) (12 × 12)	Standard
μ PD78F0148HDGC-8BT ^{Note}	80-pin plastic QFP (14 × 14)	Standard
μ PD78F0148HDGK-9EU-A ^{Note}	80-pin plastic TQFP (fine pitch) (12 × 12)	Standard
μ PD78F0148HDGC-8BT-A ^{Note}	80-pin plastic QFP (14 × 14)	Standard
μ PD78F0148HGK(A)-9EU	80-pin plastic TQFP (fine pitch) (12 × 12)	Special
μ PD78F0148HGC(A)-8BT	80-pin plastic QFP (14 × 14)	Special
μ PD78F0148HGK(A)-9EU-A	80-pin plastic TQFP (fine pitch) (12 × 12)	Special
μ PD78F0148HGC(A)-8BT-A	80-pin plastic QFP (14 × 14)	Special
μ PD78F0148HGK(A1)-9EU	80-pin plastic TQFP (fine pitch) (12 × 12)	Special
μ PD78F0148HGC(A1)-8BT	80-pin plastic QFP (14 × 14)	Special
μ PD78F0148HGK(A1)-9EU-A	80-pin plastic TQFP (fine pitch) (12 × 12)	Special
μ PD78F0148HGC(A1)-8BT-A	80-pin plastic QFP (14 × 14)	Special

Note Only the ES (engineering sample) version is available. Use this product for program evaluation.

Remark Products that have the part numbers suffixed by "-A" are lead-free products.

Please refer to "Quality Grades on NEC Semiconductor Devices" (Document No. C11531E) published by NEC Electronics Corporation to know the specification of the quality grade on the device and its recommended applications.

1.4 Pin Configuration (Top View)

- 80-pin plastic TQFP (fine pitch) (12 × 12)
- 80-pin plastic QFP (14 × 14)

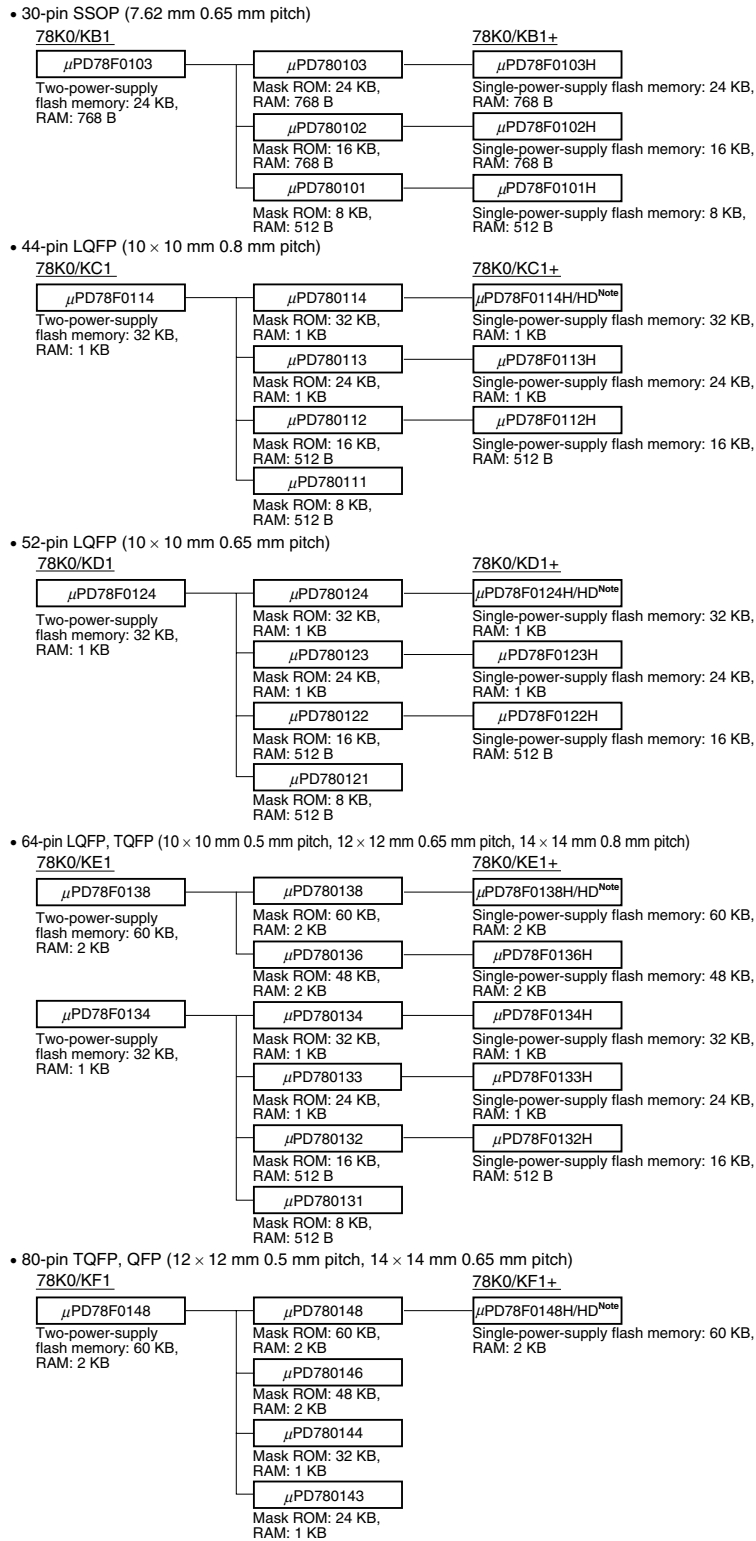

Caution Connect the AV_{SS} pin to V_{SS}.

Pin Identification

A8 to A15:	Address bus	PCL:	Programmable clock output
AD0 to AD7:	Address/data bus	$\overline{\text{RESET}}$:	Reset
ANI0 to ANI7:	Analog input	RxD0, RxD6:	Receive data
ASTB:	Address strobe	$\overline{\text{RD}}$:	Read strobe
AVREF:	Analog reference voltage	$\overline{\text{SCK10}}$, $\overline{\text{SCK11}}$,	
AVss:	Analog ground	$\overline{\text{SCKA0}}$:	Serial clock input/output
BUSY0:	Serial busy input	SI10, SI11, SIA0:	Serial data input
BUZ:	Buzzer output	SO10, SO11,	
EVDD:	Power supply for port	SOA1:	Serial data output
EVss:	Ground for port	$\overline{\text{SSI11}}$:	Serial interface chip select input
FLMD0, FLMD1:	Flash programming mode	STB0:	Serial strobe
INTP0 to INTP7:	External interrupt input	TI000, TI010,	
KR0 to KR7:	Key return	TI001, TI011,	
NC:	Non-connection	TI50, TI51:	Timer input
P00 to P06:	Port 0	TO00, TO01,	
P10 to P17:	Port 1	TO50, TO51,	
P20 to P27:	Port 2	TOH0, TOH1:	Timer output
P30 to P33:	Port 3	TxD0, TxD6:	Transmit data
P40 to P47:	Port 4	VDD:	Power supply
P50 to P57:	Port 5	Vss:	Ground
P60 to P67:	Port 6	$\overline{\text{WAIT}}$:	Wait
P70 to P77:	Port 7	$\overline{\text{WR}}$:	Write strobe
P120:	Port 12	X1, X2:	Crystal oscillator (High-speed system clock)
P130:	Port 13		
P140 to P145:	Port 14	XT1, XT2:	Crystal oscillator (Subsystem clock)

1.5 Kx1 Series Lineup

1.5.1 78K0/Kx1, 78K0/Kx1+ product lineup

Note Product with on-chip debug function

The list of functions in the 78K0/Kx1 is shown below.

Part Number		78K0/KB1			78K0/KC1			78K0/KD1			78K0/KE1				78K0/KF1			
Item		30 pins			44 pins			52 pins			64 pins				80 pins			
Internal memory (KB)	Mask ROM	8	16/24	–	8/16	24/32	–	8/16	24/32	–	8/16	24/32	–	48/60	–	24/32	48/60	–
	Flash memory	–	24	–	32	–	32	–	32	–	32	–	60	–	60	–	60	–
	RAM	0.5	0.75	0.5	1	0.5	1	0.5	1	0.5	1	2	1	2	1	2	1	2
Power supply voltage		$V_{DD} = 2.5$ to 5.5 V ^{Notes 1, 2}																
Minimum instruction execution time		0.166 μ s (when 12 MHz, $V_{DD} = 4.0$ to 5.5 V) 0.2 μ s (when 10 MHz, $V_{DD} = 3.5$ to 5.5 V) 0.238 μ s (when 8.38 MHz, $V_{DD} = 3.0$ to 5.5 V) 0.4 μ s (when 5 MHz, $V_{DD} = 2.5$ to 5.5 V)					<Connect REGC pin to V_{DD} > 0.166 μ s (when 12 MHz, $V_{DD} = 4.0$ to 5.5 V) 0.2 μ s (when 10 MHz, $V_{DD} = 3.5$ to 5.5 V) 0.238 μ s (when 8.38 MHz, $V_{DD} = 3.0$ to 5.5 V) 0.4 μ s (when 5 MHz, $V_{DD} = 2.5$ to 5.5 V)											
Clock	X1 input	2 to 12 MHz																
	Sub	–	32.768 kHz															
	Internal oscillation	240 kHz (TYP.)																
Port	CMOS I/O	17			19			26			38				54			
	CMOS input	4			8													
	CMOS output	1																
	N-ch open-drain I/O	–	4															
Timer	16 bits (TM0)	1 ch					2 ch				1 ch		2 ch					
	8 bits (TM5)	1 ch			2 ch													
	8 bits (TMH)	2 ch																
	For watch	–	1 ch															
	WDT	1 ch																
Serial interface	3-wire CSI ^{Note 3}	1 ch					2 ch				1 ch		2 ch					
	Automatic transmit/receive 3-wire CSI	–														1 ch		
	UART ^{Note 3}	–	1 ch															
	UART supporting LIN-bus	1 ch																
10-bit A/D converter		4 ch			8 ch													
Interrupt	External	6			7			8			9				9			
	Internal	11	12	15			16			19				17	20			
Key return input		–	4 ch			8 ch												
Reset	RESET pin	Provided																
	POC	2.85 V ± 0.15 V/ 3.5 V ± 0.20 V (selectable by mask option)																
	LVI	2.85 V/ 3.1 V/ 3.3 V ± 0.15 V/ 3.5 V/ 3.7 V/ 3.9 V/ 4.1 V/ 4.3 V ± 0.2 V (selectable by software)																
	Clock monitor	Provided																
	WDT	Provided																
Clock output/buzzer output		–					Clock output only			Provided								
Multiplier/divider		–														16 bits \times 16 bits, 32 bits \div 16 bits		
ROM correction		–														Provided		–
Standby function		HALT/STOP mode																
Operating ambient temperature		Standard and special (A) grade products: -40 to $+85^{\circ}$ C Special (A1) grade products: -40 to $+110^{\circ}$ C (mask ROM version), -40 to $+105^{\circ}$ C (flash memory version), Special (A2) grade products: -40 to $+125^{\circ}$ C (mask ROM version)																

- Notes 1.** If the POC circuit detection voltage (V_{POC}) is used with 2.85 V ± 0.15 V, then use the products in the voltage range of 3.0 to 5.5 V.
- 2.** If the POC circuit detection voltage (V_{POC}) is used with 3.5 V ± 0.2 V, then use the products in the voltage range of 3.7 to 5.5 V.
- 3.** Select either of the functions of these alternate-function pins.

The list of functions in the 78K0/Kx1+ is shown below.

Part Number		78K0/KB1+		78K0/KC1+		78K0/KD1+		78K0/KE1+			78K0/KF1+	
Item												
Number of pins		30 pins		44 pins		52 pins		64 pins			80 pins	
Internal memory (KB)	Flash memory	8	16/24	16	24/32	16	24/32	16	24/32	48/60	60	
	RAM	0.5	0.75	0.5	1	0.5	1	0.5	1	2	2	
Power supply voltage		$V_{DD} = 2.5$ to 5.5 V (with internal oscillation clock or subclock: $V_{DD} = 2.0$ to 5.5 V ^{Note 1})										
Minimum instruction execution time		0.125 μ s (when 16 MHz, $V_{DD} = 4.0$ to 5.5 V), 0.2 μ s (when 10 MHz, $V_{DD} = 3.5$ to 5.5 V), 0.238 μ s (when 8.38 MHz, $V_{DD} = 3.0$ to 5.5 V), 0.4 μ s (when 5 MHz, $V_{DD} = 2.5$ to 5.5 V)										
Clock	Crystal/ceramic	2 to 16 MHz										
	RC	3 to 4 MHz				-						
	Sub	-		32.768 kHz								
	Internal oscillation	240 kHz (TYP.)										
Ports	CMOS I/O	17		19		26		38			54	
	CMOS input	4		8								
	CMOS output	1										
	N-ch open-drain I/O	-		4								
Timer	16 bits (TM0)	1 ch					2 ch					
	8 bits (TM5)	1 ch		2 ch								
	8 bits (TMH)	2 ch										
	For watch	-		1 ch								
	WDT	1 ch										
Serial interface	3-wire CSI ^{Note 2}	1 ch					2 ch					
	Automatic transmit/receive 3-wire CSI	-								1 ch		
	UART ^{Note 2}	-		1 ch								
	UART supporting LIN-bus	1 ch										
10-bit A/D converter		4 ch		8 ch								
Interrupts	External	6		7		8		9			9	
	Internal	11	12	15			16	19		20		
Key return input		-		4 ch		8 ch						
Reset	RESET pin	Provided										
	POC	2.1 V \pm 0.1 V (detection voltage is fixed)										
	LVI	2.35 V/2.6 V/2.85 V/3.1 V/3.3 V \pm 0.15 V/3.5 V/3.7 V/3.9 V/4.1 V/4.3 V \pm 0.2 V (selectable by software)										
	Clock monitor	Provided										
	WDT	Provided										
Clock output/buzzer output		-				Clock output only		Provided				
External bus interface		-								Provided		
Multiplier/divider		-					16 bits \times 16 bits, 32 bits \div 16 bits					
ROM correction		-							Provided		-	
Self-programming function		Provided										
Product with on-chip debug function		μ PD78F0114HD, 78F0124HD, 78F0138HD, 78F0148HD										
Standby function		HALT/STOP mode										
Operating ambient temperature		Standard and special (A) grade products: -40 to $+85^{\circ}$ C Special (A1) grade products: -40 to $+110^{\circ}$ C										

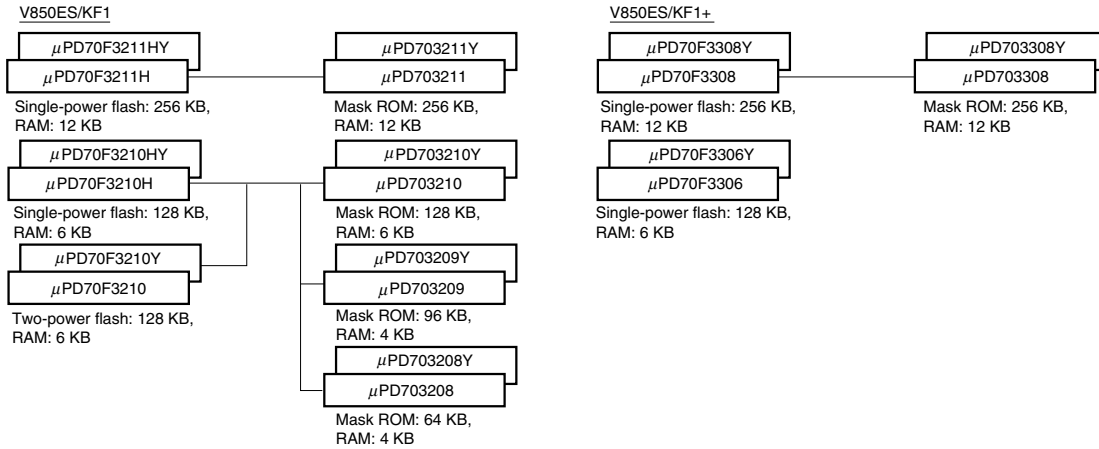

- Notes**
1. Because the POC circuit detection voltage (V_{POC}) is 2.1 V \pm 0.1 V, use the products in the voltage range of 2.2 to 5.5 V.
 2. Select either of the functions of these alternate-function pins.

1.5.2 V850ES/Kx1, V850ES/Kx1+ product lineup

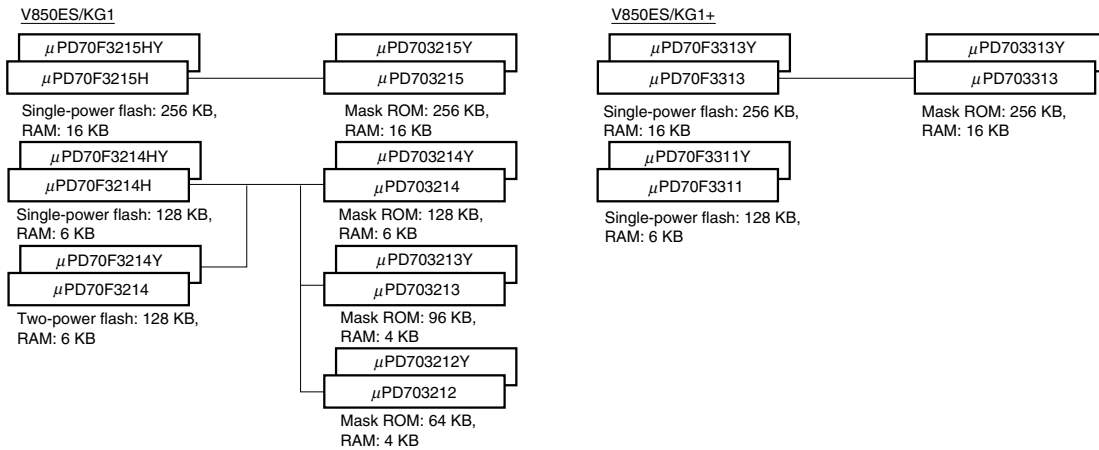

- 64-pin plastic LQFP (10 × 10 mm, 0.5 mm pitch)
- 64-pin plastic TQFP (12 × 12 mm, 0.65 mm pitch)

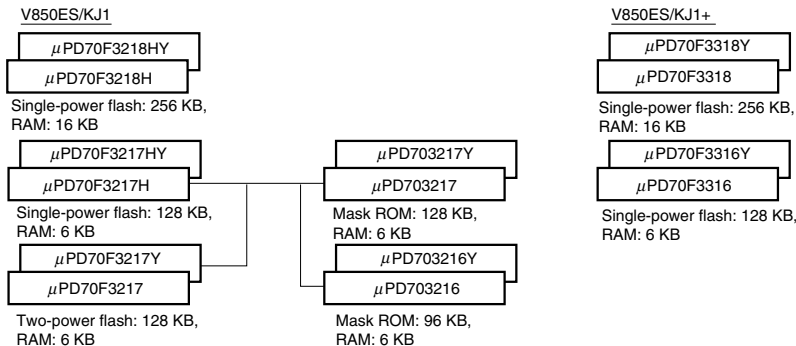

- 80-pin plastic TQFP (12 × 12 mm, 0.5 mm pitch)
- 80-pin plastic QFP (14 × 14 mm, 0.65 mm pitch)

- 100-pin plastic LQFP (14 × 14 mm, 0.5 mm pitch)
- 100-pin plastic QFP (14 × 20 mm, 0.65 mm pitch)

- 144-pin plastic LQFP (20 × 20 mm, 0.5 mm pitch)

The list of functions in the V850ES/Kx1 is shown below.

Product Name		V850ES/KE1		V850ES/KF1				V850ES/KG1				V850ES/KJ1				
Number of pins		64 pins		80 pins				100 pins				144 pins				
Internal memory (KB)	Mask ROM	128	–	64/96	128	–	256	–	64/96	128	–	256	–	96/128	–	–
	Flash memory	–	128	–	–	128	–	256	–	–	128	–	256	–	128	256
	RAM	4		4	6		12		4	6		16		6		16
Supply voltage		2.7 to 5.5 V														
Minimum instruction execution time		50 ns @20 MHz														
Clock	X1 input	2 to 10 MHz														
	Subclock	32.768 kHz														
	Internal oscillator	–														
Port	CMOS input	8		8				8				16				
	CMOS I/O	41 (4) ^{Note 1}		57 (6) ^{Note 1}				72 (8) ^{Note 1}				106 (12) ^{Note 1}				
	N-ch open-drain I/O	2		2				4				6				
Timer	16-bit (TMP)	1 ch		–	1 ch		–	1 ch		–	1 ch		–	1 ch

	WDT2	1 ch		1 ch				1 ch				1 ch				
RTO		6 bits × 1 ch		6 bits × 1 ch				6 bits × 1 ch				6 bits × 2 ch				
Serial interface	CSI	2 ch		2 ch				2 ch				3 ch				
	Automatic transmit/receive 3-wire CSI	–		1 ch				2 ch				2 ch				
	UART	2 ch		2 ch				2 ch				3 ch				
	UART supporting LIN-bus	–		–				–				–				
	I ² C ^{Note 2}	1 ch		1 ch				1 ch				2 ch				
External bus	Address space	–		128 KB				3 MB				15 MB				
	Address bus	–		16 bits				22 bits				24 bits				
	Mode	–		Multiplex only				Multiplex/separate				–				
DMA controller		–		–				–				–				
10-bit A/D converter		8 ch		8 ch				8 ch				16 ch				
8-bit D/A converter		–		–				2 ch				2 ch				
Interrupt	External	8		8				8				8				
	Internal	25/26 ^{Note 2}		25/26 ^{Note 2}	28/29 ^{Note 2}		30/31 ^{Note 2}	33/34 ^{Note 2}		38/40 ^{Note 2}	41/43 ^{Note 2}		–		–	
Key return input		8 ch		8 ch				8 ch				8 ch				
Reset	RESET pin	Provided														
	POC	None														
	LVI	None														
	Clock monitor	None														
	WDT1	Provided														
	WDT2	Provided														
ROM correction		4														
Regulator		None		Provided												
Standby function		HALT/IDLE/STOP/sub-IDLE mode														
Operating ambient temperature		T _A = –40 to +85°C														

- Notes**
1. The number of channels in parentheses indicates the number of pins for which the N-ch open drain output can be selected by software.
 2. Only in products with an I²C bus (Y products). For the product name, refer to each user's manual.

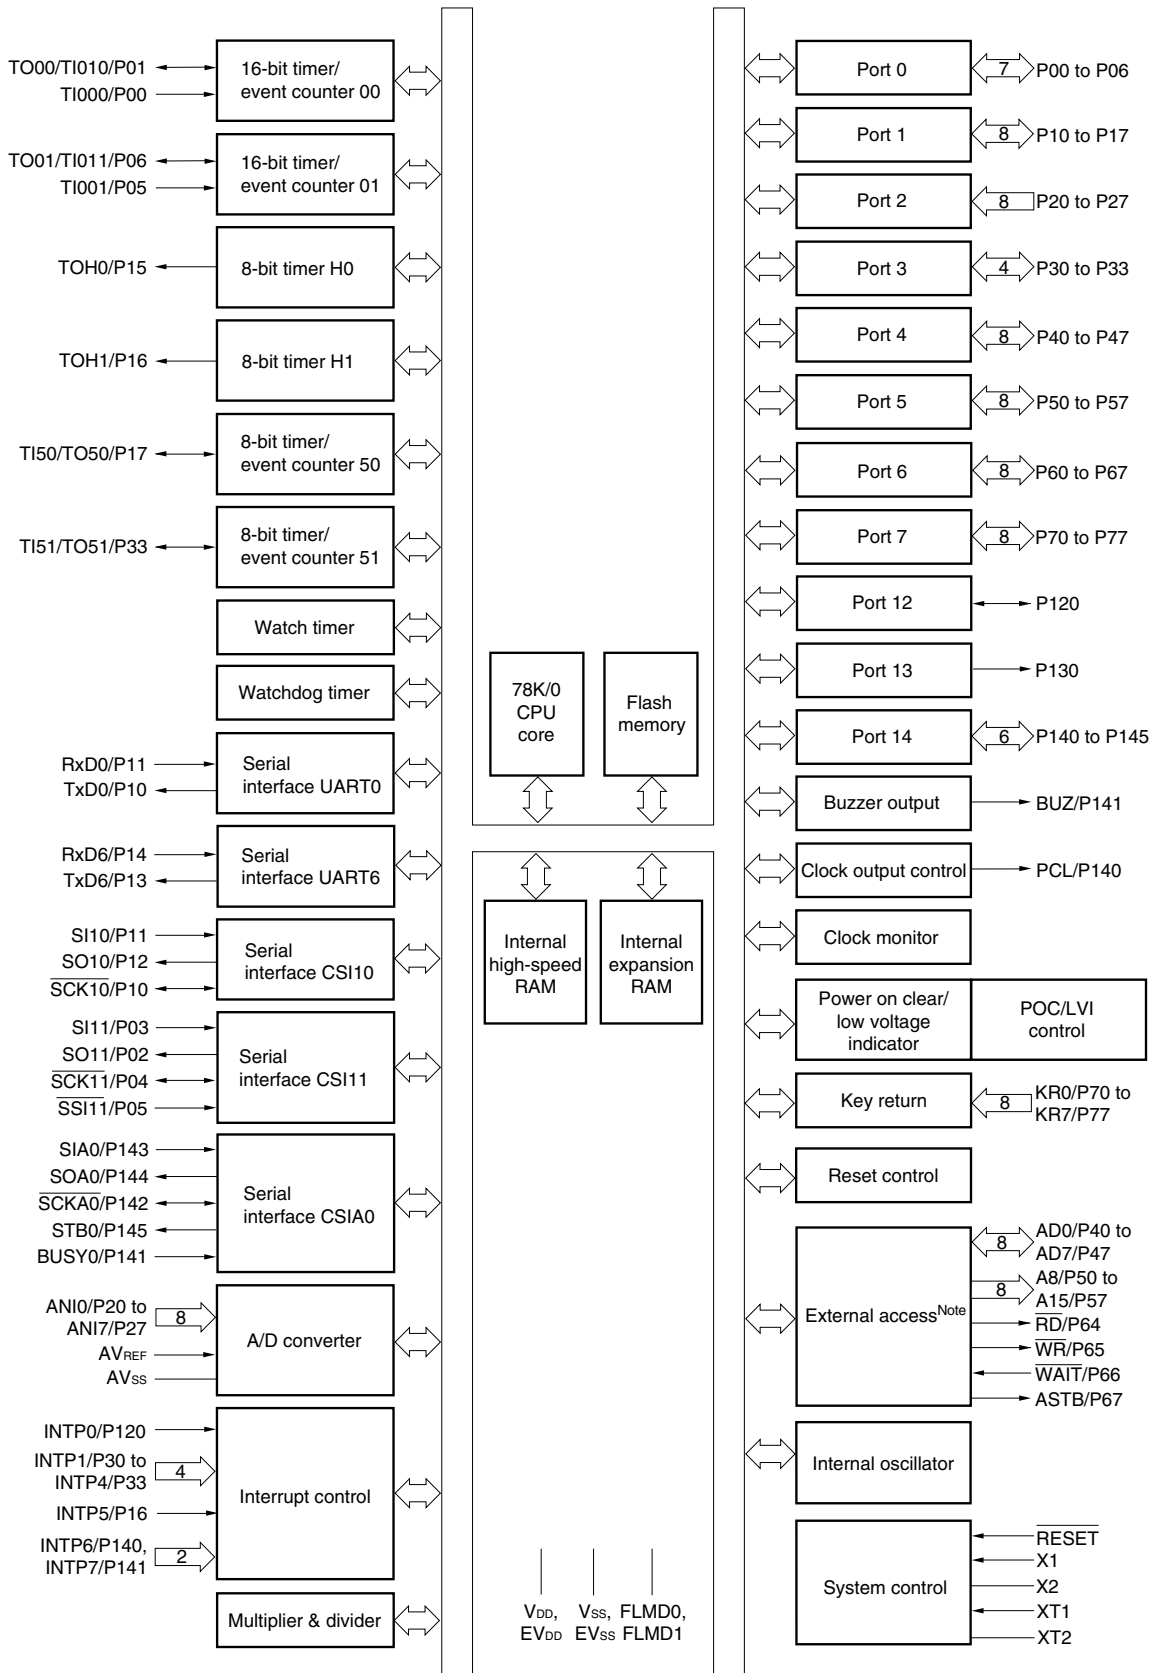

The list of functions in the V850ES/Kx1+ is shown below.

Product Name		V850ES/KE1+	V850ES/KF1+	V850ES/KG1+	V850ES/KJ1+						
Number of pins		64 pins		80 pins		100 pins		144 pins			
Internal memory (KB)	Mask ROM	128	–	–	256	–	–	256	–	–	–
	Flash memory	–	128	128	–	256	128	–	256	128	256
	RAM	4		6	12		6	16		6	16
Supply voltage		2.7 to 5.5 V									
Minimum instruction execution time		50 ns @20 MHz									
Clock	X1 input	2 to 10 MHz									
	Subclock	32.768 kHz									
	Internal oscillator	240 kHz (TYP.)									
Port	CMOS input	8		8		8		16			
	CMOS I/O	41 (4) ^{Note 1}		57 (6) ^{Note 1}		72 (8) ^{Note 1}		106 (12) ^{Note 1}			
	N-ch open-drain I/O	2		2		4		6			
Timer	16-bit (TMP)	1 ch		1 ch		1 ch		1 ch			
	16-bit (TM0)	1 ch		2 ch		4 ch		6 ch			
	8-bit (TM5)	2 ch		2 ch		2 ch		2 ch			
	8-bit (TMH)	2 ch		2 ch		2 ch		2 ch			
	Interval timer	1 ch		1 ch		1 ch		1 ch			
	Watch	1 ch		1 ch		1 ch		1 ch			
	WDT1	1 ch		1 ch		1 ch		1 ch			
	WDT2	1 ch		1 ch		1 ch		1 ch			
RTO		6 bits × 1 ch		6 bits × 1 ch		6 bits × 1 ch		6 bits × 2 ch			
Serial interface	CSI	2 ch		2 ch		2 ch		3 ch			
	Automatic transmit/receive 3-wire CSI	–		1 ch		2 ch		2 ch			
	UART	1 ch		1 ch		2 ch		2 ch			
	UART supporting LIN-bus	1 ch		1 ch		1 ch		1 ch			
	I ² C ^{Note 2}	1 ch		1 ch		1 ch		2 ch			
External bus	Address space	–		128 KB		3 MB		15 MB

	Interrupt source	2	2	1	1	1	1	1	–

Note In the watch timer, the watch timer function and interval timer function can be used simultaneously.

Remark TM51 and TMH1 can be used in combination as a carrier generator mode.

CHAPTER 2 PIN FUNCTIONS

2.1 Pin Function List

There are three types of pin I/O buffer power supplies: AV_{REF} , EV_{DD} , and V_{DD} . The relationship between these power supplies and the pins is shown below.

Table 2-1. Pin I/O Buffer Power Supplies

Power Supply	Corresponding Pins
AV_{REF}	P20 to P27
EV_{DD}	Port pins other than P20 to P27
V_{DD}	Pins other than port pins

(1) Port pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
P00	I/O	Port 0. 7-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	TI000
P01				TI010/TO00
P02				SO11
P03				SI11
P04				$\overline{SCK11}$
P05				$\overline{SSI11}/TI001$
P06				TI011/TO01
P10	I/O	Port 1. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	$\overline{SCK10}/TxD0$
P11				SI10/RxD0
P12				SO10
P13				TxD6
P14				RxD6
P15				TOH0
P16				TOH1/INTP5
P17				TI50/TO50/FLMD1
P20 to P27	Input	Port 2. 8-bit input-only port.	Input	ANI0 to ANI7
P30 to P32	I/O	Port 3. 4-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	INTP1 to INTP3
P33				INTP4/TI51/TO51
P40 to P47	I/O	Port 4. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	AD0 to AD7

(1) Port pins (2/2)

Pin Name	I/O	Function		After Reset	Alternate Function
P50 to P57	I/O	Port 5. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	A8 to A15
P60 to P63	I/O	Port 6. 8-bit I/O port. Input/output can be specified in 1-bit units.	N-ch open-drain I/O port. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	–
P64					\overline{RD}
P65					\overline{WR}
P66					\overline{WAIT}
P67					ASTB
P70 to P77	I/O	Port 7. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	KR0 to KR7
P120	I/O	Port 12. 1-bit I/O port. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	INTP0
P130	Output	Port 13. 1-bit output-only port.		Output	–
P140	I/O	Port 14. 6-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	PCL/INTP6
P141					BUZ/BUSY0/ INTP7
P142					$\overline{SCKA0}$
P143					SIA0
P144					SOA0
P145					STB0

(2) Non-port pins (1/2)

Pin Name	I/O	Function	After Reset	Alternate Function
INTP0	Input	External interrupt request input for which the valid edge (rising edge, falling edge, or both rising and falling edges) can be specified	Input	P120
INTP1 to INTP3				P30 to P32
INTP4				P33/TI51/TO51
INTP5				P16/TOH1
INTP6				P140/PCL
INTP7				P141/BUZ/BUSY0
SI10				Input
SI11	P03			
SIA0	P143			
SO10	Output	Serial data output from serial interface	Input	P12
SO11				P02
SOA0				P144
SCK10	I/O	Clock input/output for serial interface	Input	P10/TxD0
SCK11				P04
SCKA0				P142
SSI1	Input	Serial interface chip select input	Input	P05/TI001
BUSY0	Input	Serial interface busy input	Input	P141/BUZ/INTP7
STB0	Output	Serial interface strobe output	Input	P145
RxD0	Input	Serial data input to asynchronous serial interface	Input	P11/SI10
RxD6				P14
TxD0	Output	Serial data output from asynchronous serial interface	Input	P10/SCK10
TxD6				P13
TI000	Input	External count clock input to 16-bit timer/event counter 00 Capture trigger input to capture registers (CR000, CR010) of 16-bit timer/event counter 00	Input	P00
TI001		External count clock input to 16-bit timer/event counter 01 Capture trigger input to capture registers (CR001, CR011) of 16-bit timer/event counter 01		P05/SSI1
TI010		Capture trigger input to capture register (CR000) of 16-bit timer/event counter 00		P01/TO00
TI011		Capture trigger input to capture register (CR001) of 16-bit timer/event counter 01		P06/TO01
TO00	Output	16-bit timer/event counter 00 output	Input	P01/TI010
TO01		16-bit timer/event counter 01 output		P06/TI011
TI50	Input	External count clock input to 8-bit timer/event counter 50	Input	P17/TO50/FLMD1
TI51		External count clock input to 8-bit timer/event counter 51		P33/TO51/INTP4
TO50	Output	8-bit timer/event counter 50 output	Input	P17/TI50/FLMD1
TO51		8-bit timer/event counter 51 output		P33/TI51/INTP4
TOH0		8-bit timer H0 output		P15
TOH1		8-bit timer H1 output		P16/INTP5

(2) Non-port pins (2/2)

Pin Name	I/O	Function	After Reset	Alternate Function
PCL	Output	Clock output (for trimming of high-speed system clock, subsystem clock)	Input	P140/INTP6
BUZ	Output	Buzzer output	Input	P141/INTP7/BUSY0
AD0 to AD7	I/O	Lower address/data bus for external memory expansion	Input	P40 to P47
A8 to A15	Output	Higher address bus for external memory expansion	Input	P50 to P57
\overline{RD}	Output	Strobe signal output for external memory read operation	Input	P64
\overline{WR}	Output	Strobe signal output for external memory write operation	Input	P65
\overline{WAIT}	Input	Wait insertion on external memory access	Input	P66
ASTB	Output	Strobe output that externally latches address information output to ports 4 and 5 for access to external memory	Input	P67
ANI0 to ANI7	Input	A/D converter analog input	Input	P20 to P27
AV _{REF}	Input	A/D converter reference voltage input and positive power supply for port 2	–	–
AV _{SS}	–	A/D converter ground potential. Make the same potential as EV _{SS} or V _{SS} .	–	–
KR0 to KR7	Input	Key interrupt input	Input	P70 to P77
\overline{RESET}	Input	System reset input	–	–
X1	Input	Connecting resonator for high-speed system clock	–	–
X2	–		–	–
XT1	Input	Connecting resonator for subsystem clock	–	–
XT2	–		–	–
V _{DD}	–	Positive power supply (except for ports)	–	–
EV _{DD}	–	Positive power supply for ports	–	–
V _{SS}	–	Ground potential (except for ports)	–	–
EV _{SS}	–	Ground potential for ports	–	–
FLMD0	–	Flash memory programming mode setting.	–	–
FLMD1	–		Input	P17/TI50/TO50
NC	–	Not internally connected. Leave open (connecting to V _{DD} or V _{SS} is also possible).	–	–

2.2 Description of Pin Functions

2.2.1 P00 to P06 (port 0)

P00 to P06 function as a 7-bit I/O port. These pins also function as timer I/O, serial interface data I/O, clock I/O, and chip select input.

The following operation modes can be specified in 1-bit units.

(1) Port mode

P00 to P06 function as a 7-bit I/O port. P00 to P06 can be set to input or output in 1-bit units using port mode register 0 (PM0). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 0 (PU0).

(2) Control mode

P00 to P06 function as timer I/O, serial interface data I/O, clock I/O, and chip select input.

(a) TI000, TI001

These are the pins for inputting an external count clock to 16-bit timer/event counters 00 and 01 and are also for inputting a capture trigger signal to the capture registers (CR000, CR010 or CR001, CR011) of 16-bit timer/event counters 00 and 01.

(b) TI010, TI011

These are the pins for inputting a capture trigger signal to the capture register (CR000 or CR001) of 16-bit timer/event counters 00 and 01.

(c) TO00, TO01

These are timer output pins.

(d) SI11

This is a serial interface serial data input pin.

(e) SO11

This is a serial interface serial data output pin.

(f) $\overline{\text{SCK11}}$

This is the serial interface serial clock I/O pin.

(g) $\overline{\text{SSI11}}$

This is the serial interface chip select input pin.

2.2.2 P10 to P17 (port 1)

P10 to P17 function as an 8-bit I/O port. These pins also function as pins for external interrupt request input, serial interface data I/O, clock I/O, timer I/O, and flash memory programming mode setting.

The following operation modes can be specified in 1-bit units.

(1) Port mode

P10 to P17 function as an 8-bit I/O port. P10 to P17 can be set to input or output in 1-bit units using port mode register 1 (PM1). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 1 (PU1).

(2) Control mode

P10 to P17 function as external interrupt request input, serial interface data I/O, clock I/O, timer I/O, and flash memory programming mode setting.

(a) SI10

This is a serial interface serial data input pin.

(b) SO10

This is a serial interface serial data output pin.

(c) $\overline{\text{SCK10}}$

This is a serial interface serial clock I/O pin.

(d) RxD0, RxD6

These are the serial data input pins of the asynchronous serial interface.

(e) TxD0, TxD6

These are the serial data output pins of the asynchronous serial interface.

(f) TI50

This is the pin for inputting an external count clock to 8-bit timer/event counter 50.

(g) TO50, TOH0, and TOH1

These are timer output pins.

(h) INTP5

This is an external interrupt request input pin for which the valid edge (rising edge, falling edge, or both rising and falling edges) can be specified.

(i) FLMD1

This is the pin for setting the flash memory programming mode.

2.2.3 P20 to P27 (port 2)

P20 to P27 function as an 8-bit input-only port. These pins also function as pins for A/D converter analog input. The following operation modes can be specified in 1-bit units.

(1) Port mode

P20 to P27 function as an 8-bit input-only port.

(2) Control mode

P20 to P27 function as A/D converter analog input pins (ANI0 to ANI7). When using these pins as analog input pins, see **(5) ANI0/P20 to ANI7/P27** in **13.6 Cautions for A/D Converter**.

2.2.4 P30 to P33 (port 3)

P30 to P33 function as a 4-bit I/O port. These pins also function as pins for external interrupt request input and timer I/O.

The following operation modes can be specified in 1-bit units.

(1) Port mode

P30 to P33 function as a 4-bit I/O port. P30 to P33 can be set to input or output in 1-bit units using port mode register 3 (PM3). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 3 (PU3).

(2) Control mode

P30 to P33 function as external interrupt request input pins and timer I/O pins.

(a) INTP1 to INTP4

These are the external interrupt request input pins for which the valid edge (rising edge, falling edge, or both rising and falling edges) can be specified.

(b) TI51

This is an external count clock input pin to 8-bit timer/event counter 51.

(c) TO51

This is a timer output pin.

Caution In the μ PD78F0148HD, be sure to pull the P31 pin down after reset to prevent malfunction.

Remark P31/INTP2 and P32/INTP3 of the μ PD78F0148HD can be used as on-chip debug mode setting pins when the on-chip debug function is used. For details, refer to **CHAPTER 28 ON-CHIP DEBUG FUNCTION (μ PD78F0148HD ONLY)**.

2.2.5 P40 to P47 (port 4)

P40 to P47 function as an 8-bit I/O port. These pins also function as address/data bus pins.

The following operation modes can be specified.

(1) Port mode

P40 to P47 function as an 8-bit I/O port. P40 to P47 can be set to input or output in 1-bit units using port mode register 4 (PM4). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 4 (PU4).

(2) Control mode

P40 to P47 function as the pins for the lower address/data bus (AD0 to AD7) in external memory expansion mode.

<R> **Caution The external bus interface function cannot be used in (A1) grade products.**

2.2.6 P50 to P57 (port 5)

P50 to P57 function as an 8-bit I/O port. These pins also function as address bus pins.

The following operation modes can be specified.

(1) Port mode

P50 to P57 function as an 8-bit I/O port. P50 to P57 can be set to input or output in 1-bit units using port mode register 5 (PM5). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 5 (PU5).

(2) Control mode

P50 to P57 function as the pins for the higher address bus (A8 to A15) in external memory expansion mode.

<R> **Caution The external bus interface function cannot be used in (A1) grade products.**

2.2.7 P60 to P67 (port 6)

P60 to P67 function as an 8-bit I/O port. These pins also function as control pins in external memory expansion mode.

The following operation modes can be specified.

(1) Port mode

P60 to P67 function as an 8-bit I/O port. P60 to P67 can be set to input port or output port in 1-bit units using port mode register 6 (PM6).

P60 to P63 are N-ch open-drain pins. Use of an on-chip pull-up resistor can be specified for P64 to P67 by pull-up resistor option register 6 (PU6).

(2) Control mode

P64 to P67 function as control signal output pins (\overline{RD} , \overline{WR} , \overline{WAIT} , ASTB) in external memory expansion mode.

Cautions 1. P66 can be used as an I/O port if the external wait is not used in external memory expansion mode.

<R> **2. The external bus interface function cannot be used in (A1) grade products.**

2.2.8 P70 to P77 (port 7)

P70 to P77 function as an 8-bit I/O port. These pins also function as key interrupt input pins.

The following operation modes can be specified in 1-bit units.

(1) Port mode

P70 to P77 function as an 8-bit I/O port. P70 to P77 can be set to input or output in 1-bit units using port mode register 7 (PM7). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 7 (PU7).

(2) Control mode

P70 to P77 function as key interrupt input pins.

2.2.9 P120 (port 12)

P120 functions as a 1-bit I/O port. This pin also functions as a pin for external interrupt request input.

The following operation modes can be specified.

(1) Port mode

P120 functions as a 1-bit I/O port. P120 can be set to input or output using port mode register 12 (PM12). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 12 (PU12).

(2) Control mode

P120 functions as an external interrupt request input pin (INTP0) for which the valid edge (rising edge, falling edge, or both rising and falling edges) can be specified.

2.2.10 P130 (port 13)

P130 functions as a 1-bit output-only port.

2.2.11 P140 to P145 (port 14)

P140 to P145 function as a 6-bit I/O port. These pins also function as external interrupt request input, clock output, buzzer output, serial interface data I/O, clock I/O, busy input, and strobe output pins.

The following operation modes can be specified in 1-bit units.

(1) Port mode

P140 to P145 function as a 6-bit I/O port. P140 to P145 can be set to input or output in 1-bit units using port mode register 14 (PM14). Use of an on-chip pull-up resistor can be specified by pull-up resistor option register 14 (PU14).

(2) Control mode

P140 to P145 function as external interrupt request input, clock output, buzzer output, serial interface data I/O, clock I/O, busy input, and strobe output pins.

(a) INTP6, INTP7

These are the external interrupt request input pins for which the valid edge (rising edge, falling edge, or both rising and falling edges) can be specified.

(b) PCL

This is a clock output pin.

(c) BUZ

This is a buzzer output pin.

(d) SIA0

This is a serial interface serial data input pin.

(e) SOA0

This is a serial interface serial data output pin.

(f) $\overline{\text{SCKA0}}$

This is a serial interface serial clock I/O pin.

(g) BUSY0

This is a serial interface busy input pin.

(h) STB0

This is a serial interface strobe output pin.

2.2.12 AV_{REF}

This is the A/D converter reference voltage input pin and the positive power supply pin of P20 to P27 and A/D converter.

When the A/D converter is not used, connect this pin directly to EV_{DD} or V_{DD}^{Note}.

Note Connect port 2 directly to EV_{DD} when it is used as a digital port.

2.2.13 AV_{SS}

This is the A/D converter ground potential pin. Even when the A/D converter is not used, always use this pin with the same potential as the EV_{SS} pin or V_{SS} pin.

2.2.14 $\overline{\text{RESET}}$

This is the active-low system reset input pin.

2.2.15 X1 and X2

These are the pins for connecting a resonator for high-speed system clock.

When supplying an external clock, input a signal to the X1 pin and input the inverse signal to the X2 pin.

Remark The X1 and X2 pins of the μ PD78F0148HD can be used as on-chip debug mode setting pins when the on-chip debug function is used. For details, refer to **CHAPTER 28 ON-CHIP DEBUG FUNCTION (μ PD78F0148HD ONLY)**.

2.2.16 XT1 and XT2

These are the pins for connecting a resonator for subsystem clock.

When supplying an external clock, input a signal to the XT1 pin and input the inverse signal to the XT2 pin.

2.2.17 V_{DD} and EV_{DD}

V_{DD} is the positive power supply pin for other than ports.

EV_{DD} is the positive power supply pin for ports.

2.2.18 V_{SS} and EV_{SS}

V_{SS} is the ground potential pin for other than ports.

EV_{SS} is the ground potential pin for ports.

2.2.19 FLMD0 and FLMD1

This is a pin for setting flash memory programming mode.

Connect FLMD0 to EV_{SS} or V_{SS} in the normal operation mode (FLMD1 is used as P17/TI50/TO50 pin).

In flash memory programming mode, be sure to connect these pins to the flash programmer.

2.3 Pin I/O Circuits and Recommended Connection of Unused Pins

Table 2-2 shows the types of pin I/O circuits and the recommended connections of unused pins.
Refer to **Figure 2-1** for the configuration of the I/O circuit of each type.

Table 2-2. Pin I/O Circuit Types (1/2)

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pins	
P00/TI000	8-A	I/O	Input: Independently connect to EV _{DD} or EV _{SS} via a resistor. Output: Leave open.	
P01/TI010/TO00				
P02/SO11				
P03/SI11				
P04/ $\overline{\text{SCK11}}$				
P05/ $\overline{\text{SSI11}}$ /TI001				
P06/TI011/TO01				
P10/ $\overline{\text{SCK10}}$ /TxD0				
P11/SI10/RxD0				
P12/SO10				5-A
P13/TxD6				
P14/RxD6	8-A			
P15/TOH0	5-A			
P16/TOH1/INTP5	8-A			
P17/TI50/TO50/FLMD1				
P20/ANI0 to P27/ANI7	9-C	Input	Connect to AV _{REF} or AV _{SS} .	
P30/INTP1	8-A	I/O	Input: Independently connect to EV _{DD} or EV _{SS} via a resistor. Output: Leave open.	
P31/INTP2 (except $\mu\text{PD78F0148HD}$)				
P31/INTP2 ($\mu\text{PD78F0148HD}$)			Connect to EV _{SS} via a resistor.	
P32/INTP3			Input: Independently connect to EV _{DD} or EV _{SS} via a resistor. Output: Leave open.	
P33/TI51/TO51/INTP4				
P40/AD0 to P47/AD7	5-A			
P50/A8 to P57/A15				
P60, P61	13-R	Input: Connect to EV _{SS} . Output: Leave this pin open at low-level output after clearing the output latch of the port to 0.		
P62, P63	13-W			
P64/ $\overline{\text{WD}}$	5-A	Input: Independently connect to EV _{DD} or EV _{SS} via a resistor. Output: Leave open.		
P65/ $\overline{\text{WR}}$				
P66/ $\overline{\text{WAIT}}$				
P67/ASTB				
P70/KR0 to P77/KR7	8-A			
P120/INTP0				

Table 2-2. Pin I/O Circuit Types (2/2)

Pin Name	I/O Circuit Type	I/O	Recommended Connection of Unused Pins
P130	3-C	Output	Leave open.
P140/PCL/INTP6	8-A	I/O	Input: Independently connect to EV _{DD} or EV _{SS} via a resistor. Output: Leave open.
P141/BUZ/BUSY0/INTP7			
P142/ $\overline{\text{SCKA0}}$			
P143/SIA0			
P144/SOA0			
P145/STB	5-A		
$\overline{\text{RESET}}$	2	Input	Connect to EV _{DD} or V _{DD} .
XT1	16		Connect directly to EV _{SS} or V _{SS} ^{Note 1} .
XT2		–	Leave open.
AV _{REF}	–		Connect directly to EV _{DD} or V _{DD} ^{Note 2} .
AV _{SS}			Connect directly to EV _{SS} or V _{SS} .
FLMD0			Connect to EV _{SS} or V _{SS} .
NC			Leave open (connecting to V _{DD} or V _{SS} is also possible).

Notes 1. Bit 6 (FRC) of the processor clock control register (PCC) must be set to 1 after reset mode is released.

2. Connect port 2 directly to EV_{DD} when it is used as a digital port.

Figure 2-1. Pin I/O Circuit List (1/2)

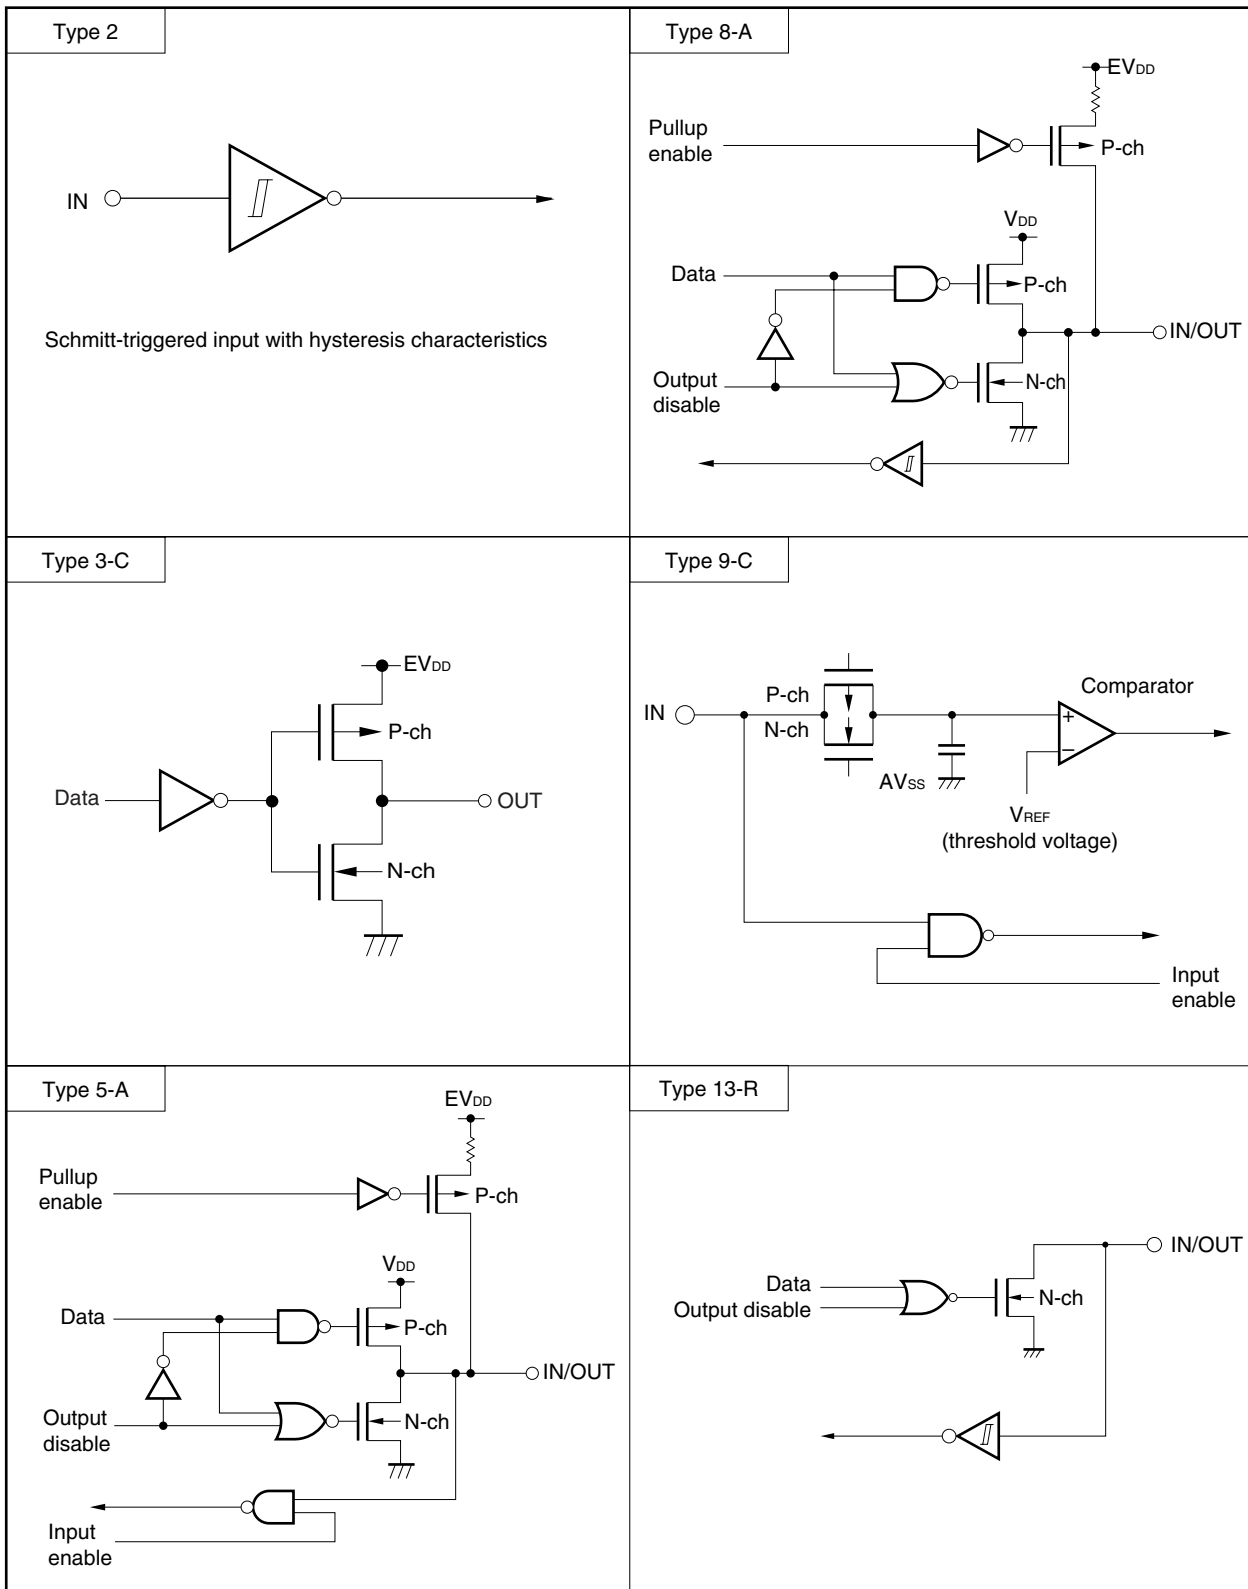

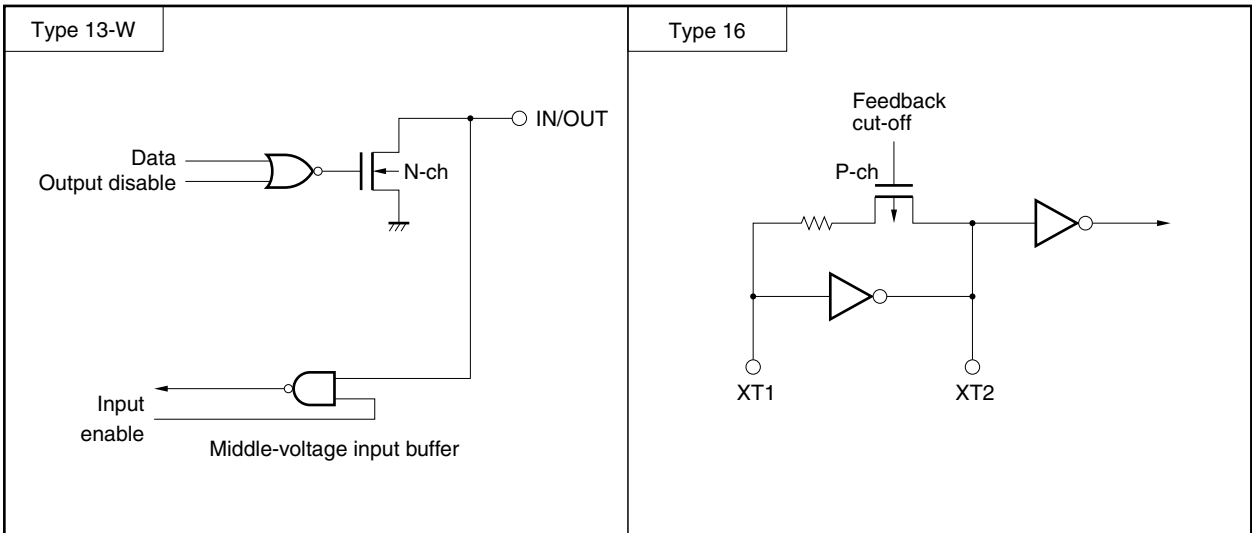

Figure 2-1. Pin I/O Circuit List (2/2)

CHAPTER 3 CPU ARCHITECTURE

3.1 Memory Space

Products in the 78K0/KF1+ can each access a 64 KB memory space. Figures 3-1 and 3-2 show the memory maps.

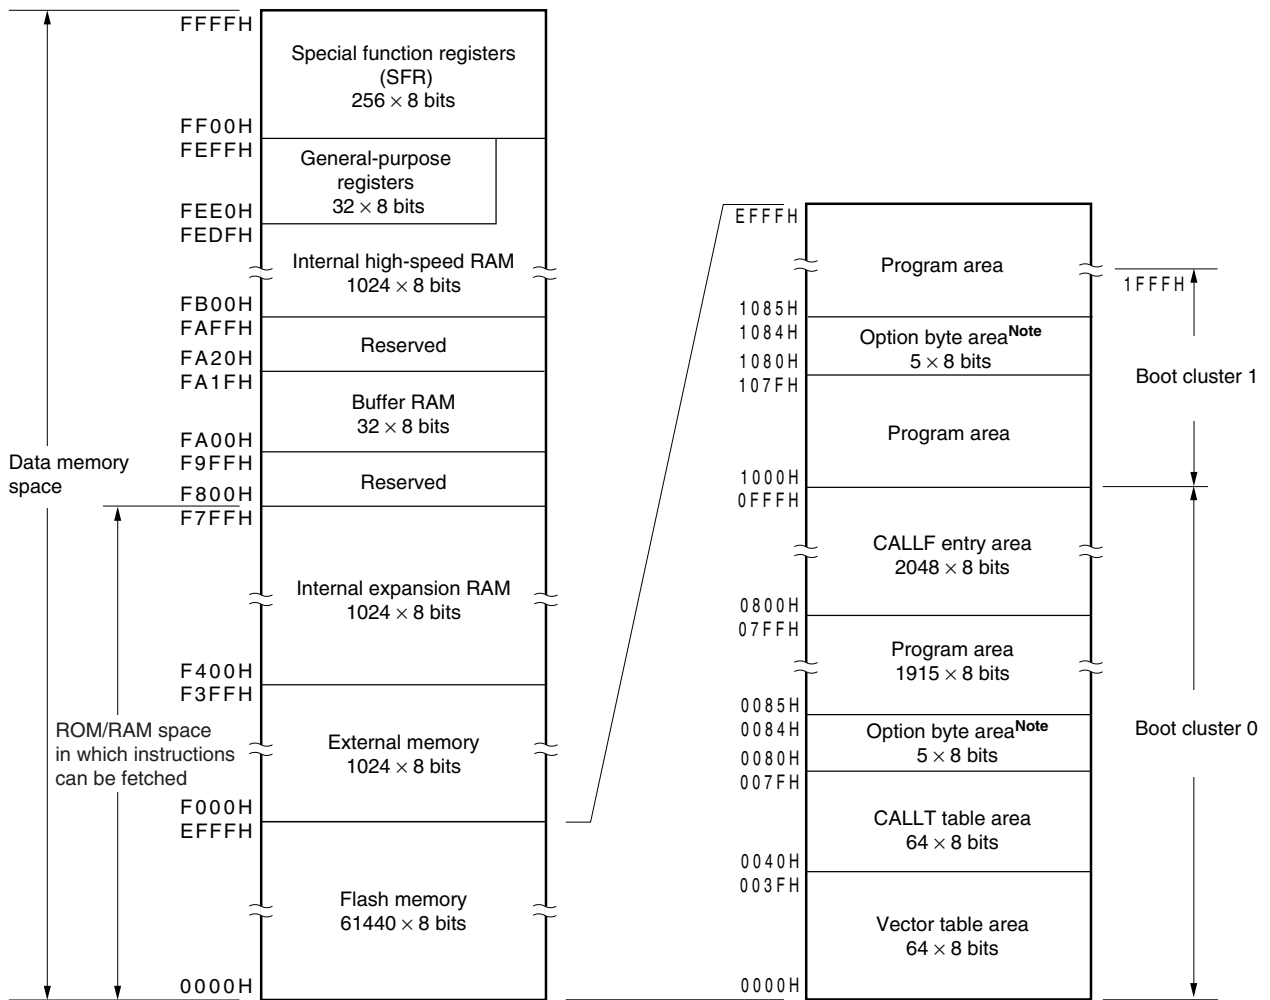

Caution Because the initial value of the internal expansion RAM size switching register (IXS) is 0CH, set IXS = 0AH as the initial setting. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, set the following values to the internal memory size switching register (IMS) and IXS.

Table 3-1. Set Values of Internal Memory Size Switching Register (IMS) and Internal Expansion RAM Size Switching Register (IXS)

Flash Memory Version (78K0/KF1+)	Target Mask ROM Version (78K0/KF1)	IMS	IXS
–	μPD780143	C6H	0CH
–	μPD780144	C8H	
–	μPD780146	CCH	0AH
μPD78F0148H, 78F0148HD	μPD780148	CFH	

<R>

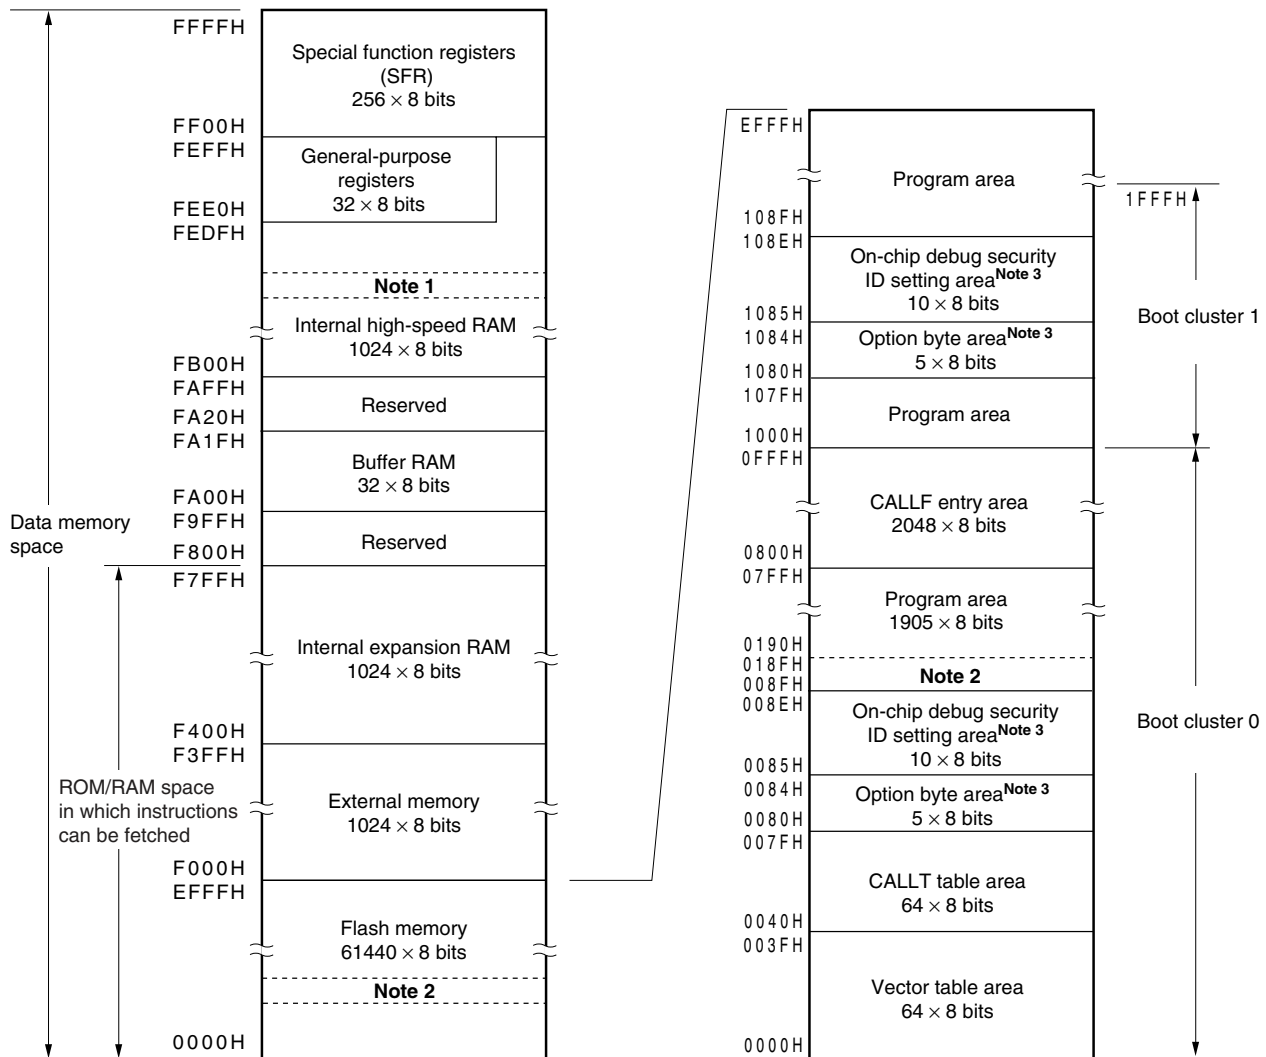

Figure 3-1. Memory Map (μ PD78F0148H)

Note When boot swap is not used: Set the option bytes to 0080H to 0084H.
 When boot swap is used: Set the option bytes to 0080H to 0084H and 1080H to 1084H.

<R>

Figure 3-2. Memory Map (μ PD78F0148HD)

- Notes**
1. During on-chip debugging, about 7 to 16 bytes of this area are used as the user data backup area for communication.
 2. During on-chip debugging, use of this area is disabled because it is used as the communication command area (008FH to 018FH: debugger's default setting).
 3. When boot swap is not used: Set the option bytes to 0080H to 0084H, and the on-chip debug security IDs to 0085H to 008EH.
When boot swap is used: Set the option bytes to 0080H to 0084H and 1080H to 1084H, and the on-chip debug security IDs to 0085H to 008EH and 1085H to 108EH.

3.1.1 Internal program memory space

The internal program memory space stores the program and table data. Normally, it is addressed with the program counter (PC).

78K0/KF1+ products incorporate internal ROM (flash memory), as shown below.

Table 3-2. Internal ROM Capacity

Part Number	Internal ROM	
	Structure	Capacity
μ PD78F0148H, 78F0148HD	Flash memory	61440 \times 8 bits (0000H to EFFFH)

The internal program memory space is divided into the following areas.

(1) Vector table area

The 64-byte area 0000H to 003FH is reserved as a vector table area. The program start addresses for branch upon reset signal input or generation of each interrupt request are stored in the vector table area.

Of the 16-bit address, the lower 8 bits are stored at even addresses and the higher 8 bits are stored at odd addresses.

Table 3-3. Vector Table

Vector Table Address	Interrupt Source	Vector Table Address	Interrupt Source
0000H	RESET input, POC, LVI, clock monitor, WDT	0020H	INTTM000
		0022H	INTTM010
0004H	INTLVI	0024H	INTAD
0006H	INTP0	0026H	INTSR0
0008H	INTP1	0028H	INTWTI
000AH	INTP2	002AH	INTTM51
000CH	INTP3	002CH	INTKR
000EH	INTP4	002EH	INTWT
0010H	INTP5	0030H	INTP6
0012H	INTSRE6	0032H	INTP7
0014H	INTSR6	0034H	INTDMU
0016H	INTST6	0036H	INTCSI11
0018H	INTCSI10/INTST0	0038H	INTTM001
001AH	INTTMH1	003AH	INTTM011
001CH	INTTMH0	003CH	INTACSI
001EH	INTTM50	003EH	BRK

(2) CALLT instruction table area

The 64-byte area 0040H to 007FH can store the subroutine entry address of a 1-byte call instruction (CALLT).

(3) Option byte area

The option byte area is assigned to the 1-byte area of 0080H. Refer to **CHAPTER 26 OPTION BYTE** for details.

(4) CALLF instruction entry area

The area 0800H to 0FFFH can perform a direct subroutine call with a 2-byte call instruction (CALLF).

3.1.2 Internal data memory space

78K0/KF1+ products incorporate the following RAMs.

(1) Internal high-speed RAM

The internal high-speed RAM consists of 1024×8 bits (FB00H to FFFFH).

The 32-byte area FEE0H to FFFFH is assigned to four general-purpose register banks consisting of eight 8-bit registers per one bank.

This area cannot be used as a program area in which instructions are written and executed.

The internal high-speed RAM can also be used as a stack memory.

(2) Internal expansion RAM

The internal expansion RAM consists of 1024×8 bits (F400H to F7FFH).

The internal expansion RAM can also be used as a normal data area similar to the internal high-speed RAM, as well as a program area in which instructions can be written and executed.

The internal expansion RAM cannot be used as a stack memory.

3.1.3 Special function register (SFR) area

On-chip peripheral hardware special function registers (SFRs) are allocated in the area FF00H to FFFFH (refer to **Table 3-4 Special Function Register List** in **3.2.3 Special function registers (SFRs)**).

Caution Do not access addresses to which SFRs are not assigned.

3.1.4 Data memory addressing

Addressing refers to the method of specifying the address of the instruction to be executed next or the address of the register or memory relevant to the execution of instructions.

Several addressing modes are provided for addressing the memory relevant to the execution of instructions for the 78K0/KF1+, based on operability and other considerations. For areas containing data memory in particular, special addressing methods designed for the functions of special function registers (SFR) and general-purpose registers are available for use. Figures 3-3 and 3-4 show correspondence between data memory and addressing. For details of each addressing mode, refer to **3.4 Operand Address Addressing**.

Figure 3-3. Correspondence Between Data Memory and Addressing (μ PD78F0148H)

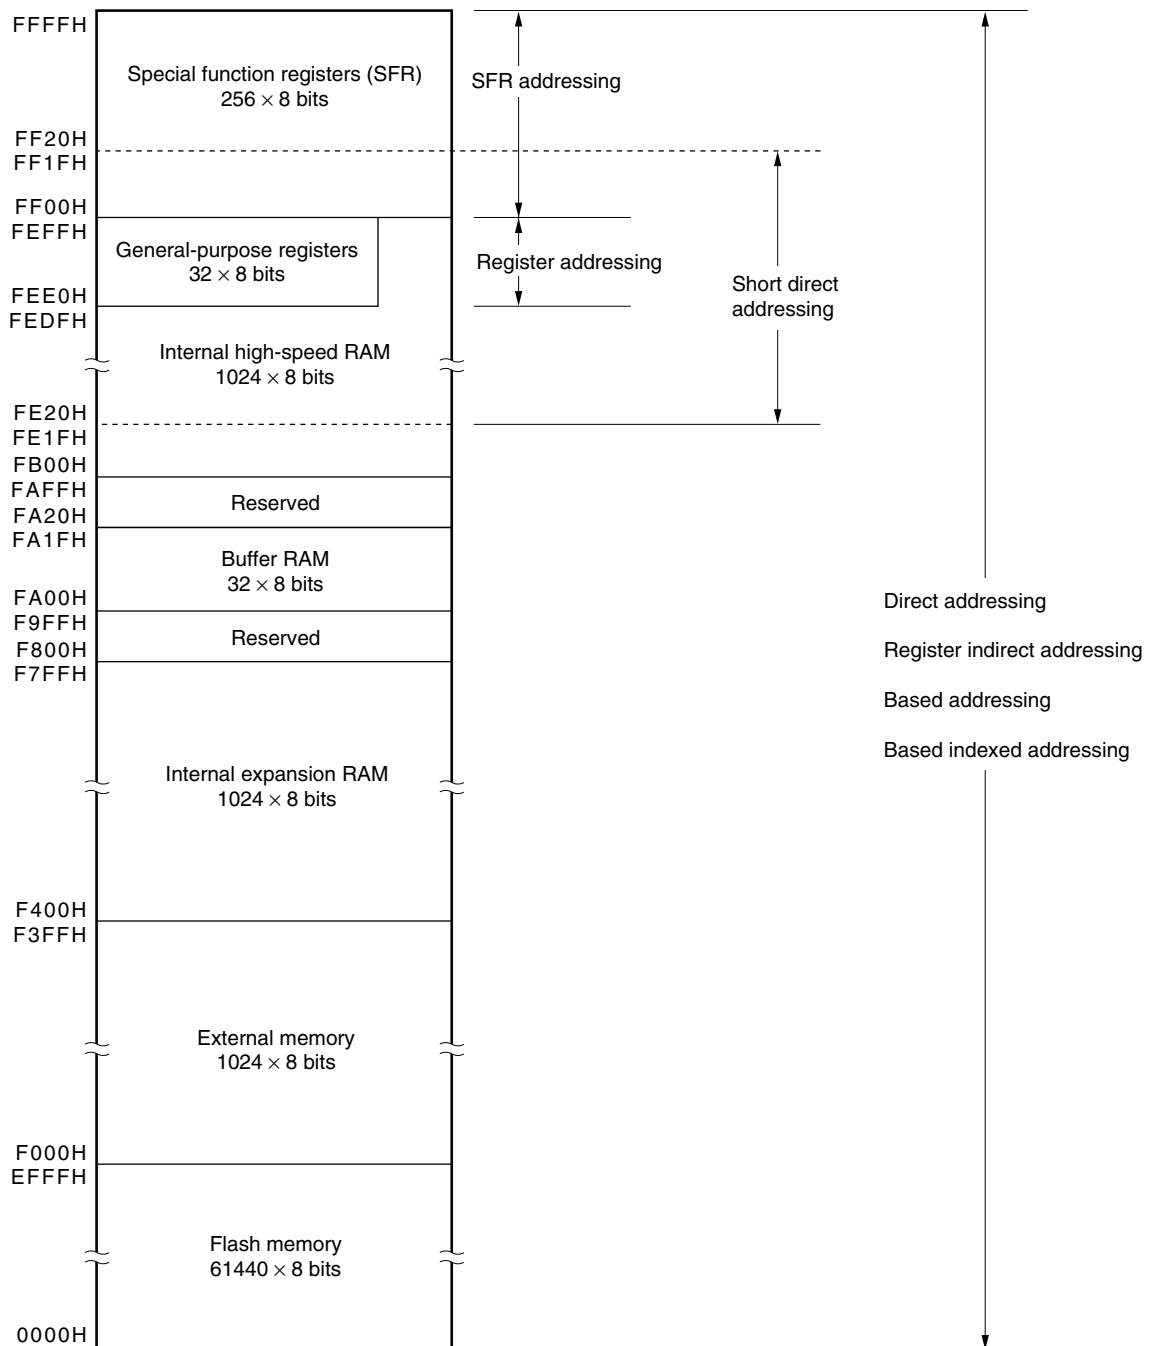

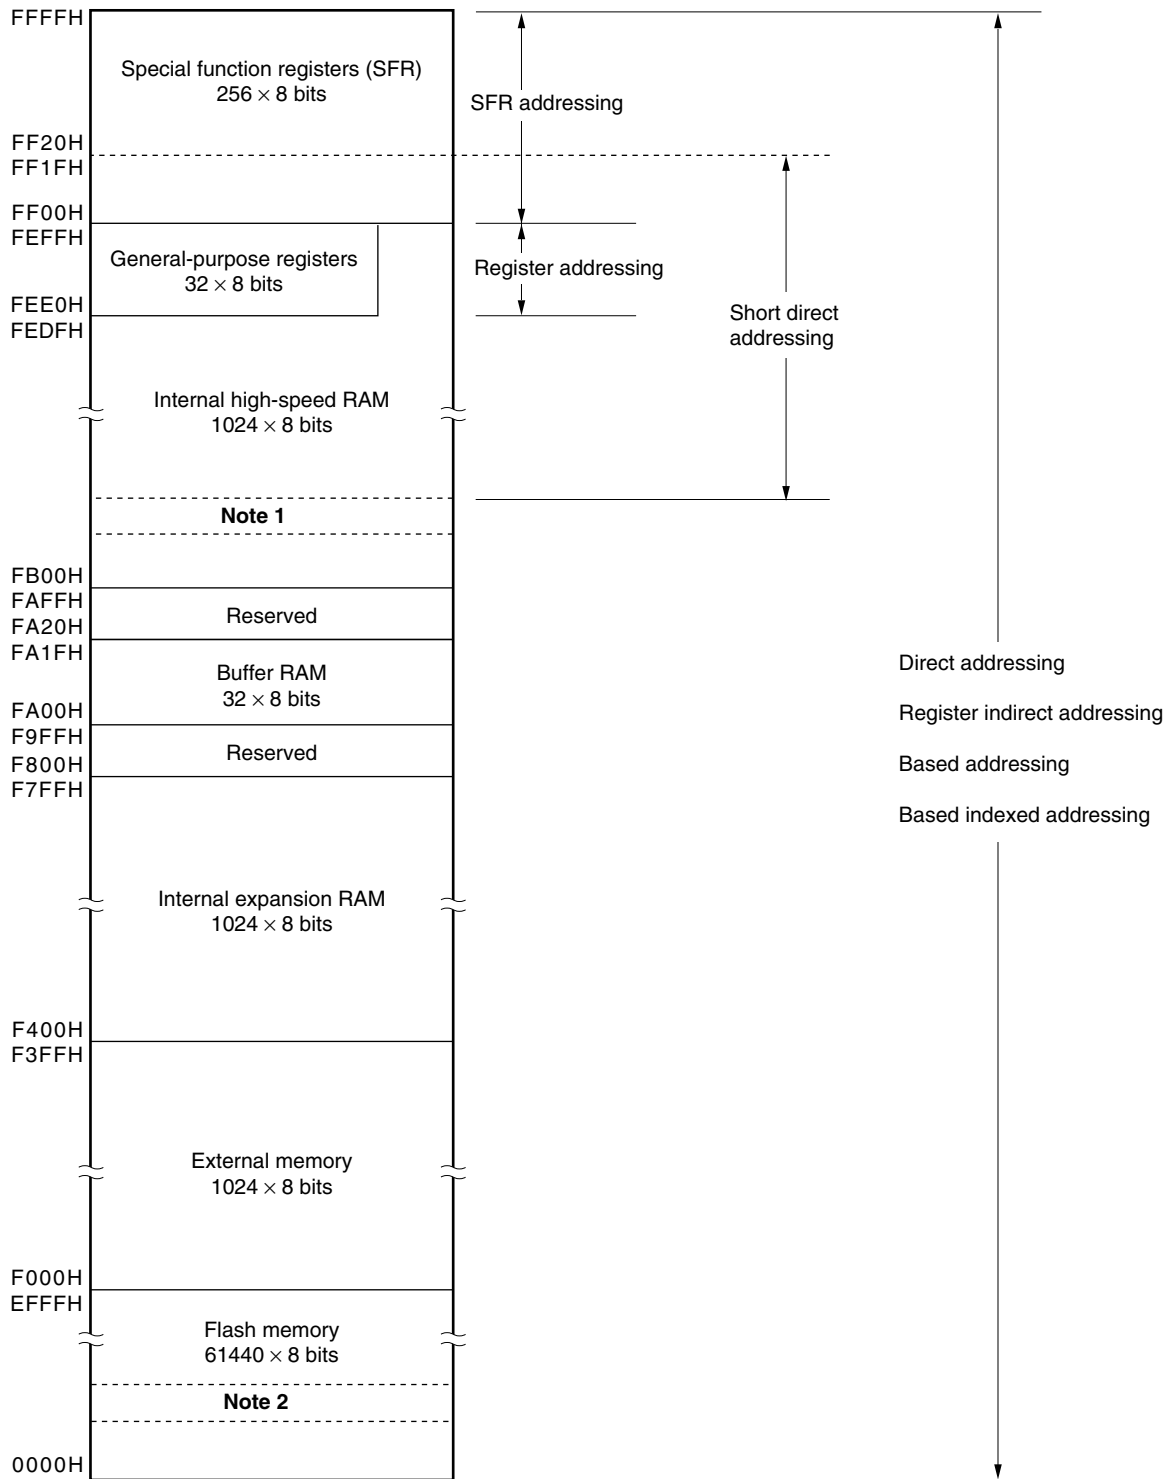

Figure 3-4. Correspondence Between Data Memory and Addressing (μ PD78F0148HD)

<R> **Notes** 1. During on-chip debugging, about 7 to 16 bytes of this area are used as the user data backup area for communication.

<R> 2. During on-chip debugging, use of this area is disabled because it is used as the communication command area (008FH to 018FH: debugger's default setting).

3.2 Processor Registers

The 78K0/KF1+ products incorporate the following processor registers.

3.2.1 Control registers

The control registers control the program sequence, statuses and stack memory. The control registers consist of a program counter (PC), a program status word (PSW) and a stack pointer (SP).

(1) Program counter (PC)

The program counter is a 16-bit register that holds the address information of the next program to be executed. In normal operation, the PC is automatically incremented according to the number of bytes of the instruction to be fetched. When a branch instruction is executed, immediate data and register contents are set. $\overline{\text{RESET}}$ input sets the reset vector table values at addresses 0000H and 0001H to the program counter.

Figure 3-5. Format of Program Counter

(2) Program status word (PSW)

The program status word is an 8-bit register consisting of various flags set/reset by instruction execution. Program status word contents are automatically stacked upon interrupt request generation or PUSH PSW instruction execution and are restored upon execution of the RETB, RETI and POP PSW instructions. $\overline{\text{RESET}}$ input sets the PSW to 02H.

Figure 3-6. Format of Program Status Word

(a) Interrupt enable flag (IE)

This flag controls the interrupt request acknowledge operations of the CPU. When 0, the IE flag is set to the interrupt disabled (DI) state, and all maskable interrupt requests are disabled. Other interrupt requests are all disabled. When 1, the IE flag is set to the interrupt enabled (EI) state and interrupt request acknowledgment is controlled with an in-service priority flag (ISP), an interrupt mask flag for various interrupt sources, and a priority specification flag. The IE flag is reset (0) upon DI instruction execution or interrupt acknowledgment and is set (1) upon EI instruction execution.

(b) Zero flag (Z)

When the operation result is zero, this flag is set (1). It is reset (0) in all other cases.

(c) Register bank select flags (RBS0 and RBS1)

These are 2-bit flags to select one of the four register banks.

In these flags, the 2-bit information that indicates the register bank selected by SEL RBn instruction execution is stored.

(d) Auxiliary carry flag (AC)

If the operation result has a carry from bit 3 or a borrow at bit 3, this flag is set (1). It is reset (0) in all other cases.

(e) In-service priority flag (ISP)

This flag manages the priority of acknowledgeable maskable vectored interrupts. When this flag is 0, low-level vectored interrupt requests specified by a priority specification flag register (PR0L, PR0H, PR1L, PR1H) (refer to **19.3 (3) Priority specification flag registers (PR0L, PR0H, PR1L, PR1H)**) can not be acknowledged. Actual request acknowledgment is controlled by the interrupt enable flag (IE).

(f) Carry flag (CY)

This flag stores overflow and underflow upon add/subtract instruction execution. It stores the shift-out value upon rotate instruction execution and functions as a bit accumulator during bit operation instruction execution.

(3) Stack pointer (SP)

This is a 16-bit register to hold the start address of the memory stack area. Only the internal high-speed RAM area can be set as the stack area.

Figure 3-7. Format of Stack Pointer

The SP is decremented ahead of write (save) to the stack memory and is incremented after read (restored) from the stack memory.

Each stack operation saves/restores data as shown in Figures 3-8 and 3-9.

Caution Since $\overline{\text{RESET}}$ input makes the SP contents undefined, be sure to initialize the SP before using the stack.

Figure 3-8. Data to Be Saved to Stack Memory

(a) PUSH rp instruction (when SP = FEE0H)

(b) CALL, CALLF, CALLT instructions (when SP = FEE0H)

(c) Interrupt, BRK instructions (when SP = FEE0H)

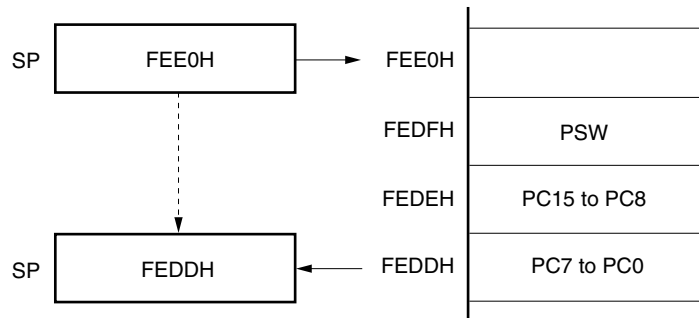

Figure 3-9. Data to Be Restored from Stack Memory

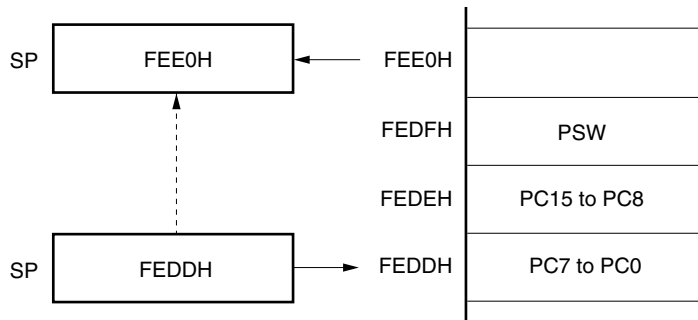

(a) POP rp instruction (when SP = FEDEH)

(b) RET instruction (when SP = FEDEH)

(c) RETI, RETB instructions (when SP = FEDDH)

3.2.2 General-purpose registers

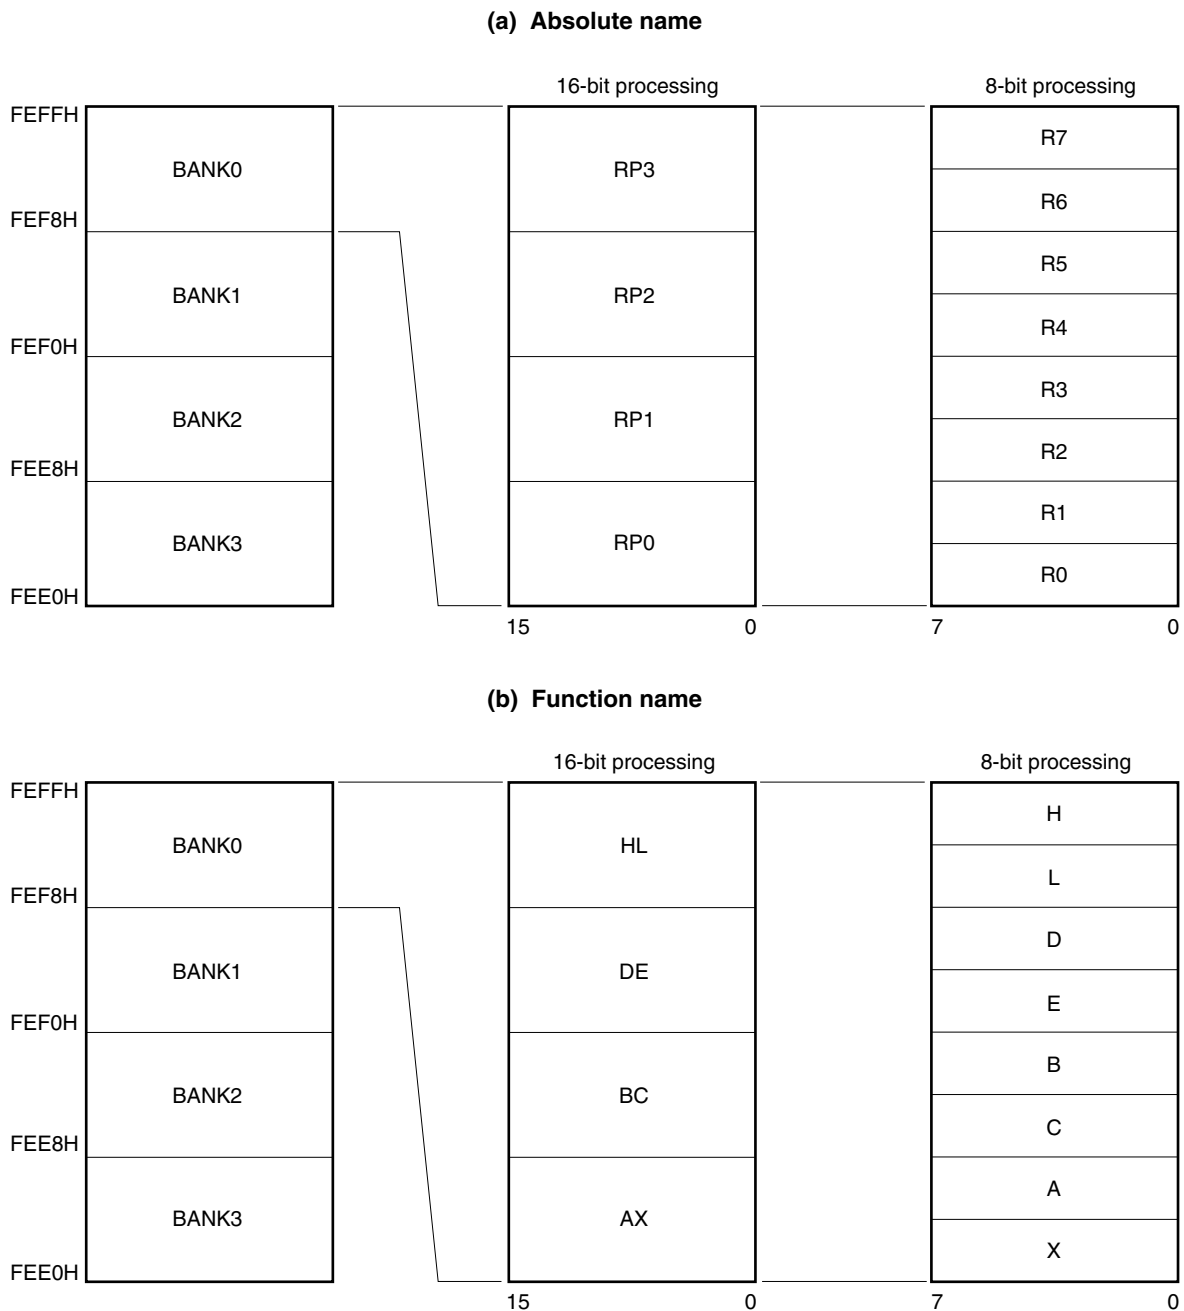

General-purpose registers are mapped at particular addresses (FEE0H to FEFFH) of the data memory. The general-purpose registers consists of 4 banks, each bank consisting of eight 8-bit registers (X, A, C, B, E, D, L, and H).

Each register can be used as an 8-bit register, and two 8-bit registers can also be used in a pair as a 16-bit register (AX, BC, DE, and HL).

These registers can be described in terms of function names (X, A, C, B, E, D, L, H, AX, BC, DE, and HL) and absolute names (R0 to R7 and RP0 to RP3).

Register banks to be used for instruction execution are set by the CPU control instruction (SEL RBn). Because of the 4-register bank configuration, an efficient program can be created by switching between a register for normal processing and a register for interrupts for each bank.

Figure 3-10. Configuration of General-Purpose Registers

3.2.3 Special function registers (SFRs)

Unlike a general-purpose register, each special function register has a special function.

SFRs are allocated to the FF00H to FFFFH area.

Special function registers can be manipulated like general-purpose registers, using operation, transfer and bit manipulation instructions. The manipulatable bit units, 1, 8, and 16, depend on the special function register type.

Each manipulation bit unit can be specified as follows.

- 1-bit manipulation
Describe the symbol reserved by the assembler for the 1-bit manipulation instruction operand (sfr.bit).
This manipulation can also be specified with an address.
- 8-bit manipulation
Describe the symbol reserved by the assembler for the 8-bit manipulation instruction operand (sfr).
This manipulation can also be specified with an address.
- 16-bit manipulation
Describe the symbol reserved by the assembler for the 16-bit manipulation instruction operand (sfrp).
When specifying an address, describe an even address.

Table 3-4 gives a list of the special function registers. The meanings of items in the table are as follows.

- Symbol
Symbol indicating the address of a special function register. It is a reserved word in the RA78K0, and is defined as an sfr variable using the #pragma sfr directive in the CC78K0. When using the RA78K0, ID78K0-NS, ID78K0, or SM78K0, symbols can be written as an instruction operand.
- R/W
Indicates whether the corresponding special function register can be read or written.
R/W: Read/write enable
R: Read only
W: Write only
- Manipulatable bit units
Indicates the manipulatable bit unit (1, 8, or 16). “–” indicates a bit unit for which manipulation is not possible.
- After reset
Indicates each register status upon $\overline{\text{RESET}}$ input.

Table 3-4. Special Function Register List (1/4)

Address	Special Function Register (SFR) Name	Symbol	R/W	Manipulatable Bit Unit			After Reset
				1 Bit	8 Bits	16 Bits	
FF00H	Port register 0	P0	R/W	√	√	–	00H
FF01H	Port register 1	P1	R/W	√	√	–	00H
FF02H	Port register 2	P2	R	√	√	–	Undefined
FF03H	Port register 3	P3	R/W	√	√	–	00H
FF04H	Port register 4	P4	R/W	√	√	–	00H
FF05H	Port register 5	P5	R/W	√	√	–	00H
FF06H	Port register 6	P6	R/W	√	√	–	00H
FF07H	Port register 7	P7	R/W	√	√	–	00H
FF08H	A/D conversion result register	ADCR	R	–	–	√	Undefined
FF09H							
FF0AH	Receive buffer register 6	RXB6	R	–	√	–	FFH
FF0BH	Transmit buffer register 6	TXB6	R/W	–	√	–	FFH
FF0CH	Port register 12	P12	R/W	√	√	–	00H
FF0DH	Port register 13	P13	R/W	√	√	–	00H
FF0EH	Port register 14	P14	R/W	√	√	–	00H
FF0FH	Serial I/O shift register 10	SIO10	R	–	√	–	00H
FF10H	16-bit timer counter 00	TM00	R	–	–	√	0000H

FFF0H	Internal memory size switching register ^{Note 3}	IMS	R/W	–	√	–	CFH	
FFF4H	Internal expansion RAM size switching register ^{Note 3}	IXS	R/W	–	√	–	0CH	
FFF8H	Memory expansion wait setting register	MM	R/W	√	√	–	10H	
FFFBH	Processor clock control register	PCC	R/W	√	√	–	00H	

- Notes 1.** This value varies depending on the reset source.
- 2.** This value varies depending on the operation mode.
- User mode: 08H
 - On-board mode: 0CH

Note 3. Because the initial value of the internal expansion RAM size switching register (IXS) is 0CH, set IXS = 0AH as the initial setting. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, set the following values to the internal memory size switching register (IMS) and IXS.

Flash Memory Version (78K0/KF1+)	Target Mask ROM Version (78K0/KF1)	IMS	IXS
–	μPD780143	C6H	0CH
–	μPD780144	C8H	
–	μPD780146	CCH	0AH
μPD78F0148H, 78F0148HD	μPD780148	CFH	

3.3 Instruction Address Addressing

An instruction address is determined by program counter (PC) contents and is normally incremented (+1 for each byte) automatically according to the number of bytes of an instruction to be fetched each time another instruction is executed. When a branch instruction is executed, the branch destination information is set to the PC and branched by the following addressing (for details of instructions, refer to **78K/0 Series Instructions User's Manual (U12326E)**).

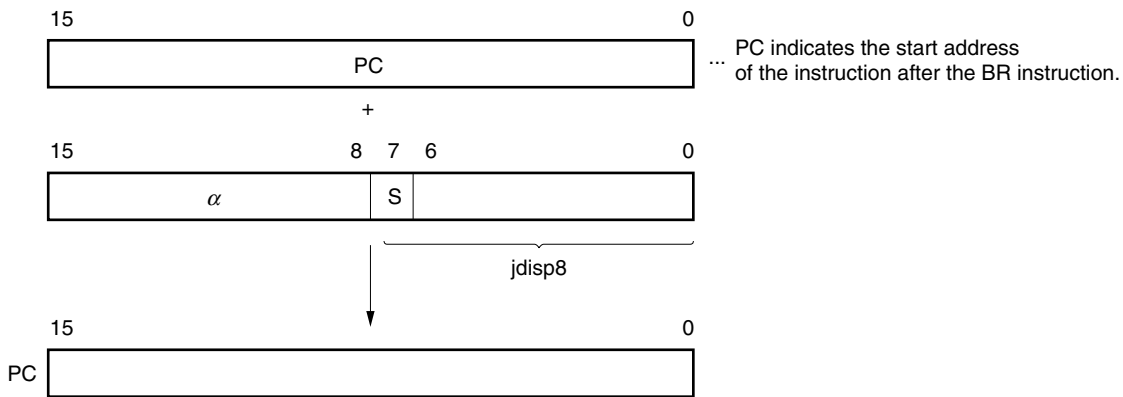

3.3.1 Relative addressing

[Function]

The value obtained by adding 8-bit immediate data (displacement value: $jdisp8$) of an instruction code to the start address of the following instruction is transferred to the program counter (PC) and branched. The displacement value is treated as signed two's complement data (−128 to +127) and bit 7 becomes a sign bit. In other words, relative addressing consists of relative branching from the start address of the following instruction to the −128 to +127 range.

This function is carried out when the BR \$addr16 instruction or a conditional branch instruction is executed.

[Illustration]

When S = 0, all bits of α are 0.
 When S = 1, all bits of α are 1.

3.3.2 Immediate addressing

[Function]

Immediate data in the instruction word is transferred to the program counter (PC) and branched. This function is carried out when the CALL !addr16 or BR !addr16 or CALLF !addr11 instruction is executed. CALL !addr16 and BR !addr16 instructions can be branched to the entire memory space. The CALLF !addr11 instruction is branched to the 0800H to 0FFFH area.

[Illustration]

In the case of CALL !addr16 and BR !addr16 instructions

In the case of CALLF !addr11 instruction

3.3.3 Table indirect addressing

[Function]

Table contents (branch destination address) of the particular location to be addressed by bits 1 to 5 of the immediate data of an operation code are transferred to the program counter (PC) and branched.

This function is carried out when the CALLT [addr5] instruction is executed.

This instruction references the address stored in the memory table from 40H to 7FH, and allows branching to the entire memory space.

[Illustration]

3.3.4 Register addressing

[Function]

Register pair (AX) contents to be specified with an instruction word are transferred to the program counter (PC) and branched.

This function is carried out when the BR AX instruction is executed.

[Illustration]

3.4 Operand Address Addressing

The following methods are available to specify the register and memory (addressing) to undergo manipulation during instruction execution.

3.4.1 Implied addressing

[Function]

The register that functions as an accumulator (A and AX) among the general-purpose registers is automatically (implicitly) addressed.

Of the 78K0/KF1+ instruction words, the following instructions employ implied addressing.

Instruction	Register to Be Specified by Implied Addressing
MULU	A register for multiplicand and AX register for product storage
DIVUW	AX register for dividend and quotient storage
ADJBA/ADJBS	A register for storage of numeric values that become decimal correction targets
ROR4/ROL4	A register for storage of digit data that undergoes digit rotation

[Operand format]

Because implied addressing can be automatically employed with an instruction, no particular operand format is necessary.

[Description example]

In the case of MULU X

With an 8-bit × 8-bit multiply instruction, the product of A register and X register is stored in AX. In this example, the A and AX registers are specified by implied addressing.

3.4.2 Register addressing

[Function]

The general-purpose register to be specified is accessed as an operand with the register bank select flags (RBS0 to RBS1) and the register specify codes (Rn and RPn) of an operation code.

Register addressing is carried out when an instruction with the following operand format is executed. When an 8-bit register is specified, one of the eight registers is specified with 3 bits in the operation code.

[Operand format]

Identifier	Description
r	X, A, C, B, E, D, L, H
rp	AX, BC, DE, HL

'r' and 'rp' can be described by absolute names (R0 to R7 and RP0 to RP3) as well as function names (X, A, C, B, E, D, L, H, AX, BC, DE, and HL).

[Description example]

MOV A, C; when selecting C register as r

INCW DE; when selecting DE register pair as rp

3.4.3 Direct addressing

[Function]

The memory to be manipulated is directly addressed with immediate data in an instruction word becoming an operand address.

[Operand format]

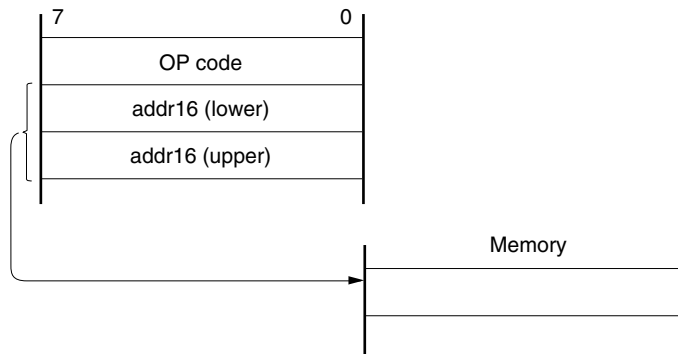

Identifier	Description
addr16	Label or 16-bit immediate data

[Description example]

MOV A, !0FE00H; when setting !addr16 to FE00H

[Illustration]

3.4.4 Short direct addressing

[Function]

The memory to be manipulated in the fixed space is directly addressed with 8-bit data in an instruction word. This addressing is applied to the 256-byte space FE20H to FF1FH. Internal RAM and special function registers (SFRs) are mapped at FE20H to FEFFH and FF00H to FF1FH, respectively. The SFR area (FF00H to FF1FH) where short direct addressing is applied is a part of the overall SFR area. Ports that are frequently accessed in a program and compare and capture registers of the timer/event counter are mapped in this area, allowing SFRs to be manipulated with a small number of bytes and clocks. When 8-bit immediate data is at 20H to FFH, bit 8 of an effective address is set to 0. When it is at 00H to 1FH, bit 8 is set to 1. Refer to the **[Illustration]** shown below.

[Operand format]

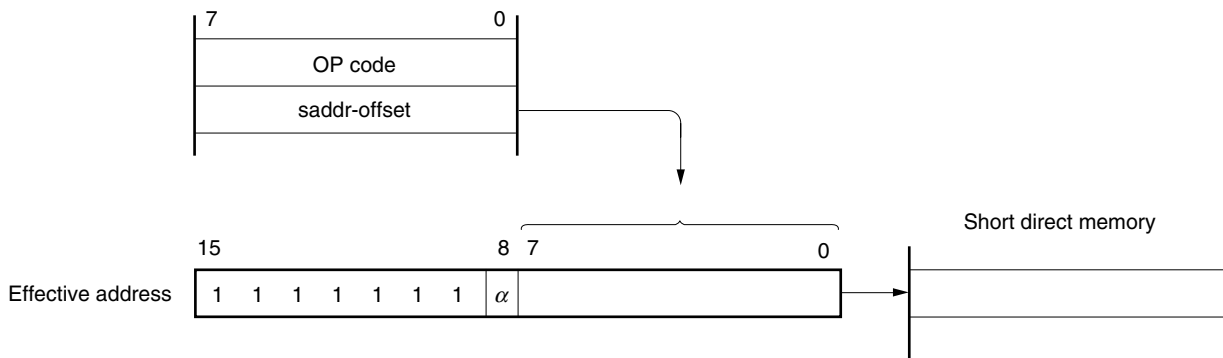

Identifier	Description
saddr	Immediate data that indicate label or FE20H to FF1FH
saddrp	Immediate data that indicate label or FE20H to FF1FH (even address only)

[Description example]

MOV 0FE30H, A; when transferring value of A register to saddr (FE30H)

[Illustration]

When 8-bit immediate data is 20H to FFH, $\alpha = 0$

When 8-bit immediate data is 00H to 1FH, $\alpha = 1$

3.4.5 Special function register (SFR) addressing

[Function]

A memory-mapped special function register (SFR) is addressed with 8-bit immediate data in an instruction word. This addressing is applied to the 240-byte spaces FF00H to FFCFH and FFE0H to FFFFH. However, the SFRs mapped at FF00H to FF1FH can be accessed with short direct addressing.

[Operand format]

Identifier	Description
sfr	Special function register name
sfrp	16-bit manipulatable special function register name (even address only)

[Description example]

MOV PM0, A; when selecting PM0 (FF20H) as sfr

[Illustration]

3.4.6 Register indirect addressing

[Function]

Register pair contents specified by a register pair specify code in an instruction word and by a register bank select flag (RBS0 and RBS1) serve as an operand address for addressing the memory. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
-	[DE], [HL]

[Description example]

MOV A, [DE]; when selecting [DE] as register pair

Operation code

1	0	0	0	0	1	0	1
---	---	---	---	---	---	---	---

[Illustration]

3.4.7 Based addressing

[Function]

8-bit immediate data is added as offset data to the contents of the base register, that is, the HL register pair in the register bank specified by the register bank select flag (RBS0 and RBS1), and the sum is used to address the memory. Addition is performed by expanding the offset data as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
-	[HL + byte]

[Description example]

MOV A, [HL + 10H]; when setting byte to 10H

Operation code

1 0 1 0 1 1 1 0

0 0 0 1 0 0 0 0

[Illustration]

3.4.8 Based indexed addressing

[Function]

The B or C register contents specified in an instruction word are added to the contents of the base register, that is, the HL register pair in the register bank specified by the register bank select flag (RBS0 and RBS1), and the sum is used to address the memory. Addition is performed by expanding the B or C register contents as a positive number to 16 bits. A carry from the 16th bit is ignored. This addressing can be carried out for all the memory spaces.

[Operand format]

Identifier	Description
-	[HL + B], [HL + C]

[Description example]

MOV A, [HL + B]; when selecting B register

Operation code 1 0 1 0 1 0 1 1

[Illustration]

3.4.9 Stack addressing

[Function]

The stack area is indirectly addressed with the stack pointer (SP) contents.

This addressing method is automatically employed when the PUSH, POP, subroutine call and return instructions are executed or the register is saved/reset upon generation of an interrupt request.

With stack addressing, only the internal high-speed RAM area can be accessed.

[Description example]

PUSH DE; when saving DE register

Operation code

[Illustration]

CHAPTER 4 PORT FUNCTIONS

4.1 Port Functions

There are two types of pin I/O buffer power supplies: AV_{REF} and EV_{DD} . The relationship between these power supplies and the pins is shown below.

Table 4-1. Pin I/O Buffer Power Supplies

Power Supply	Corresponding Pins
AV_{REF}	P20 to P27
EV_{DD}	Port pins other than P20 to P27

78K0/KF1+ products are provided with the ports shown in Figure 4-1, which enable variety of control operations. The functions of each port are shown in Table 4-2.

In addition to the function as digital I/O ports, these ports have several alternate functions. For details of the alternate functions, refer to **CHAPTER 2 PIN FUNCTIONS**.

Figure 4-1. Port Types

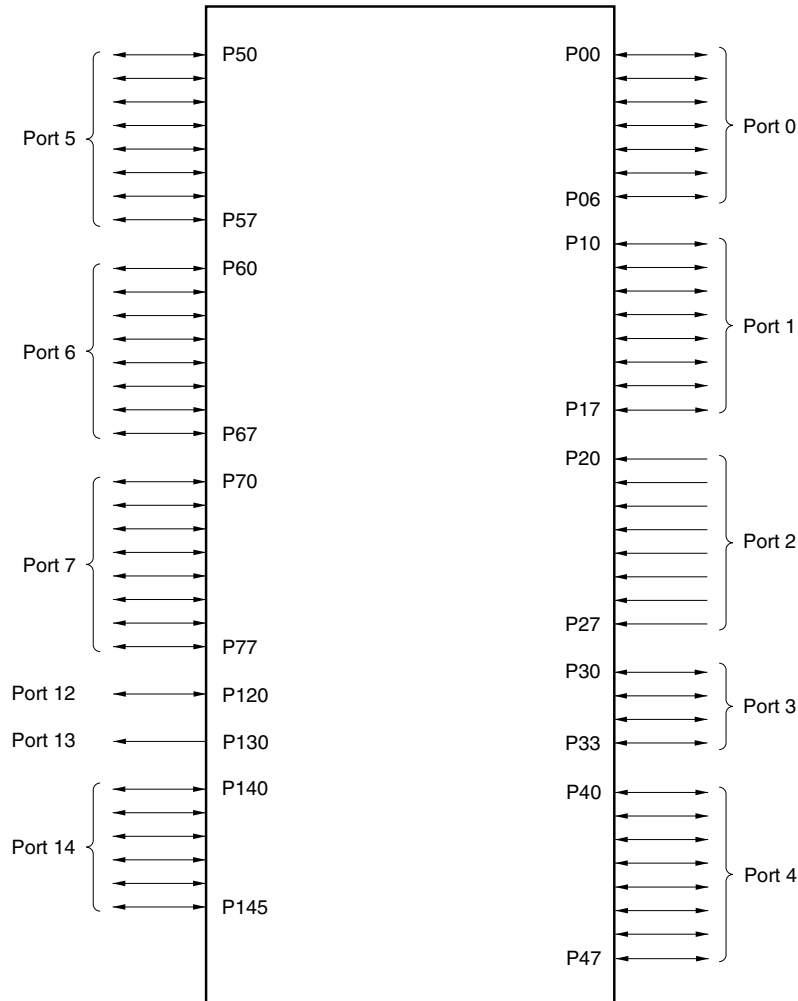

Table 4-2. Port Functions (1/2)

Pin Name	I/O	Function		After Reset	Alternate Function	
P00	I/O	Port 0. 7-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	TI000	
P01					TI010/TO00	
P02					SO11	
P03					SI11	
P04					SCK11	
P05					SSI11/TI001	
P06					TI011/TO01	
P10	I/O	Port 1. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	SCK10/TxD0	
P11					SI10/RxD0	
P12					SO10	
P13					TxD6	
P14					RxD6	
P15					TOH0	
P16					TOH1/INTP5/ FLMD1	
P17					TI50/TO50	
P20 to P27	Input	Port 2. 8-bit input-only port.		Input	ANI0 to ANI7	
P30 to P32	I/O	Port 3. 4-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	INTP1 to INTP3	
P33					INTP4/TI51/TO51	
P40 to P47	I/O	Port 4. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	AD0 to AD7	
P50 to P57	I/O	Port 5. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.		Input	A8 to A15	
P60 to P63	I/O	Port 6. 8-bit I/O port. Input/output can be specified in 1-bit units.		Input	N-ch open-drain I/O port.	
P64					Use of an on-chip pull-up resistor can be specified by a software setting.	RD
P65						WR
P66						WAIT
P67						ASTB

Table 4-2. Port Functions (2/2)

Pin Name	I/O	Function	After Reset	Alternate Function
P70 to P77	I/O	Port 7. 8-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	KR0 to KR7
P120	I/O	Port 12. 1-bit I/O port. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	INTP0
P130	Output	Port 13. 1-bit output-only port.	Output	–
P140	I/O	Port 14. 6-bit I/O port. Input/output can be specified in 1-bit units. Use of an on-chip pull-up resistor can be specified by a software setting.	Input	PCL/INTP6
P141				BUZ/BUSY0/ INTP7
P142				SCKA0
P143				SIA0
P144				SOA0
P145				STB0

4.2 Port Configuration

Ports consist of the following hardware.

Table 4-3. Port Configuration

Item	Configuration
Control registers	Port mode register (PM0, PM1, PM3 to PM7, PM12, PM14) Port register (P0 to P7, P12 to P14) Pull-up resistor option register (PU0, PU1, PU3 to PU7, PU12, PU14)
Port	Total: 67 (CMOS I/O: 54, CMOS input: 8, CMOS output: 1, N-ch open drain I/O: 4)
Pull-up resistor	Total: 54

4.2.1 Port 0

Port 0 is a 7-bit I/O port with an output latch. Port 0 can be set to the input mode or output mode in 1-bit units using port mode register 0 (PM0). When the P00 to P06 pins are used as an input port, use of an on-chip pull-up resistor can be specified in 1-bit units by pull-up resistor option register 0 (PU0).

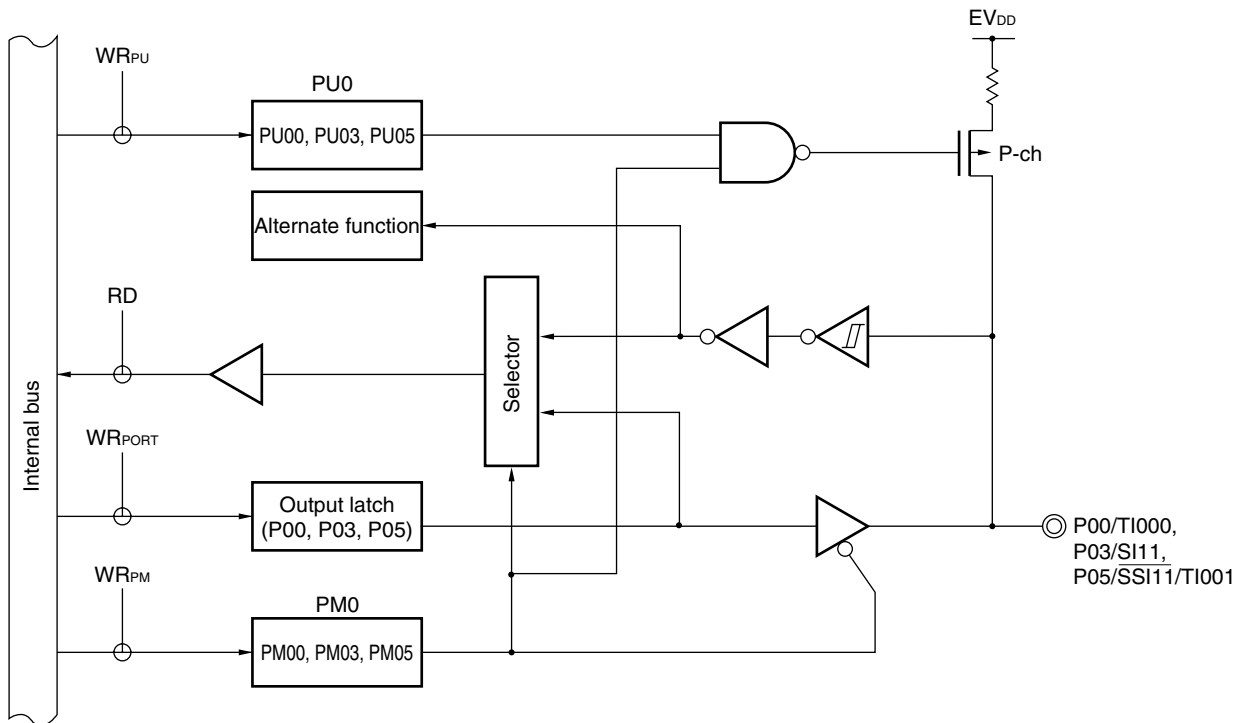

This port can also be used for timer I/O, serial interface data I/O, and clock I/O.

$\overline{\text{RESET}}$ input sets port 0 to input mode.

Figures 4-2 to 4-5 show block diagrams of port 0.

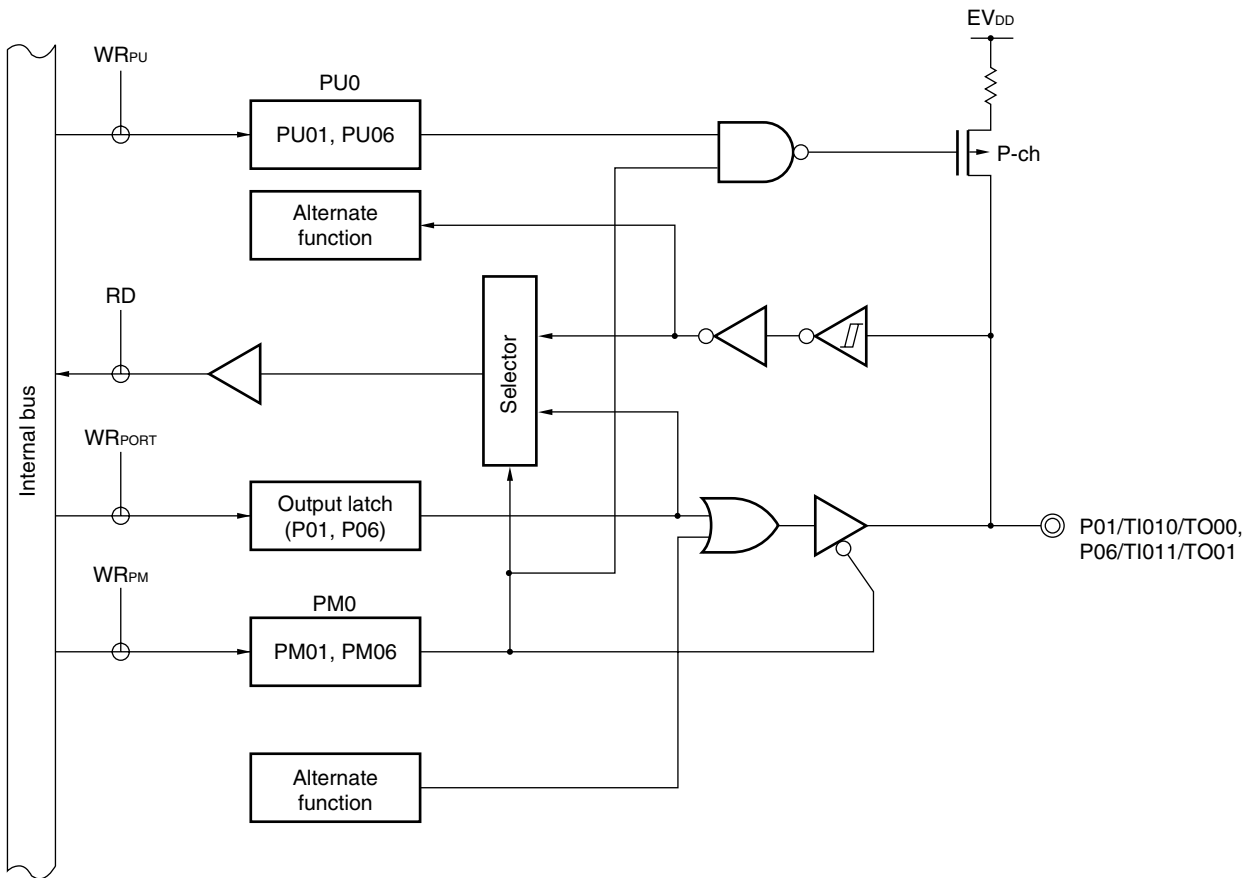

<R> **Caution** To use P02/SO11, P03/SI11, and P04/ $\overline{\text{SCK11}}$ as general-purpose ports, set serial operation mode register 11 (CSIM11) and serial clock selection register 11 (CSIC11) to the default status (00H).

4.2.2 Port 1

Port 1 is an 8-bit I/O port with an output latch. Port 1 can be set to the input mode or output mode in 1-bit units using port mode register 1 (PM1). When the P10 to P17 pins are used as an input port, use of an on-chip pull-up resistor can be specified in 1-bit units by pull-up resistor option register 1 (PU1).

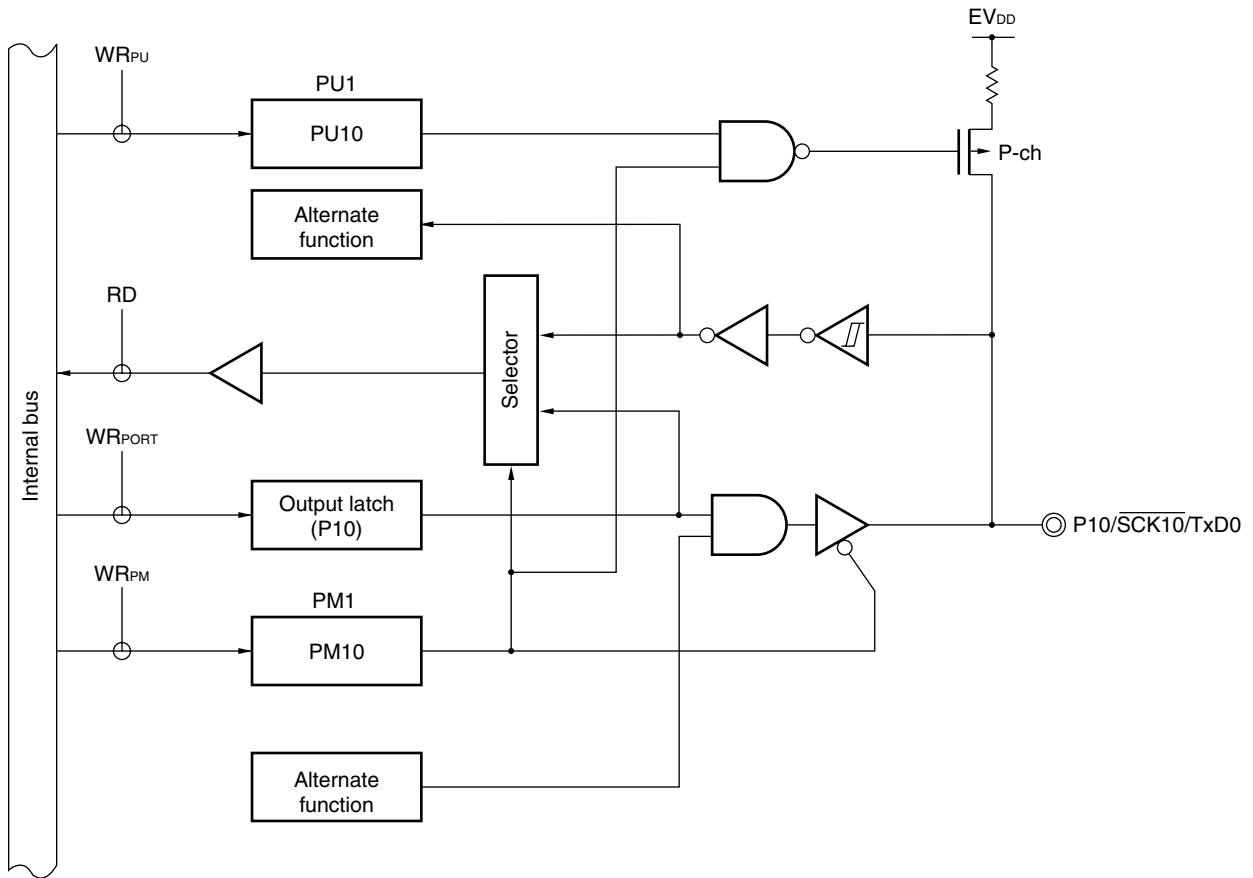

This port can also be used for external interrupt request input, serial interface data I/O, clock I/O, timer I/O, and flash memory programming mode setting.

RESET input sets port 1 to input mode.

Figures 4-6 to 4-10 show block diagrams of port 1.

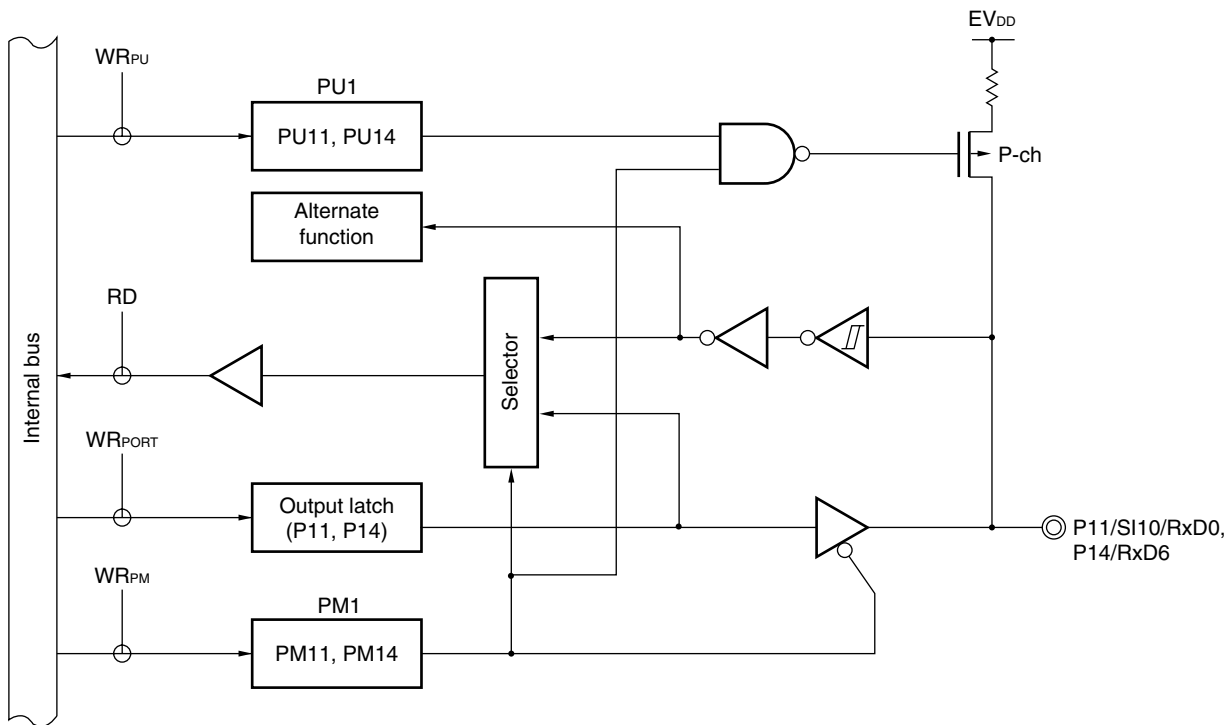

<R> **Caution** To use P10/SCK10/TxD0, P11/SI10/RxD0, and P12/SO10 as general-purpose ports, set serial operation mode register 10 (CSIM10) and serial clock selection register 10 (CSIC10) to the default status (00H).

4.2.3 Port 2

Port 2 is an 8-bit input-only port.

This port can also be used for A/D converter analog input.

Figure 4-11 shows a block diagram of port 2.

Figure 4-11. Block Diagram of P20 to P27

RD: Read signal

4.2.4 Port 3

Port 3 is a 4-bit I/O port with an output latch. Port 3 can be set to the input mode or output mode in 1-bit units using port mode register 3 (PM3). When used as an input port, use of an on-chip pull-up resistor can be specified in 1-bit units by pull-up resistor option register 3 (PU3).

This port can also be used for external interrupt request input and timer I/O.

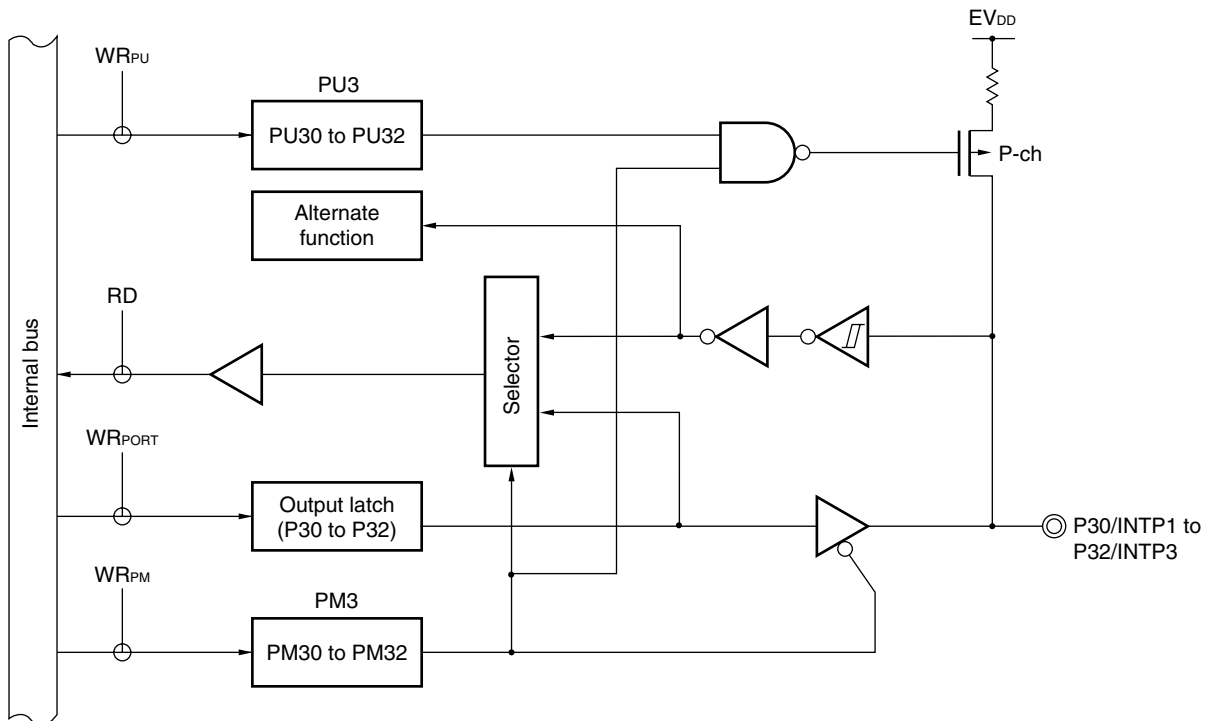

RESET input sets port 3 to input mode.

Figures 4-12 and 4-13 show block diagrams of port 3.

Caution In the μ PD78F0148HD, be sure to pull the P31 pin down after reset to prevent malfunction.

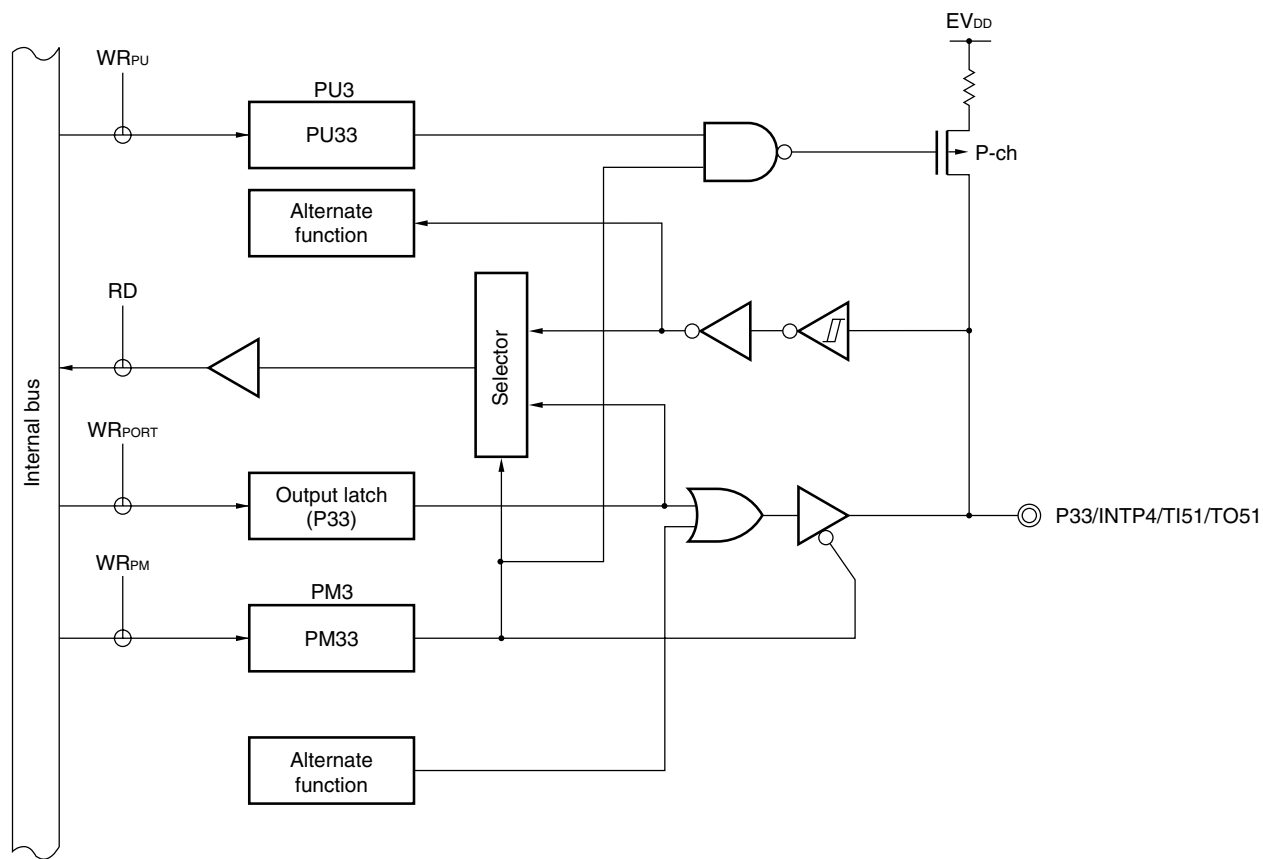

Remark P31/INTP2 and P32/INTP3 of the μ PD78F0148HD can be used for on-chip debug mode setting when the on-chip debug function is used. For details, refer to **CHAPTER 28 ON-CHIP DEBUG FUNCTION (μ PD78F0148HD ONLY)**.

4.2.5 Port 4

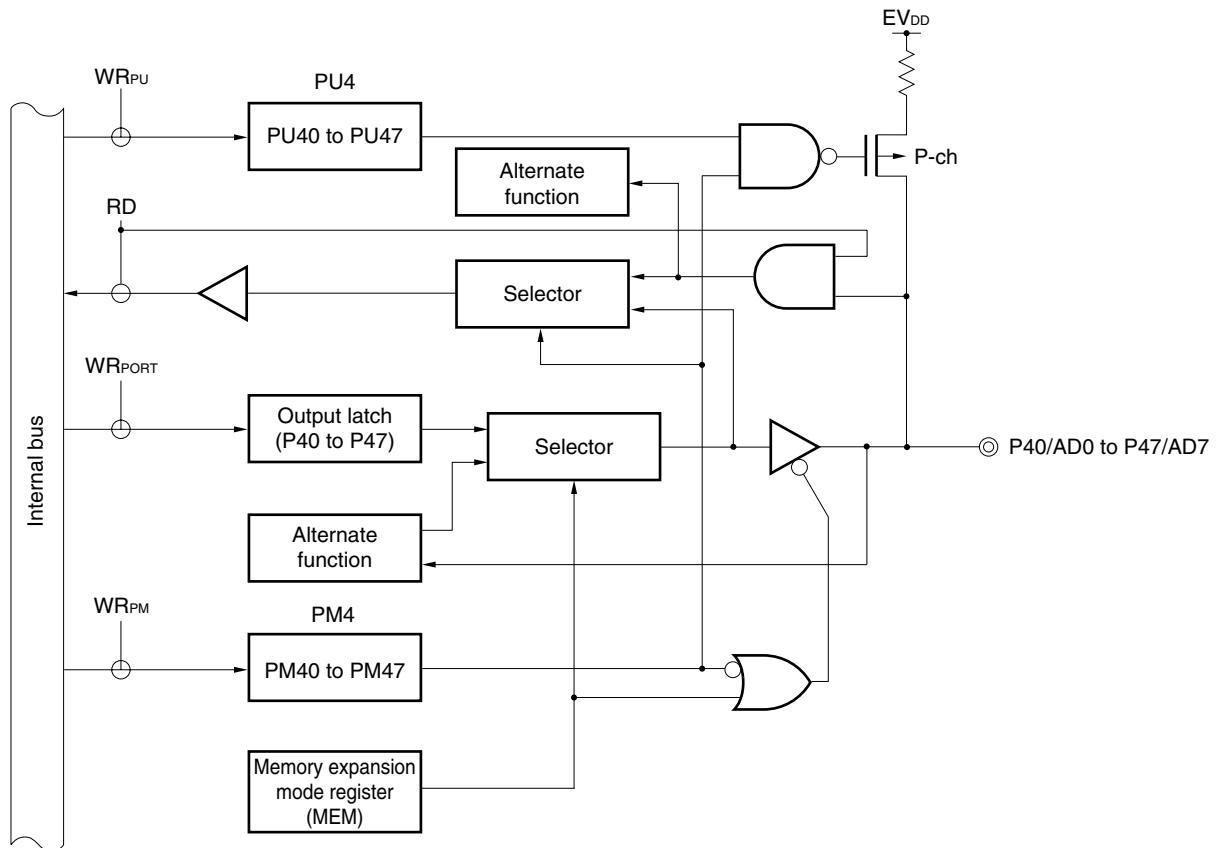

Port 4 is an 8-bit I/O port with an output latch. Port 4 can be set to the input mode or output mode in 1-bit units using port mode register 4 (PM4). Use of an on-chip pull-up resistor can be specified in 1-bit units with pull-up resistor option register 4 (PU4).

This port can also be used as an address/data bus in external memory expansion mode.

RESET input sets port 4 to input mode.

Figure 4-14 shows a block diagram of port 4.

Figure 4-14. Block Diagram of P40 to P47

PU4: Pull-up resistor option register 4

WR_{xx}: Write signal

4.2.6 Port 5

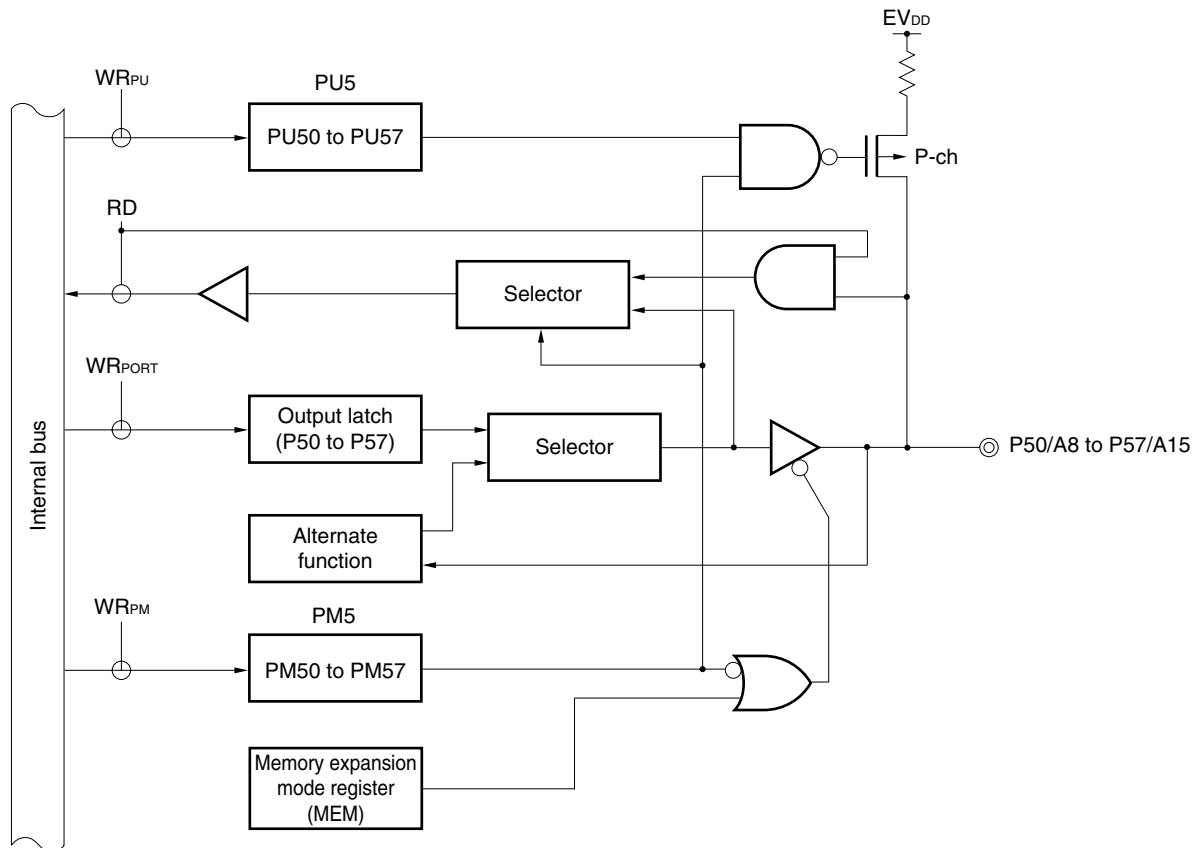

Port 5 is an 8-bit I/O port with an output latch. Port 5 can be set to the input mode or output mode in 1-bit units using port mode register 5 (PM5). Use of an on-chip pull-up resistor can be specified in 1-bit units using pull-up resistor option register 5 (PU5).

This port can also be used as an address bus in external memory expansion mode.

$\overline{\text{RESET}}$ input sets port 5 to input mode.

Figure 4-15 shows a block diagram of port 5.

Figure 4-15. Block Diagram of P50 to P57

PU5: Pull-up resistor option register 5

PM5: Port mode register 5

RD: Read signal

WR_{xx}: Write signal

4.2.7 Port 6

Port 6 is an 8-bit I/O port with an output latch. Port 6 can be set to the input mode or output mode in 1-bit units using port mode register 6 (PM6).

This port has the following functions for pull-up resistors. These functions differ depending on the higher 4 bits/lower 4 bits of the port.

Table 4-4. Pull-up Resistor of Port 6

Higher 4 Bits (Pins P64 to P67)	Lower 4 Bits (Pins P60 to P63)
An on-chip pull-up resistor can be connected in 1-bit units by PU6	On-chip pull-up resistors are not provided

PU6: Pull-up resistor option register 6

The P60 to P63 pins are N-ch open-drain pins.

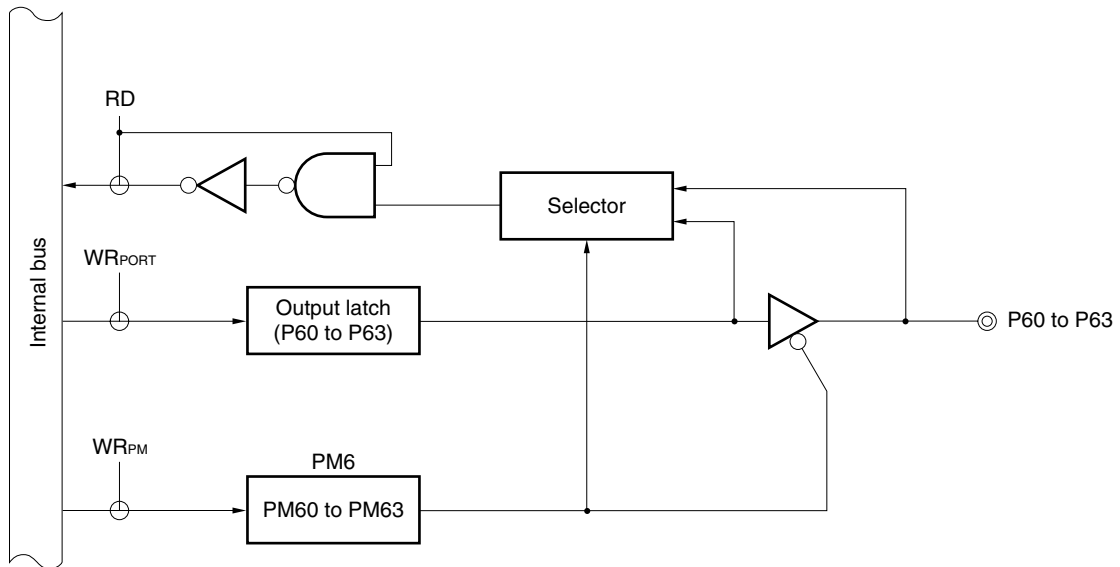

The P64 to P67 pins can also be used for the control signal output function in external memory expansion mode.

$\overline{\text{RESET}}$ input sets port 6 to input mode.

Figures 4-16 to 4-18 show block diagrams of port 6.

Caution P66 can be used as an I/O port when an external wait is not used in external memory expansion mode.

4.2.8 Port 7

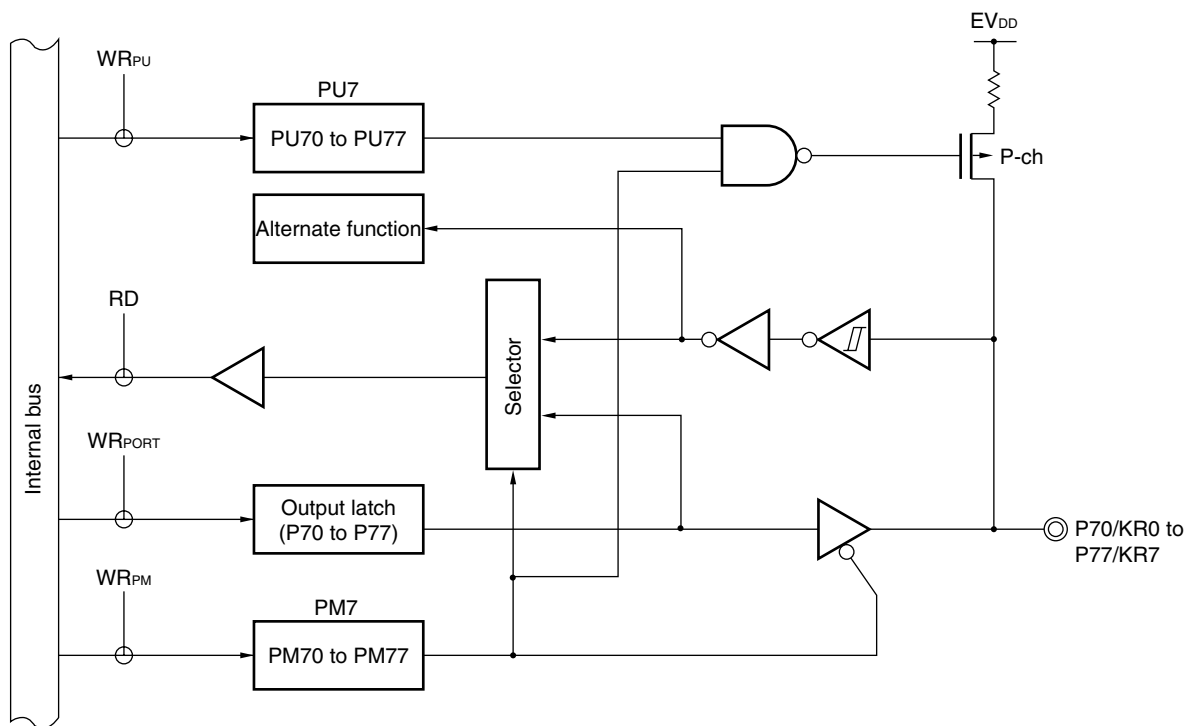

Port 7 is an 8-bit I/O port with an output latch. Port 7 can be set to the input mode or output mode in 1-bit units using port mode register 7 (PM7). When the P70 to P77 pins are used as an input port, use of an on-chip pull-up resistor can be specified in 1-bit units by pull-up resistor option register 7 (PU7).

This port can also be used for key return input.

RESET input sets port 7 to input mode.

Figure 4-19 shows a block diagram of port 7.

Figure 4-19. Block Diagram of P70 to P77

- PU7: Pull-up resistor option register 7
- PM7: Port mode register 7
- RD: Read signal
- WR_{xx}: Write signal

4.2.9 Port 12

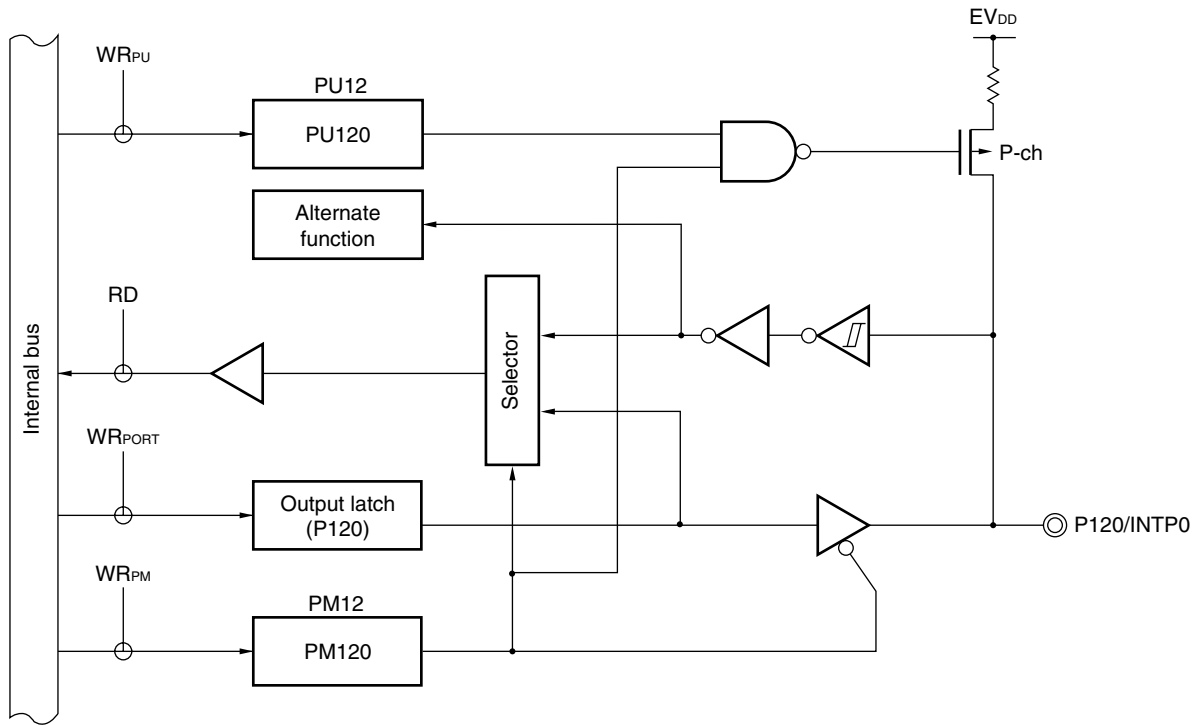

Port 12 is a 1-bit I/O port with an output latch. Port 12 can be set to the input mode or output mode in 1-bit units using port mode register 12 (PM12). When used as an input port, use of an on-chip pull-up resistor can be specified by pull-up resistor option register 12 (PU12).

This port can also be used for external interrupt request input.

$\overline{\text{RESET}}$ input sets port 12 to input mode.

Figure 4-20 shows a block diagram of port 12.

Figure 4-20. Block Diagram of P120

PU12: Pull-up resistor option register 12

PM12: Port mode register 12

RD: Read signal

WR_{xx}: Write signal

4.2.10 Port 13

Port 13 is a 1-bit output-only port.

Figure 4-21 shows a block diagram of port 13.

Figure 4-21. Block Diagram of P130

RD: Read signal

WR_{xx}: Write signal

Remark When reset is effected, P130 outputs a low level. If P130 is set to output a high level before reset is effected, the output signal of P130 can be dummy-output as the CPU reset signal.

4.2.11 Port 14

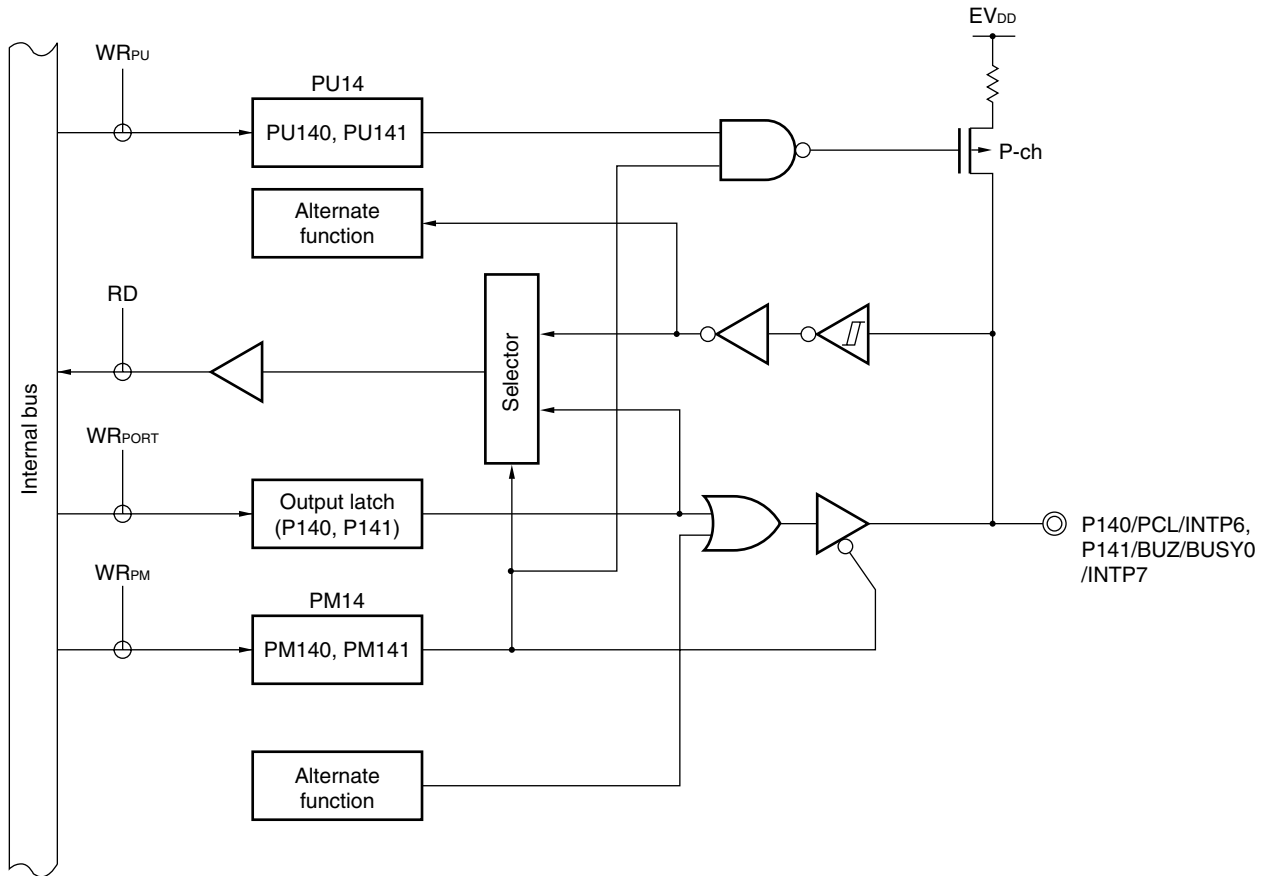

Port 14 is a 6-bit I/O port with an output latch. Port 14 can be set to the input mode or output mode in 1-bit units using port mode register 14 (PM14). When the P140 to P145 pins are used as an input port, use of an on-chip pull-up resistor can be specified in 1-bit units by pull-up resistor option register 14 (PU14).

This port can also be used for external interrupt request input, serial interface data I/O, clock I/O, busy input, buzzer output, and clock output.

$\overline{\text{RESET}}$ input sets port 14 to input mode.

Figures 4-22 to 4-25 show block diagrams of port 14.

4.3 Registers Controlling Port Function

Port functions are controlled by the following three types of registers.

- Port mode registers (PM0, PM1, PM3 to PM7, PM12, PM14)
- Port registers (P0 to P7, P12 to P14)
- Pull-up resistor option registers (PU0, PU1, PU3 to PU7, PU12, PU14)

(1) Port mode registers (PM0, PM1, PM3 to PM7, PM12, and PM14)

These registers specify input or output mode for the port in 1-bit units.

These registers can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets these registers to FFH.

When port pins are used as alternate-function pins, set the port mode register and output latch as shown in Table 4-5.

Figure 4-26. Format of Port Mode Register

Symbol	7	6	5	4	3	2	1	0	Address	After reset	R/W

Remark ×: Don't care
 PM_{xx}: Port mode register
 P_{xx}: Port output latch

(2) Port registers (P0 to P7, P12 to P14)

These registers write the data that is output from the chip when data is output from a port.

If the data is read in the input mode, the pin level is read. If it is read in the output mode, the value of the output latch is read.

These registers can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears these registers to 00H (but P2 is undefined).

Figure 4-27. Format of Port Register

Symbol	7	6	5	4	3	2	1	0	Address	After reset	R/W
P0	0	P06	P05	P04	P03	P02	P01	P00	FF00H	00H (output latch)	R/W

P14	0	0	P145	P144	P143	P142	P141	P140	FF0EH	00H (output latch)	R/W

Pmn	m = 0 to 7, 12 to 14; n = 0 to 7	
	Output data control (in output mode)	Input data read (in input mode)
0	Output 0	Input low level
1	Output 1	Input high level

(3) Pull-up resistor option registers (PU0, PU1, PU3 to PU7, PU12, and PU14)

These registers specify whether the on-chip pull-up resistors of P00 to P06, P10 to P17, P30 to P33, P40 to P47, P50 to P57, P64 to P67, P70 to P77, P120, or P140 to P145 are to be used or not. On-chip pull-up resistors can be used in 1-bit units only for the bits set to input mode of the pins to which the use of an on-chip pull-up resistor has been specified in PU0, PU1, PU3 to PU7, PU12, and PU14. On-chip pull-up resistors cannot be connected to bits set to output mode and bits used as alternate-function output pins, regardless of the settings of PU0, PU1, PU3 to PU7, PU12, and PU14.

These registers can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears these registers to 00H.

Figure 4-28. Format of Pull-up Resistor Option Register

Symbol	7	6	5	4	3	2	1	0	Address	After reset	R/W

PU12	0	0	0	0	0	0	0	PU120	FF3CH	00H	R/W
PU14	0	0	PU145	PU144	PU143	PU142	PU141	PU140	FF3EH	00H	R/W

PU _m n	P _m n pin on-chip pull-up resistor selection (m = 0, 1, 3 to 7, 12, 14; n = 0 to 7)
0	On-chip pull-up resistor not connected
1	On-chip pull-up resistor connected

4.4 Port Function Operations

Port operations differ depending on whether the input or output mode is set, as shown below.

Caution In the case of 1-bit memory manipulation instruction, although a single bit is manipulated, the port is accessed as an 8-bit unit. Therefore, on a port with a mixture of input and output pins, the output latch contents for pins specified as input are undefined, even for bits other than the manipulated bit.

4.4.1 Writing to I/O port

(1) Output mode

A value is written to the output latch by a transfer instruction, and the output latch contents are output from the pin. Once data is written to the output latch, it is retained until data is written to the output latch again. The data of the output latch is cleared by reset.

(2) Input mode

A value is written to the output latch by a transfer instruction, but since the output buffer is off, the pin status does not change. Once data is written to the output latch, it is retained until data is written to the output latch again.

4.4.2 Reading from I/O port

(1) Output mode

The output latch contents are read by a transfer instruction. The output latch contents do not change.

(2) Input mode

The pin status is read by a transfer instruction. The output latch contents do not change.

4.4.3 Operations on I/O port

(1) Output mode

An operation is performed on the output latch contents, and the result is written to the output latch. The output latch contents are output from the pins. Once data is written to the output latch, it is retained until data is written to the output latch again. The data of the output latch is cleared by reset.

(2) Input mode

The pin level is read and an operation is performed on its contents. The result of the operation is written to the output latch, but since the output buffer is off, the pin status does not change.

CHAPTER 5 EXTERNAL BUS INTERFACE

5.1 External Bus Interface

The external bus interface connects external devices to areas other than the internal ROM, RAM, and SFR areas. Connection of external devices uses ports 4 to 6. Ports 4 to 6 control address/data, read/write strobe, wait, address strobe, etc.

The external bus interface is usable only when the high-speed system clock is selected as the CPU clock.

<R> **Caution** The external bus interface function cannot be used in (A1) grade products.

Table 5-1. Pin Functions in External Memory Expansion Mode

Pin Function When External Device Is Connected		Alternate Function
Name	Function	
AD0 to AD7	Multiplexed address/data bus	P40 to P47
A8 to A15	Address bus	P50 to P57
\overline{RD}	Read strobe signal	P64
\overline{WR}	Write strobe signal	P65
\overline{WAIT}	Wait signal	P66
ASTB	Address strobe signal	P67

Table 5-2. State of Ports 4 to 6 Pins in External Memory Expansion Mode

External Expansion Mode	Port	Port 4								Port 5								Port 6															
		0 to 7								0	1	2	3	4	5	6	7	0	1	2	3	4	5	6	7								
Single-chip mode	Port	Port								Port								Port															
256-byte expansion mode	Address/data	Port								Port								Port				\overline{RD} , \overline{WR} , \overline{WAIT} , ASTB											
4 KB expansion mode	Address/data	Address				Port				Port								Port				\overline{RD} , \overline{WR} , \overline{WAIT} , ASTB											
16 KB expansion mode	Address/data	Address				Port				Port								Port				\overline{RD} , \overline{WR} , \overline{WAIT} , ASTB											
Full-address mode	Address/data	Address								Port								Port								Port				\overline{RD} , \overline{WR} , \overline{WAIT} , ASTB			

Caution When the external wait function is not used, the \overline{WAIT} pin can be used as a port in all modes.

The memory maps when the external bus interface is used are as follows.

Figure 5-1. Memory Map When Using External Bus Interface (1/2)

- (a) Memory map of 78K0/KF1+ when flash memory is 24 KB, internal expansion RAM is 0 bytes
 (b) Memory map of 78K0/KF1+ when flash memory is 32 KB, internal expansion RAM is 0 bytes

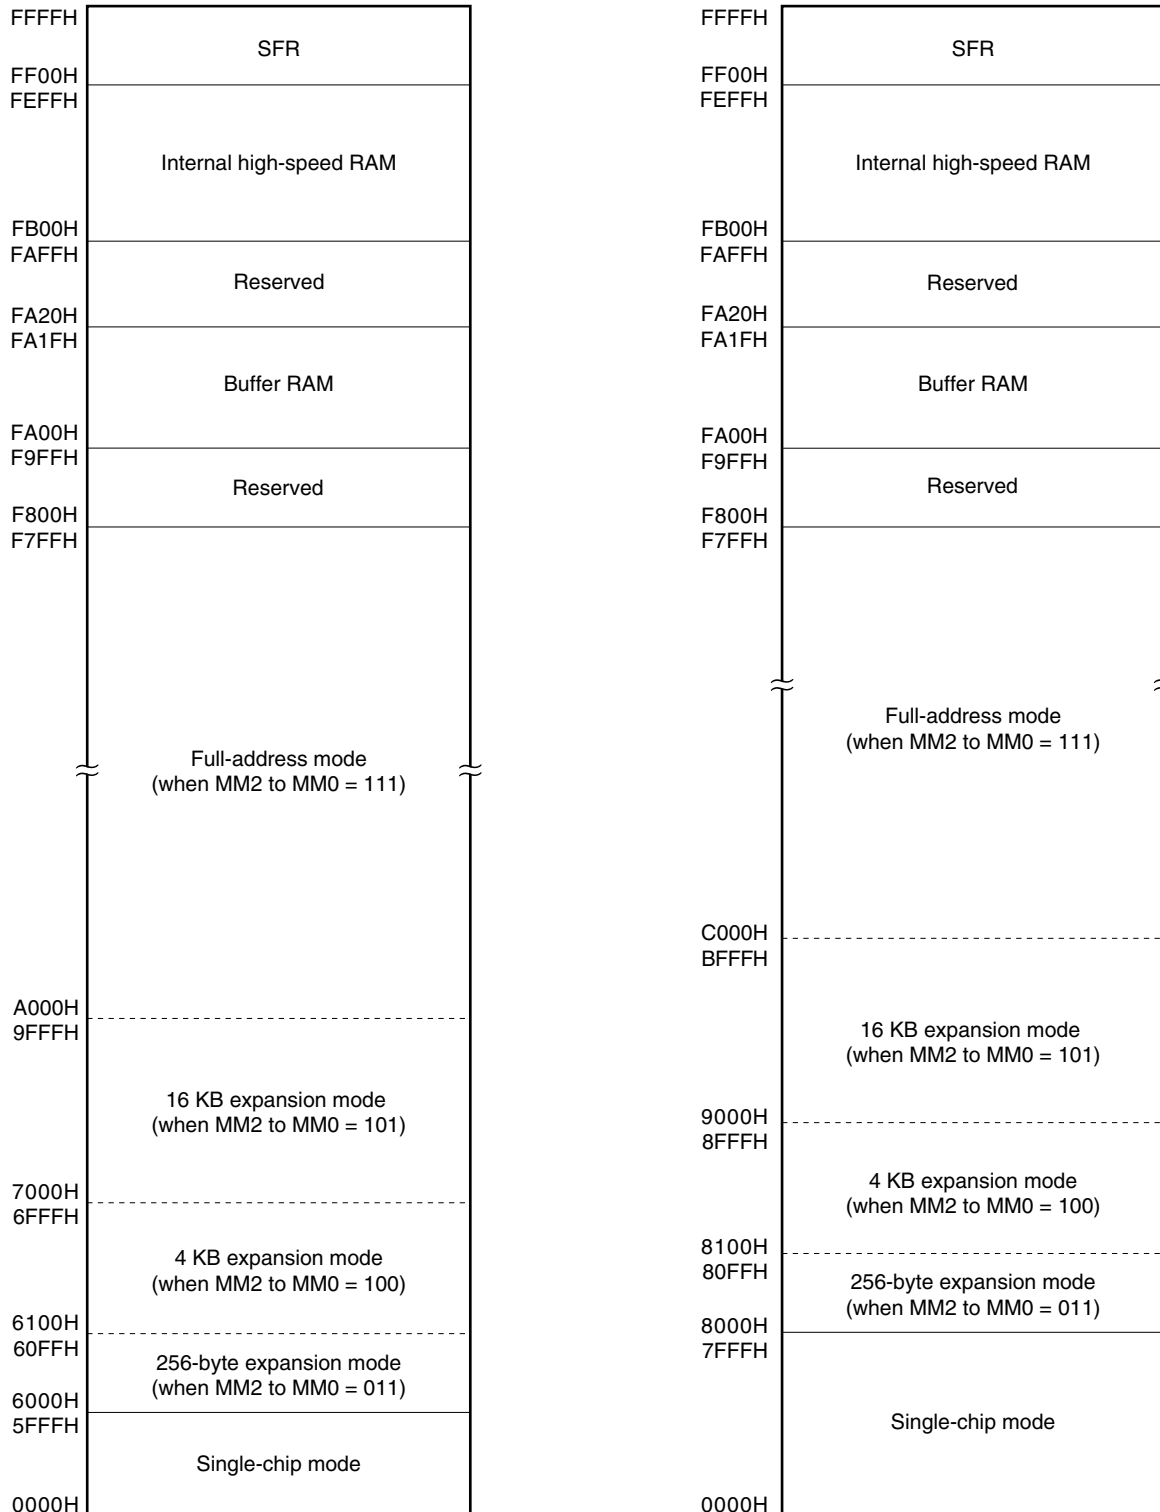

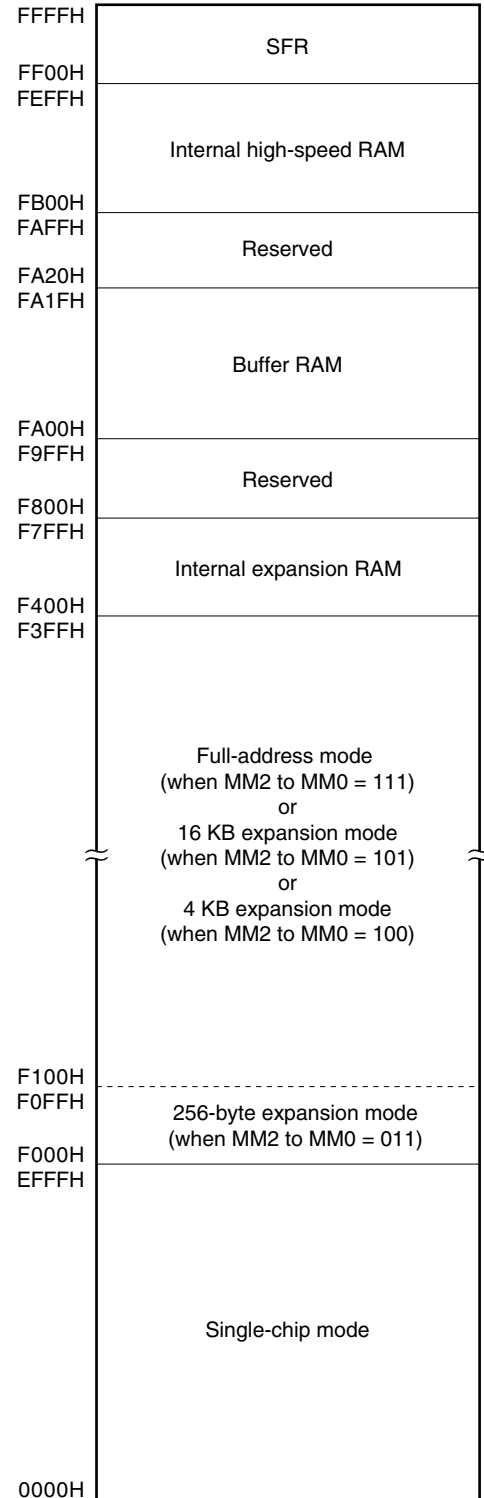

Figure 5-1. Memory Map When Using External Bus Interface (2/2)

- (c) Memory map of μ PD78F0148H and μ PD78F0148HD when flash memory is 48 KB, internal explanation RAM is 1 KB
- (d) Memory map of μ PD78F0148H and μ PD78F0148HD when flash memory is 60 KB, internal explanation RAM is 1 KB

5.2 Registers Controlling External Bus Interface

The external bus interface is controlled by the following two registers.

- Memory expansion mode register (MEM)
- Memory expansion wait setting register (MM)

(1) Memory expansion mode register (MEM)

MEM sets the external expansion area.

MEM is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears MEM to 00H.

Figure 5-2. Format of Memory Expansion Mode Register (MEM)

Address: FF47H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
MEM	0	0	0	0	0	MM2	MM1	MM0

MM2	MM1	MM0	Single-chip/memory expansion mode selection		P40 to P47, P50 to P57, P64 to P67 pin state				
					P40 to P47	P50 to P53	P54, P55	P56, P57	P64 to P67
0	0	0	Single-chip mode		Port mode				
0	1	1	Memory expansion mode ^{Note}	256-byte mode	AD0 to AD7	Port mode			P64 = $\overline{\text{RD}}$ P65 = $\overline{\text{WR}}$ P66 = $\overline{\text{WAIT}}$ P67 = $\overline{\text{ASTB}}$
1	0	0		4 KB mode		A8 to A11	Port mode		
1	0	1		16 KB mode			A12, A13	Port mode	
1	1	1		Full-address mode		A14, A15			
Other than above			Setting prohibited						

Note When the CPU accesses the external memory expansion area, the lower bits of the address to be accessed are output to the specified pins (except in the full-address mode).

Figure 5-3. Pins Specified for Address (When Flash Memory Is 24 KB, Internal Expansion RAM Is 0 Bytes)

External Expansion Mode	Address Accessed by CPU	Pins Specified for Address															
		A15	A14	A13	A12	A11	A10	A9	A8	AD7	AD6	AD5	AD4	AD3	AD2	AD1	AD0

	8000H	(1)	(0)	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	9000H	(1)	(0)	0	1	0	0	0	0	0	0	0	0	0	0	0	0
	9FFFH	(1)	(0)	0	1	1	1	1	1	1	1	1	1	1	1	1	1
Full-address mode	6000H	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
	6001H	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1
	F7FFH	1	1	1	1	0	1	1	1	1	1	1	1	1	1	1	1

Remark The value in () is not actually output. This pin can be used as a port pin.

(2) Memory expansion wait setting register (MM)

MM sets the number of waits.

MM is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets MM to 10H.

Figure 5-4. Format of Memory Expansion Wait Setting Register (MM)

Address: FFF8H After reset: 10H R/W

Symbol	7	6	5	4	3	2	1	0
MM	0	0	PW1	PW0	0	0	0	0

PW1	PW0	Wait control
0	0	No wait
0	1	Wait (one wait state inserted)
1	0	Setting prohibited
1	1	Wait control by external wait pin

- Cautions**
- To control wait with external wait pin, be sure to set WAIT/P66 pin to input mode (set bit 6 (PM66) of port mode register 6 (PM6) to 1).
 - If the external wait pin is not used for wait control, the WAIT/P66 pin can be used as an I/O port pin.

5.3 External Bus Interface Function Timing

Timing control signal output pins in the external memory expansion mode are as follows.

(1) \overline{RD} pin (Alternate function: P64)

Read strobe signal output pin. The read strobe signal is output in data read and instruction fetch from external memory.

During internal memory read, the read strobe signal is not output (maintains high level).

(2) \overline{WR} pin (Alternate function: P65)

Write strobe signal output pin. The write strobe signal is output in data write to external memory.

During internal memory write, the write strobe signal is not output (maintains high level).

(3) \overline{WAIT} pin (Alternate function: P66)

External wait signal input pin.

When the external wait is not used, the \overline{WAIT} pin can be used as an I/O port.

During internal memory access, the external wait signal is ignored.

(4) \overline{ASTB} pin (Alternate function: P67)

Address strobe signal output pin. The address strobe signal is output regardless of data access and instruction fetch from external memory.

During internal memory access, the address strobe signal is output.

(5) AD_0 to AD_7 , A_8 to A_{15} pins (Alternate function: P40 to P47, P50 to P57)

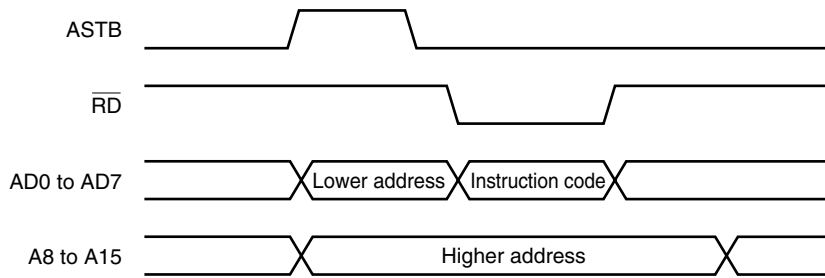

Address/data signal output pins. Valid signal is output or input during data accesses and instruction fetches from external memory.

These signals change even during internal memory access (output values are undefined).

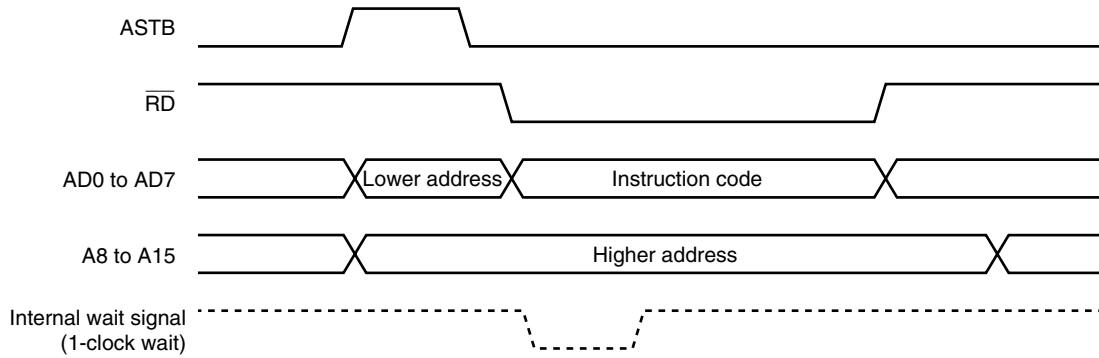

The timing charts are shown in Figures 5-5 to 5-8.

Figure 5-5. Instruction Fetch from External Memory

(a) No wait (PW1, PW0 = 0, 0) setting

(b) Wait (PW1, PW0 = 0, 1) setting

(c) External wait (PW1, PW0 = 1, 1) setting

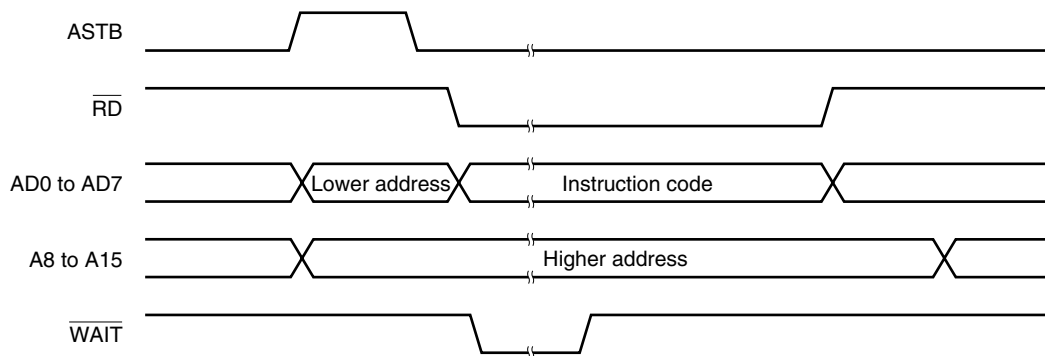

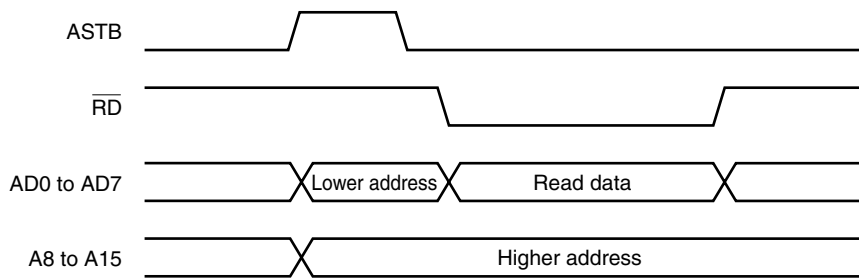

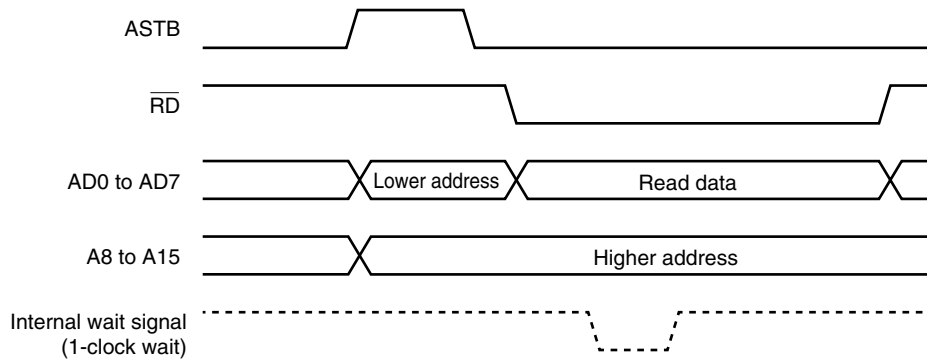

Figure 5-6. External Memory Read Timing

(a) No wait (PW1, PW0 = 0, 0) setting

(b) Wait (PW1, PW0 = 0, 1) setting

(c) External wait (PW1, PW0 = 1, 1) setting

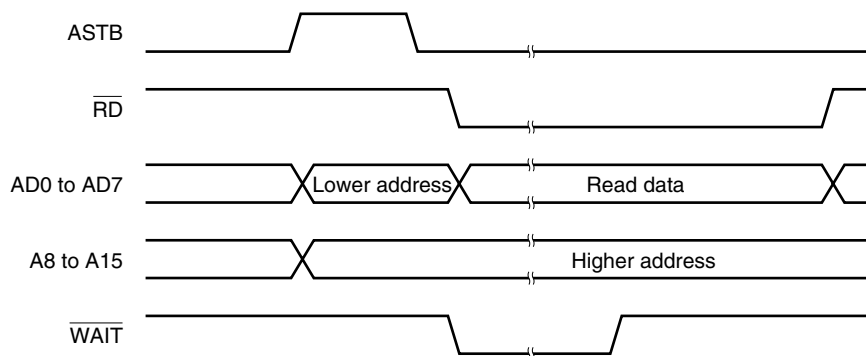

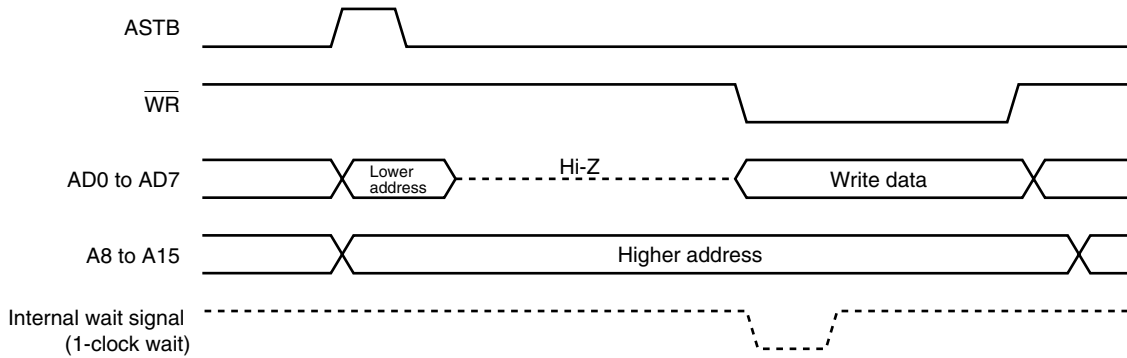

Figure 5-7. External Memory Write Timing

(a) No wait (PW1, PW0 = 0, 0) setting

(b) Wait (PW1, PW0 = 0, 1) setting

(c) External wait (PW1, PW0 = 1, 1) setting

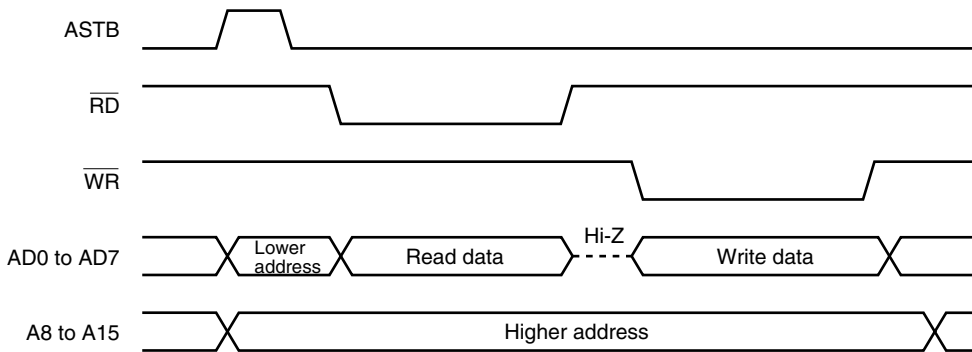

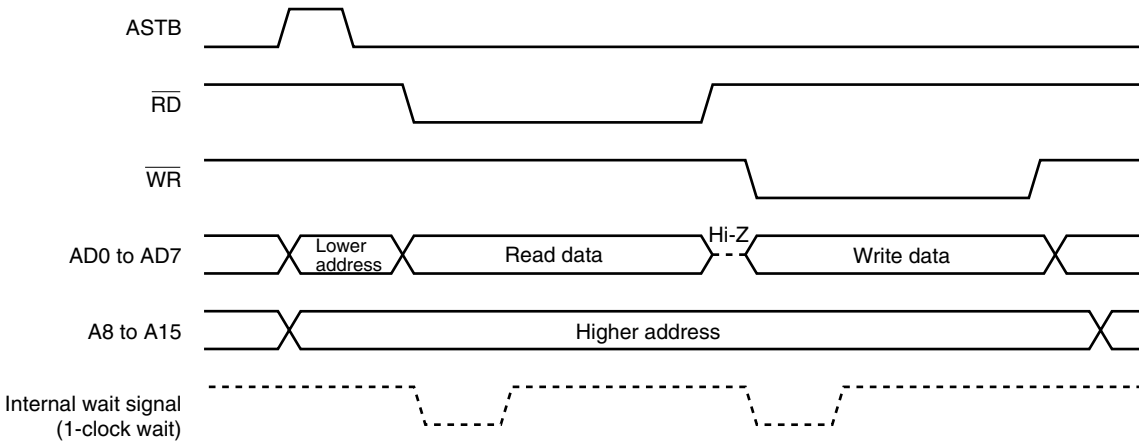

Figure 5-8. External Memory Read Modify Write Timing

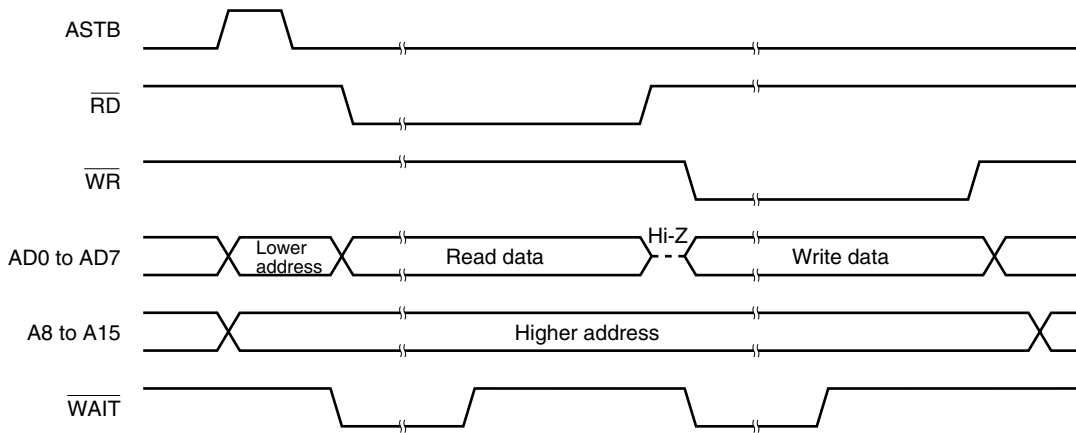

(a) No wait (PW1, PW0 = 0, 0) setting

(b) Wait (PW1, PW0 = 0, 1) setting

(c) External wait (PW1, PW0 = 1, 1) setting

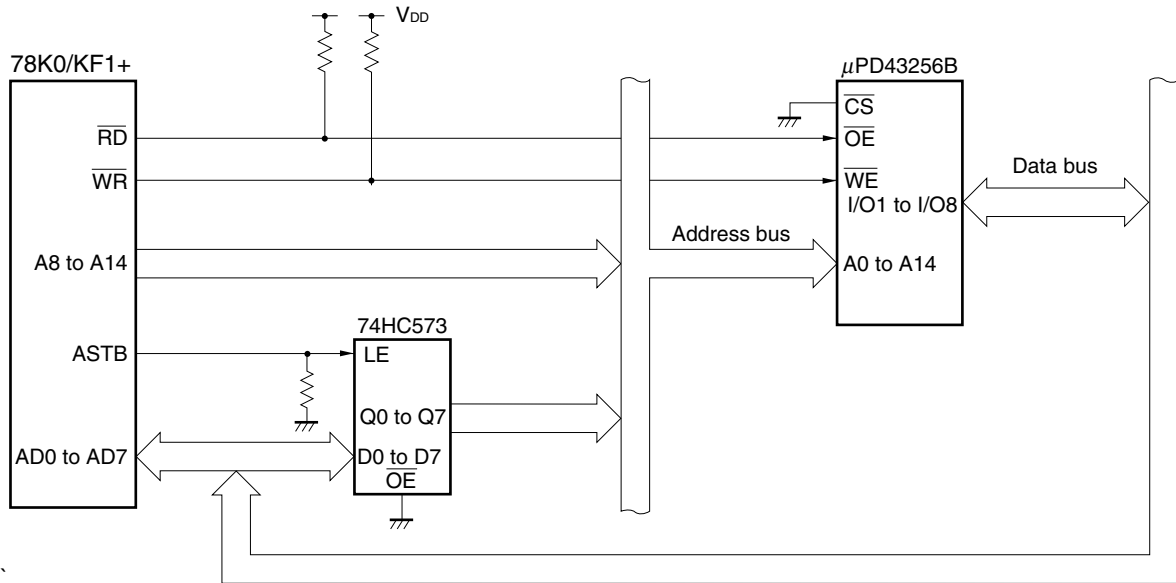

Remark The read-modify-write timing is that of an operation when a bit manipulation instruction is executed.

5.4 Example of Connection with Memory

An example of connecting the 78K0/KF1+ with external memory when the flash memory is 32 KB and the internal expansion RAM is 0 bytes (in this example, SRAM) is shown in Figure 5-9. In addition, the external bus interface function is used in the full-address mode, and the addresses from 0000H to 7FFFH (32 KB) are allocated to internal ROM, and the addresses after 8000H to SRAM.

Figure 5-9. Connection Example of 78K0/KF1+ and Memory When Flash Memory Is 32 KB and Internal Expansion RAM Is 0 Bytes

CHAPTER 6 CLOCK GENERATOR

6.1 Functions of Clock Generator

The clock generator generates the clock to be supplied to the CPU and peripheral hardware. The following three system clock oscillators are available.

- High-speed system clock oscillator
The high-speed system clock oscillator oscillates a clock of $f_{XP} = 2.0$ to 16.0 MHz. Oscillation can be stopped by executing the STOP instruction or setting the main OSC control register (MOC) and processor clock control register (PCC).
- Internal oscillator
The internal oscillator oscillates a clock of $f_R = 240$ kHz (TYP.). Oscillation can be stopped by setting the internal oscillation mode register (RCM) when “Can be stopped by software” is set by the option byte and the high-speed system clock is used as the CPU clock.
- Subsystem clock oscillator
The subsystem clock oscillator oscillates a clock of $f_{XT} = 32.768$ kHz. Oscillation cannot be stopped. When subsystem clock oscillator is not used, setting not to use the on-chip feedback resistor is possible using the processor clock control register (PCC), and the operating current can be reduced in the STOP mode.

- Remarks**
1. f_{XP} : High-speed system clock oscillation frequency
 2. f_R : Internal oscillation clock frequency
 3. f_{XT} : Subsystem clock oscillation frequency

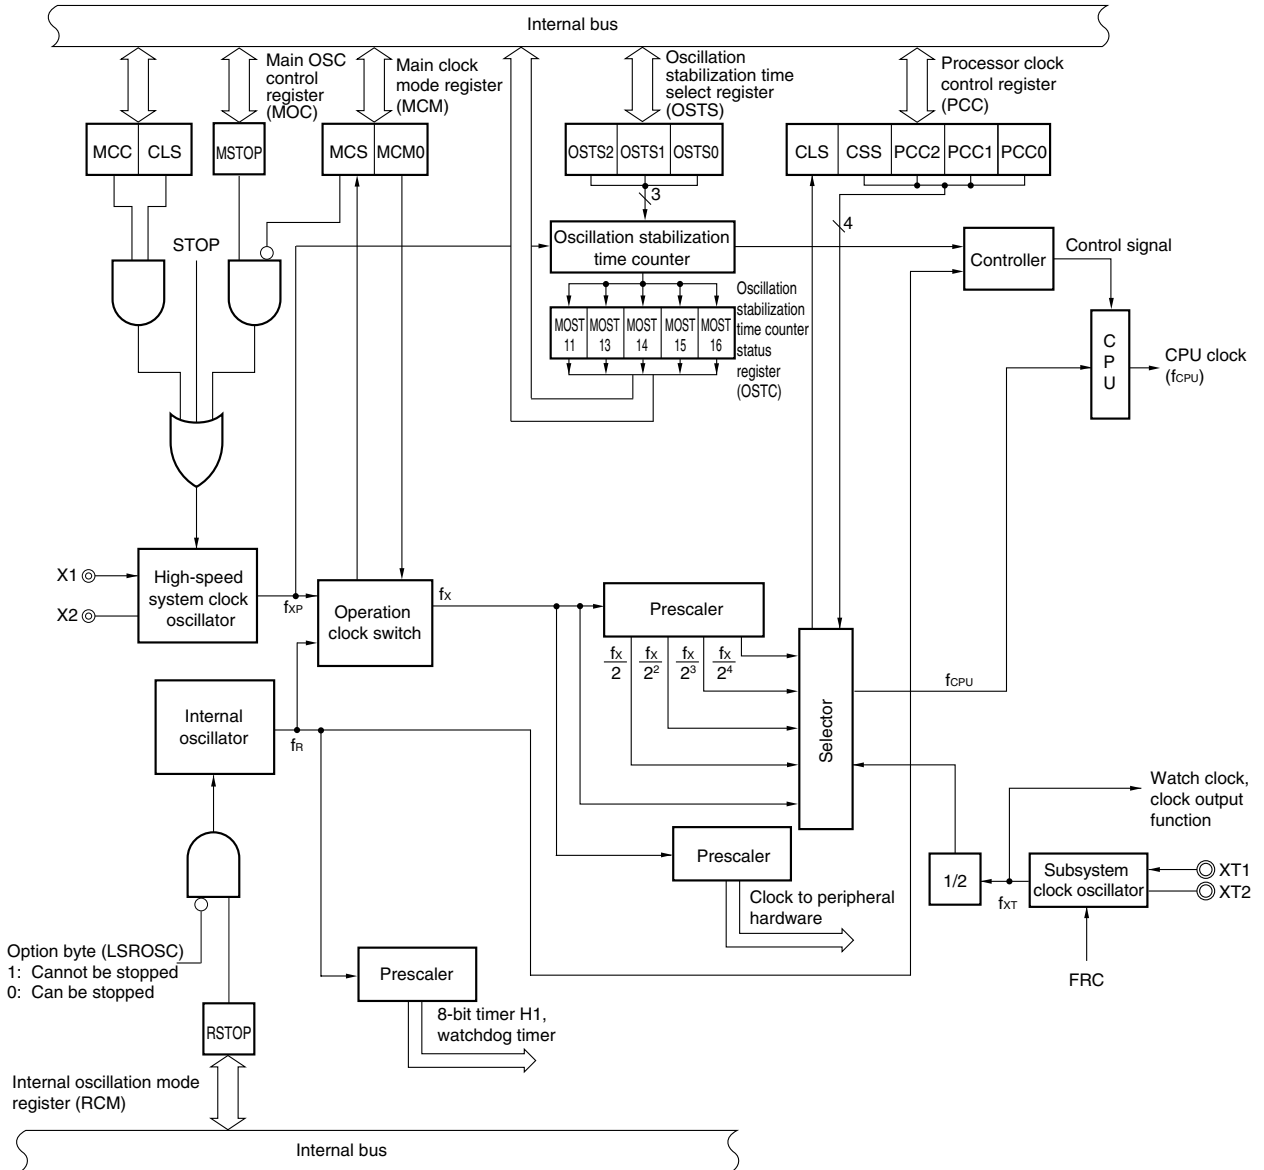

6.2 Configuration of Clock Generator

The clock generator includes the following hardware.

Table 6-1. Configuration of Clock Generator

Item	Configuration
Control registers	Processor clock control register (PCC) Internal oscillation mode register (RCM) Main clock mode register (MCM) Main OSC control register (MOC) Oscillation stabilization time counter status register (OSTC) Oscillation stabilization time select register (OSTS)
Oscillators	High-speed system clock oscillator Internal oscillator Subsystem clock oscillator

Figure 6-1. Block Diagram of Clock Generator

6.3 Registers Controlling Clock Generator

The following six registers are used to control the clock generator.

- Processor clock control register (PCC)
- Internal oscillation mode register (RCM)
- Main clock mode register (MCM)
- Main OSC control register (MOC)
- Oscillation stabilization time counter status register (OSTC)
- Oscillation stabilization time select register (OSTS)

(1) Processor clock control register (PCC)

The PCC register is used to select the CPU clock, the division ratio, main system clock oscillator operation/stop and whether to use the on-chip feedback resistor^{Note} of the subsystem clock oscillator.

The PCC is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears PCC to 00H.

Note The feedback resistor is required to control the bias point of the oscillation waveform so that the bias point is in the middle of the power supply voltage (see **Figure 6-11 Subsystem Clock Feedback Resistor**).

Figure 6-2. Format of Processor Clock Control Register (PCC)

Address: FFFBH After reset: 00H R/W^{Note 1}

Symbol	<7>	<6>	<5>	<4>	3	2	1	0
PCC	MCC	FRC	CLS	CSS	0	PCC2	PCC1	PCC0

MCC	Control of high-speed system clock oscillator operation ^{Note 2}
0	Oscillation possible
1	Oscillation stopped

FRC	Subsystem clock feedback resistor selection ^{Note 3}
0	On-chip feedback resistor used
1	On-chip feedback resistor not used

CLS	CPU clock status
0	High-speed system clock or internal oscillation clock
1	Subsystem clock

CSS ^{Note 4}	PCC2	PCC1	PCC0	CPU clock (f _{CPU}) selection		
				MCM0 = 0	MCM0 = 1	
0	0	0	0	f _x	f _R	f _{XP}
	0	0	1	f _x /2	f _R /2 ^{Note 5}	f _{XP} /2
	0	1	0	f _x /2 ²	Setting prohibited	f _{XP} /2 ²
	0	1	1	f _x /2 ³	Setting prohibited	f _{XP} /2 ³
	1	0	0	f _x /2 ⁴	Setting prohibited	f _{XP} /2 ⁴
1	0	0	0	f _{XT} /2		
	0	0	1			
	0	1	0			
	0	1	1			
	1	0	0			
Other than above				Setting prohibited		

- Notes**
1. Bit 5 is read-only.
 2. When the CPU is operating on the subsystem clock, MCC should be used to stop the high-speed system clock oscillator operation. When the CPU is operating on the internal oscillation clock, use bit 7 (MSTOP) of the main OSC control register (MOC) to stop the high-speed system clock oscillator operation (this cannot be set by MCC). A STOP instruction should not be used.
 3. Clear this bit to 0 when the subsystem clock is used, and set it to 1 when the subsystem clock is not used.
 4. Be sure to switch CSS from 1 to 0 when bits 1 (MCS) and 0 (MCM0) of the main clock mode register (MCM) are 1.
 5. Setting is prohibited for the (A1) grade products.

<R>

Caution Be sure to clear bit 3 to 0.

- Remarks**
1. MCM0: Bit 0 of the main clock mode register (MCM)
 2. f_x : Main system clock oscillation frequency (high-speed system clock oscillation frequency or internal oscillation clock frequency)
 3. f_R : Internal oscillation clock frequency
 4. f_{XP} : High-speed system clock oscillation frequency
 5. f_{XT} : Subsystem clock oscillation frequency

The fastest instruction can be executed in 2 clocks of the CPU clock in the 78K0/KF1+. Therefore, the relationship between the CPU clock (f_{CPU}) and minimum instruction execution time is as shown in the Table 6-2.

Table 6-2. Relationship Between CPU Clock and Minimum Instruction Execution Time

CPU Clock (f_{CPU})	Minimum Instruction Execution Time: $2/f_{CPU}$			
	High-Speed System Clock ^{Note 1}		Internal Oscillation Clock ^{Note 1}	Subsystem Clock
	At 10 MHz Operation	At 16 MHz Operation	At 240 kHz (TYP.) Operation	At 32.768 kHz Operation
f_x	0.2 μs	0.125 μs	8.3 μs (TYP.)	–
$f_x/2$	0.4 μs	0.25 μs	16.6 μs (TYP.) ^{Note 2}	–
$f_x/2^2$	0.8 μs	0.5 μs	Setting prohibited	–
$f_x/2^3$	1.6 μs	1.0 μs	Setting prohibited	–
$f_x/2^4$	3.2 μs	2.0 μs	Setting prohibited	–
$f_{XT}/2$	–		–	122.1 μs

Notes

1. The main clock mode register (MCM) is used to set the CPU clock (high-speed system clock/internal oscillation clock) (see **Figure 6-4**).

<R>

2. Setting is prohibited for the (A1) grade products.

(2) Internal oscillation mode register (RCM)

This register sets the operation mode of the internal oscillator.

This register is valid when “Can be stopped by software” is set for the internal oscillator by the option byte, and the high-speed system clock or subsystem clock is selected as the CPU clock. If “Cannot be stopped” is selected for the internal oscillator by the option byte, settings for this register are invalid.

RCM can be set by a 1-bit or 8-bit memory manipulation instruction.

\overline{RESET} input clears this register to 00H.

Figure 6-3. Format of Internal Oscillation Mode Register (RCM)

Address: FFA0H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	<0>
RCM	0	0	0	0	0	0	0	RSTOP

RSTOP	Internal oscillator oscillating/stopped
0	Internal oscillator oscillating
1	Internal oscillator stopped

Caution Make sure that the bit 1 (MCS) of the main clock mode register (MCM) is 1 before setting RSTOP.

(3) Main clock mode register (MCM)

This register sets the CPU clock (high-speed system clock/internal oscillation clock).

MCM can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 6-4. Format of Main Clock Mode Register (MCM)

Address: FFA1H After reset: 00H R/W^{Note}

Symbol	7	6	5	4	3	2	<1>	<0>
MCM	0	0	0	0	0	0	MCS	MCM0

MCS	CPU clock status
0	Operates with internal oscillation clock
1	Operates with high-speed system clock

MCM0	Selection of clock supplied to CPU
0	Internal oscillation clock
1	High-speed system clock

Note Bit 1 is read-only.

Cautions 1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the divided clock of the internal oscillator output (f_x) is supplied to the peripheral hardware ($f_x = 240 \text{ kHz (TYP.)}$).

Operation of the peripheral hardware with the internal oscillation clock cannot be guaranteed. Therefore, when the internal oscillation clock is selected as the clock supplied to the CPU, do not use peripheral hardware. In addition, stop the peripheral hardware before switching the clock supplied to the CPU from the high-speed system clock to the internal oscillation clock. Note, however, that the following peripheral hardware can be used when the CPU operates on the internal oscillation clock.

- Watchdog timer
- Clock monitor
- 8-bit timer H1 when $f_R/2^7$ is selected as count clock
- Peripheral hardware selecting external clock as the clock source
(Except when external count clock of TM0n ($n = 0, 1$) is selected (TI00n valid edge))

2. Set MCS = 1 and MCM0 = 1 before switching subsystem clock operation to high-speed system clock operation (bit 4 (CSS) of the processor clock control register (PCC) is changed from 1 to 0).

(4) Main OSC control register (MOC)

This register selects the operation mode of the high-speed system clock.

This register is used to stop the high-speed system clock oscillator operation when the CPU is operating with the internal oscillation clock. Therefore, this register is valid only when the CPU is operating with the internal oscillation clock.

MOC can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 6-5. Format of Main OSC Control Register (MOC)

Address: FFA2H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
MOC	MSTOP	0	0	0	0	0	0	0
MSTOP	Control of high-speed system clock oscillator operation							
0	High-speed system clock oscillator operating							
1	High-speed system clock oscillator stopped							

- Cautions**
1. Make sure that bit 1 (MCS) of the main clock mode register (MCM) is 0 before setting MSTOP.
 2. To stop high-speed system clock oscillation when the CPU is operating on the subsystem clock, set bit 7 (MCC) of the processor clock control register (PCC) to 1 (setting by MSTOP is not possible).

(5) Oscillation stabilization time counter status register (OSTC)

This is the status register of the high-speed system clock oscillation stabilization time counter. If the internal oscillation clock is used as the CPU clock, the high-speed system clock oscillation stabilization time can be checked.

OSTC can be read by a 1-bit or 8-bit memory manipulation instruction.

When reset is released (reset by $\overline{\text{RESET}}$ input, POC, LVI, clock monitor, and WDT), the STOP instruction, MSTOP = 1, and MCC = 1 clear OSTC to 00H.

Figure 6-6. Format of Oscillation Stabilization Time Counter Status Register (OSTC)

Address: FFA3H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
OSTC	0	0	0	MOST11	MOST13	MOST14	MOST15	MOST16

MOST11	MOST13	MOST14	MOST15	MOST16	Oscillation stabilization time status		
					$f_{XP} = 10 \text{ MHz}$	$f_{XP} = 16 \text{ MHz}$	
1	0	0	0	0	$2^{11}/f_{XP} \text{ min.}$	204.8 $\mu\text{s min.}$	128 $\mu\text{s min.}$
1	1	0	0	0	$2^{13}/f_{XP} \text{ min.}$	819.2 $\mu\text{s min.}$	512 $\mu\text{s min.}$
1	1	1	0	0	$2^{14}/f_{XP} \text{ min.}$	1.64 ms min.	1.02 ms min.
1	1	1	1	0	$2^{15}/f_{XP} \text{ min.}$	3.27 ms min.	2.04 ms min.
1	1	1	1	1	$2^{16}/f_{XP} \text{ min.}$	6.55 ms min.	4.09 ms min.

Cautions 1. After the above time has elapsed, the bits are set to 1 in order from MOST11 and remain 1.

2. If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows.

- Desired OSTC oscillation stabilization time \leq Oscillation stabilization time set by OSTC

The oscillation stabilization time counter counts up to the oscillation stabilization time set by OSTC. Note, therefore, that only the status up to the oscillation stabilization time set by OSTC is set to OSTC after STOP mode is released.

3. The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by $\overline{\text{RESET}}$ input or interrupt generation.

Remark f_{XP} : High-speed system clock oscillation frequency

(6) Oscillation stabilization time select register (OSTS)

This register is used to select the high-speed system clock oscillation stabilization wait time when STOP mode is released.

The wait time set by OSTS is valid only after STOP mode is released with the high-speed system clock selected as CPU clock. After STOP mode is released with the internal oscillation clock selected as the CPU clock, the oscillation stabilization time must be confirmed by OSTC.

OSTS can be set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets OSTS to 05H.

Figure 6-7. Format of Oscillation Stabilization Time Select Register (OSTS)

Address: FFA4H After reset: 05H R/W

Symbol	7	6	5	4	3	2	1	0
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0

OSTS2	OSTS1	OSTS0	Oscillation stabilization time selection		
				$f_{XP} = 10 \text{ MHz}$	$f_{XP} = 16 \text{ MHz}$
0	0	1	$2^{11}/f_{XP}$	204.8 μs	128 μs
0	1	0	$2^{13}/f_{XP}$	819.2 μs	512 μs
0	1	1	$2^{14}/f_{XP}$	1.64 ms	1.02 ms
1	0	0	$2^{15}/f_{XP}$	3.27 ms	2.04 ms
1	0	1	$2^{16}/f_{XP}$	6.55 ms	4.09 ms
Other than above			Setting prohibited		

Cautions 1. To set the STOP mode when the high-speed system clock is used as the CPU clock, set OSTS before executing a STOP instruction.

2. Before setting OSTS, confirm with OSTC that the desired oscillation stabilization time has elapsed.

3. If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows.

- **Desired OSTC oscillation stabilization time \leq Oscillation stabilization time set by OSTS**

The oscillation stabilization time counter counts up to the oscillation stabilization time set by OSTS. Note, therefore, that only the status up to the oscillation stabilization time set by OSTS is set to OSTC after STOP mode is released.

4. The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by $\overline{\text{RESET}}$ input or interrupt generation.

Remark f_{XP} : High-speed system clock oscillation frequency

6.4 System Clock Oscillator

6.4.1 High-speed system clock oscillator

The high-speed system clock oscillator oscillates with a crystal resonator or ceramic resonator connected to the X1 and X2 pins.

An external clock can be input to the high-speed system clock oscillator. In this case, input the clock signal to the X1 pin and input the inverse signal to the X2 pin.

Figure 6-8 shows examples of the external circuit of the high-speed system clock oscillator.

Figure 6-8. Examples of External Circuit of High-Speed System Clock Oscillator

Cautions are listed on the next page.

6.4.2 Subsystem clock oscillator

The subsystem clock oscillator oscillates with a crystal resonator (Standard: 32.768 kHz) connected to the XT1 and XT2 pins.

External clocks can be input to the subsystem clock oscillator. In this case, input the clock signal to the XT1 pin and the inverse signal to the XT2 pin.

Figure 6-9 shows examples of an external circuit of the subsystem clock oscillator.

Figure 6-9. Examples of External Circuit of Subsystem Clock Oscillator

Cautions are listed on the next page.

Caution When using the high-speed system clock oscillator and subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the Figures 6-8 and 6-9 to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V_{ss} . Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

Note that the subsystem clock oscillator is designed as a low-amplitude circuit for reducing power consumption.

Figure 6-10 shows examples of incorrect resonator connection.

Figure 6-10. Examples of Incorrect Resonator Connection (1/2)

Remark When using the subsystem clock, replace X1 and X2 with XT1 and XT2, respectively. Also, insert resistors in series on the XT2 side.

Figure 6-10. Examples of Incorrect Resonator Connection (2/2)

(c) Wiring near high alternating current

(d) Current flowing through ground line of oscillator (potential at points A, B, and C fluctuates)

(e) Signals are fetched

Remark When using the subsystem clock, replace X1 and X2 with XT1 and XT2, respectively. Also, insert resistors in series on the XT2 side.

6.4.3 When subsystem clock is not used

If it is not necessary to use the subsystem clock for low power consumption operations and watch operations, connect the XT1 and XT2 pins as follows.

XT1: Connect directly to EV_{SS} or V_{SS} ^{Note}

XT2: Leave open

Note When the subsystem clock is not used, the on-chip feedback resistor must be set after a reset is released so that it is not used (bit 6 (FRC) of processor clock control register (PCC) = 1).

Figure 6-11. Subsystem Clock Feedback Resistor

Remark The feedback resistor is required to control the bias point of the oscillation waveform so that the bias point is in the middle of the power supply voltage.

6.4.4 Internal oscillator

An internal oscillator is incorporated in the 78K0/KF1+.

“Can be stopped by software” or “Cannot be stopped” can be selected using the option byte. The internal oscillator always oscillates the internal oscillation clock after $\overline{\text{RESET}}$ release (240 kHz (TYP.)).

6.4.5 Prescaler

The prescaler generates various clocks by dividing the high-speed system clock oscillator output when the high-speed system clock is selected as the clock to be supplied to the CPU.

Caution When the internal oscillation clock is selected as the clock supplied to the CPU, the prescaler generates various clocks by dividing the internal oscillator output ($f_x = 240 \text{ kHz (TYP.)}$).

6.5 Clock Generator Operation

The clock generator generates the following clocks and controls the operation modes of the CPU, such as standby mode.

- High-speed system clock f_{XP}
- Internal oscillation clock f_R
- Subsystem clock f_{XT}
- CPU clock f_{CPU}
- Clock to peripheral hardware

The CPU starts operation when the internal oscillator starts outputting after reset release in the 78K0/KF1+, thus enabling the following.

(1) Enhancement of security function

When the high-speed system clock is set as the CPU clock by the default setting, the device cannot operate if the high-speed system clock is damaged or badly connected and therefore does not operate after reset is released. However, the start clock of the CPU is the internal oscillation clock, so the device can be started by the internal oscillation clock after reset release by the clock monitor (detection of high-speed system clock stop). Consequently, the system can be safely shut down by performing a minimum operation, such as acknowledging a reset source by software or performing safety processing when there is a malfunction.

(2) Improvement of performance

Because the CPU can be started without waiting for the high-speed system clock oscillation stabilization time, the total performance can be improved.

A timing diagram of the CPU default start using the internal oscillator is shown in Figure 6-12.

Figure 6-12. Timing Diagram of CPU Default Start Using Internal Oscillator

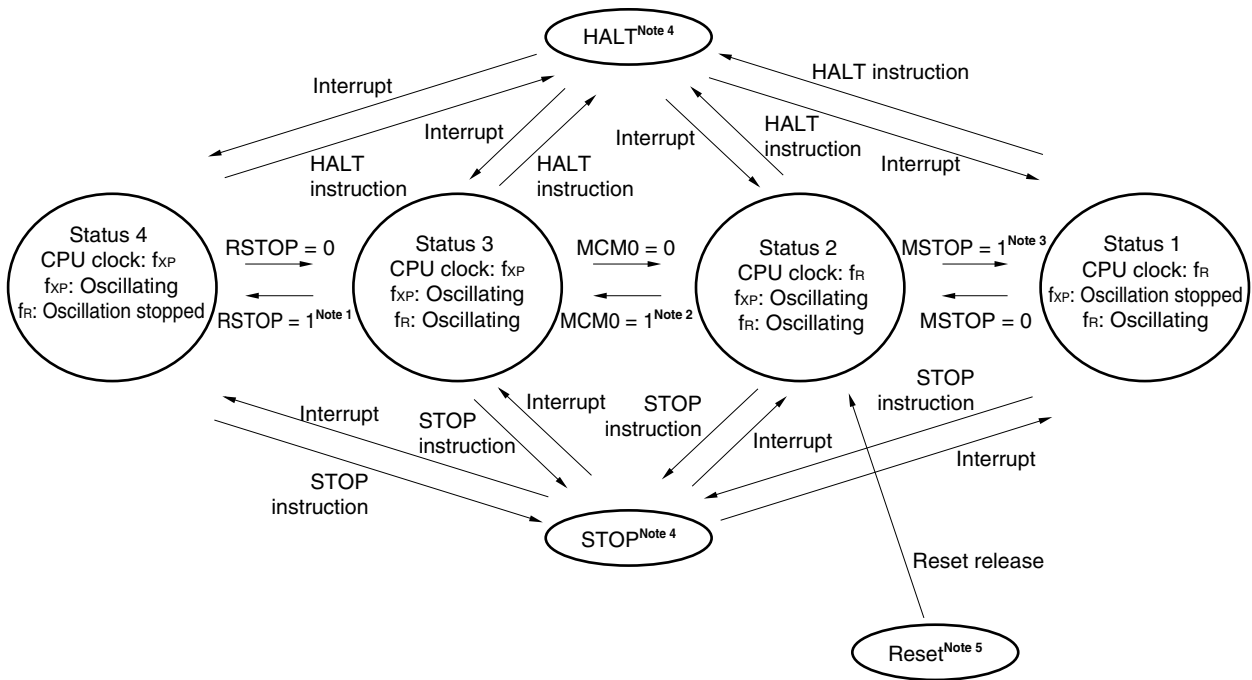

Note Check using the oscillation stabilization time counter status register (OSTC).

- When the \overline{RESET} signal is generated, bit 0 (MCM0) of the main clock mode register (MCM) is set to 0 and the internal oscillation clock is set as the CPU clock. However, a clock is supplied to the CPU after 17 clocks of the internal oscillation clock have elapsed after \overline{RESET} release (or clock supply to the CPU stops for 17 clocks). During the \overline{RESET} period, oscillation of the high-speed system clock and the internal oscillation clock is stopped.
- After \overline{RESET} release, the CPU clock can be switched from the internal oscillation clock to the high-speed system clock using bit 0 (MCM0) of the main clock mode register (MCM) after the high-speed system clock oscillation stabilization time has elapsed. At this time, check the oscillation stabilization time using the oscillation stabilization time counter status register (OSTC) before switching the CPU clock. The CPU clock status can be checked using bit 1 (MCS) of MCM.
- The internal oscillator can be set to stopped/oscillating using the internal oscillation mode register (RCM) when "Can be stopped by software" is selected for the internal oscillator by the option byte, if the high-speed system or subsystem clock is used as the CPU clock. Make sure that MCS is 1 at this time.
- When the internal oscillation clock is used as the CPU clock, the high-speed system clock can be set to stopped/oscillating using the main OSC control register (MOC). Make sure that MCS is 0 at this time. When the subsystem clock is used as the CPU clock, whether the high-speed system clock stops or oscillates can be set by the processor clock control register (PCC). In addition, HALT mode can be used during operation with the subsystem clock, but STOP mode cannot be used (subsystem clock oscillation cannot be stopped by the STOP instruction).
- Select the high-speed system clock oscillation stabilization time ($2^{11}/f_{XP}$, $2^{13}/f_{XP}$, $2^{14}/f_{XP}$, $2^{15}/f_{XP}$, $2^{16}/f_{XP}$) using the oscillation stabilization time select register (OSTS) when releasing STOP mode while high-speed system clock is being used as the CPU clock. In addition, when releasing STOP mode while \overline{RESET} is released and the internal oscillation clock is being used as the CPU clock, check the high-speed system clock oscillation stabilization time using the oscillation stabilization time counter status register (OSTC).

A status transition diagram of this product is shown in Figure 6-13, and the relationship between the operation clocks in each operation status and between the oscillation control flag and oscillation status of each clock are shown in Tables 6-3 and 6-4, respectively.

Figure 6-13. Status Transition Diagram (1/4)

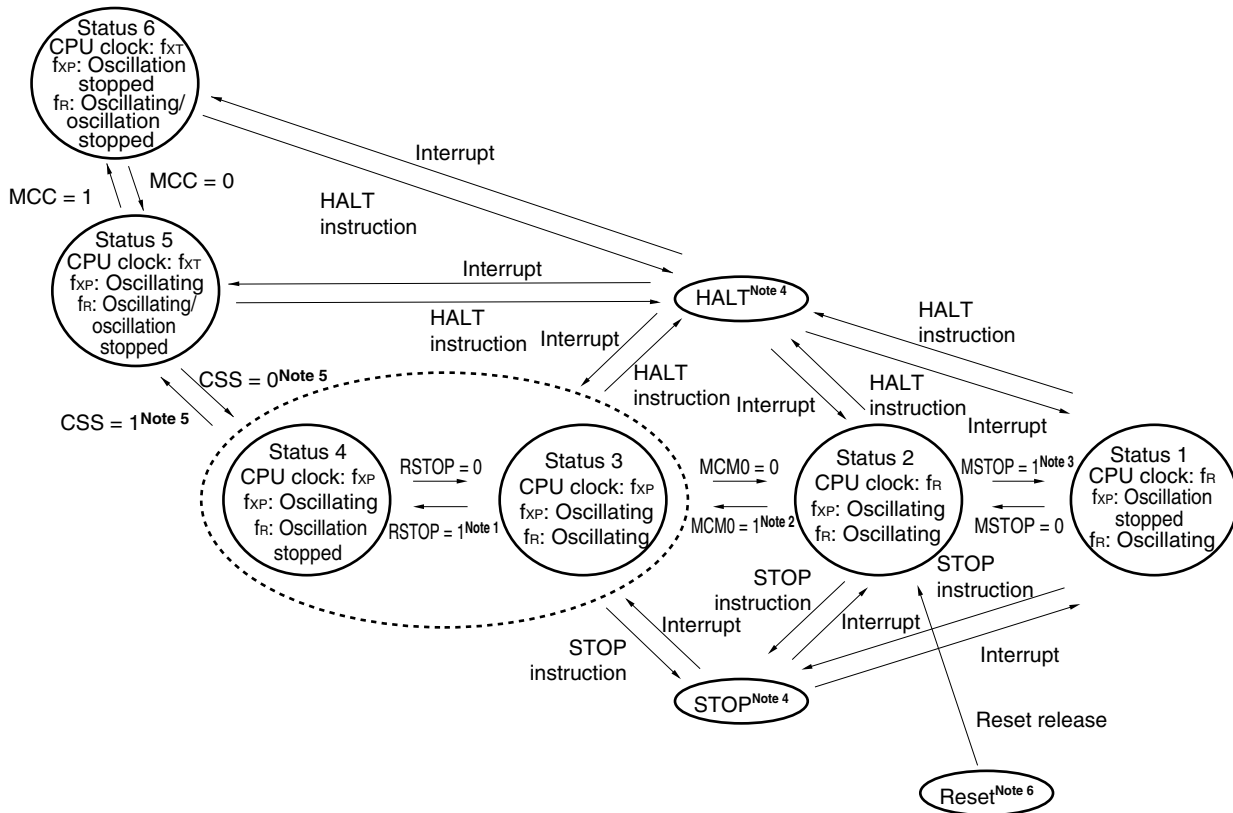

(1) When “Internal oscillator can be stopped by software” is selected by option byte
(when subsystem clock is not used)

- Notes**
1. When shifting from status 3 to status 4, make sure that bit 1 (MCS) of the main clock mode register (MCM) is 1.
 2. Before shifting from status 2 to status 3 after reset and STOP are released, check the high-speed system clock oscillation stabilization time status using the oscillation stabilization time counter status register (OSTC).
 3. When shifting from status 2 to status 1, make sure that MCS is 0.
 4. When “Internal oscillator can be stopped by software” is selected by the option byte, the watchdog timer stops operating in the HALT and STOP modes, regardless of the source clock of the watchdog timer. However, oscillation of the internal oscillator does not stop even in the HALT and STOP modes if $RSTOP = 0$.
 5. All reset sources (\overline{RESET} input, POC, LVI, clock monitor, and WDT)

Figure 6-13. Status Transition Diagram (2/4)

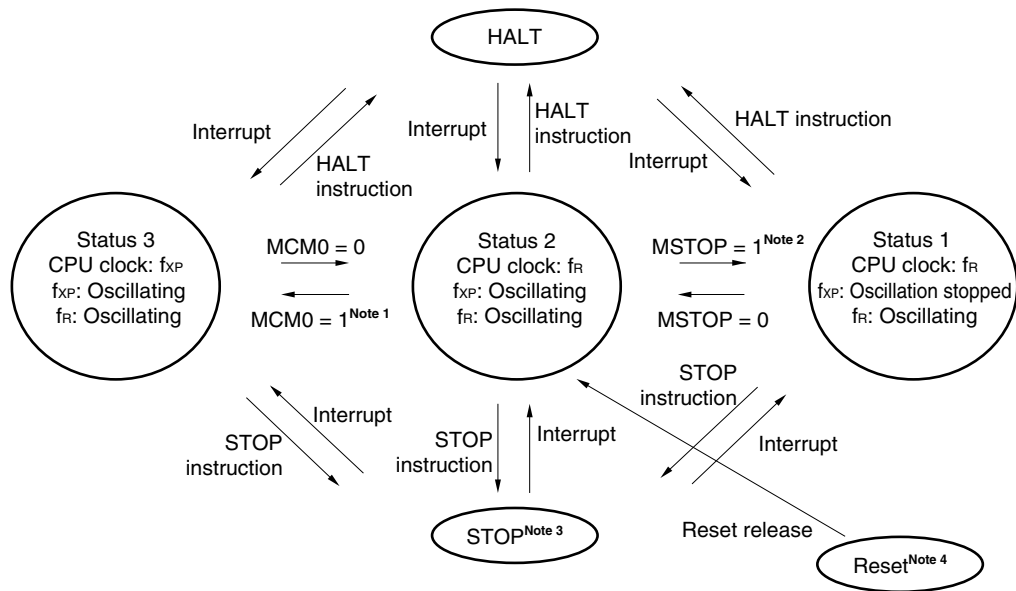

(2) When “Internal oscillator can be stopped by software” is selected by option byte (when subsystem clock is used)

- Notes**
1. When shifting from status 3 to status 4, make sure that bit 1 (MCS) of the main clock mode register (MCM) is 1.
 2. Before shifting from status 2 to status 3 after reset and STOP are released, check the high-speed system clock oscillation stabilization time status using the oscillation stabilization time counter status register (OSTC).
 3. When shifting from status 2 to status 1, make sure that MCS is 0.
 4. When “Internal oscillator can be stopped by software” is selected by the option byte, the clock supply to the watchdog timer is stopped after the HALT or STOP instruction has been executed, regardless of the setting of bit 0 (RSTOP) of the internal oscillation mode register (RCM) and bit 0 (MCM0) of the main clock mode register (MCM).
 5. The operation cannot be shifted between subsystem clock operation and internal oscillation clock operation.
 6. All reset sources ($\overline{\text{RESET}}$ input, POC, LVI, clock monitor, and WDT)

Figure 6-13. Status Transition Diagram (3/4)

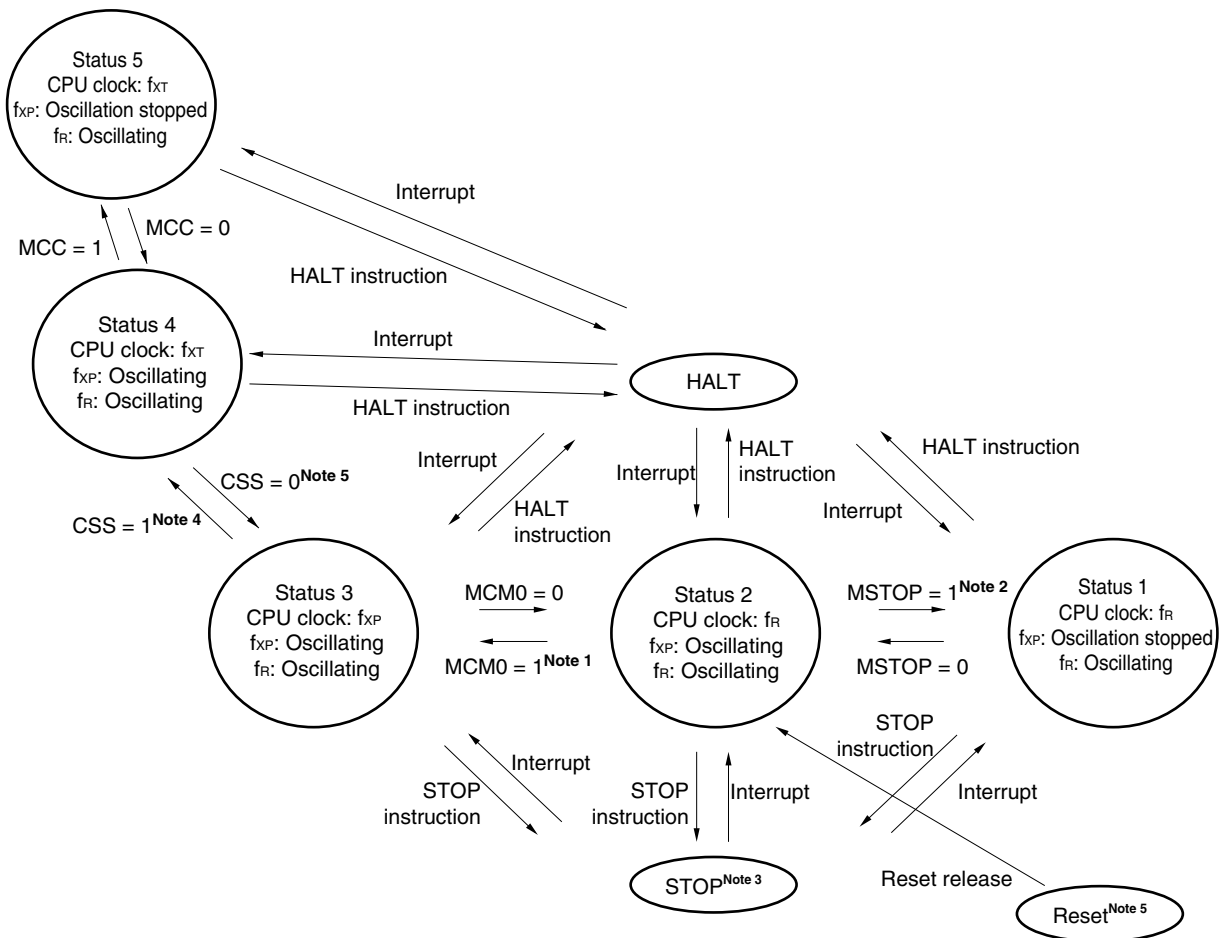

(3) When “Internal oscillator cannot be stopped” is selected by option byte
(when subsystem clock is not used)

- Notes**
1. Before shifting from status 2 to status 3 after reset and STOP are released, check the high-speed system clock oscillation stabilization time status using the oscillation stabilization time counter status register (OSTC).
 2. When shifting from status 2 to status 1, make sure that MCS is 0.
 3. The watchdog timer operates using the internal oscillation clock even in STOP mode if “Internal oscillator cannot be stopped” is selected by the option byte. Internal oscillation clock division can be selected as the count source of 8-bit timer H1 (TMH1), so clear the watchdog timer using the TMH1 interrupt request before watchdog timer overflow. If this processing is not performed, an internal reset signal is generated at watchdog timer overflow after STOP instruction execution.
 4. All reset sources (\overline{RESET} input, POC, LVI, clock monitor, and WDT)

Figure 6-13. Status Transition Diagram (4/4)

(4) When “Internal oscillator cannot be stopped” is selected by option byte
(when subsystem clock is used)

- Notes**
- Before shifting from status 2 to status 3 after reset and STOP are released, check the high-speed system clock oscillation stabilization time status using the oscillation stabilization time counter status register (OSTC).
 - When shifting from status 2 to status 1, make sure that MCS is 0.
 - The watchdog timer operates using the internal oscillation clock even in STOP mode if “Internal oscillator cannot be stopped” is selected by the option byte. Internal oscillation clock division can be selected as the count source of 8-bit timer H1 (TMH1), so clear the watchdog timer using the TMH1 interrupt request before watchdog timer overflow. If this processing is not performed, an internal reset signal is generated at watchdog timer overflow after STOP instruction execution.
 - The operation cannot be shifted between subsystem clock operation and the internal oscillation clock operation.
 - All reset sources (\overline{RESET} input, POC, LVI, clock monitor, and WDT)

Table 6-3. Relationship Between Operation Clocks in Each Operation Status

Operation Mode	High-Speed System Clock Oscillator		Internal Oscillator			Subsystem Clock Oscillator	CPU Clock After Release	Prescaler Clock Supplied to Peripherals	
	MSTOP = 0	MSTOP = 1	Note 1	Note 2				MCM0 = 0	MCM0 = 1
	MCC = 0	MCC = 1		RSTOP = 0	RSTOP = 1				
Reset	Stopped		Stopped			Oscillating	Internal oscillation	Stopped	
STOP			Oscillating	Oscillating	Stopped		Note 3	Stopped	
HALT	Oscillating	Stopped					Note 4	Internal oscillation	High-speed system clock

- Notes**
1. When “Cannot be stopped” is selected for the internal oscillator by the option byte.
 2. When “Can be stopped by software” is selected for the internal oscillator by the option byte.
 3. Operates using the CPU clock at STOP instruction execution.
 4. Operates using the CPU clock at HALT instruction execution.

Caution The RSTOP setting is valid only when “Can be stopped by software” is set for the internal oscillator by the option byte.

Remark MSTOP: Bit 7 of the main OSC control register (MOC)
MCC: Bit 7 of the processor clock control register (PCC)
RSTOP: Bit 0 of the internal oscillation mode register (RCM)
MCM0: Bit 0 of the main clock mode register (MCM)

Table 6-4. Oscillation Control Flags and Clock Oscillation Status

		High-Speed System Clock Oscillator	Internal Oscillator
MSTOP = 1 ^{Note}	RSTOP = 0	Stopped	Oscillating
	RSTOP = 1	Setting prohibited	
MSTOP = 0 ^{Note}	RSTOP = 0	Oscillating	Oscillating
	RSTOP = 1		Stopped
MCC = 1 ^{Note}	RSTOP = 0	Stopped	Oscillating
	RSTOP = 1		Stopped
MCC = 0 ^{Note}	RSTOP = 0	Oscillating	Oscillating
	RSTOP = 1		Stopped

Note Setting high-speed system clock oscillator oscillating/stopped differs depending on the CPU clock used.

- When the internal oscillation clock is used as the CPU clock: Set using the MSTOP bit
- When the subsystem clock is used as the CPU clock: Set using the MCC bit

Caution The RSTOP setting is valid only when “Can be stopped by software” is set for the internal oscillator by the option byte.

Remark MSTOP: Bit 7 of the main OSC control register (MOC)
MCC: Bit 7 of the processor clock control register (PCC)
RSTOP: Bit 0 of the internal oscillation mode register (RCM)

6.6 Time Required to Switch Between Internal Oscillation Clock and High-Speed System Clock

Bit 0 (MCM0) of the main clock mode register (MCM) is used to switch between the internal oscillation clock and high-speed system clock.

In the actual switching operation, switching does not occur immediately after MCM0 rewrite; several instructions are executed using the pre-switch clock after switching MCM0 (see **Table 6-5**).

Bit 1 (MCS) of MCM is used to judge that operation is performed using either the internal oscillation clock or high-speed system clock.

To stop the original clock after switching the clock, wait for the number of clocks shown in Table 6-5 before stopping.

Table 6-5. Time Required to Switch Between Internal Oscillation Clock and High-Speed System Clock

PCC			Time Required for Switching	
PCC2	PCC1	PCC0	High-Speed System Clock → Internal Oscillation	Internal Oscillation → High-Speed System Clock
0	0	0	$f_{XP}/f_R + 1$ clock	2 clocks
0	0	1	$f_{XP}/2f_R + 1$ clock ^{Note}	2 clocks ^{Note}

<R> **Note** Setting is prohibited for the (A1) grade products.

Caution To calculate the maximum time, set $f_R = 120$ kHz.

- Remarks**
1. PCC: Processor clock control register
 2. f_{XP} : High-speed system clock oscillation frequency
 3. f_R : Internal oscillation clock frequency
 4. The maximum time is the number of clocks of the CPU clock before switching.

6.7 Time Required for CPU Clock Switchover

The CPU clock can be switched using bits 0 to 2 (PCC0 to PCC2) and bit 4 (CSS) of the processor clock control register (PCC).

The actual switchover operation is not performed immediately after rewriting to the PCC; operation continues on the pre-switchover clock for several instructions (see **Table 6-6**).

Whether the system is operating on the high-speed system clock (or internal oscillation clock) or the subsystem clock can be ascertained using bit 5 (CLS) of the PCC register.

Table 6-6. Maximum Time Required for CPU Clock Switchover

Set Value Before Switchover				Set Value After Switchover																							
CSS	PCC2	PCC1	PCC0	CSS	PCC2	PCC1	PCC0	CSS	PCC2	PCC1	PCC0	CSS	PCC2	PCC1	PCC0	CSS	PCC2	PCC1	PCC0	CSS	PCC2	PCC1	PCC0				
				0	0	0	0	0	0	0	1	0	0	1	0	0	0	1	1	0	1	0	0				
0	0	0	0					16 clocks				16 clocks				16 clocks				16 clocks				2 _{f_{XP}} / _{f_{XT}} clocks (977 clocks)			
	0	0	1	8 clocks								8 clocks				8 clocks				8 clocks				f _{XP} / _{f_{XT}} clocks (489 clocks)			
	0	1	0	4 clocks				4 clocks								4 clocks				4 clocks				f _{XP} / _{2f_{XT}} clocks (245 clocks)			
	0	1	1	2 clocks				2 clocks				2 clocks								2 clocks				f _{XP} / _{4f_{XT}} clocks (123 clocks)			
	1	0	0	1 clock				1 clock				1 clock				1 clock								f _{XP} / _{8f_{XT}} clocks (62 clocks)			
1	×	×	×	2 clocks				2 clocks				2 clocks				2 clocks				2 clocks							

Cautions 1. Selection of the CPU clock cycle division factor (PCC0 to PCC2) and switchover from the high-speed system clock to the subsystem clock (changing CSS from 0 to 1) should not be set simultaneously.

Simultaneous setting is possible, however, for selection of the CPU clock cycle division factor (PCC0 to PCC2) and switchover from the subsystem clock to the high-speed system clock (changing CSS from 1 to 0).

2. While the CPU is operating on internal oscillator, setting the following values is prohibited.

- CSS, PCC2, PCC1, PCC0 = 0, 0, 1, 0
- CSS, PCC2, PCC1, PCC0 = 0, 0, 1, 1
- CSS, PCC2, PCC1, PCC0 = 0, 1, 0, 0

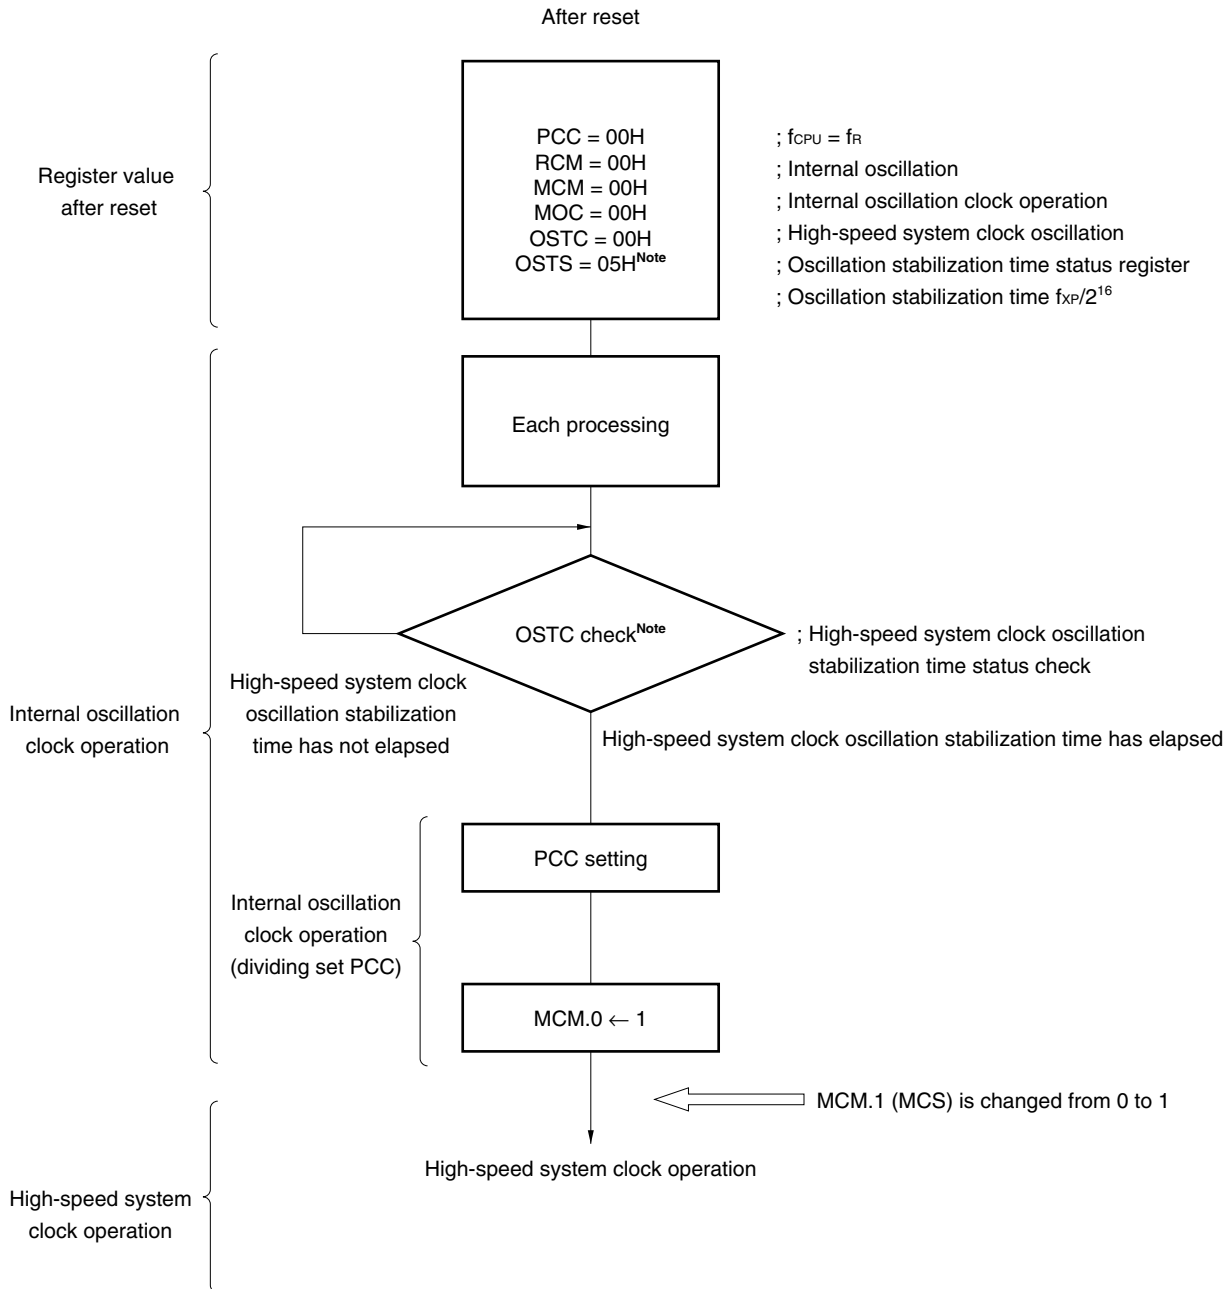

Remarks 1. The maximum time is the number of clocks of the pre-switchover CPU clock.

2. Figures in parentheses apply to operation with f_{XP} = 16 MHz and f_{XT} = 32.768 kHz.

6.8 Clock Switching Flowchart and Register Setting

6.8.1 Switching from internal oscillation clock to high-speed system clock

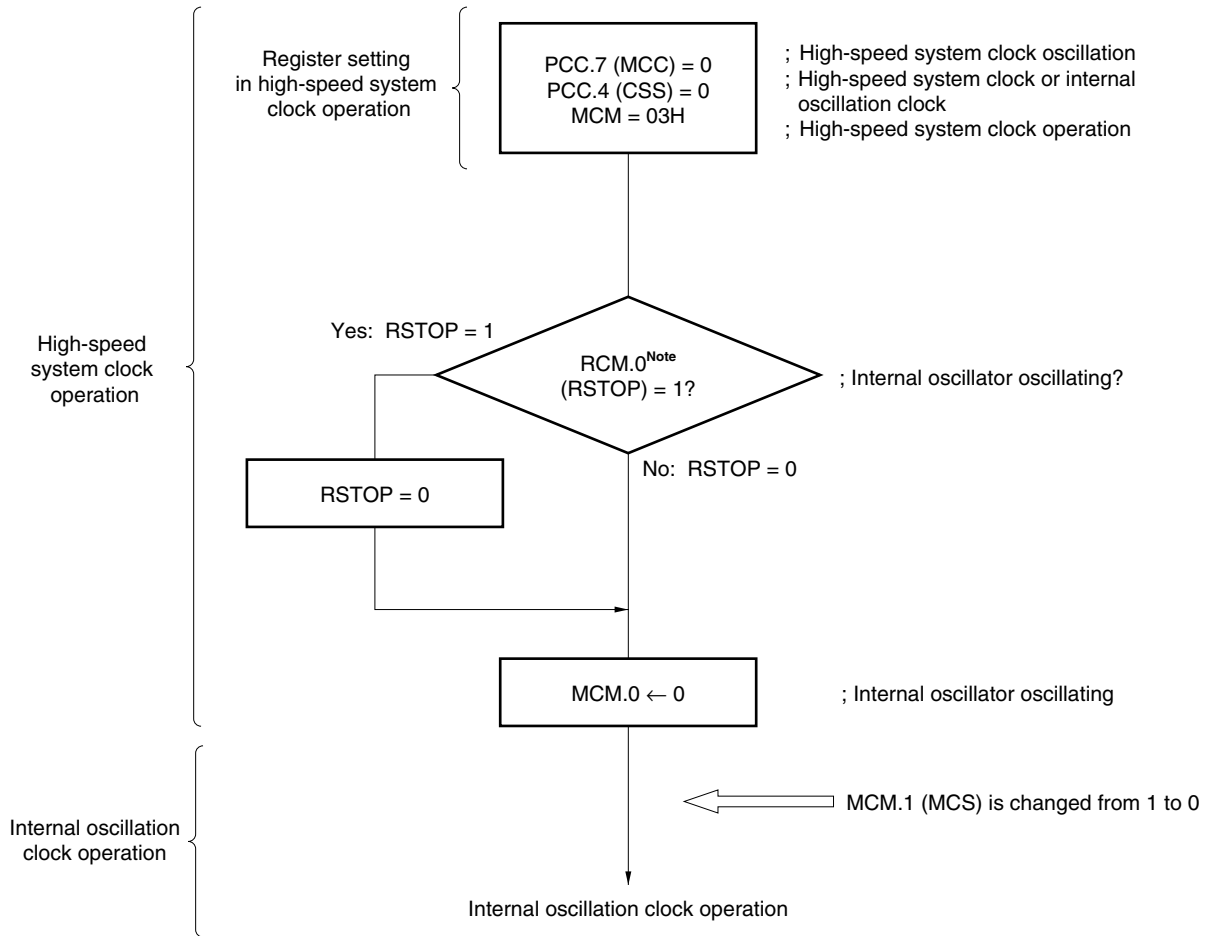

Figure 6-14. Switching from Internal Oscillation Clock to High-Speed System Clock (Flowchart)

Note Check the oscillation stabilization wait time of the high-speed system clock oscillator after reset release using the OSTC register and then switch to the high-speed system clock operation after the oscillation stabilization wait time has elapsed. The OSTS register setting is valid only after STOP mode is released by interrupt during high-speed system clock operation.

6.8.2 Switching from high-speed system clock to internal oscillation clock

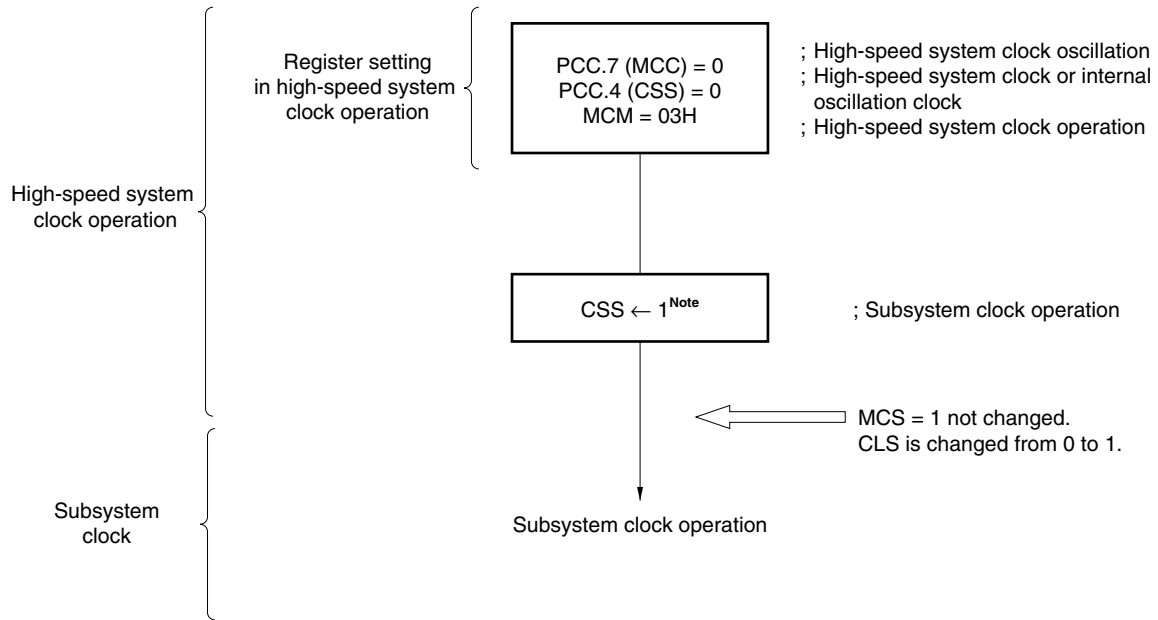

Figure 6-15. Switching from High-Speed System Clock to Internal Oscillation Clock (Flowchart)

Note Required only when “can be stopped by software” is selected for the internal oscillator by the option byte.

6.8.3 Switching from high-speed system clock to subsystem clock

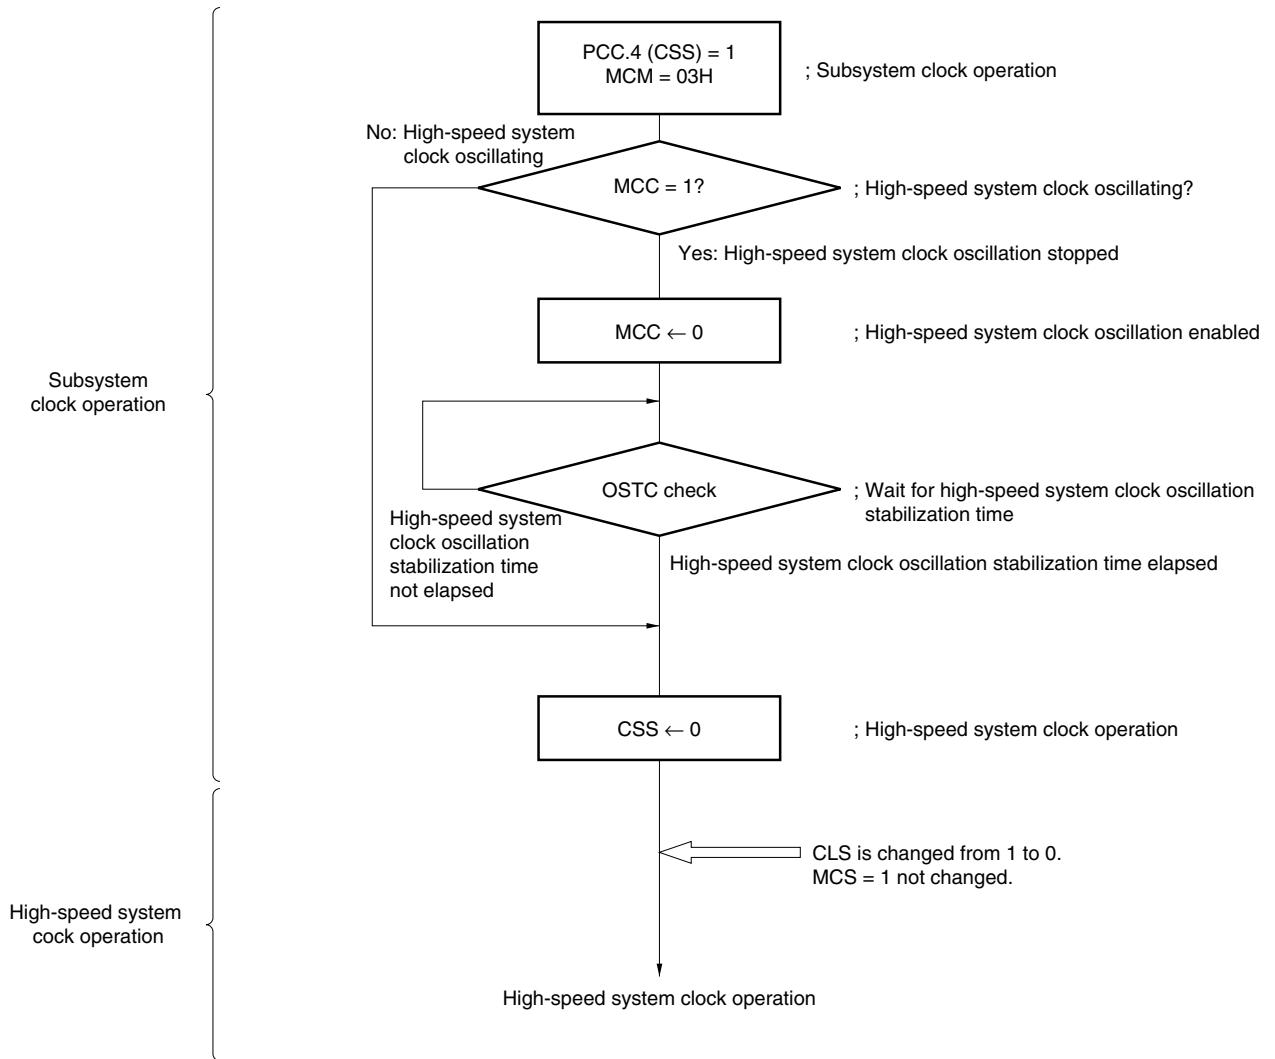

Figure 6-16. Switching from High-Speed System Clock to Subsystem Clock (Flowchart)

Note Set CSS to 1 after confirming that oscillation of the subsystem clock is stabilized.

6.8.4 Switching from subsystem clock to high-speed system clock

Figure 6-17. Switching from Subsystem Clock to High-Speed System Clock (Flowchart)

6.8.5 Register settings

The table below shows the statuses of the setting flags and status flags when each mode is set.

Table 6-7. Clock and Register Setting

fCPU	Mode	Setting Flag					Status Flag	
		PCC Register		MCM Register	MOC Register	RCM Register	PCC Register	MCM Register
		MCC	CSS	MCM0	MSTOP	RSTOP ^{Note 1}	CLS	MCS
High-speed system clock ^{Note 2}	Internal oscillation clock oscillating	0	0	1	0	0	0	1
	Internal oscillation clock stopped	0	0	1	0	1	0	1
Internal oscillation clock	High-speed system clock oscillating	0	0	0	0	0	0	0
	High-speed system clock stopped	0 ^{Note 3}	0	0	1	0	0	0
Subsystem clock ^{Note 4}	High-speed system clock oscillating, internal oscillation clock oscillating	0	1	1 ^{Note 5}	0 ^{Note 6}	0	1	1
	High-speed system clock stopped, internal oscillation clock oscillating	1	1	1 ^{Note 5}	0 ^{Note 6}	0	1	1
	High-speed system clock oscillating, internal oscillation clock stopped	0	1	1 ^{Note 5}	0 ^{Note 6}	1	1	1
	High-speed system clock stopped, internal oscillation clock stopped	1	1	1 ^{Note 5}	0 ^{Note 6}	1	1	1

- Notes**
- Valid only when “can be stopped by software” is selected for the internal oscillator by the option byte.
 - Do not set MCC = 1 or MSTOP = 1 during high-speed system clock operation (even if MCC = 1 or MSTOP = 1 is set, the high-speed system clock oscillation does not stop).
 - Do not set MCC = 1 during internal oscillation clock operation (even if MCC = 1 is set, the high-speed system clock oscillation does not stop). To stop high-speed system clock oscillation during internal oscillation clock operation, use MSTOP.
 - Shifting to subsystem clock operation mode must be performed from the high-speed system clock operation mode. From subsystem clock operation mode, only high-speed system clock operation mode can be shifted to.
 - Do not set MCM0 = 0 (shifting to internal oscillation clock) during subsystem clock operation.
 - Do not set MSTOP = 1 during subsystem clock operation (even if MSTOP = 1 is set, high-speed system clock oscillation does not stop). To stop high-speed system clock oscillation during subsystem clock operation, use MCC.

CHAPTER 7 16-BIT TIMER/EVENT COUNTERS 00 AND 01

7.1 Functions of 16-Bit Timer/Event Counters 00 and 01

16-bit timer/event counters 00 and 01 have the following functions.

- Interval timer
- PPG output
- Pulse width measurement
- External event counter
- Square-wave output
- One-shot pulse output

(1) Interval timer

16-bit timer/event counters 00 and 01 generate an interrupt request at the preset time interval.

(2) PPG output

16-bit timer/event counters 00 and 01 can output a rectangular wave whose frequency and output pulse width can be set freely.

(3) Pulse width measurement

16-bit timer/event counters 00 and 01 can measure the pulse width of an externally input signal.

(4) External event counter

16-bit timer/event counters 00 and 01 can measure the number of pulses of an externally input signal.

(5) Square-wave output

16-bit timer/event counters 00 and 01 can output a square wave with any selected frequency.

(6) One-shot pulse output

16-bit timer event counters 00 and 01 can output a one-shot pulse whose output pulse width can be set freely.

7.2 Configuration of 16-Bit Timer/Event Counters 00 and 01

16-bit timer/event counters 00 and 01 include the following hardware.

Table 7-1. Configuration of 16-Bit Timer/Event Counters 00 and 01

Item	Configuration
Timer counter	16 bits (TM0n)
Register	16-bit timer capture/compare register: 16 bits (CR00n, CR01n)
Timer input	TI00n, TI01n
Timer output	TO0n, output controller
Control registers	16-bit timer mode control register 0n (TMC0n) 16-bit timer capture/compare control register 0n (CRC0n) 16-bit timer output control register 0n (TOC0n) Prescaler mode register 0n (PRM0n) Port mode register 0 (PM0) Port register 0 (P0)

Remark n = 0, 1

Figures 7-1 and 7-2 show the block diagrams.

Figure 7-1. Block Diagram of 16-Bit Timer/Event Counter 00

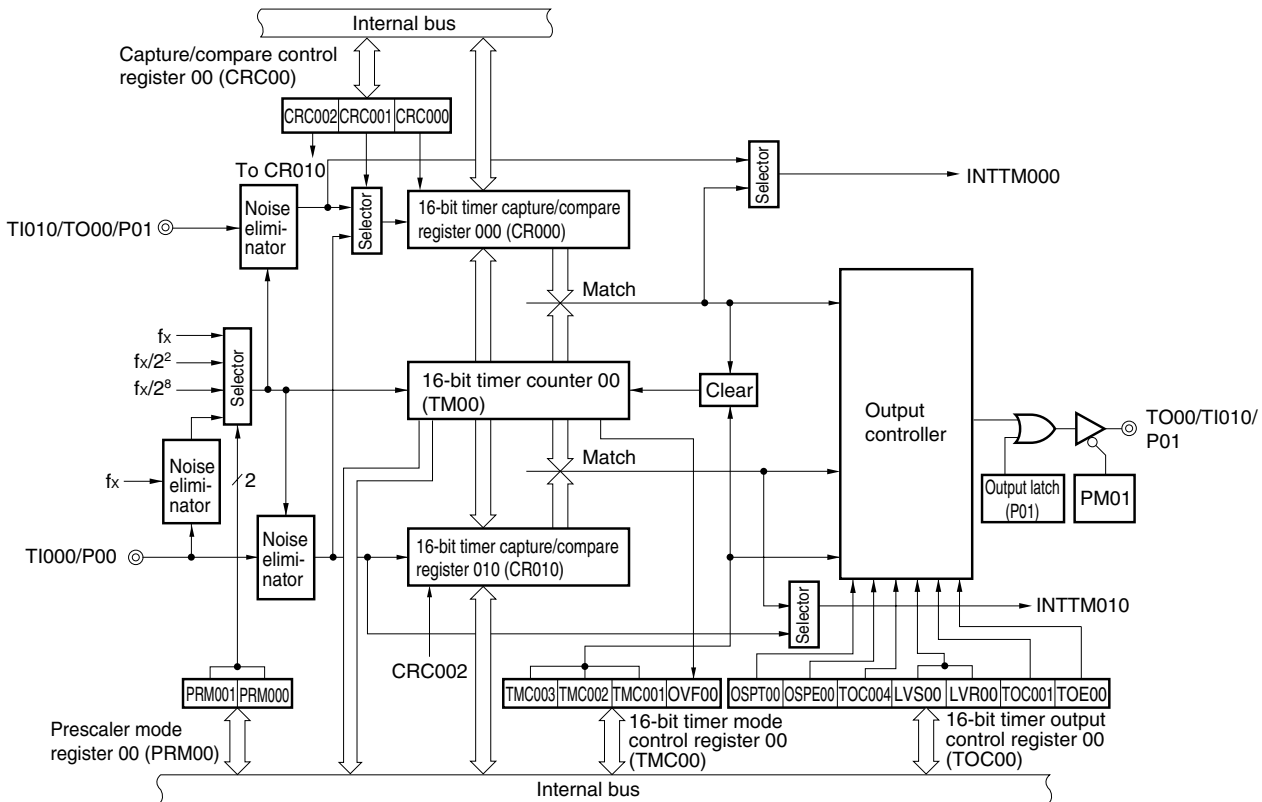

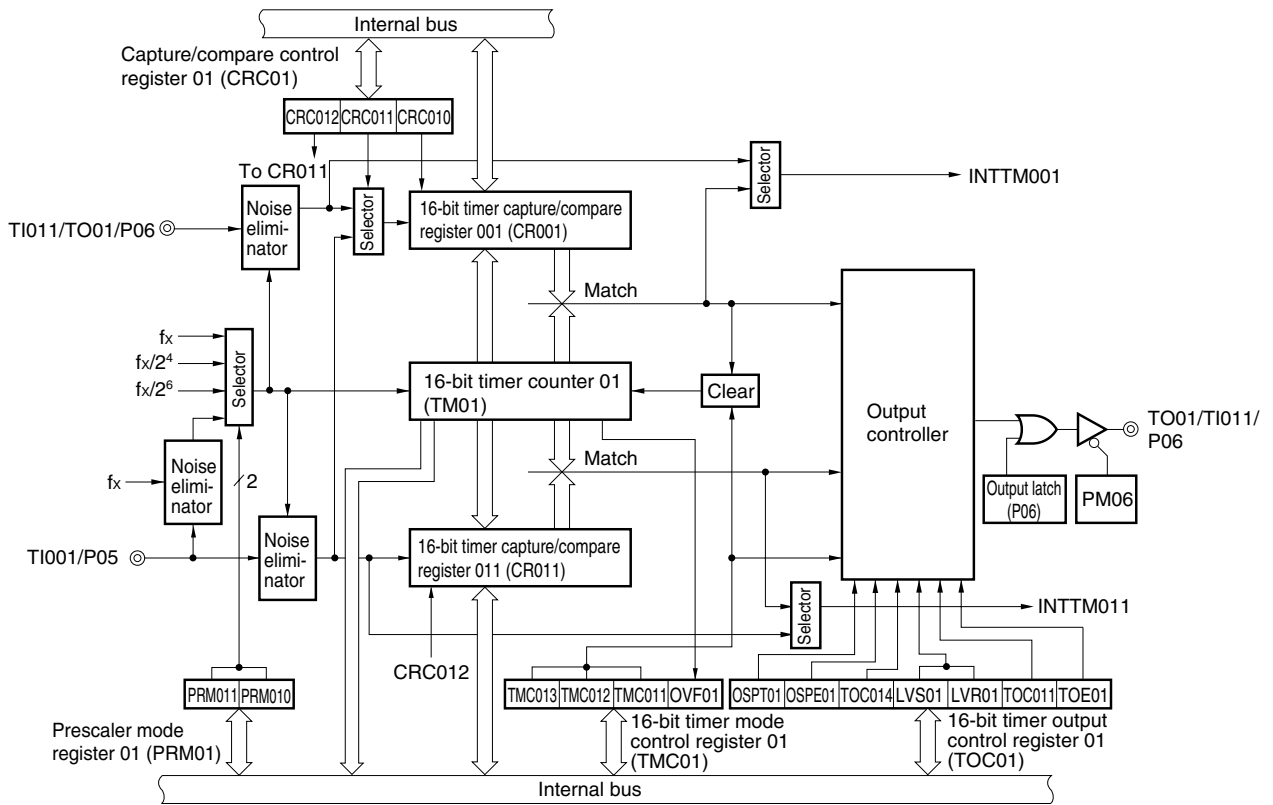

Figure 7-2. Block Diagram of 16-Bit Timer/Event Counter 01

(1) 16-bit timer counter 0n (TM0n)

TM0n is a 16-bit read-only register that counts count pulses.

The counter is incremented in synchronization with the rising edge of the input clock.

Figure 7-3. Format of 16-Bit Timer Counter 0n (TM0n)

The count value is reset to 0000H in the following cases.

- <1> At $\overline{\text{RESET}}$ input
- <2> If TMC0n3 and TMC0n2 are cleared
- <3> If the valid edge of the TI00n pin is input in the mode in which clear & start occurs when inputting the valid edge of the TI00n pin
- <4> If TM0n and CR00n match in the mode in which clear & start occurs on a match of TM0n and CR00n
- <5> If OSPT0n is set to 1 in one-shot pulse output mode

(2) 16-bit timer capture/compare register 00n (CR00n)

CR00n is a 16-bit register that has the functions of both a capture register and a compare register. Whether it is used as a capture register or as a compare register is set by bit 0 (CRC0n0) of capture/compare control register 0n (CRC0n).

CR00n can be set by a 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 0000H.

Figure 7-4. Format of 16-Bit Timer Capture/Compare Register 00n (CR00n)

- **When CR00n is used as a compare register**

The value set in CR00n is constantly compared with 16-bit timer counter 0n (TM0n) count value, and an interrupt request (INTTM00n) is generated if they match. The set value is held until CR00n is rewritten.

- **When CR00n is used as a capture register**

It is possible to select the valid edge of the TI00n pin or the TI01n pin as the capture trigger. The TI00n or TI01n pin valid edge is set using prescaler mode register 0n (PRM0n) (see **Table 7-2**).

Table 7-2. CR00n Capture Trigger and Valid Edges of TI00n and TI01n Pins

(1) TI00n pin valid edge selected as capture trigger (CRC0n1 = 1, CRC0n0 = 1)

CR00n Capture Trigger	TI00n Pin Valid Edge		
	ES0n1	ES0n0	
Falling edge	Rising edge	0	1
Rising edge	Falling edge	0	0
No capture operation	Both rising and falling edges	1	1

(2) TI01n pin valid edge selected as capture trigger (CRC0n1 = 0, CRC0n0 = 1)

CR00n Capture Trigger	TI01n Pin Valid Edge		
	ES1n1	ES1n0	
Falling edge	Falling edge	0	0
Rising edge	Rising edge	0	1
Both rising and falling edges	Both rising and falling edges	1	1

- Remarks**
- Setting ES0n1, ES0n0 = 1, 0 and ES1n1, ES1n0 = 1, 0 is prohibited.
 - ES0n1, ES0n0: Bits 5 and 4 of prescaler mode register 0n (PRM0n)
ES1n1, ES1n0: Bits 7 and 6 of prescaler mode register 0n (PRM0n)
CRC0n1, CRC0n0: Bits 1 and 0 of capture/compare control register 0n (CRC0n)
 - n = 0, 1

- Cautions**
- Set a value other than 0000H in CR00n in the mode in which clear & start occurs on a match of TM0n and CR00n.
 - If CR00n is cleared to 0000H in the free-running mode and in the clear mode using the valid edge of the TI00n pin, an interrupt request (INTTM00n) is generated when the value of CR00n changes from 0000H to 0001H following TM0n overflow (FFFFH). In addition, INTTM00n is generated after a match between TM0n and CR00n, after detecting the valid edge of the TI01n pin, or the timer is cleared by a one-shot trigger.
 - When the valid edge of the TI01n pin is used, P01 or P06 cannot be used as the timer output pin (TO0n). When P01 or P06 is used as the TO0n pin, the valid edge of the TI01n pin cannot be used.
 - When CR00n is used as a capture register, read data is undefined if the register read time and capture trigger input conflict (the capture data itself is the correct value). If a timer count stop and a capture trigger input conflict, the captured data is undefined.
 - Do not rewrite CR00n during TM0n operation.

(3) 16-bit timer capture/compare register 01n (CR01n)

CR01n is a 16-bit register that has the functions of both a capture register and a compare register. Whether it is used as a capture register or a compare register is set by bit 2 (CRC0n2) of capture/compare control register 0n (CRC0n).

CR01n can be set by a 16-bit memory manipulation instruction.

RESET input clears this register to 0000H.

Figure 7-5. Format of 16-Bit Timer Capture/Compare Register 01n (CR01n)

- **When CR01n is used as a compare register**

The value set in CR01n is constantly compared with 16-bit timer counter 0n (TM0n) count value, and an interrupt request (INTTM01n) is generated if they match. The set value is held until CR01n is rewritten.

- **When CR01n is used as a capture register**

It is possible to select the valid edge of the TI00n pin as the capture trigger. The TI00n pin valid edge is set by prescaler mode register 0n (PRM0n) (see **Table 7-3**).

Table 7-3. CR01n Capture Trigger and Valid Edge of TI00n Pin (CRC0n2 = 1)

CR01n Capture Trigger	TI00n Pin Valid Edge		
	ES0n1	ES0n0	
Falling edge	Falling edge	0	0
Rising edge	Rising edge	0	1
Both rising and falling edges	Both rising and falling edges	1	1

- Remarks**
1. Setting ES0n1, ES0n0 = 1, 0 is prohibited.
 2. ES0n1, ES0n0: Bits 5 and 4 of prescaler mode register 0n (PRM0n)
 CRC0n2: Bit 2 of capture/compare control register 0n (CRC0n)
 3. n = 0, 1

Cautions

1. If the CR01n register is cleared to 0000H, an interrupt request (INTTM01n) is generated when the value of CR01n changes from 0000H to 0001H following TM0n overflow (FFFFH). In addition, INTTM01n is generated after a match between TM0n and CR01n, after detecting the valid edge of the TI00n pin, or the timer is cleared by a one-shot trigger.

2. When CR01n is used as a capture register, read data is undefined if the register read time and capture trigger input conflict (the capture data itself is the correct value).
 If count stop input and capture trigger input conflict, the captured data is undefined.
3. CR01n can be rewritten during TM0n operation. For details, see Caution 2 in Figure 7-20.

7.3 Registers Controlling 16-Bit Timer/Event Counters 00 and 01

The following six registers are used to control 16-bit timer/event counters 00 and 01.

- 16-bit timer mode control register 0n (TMC0n)
- Capture/compare control register 0n (CRC0n)
- 16-bit timer output control register 0n (TOC0n)
- Prescaler mode register 0n (PRM0n)
- Port mode register 0 (PM0)
- Port register 0 (P0)

(1) 16-bit timer mode control register 0n (TMC0n)

This register sets the 16-bit timer operating mode, the 16-bit timer counter 0n (TM0n) clear mode, and output timing, and detects an overflow.

TMC0n can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears TMC0n to 00H.

Caution 16-bit timer counter 0n (TM0n) starts operation at the moment TMC0n2 and TMC0n3 are set to values other than 0, 0 (operation stop mode), respectively. Set TMC0n2 and TMC0n3 to 0, 0 to stop the operation.

Remark n = 0, 1

Figure 7-6. Format of 16-Bit Timer Mode Control Register 00 (TMC00)

Address FFBAH After reset: 00H R/W

Symbol 7 6 5 4 3 2 1 <0>

TMC00 0 0 0 0 TMC003 TMC002 TMC001 OVF00

TMC003	TMC002	TMC001	Operating mode and clear mode selection	TO00 inversion timing selection	Interrupt request generation
0	0	0	Operation stop (TM00 cleared to 0)	No change	Not generated
0	0	1			
0	1	0	Free-running mode	Match between TM00 and CR000 or match between TM00 and CR010	<When used as compare register> Generated on match between TM00 and CR000, or match between TM00 and CR010 <When used as capture register> Generated by inputting CR000 capture trigger
0	1	1		Match between TM00 and CR000, match between TM00 and CR010 or TI000 pin valid edge	
1	0	0	Clear & start occurs on TI000 pin valid edge	-	
1	0	1			
1	1	0	Clear & start occurs on match between TM00 and CR000	Match between TM00 and CR000 or match between TM00 and CR010	
1	1	1		Match between TM00 and CR000, match between TM00 and CR010 or TI000 pin valid edge	

OVF00	16-bit timer counter 00 (TM00) overflow detection
0	Overflow not detected
1	Overflow detected

- Cautions**
1. Timer operation must be stopped before writing to bits other than the OVF00 flag.
 2. Set the valid edge of the TI000/P00 pin using prescaler mode register 00 (PRM00).
 3. If any the following modes: the mode in which clear & start occurs on match between TM00 and CR000, the mode in which clear & start occurs at the TI000 pin valid edge, or free-running mode is selected, when the set value of CR000 is FFFFH and the TM00 value changes from FFFFH to 0000H, the OVF00 flag is set to 1.

Remark

TO00: 16-bit timer/event counter 00 output pin
 TI000: 16-bit timer/event counter 00 input pin

1	0	0	Clear & start occurs on TI001 pin valid edge	-	
1	0	1			
1	1	0	Clear & start occurs on match between TM01 and CR001	Match between TM01 and CR001 or match between TM01 and CR011	
1	1	1		Match between TM01 and CR001, match between TM01 and CR011 or TI001 pin valid edge	

OVF01	16-bit timer counter 01 (TM01) overflow detection
0	Overflow not detected
1	Overflow detected

- Cautions**
1. Timer operation must be stopped before writing to bits other than the OVF01 flag.
 2. Set the valid edge of the TI001/P05 pin using prescaler mode register 01 (PRM01).
 3. If any the following modes: the mode in which clear & start occurs on match between TM01 and CR001, the mode in which clear & start occurs at the TI001 pin valid edge, or free-running mode is selected, when the set value of CR001 is FFFFH and the TM01 value changes from FFFFH to 0000H, the OVF01 flag is set to 1.

Remark

TO01: 16-bit timer/event counter 01 output pin
 TI001: 16-bit timer/event counter 01 input pin
 TM01: 16-bit timer counter 01
 CR001: 16-bit timer capture/compare register 001
 CR011: 16-bit timer capture/compare register 011

(2) Capture/compare control register 0n (CRC0n)

This register controls the operation of the 16-bit timer capture/compare registers (CR00n, CR01n).

CRC0n can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears CRC0n to 00H.

Remark n = 0, 1

Figure 7-8. Format of Capture/Compare Control Register 00 (CRC00)

Address: FFBCH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
CRC00	0	0	0	0	0	CRC002	CRC001	CRC000

CRC002	CR010 operating mode selection
0	Operates as compare register
1	Operates as capture register

CRC001	CR000 capture trigger selection
0	Captures on valid edge of TI010 pin
1	Captures on valid edge of TI000 pin by reverse phase ^{Note}

CRC000	CR000 operating mode selection
0	Operates as compare register
1	Operates as capture register

Note The capture operation is not performed if both the rising and falling edges are specified as the valid edge of the TI000 pin.

- Cautions**
1. Timer operation must be stopped before setting CRC00.
 2. When the mode in which clear & start occurs on a match between TM00 and CR000 is selected with 16-bit timer mode control register 00 (TMC00), CR000 should not be specified as a capture register.
 3. To ensure that the capture operation is performed properly, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 00 (PRM00).

Figure 7-9. Format of Capture/Compare Control Register 01 (CRC01)

Address: FFB8H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
CRC01	0	0	0	0	0	CRC012	CRC011	CRC010

CRC012	CR011 operating mode selection
0	Operates as compare register
1	Operates as capture register

CRC011	CR001 capture trigger selection
0	Captures on valid edge of TI011 pin
1	Captures on valid edge of TI001 pin by reverse phase ^{Note}

CRC010	CR001 operating mode selection
0	Operates as compare register
1	Operates as capture register

Note The capture operation is not performed if both the rising and falling edges are specified as the valid edge of the TI001 pin.

Cautions 1. Timer operation must be stopped before setting CRC01.

2. When the mode in which clear & start occurs on a match between TM01 and CR001 is selected with 16-bit timer mode control register 01 (TMC01), CR001 should not be specified as a capture register.

3. To ensure that the capture operation is performed properly, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 01 (PRM01).

(3) 16-bit timer output control register 0n (TOC0n)

This register controls the operation of the 16-bit timer/event counter 0n output controller. It sets/resets the timer output F/F (LV0n), enables/disables output inversion and 16-bit timer/event counter 0n timer output, enables/disables the one-shot pulse output operation, and sets the one-shot pulse output trigger via software.

TOC0n can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears TOC0n to 00H.

Remark n = 0, 1

Figure 7-10. Format of 16-Bit Timer Output Control Register 00 (TOC00)

Address: FFBDH After reset: 00H R/W

Symbol	7	<6>	<5>	4	<3>	<2>	1	<0>
TOC00	0	OSPT00	OSPE00	TOC004	LVS00	LVR00	TOC001	TOE00
OSPT00	One-shot pulse output trigger control via software

OSPE00	One-shot pulse output operation control							
0	Successive pulse output mode							
1	One-shot pulse output mode ^{Note}							
TOC004	Timer output F/F control using match of CR010 and TM00							
0	Disables inversion operation							
1	Enables inversion operation							
LVS00	LVR00	Timer output F/F status setting						
0	0	No change						
0	1	Timer output F/F reset (0)						
1	0	Timer output F/F set (1)						
1	1	Setting prohibited						
TOC001	Timer output F/F control using match of CR000 and TM00							
0	Disables inversion operation							
1	Enables inversion operation							
TOE00	Timer output control							
0	Disables output (output fixed to level 0)							
1	Enables output							

Note The one-shot pulse output mode operates correctly only in the free-running mode and the mode in which clear & start occurs at the TI000 pin valid edge. In the mode in which clear & start occurs on a match between the TM00 register and CR000 register, one-shot pulse output is not possible because an overflow does not occur.

- Cautions**
1. Timer operation must be stopped before setting other than TOC004.
 2. If LVS00 and LVR00 are read, 0 is read.
 3. OSPT00 is automatically cleared after data is set, so 0 is read.
 4. Do not set OSPT00 to 1 other than in one-shot pulse output mode.
 5. A write interval of two cycles or more of the count clock selected by prescaler mode register 00 (PRM00) is required to write to OSPT00 successively.
 6. Do not set LVS00 to 1 before TOE00, and do not set LVS00 and TOE00 to 1 simultaneously.
 7. Perform <1> and <2> below in the following order, not at the same time.
 - <1> Set TOC001, TOC004, TOE00, OSPE00: Timer output operation setting
 - <2> Set LVS00, LVR00: Timer output F/F setting

Figure 7-11. Format of 16-Bit Timer Output Control Register 01 (TOC01)

Address: FFB9H After reset: 00H R/W

Symbol	7	<6>	<5>	4	<3>	<2>	1	<0>	
TOC01	0	OSPT01	OSPE01	TOC014	LVS01	LVR01	TOC011	TOE01	
OSPT01	One-shot pulse output trigger control via software								
0	No one-shot pulse output trigger								
1	One-shot pulse output trigger								
OSPE01	One-shot pulse output operation control								
0	Successive pulse output mode								
1	One-shot pulse output mode ^{Note}								
TOC014	Timer output F/F control using match of CR011 and TM01								
0	Disables inversion operation								
1	Enables inversion operation								
LVS01	LVR01	Timer output F/F status setting							
0	0	No change							
0	1	Timer output F/F reset (0)							
1	0	Timer output F/F set (1)							
1	1	Setting prohibited							
TOC011	Timer output F/F control using match of CR001 and TM01								
0	Disables inversion operation								
1	Enables inversion operation								
TOE01	Timer output control								
0	Disables output (output fixed to level 0)								
1	Enables output								

Note The one-shot pulse output mode operates correctly only in the free-running mode and the mode in which clear & start occurs at the TI001 pin valid edge. In the mode in which clear & start occurs on a match between the TM01 register and CR001 register, one-shot pulse output is not possible because an overflow does not occur.

- Cautions**
1. Timer operation must be stopped before setting other than TOC014.
 2. If LVS01 and LVR01 are read, 0 is read.
 3. OSPT01 is automatically cleared after data is set, so 0 is read.
 4. Do not set OSPT01 to 1 other than in one-shot pulse output mode.
 5. A write interval of two cycles or more of the count clock selected by prescaler mode register 01 (PRM01) is required to write to OSPT01 successively.
 6. Do not set LVS01 to 1 before TOE01, and do not set LVS01 and TOE01 to 1 simultaneously.
 7. Perform <1> and <2> below in the following order, not at the same time.
 - <1> Set TOC011, TOC014, TOE01, OSPE01: Timer output operation setting
 - <2> Set LVS01, LVR01: Timer output F/F setting

(4) Prescaler mode register 0n (PRM0n)

This register is used to set the 16-bit timer counter 0n (TM0n) count clock and TI00n and TI01n pin input valid edges.

PRM0n can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears PRM0n to 00H.

Remark n = 0, 1

Figure 7-12. Format of Prescaler Mode Register 00 (PRM00)

Address: FFBBH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
PRM00	ES101	ES100	ES001	ES000	0	0	PRM001	PRM000

ES101	ES100	TI010 pin valid edge selection
0	0	Falling edge
0	1	Rising edge
1	0	Setting prohibited
1	1	Both falling and rising edges

ES001	ES000	TI000 pin valid edge selection
0	0	Falling edge
0	1	Rising edge
1	0	Setting prohibited
1	1	Both falling and rising edges

PRM001	PRM000	Count clock selection ^{Note 1}
0	0	f_x (10 MHz)
0	1	$f_x/2^2$ (2.5 MHz)
1	0	$f_x/2^8$ (39.06 kHz)
1	1	TI000 valid edge ^{Note 2}

Notes 1. Be sure to set the count clock so that the following condition is satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Count clock ≤ 10 MHz
- $V_{DD} = 3.3$ to 4.0 V: Count clock ≤ 8.38 MHz
- $V_{DD} = 2.7$ to 3.3 V: Count clock ≤ 5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

2. The external clock requires a pulse longer than two cycles of the internal count clock (f_x).

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 16-bit timer/event counter 00 is not guaranteed. When an external clock is used and when the internal oscillation clock is selected and supplied to the CPU, the operation of 16-bit timer/event counter 00 is not guaranteed, either, because the internal oscillation clock is supplied as the sampling clock to eliminate noise.
 2. Always set data to PRM00 after stopping the timer operation.
 3. If the valid edge of the TI000 pin is to be set for the count clock, do not set the clear & start mode using the valid edge of the TI000 pin and the capture trigger.
 4. If the TI000 or TI010 pin is high level immediately after system reset, the rising edge is immediately detected after the rising edge or both the rising and falling edges are set as the valid edge(s) of the TI000 pin or TI010 pin to enable the operation of 16-bit timer counter 00 (TM00). Care is therefore required when pulling up the TI000 or TI010 pin. However, if the TI000 or TI010 pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.
 5. When the valid edge of the TI010 pin is used, P01 cannot be used as the timer output pin (TO00). When P01 is used as the TO00 pin, the valid edge of the TI010 pin cannot be used.

- Remarks**
1. f_x : High-speed system clock oscillation frequency
 2. Figures in parentheses are for operation with $f_x = 10$ MHz.

Figure 7-13. Format of Prescaler Mode Register 01 (PRM01)

Address: FFB7H After reset: 00H R/W

ES011	ES010	TI001 pin valid edge selection
0	0	Falling edge
0	1	Rising edge
1	0	Setting prohibited
1	1	Both falling and rising edges

PRM011	PRM010	Count clock selection ^{Note 1}
0	0	f_x (10 MHz)
0	1	$f_x/2^4$ (625 kHz)
1	0	$f_x/2^6$ (156.25 kHz)
1	1	TI001 valid edge ^{Note 2}

Notes 1. Be sure to set the count clock so that the following condition is satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Count clock ≤ 10 MHz
- $V_{DD} = 3.3$ to 4.0 V: Count clock ≤ 8.38 MHz
- $V_{DD} = 2.7$ to 3.3 V: Count clock ≤ 5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

2. The external clock requires a pulse longer than two cycles of the internal count clock (f_x).

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 16-bit timer/event counter 01 is not guaranteed. When an external clock is used and when the internal oscillation clock is selected and supplied to the CPU, the operation of 16-bit timer/event counter 01 is not guaranteed, either, because the internal oscillation clock is supplied as the sampling clock to eliminate noise.
 2. Always set data to PRM01 after stopping the timer operation.
 3. If the valid edge of the TI001 pin is to be set for the count clock, do not set the clear & start mode using the valid edge of the TI001 pin and the capture trigger.
 4. If the TI001 or TI011 pin is high level immediately after system reset, the rising edge is immediately detected after the rising edge or both the rising and falling edges are set as the valid edge(s) of the TI001 pin or TI011 pin to enable the operation of 16-bit timer counter 01 (TM01). Care is therefore required when pulling up the TI001 or TI011 pin. However, if the TI001 or TI011 pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.
 5. When the valid edge of the TI011 pin is used, P06 cannot be used as the timer output pin (TO01). When P06 is used as the TO01 pin, the valid edge of the TI011 pin cannot be used.

- Remarks**
1. fx: High-speed system clock oscillation frequency
 2. Figures in parentheses are for operation with fx = 10 MHz.

(5) Port mode register 0 (PM0)

This register sets port 0 input/output in 1-bit units.

When using the P01/TO00/TI010 and P06/TO01/TI011 pins for timer output, set PM01 and PM06 and the output latch of P01 and P06 to 0.

When using the P01/TO00/TI010 and P06/TO01/TI011 pins for timer input, set PM01 and PM06 to 1. At this time, the output latch of P01 and P06 may be 0 or 1.

PM0 can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets PM0 to FFH.

Figure 7-14. Format of Port Mode Register 0 (PM0)

Address: FF20H After reset: FFH R/W

0	Output mode (output buffer on)
1	Input mode (output buffer off)

7.4 Operation of 16-Bit Timer/Event Counters 00 and 01

7.4.1 Interval timer operation

Setting 16-bit timer mode control register 0n (TMC0n) and capture/compare control register 0n (CRC0n) as shown in Figure 7-15 allows operation as an interval timer.

Setting

The basic operation setting procedure is as follows.

- <1> Set the CRC0n register (see **Figure 7-15** for the set value).
- <2> Set any value to the CR00n register.
- <3> Set the count clock by using the PRM0n register.
- <4> Set the TMC0n register to start the operation (see **Figure 7-15** for the set value).

Caution Do not rewrite CR00n during TM0n operation.

Remark For how to enable the INTTM00n interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.

Interrupt requests are generated repeatedly using the count value preset in 16-bit timer capture/compare register 00n (CR00n) as the interval.

When the count value of 16-bit timer counter 0n (TM0n) matches the value set in CR00n, counting continues with the TM0n value cleared to 0 and the interrupt request signal (INTTM00n) is generated.

The count clock of 16-bit timer/event counter 0n can be selected with bits 0 and 1 (PRM0n0, PRM0n1) of prescaler mode register 0n (PRM0n).

Remark n = 0, 1

Figure 7-15. Control Register Settings for Interval Timer Operation

(a) 16-bit timer mode control register 0n (TMC0n)

(b) Capture/compare control register 0n (CRC0n)

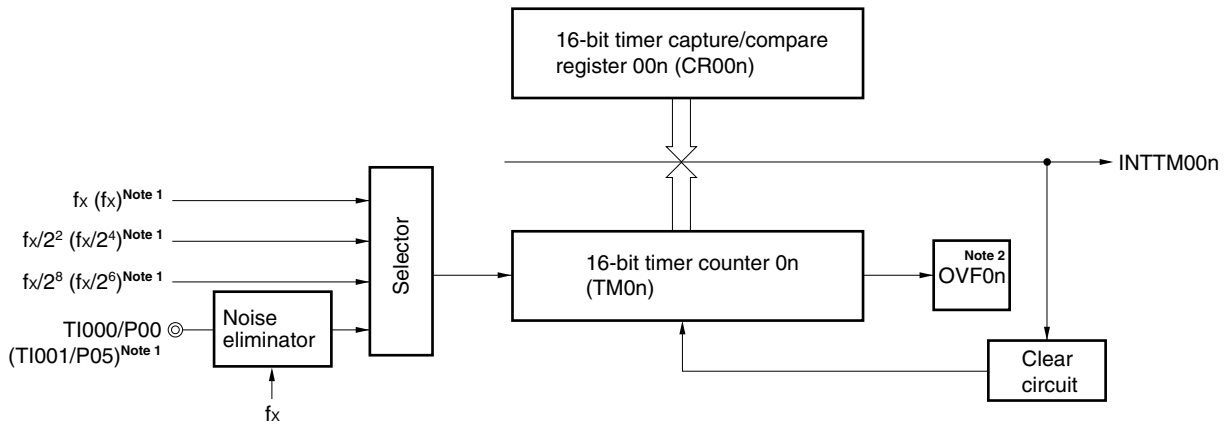

(c) Prescaler mode register 0n (PRM0n)

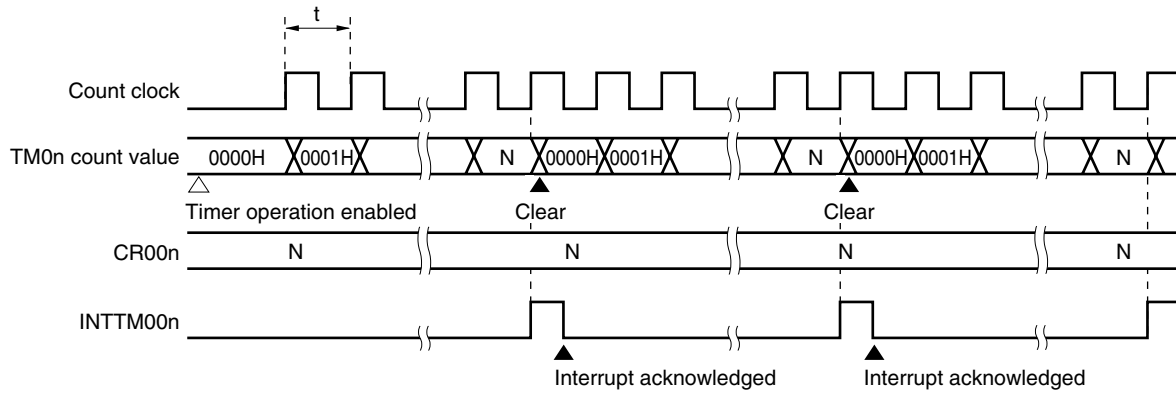

- Remarks**
- 0/1: Setting 0 or 1 allows another function to be used simultaneously with the interval timer. See the description of the respective control registers for details.
 - n = 0, 1

Figure 7-16. Interval Timer Configuration Diagram

- Notes**
1. Frequencies and pin names without parentheses are for 16-bit timer/event counter 00, and those in parentheses are for 16-bit timer/event counter 01.
 2. OVF0n is set to 1 only when 16-bit timer capture/compare register 00n is set to FFFFH.

Figure 7-17. Timing of Interval Timer Operation

Remark Interval time = $(N + 1) \times t$
 $N = 0001H$ to $FFFFH$ (settable range)
 $n = 0, 1$

7.4.2 PPG output operations

Setting 16-bit timer mode control register 0n (TMC0n) and capture/compare control register 0n (CRC0n) as shown in Figure 7-18 allows operation as PPG (Programmable Pulse Generator) output.

Setting

The basic operation setting procedure is as follows.

- <1> Set the CRC0n register (see **Figure 7-18** for the set value).
- <2> Set any value to the CR00n register as the cycle.
- <3> Set any value to the CR01n register as the duty factor.
- <4> Set the TOC0n register (see **Figure 7-18** for the set value).
- <5> Set the count clock by using the PRM0n register.
- <6> Set the TMC0n register to start the operation (see **Figure 7-18** for the set value).

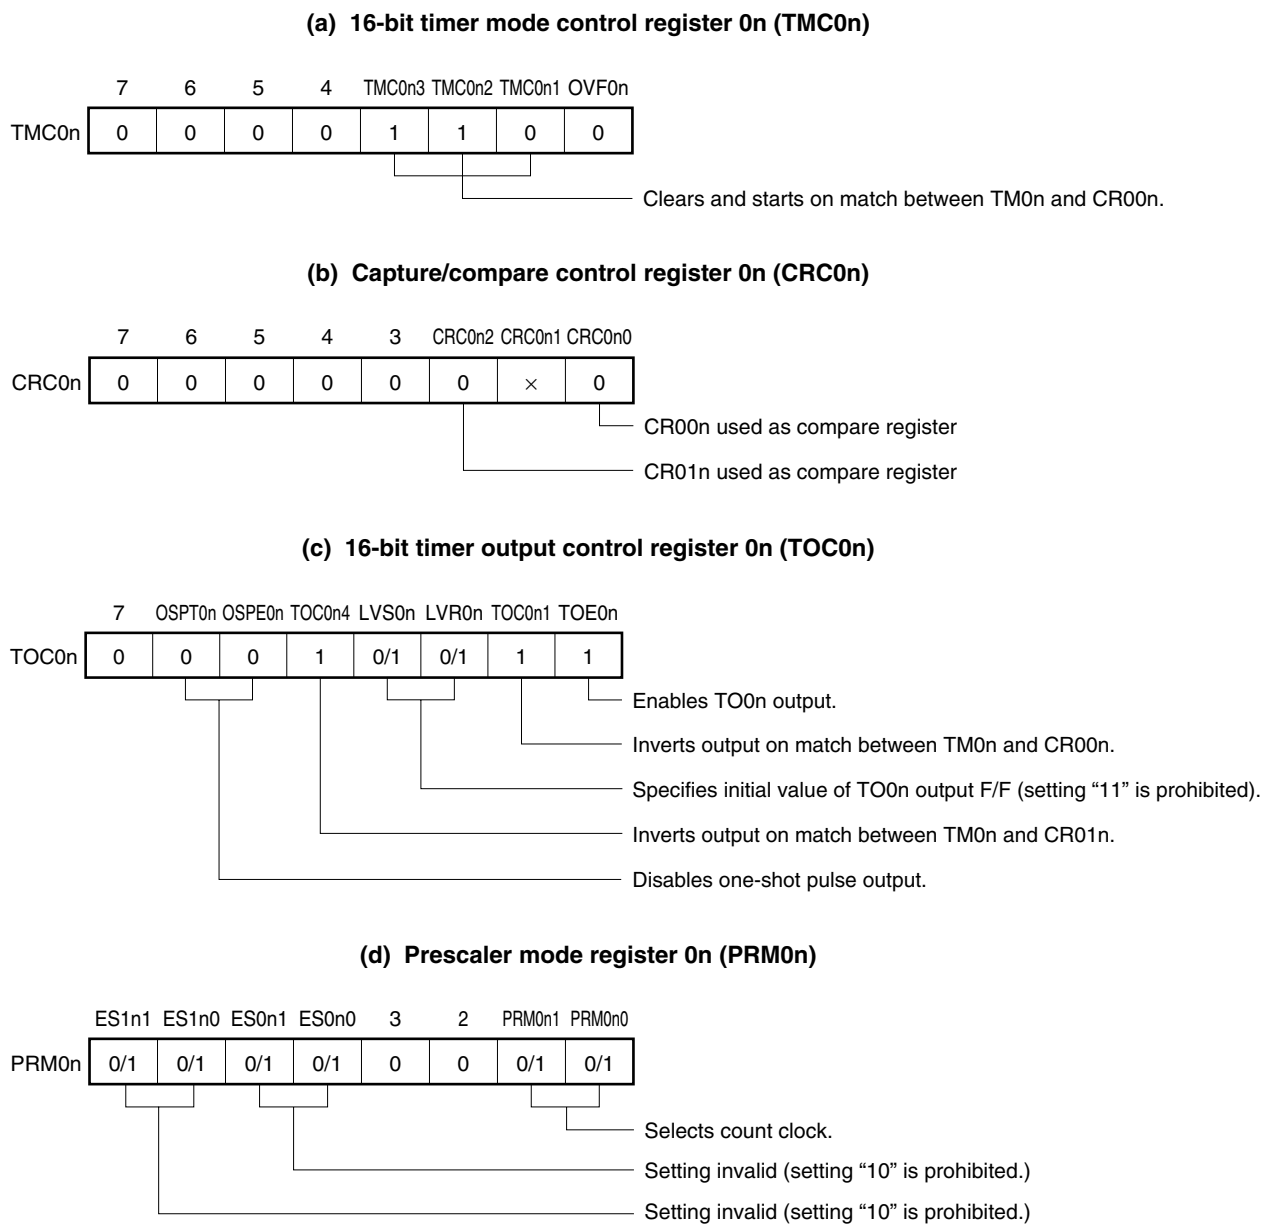

Caution To change the value of the duty factor (the value of the CR01n register) during operation, see **Caution 2 in Figure 7-20 PPG Output Operation Timing**.

- Remarks**
- 1. For the setting of the TO0n pin, see **7.3 (5) Port mode register 0 (PM0)**.
 - 2. For how to enable the INTTM00n interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.

In the PPG output operation, rectangular waves are output from the TO0n pin with the pulse width and the cycle that correspond to the count values preset in 16-bit timer capture/compare register 01n (CR01n) and in 16-bit timer capture/compare register 00n (CR00n), respectively.

Remark n = 0, 1

Figure 7-18. Control Register Settings for PPG Output Operation

Cautions 1. Values in the following range should be set in CR00n and CR01n:

$$0000H \leq CR01n < CR00n \leq FFFFH$$

2. The pulse generated through PPG output has a cycle of [CR00n setting value + 1], and a duty of [(CR01n setting value + 1)/(CR00n setting value + 1)].

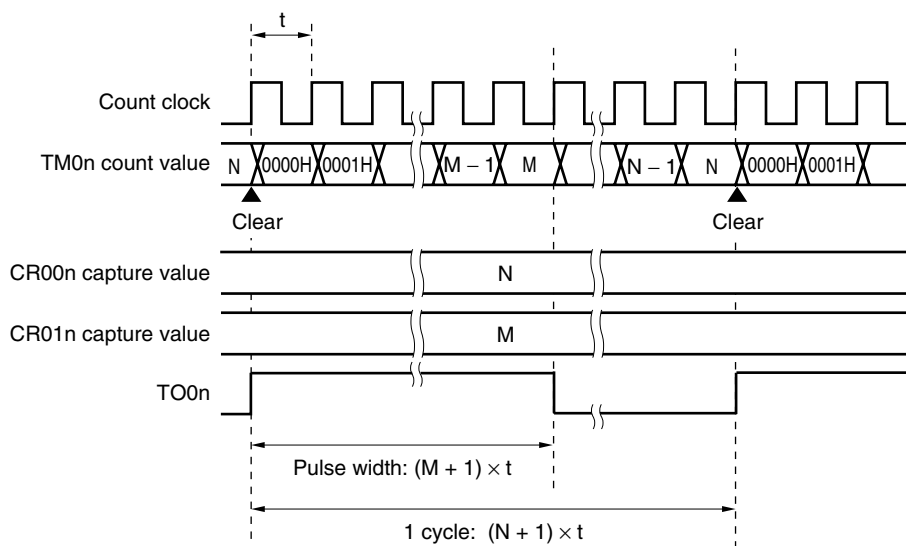

Remark ×: Don't care
n = 0, 1

Figure 7-19. Configuration Diagram of PPG Output

Note Frequencies and pin names without parentheses are for 16-bit timer/event counter 00, and those in parentheses are for 16-bit timer/event counter 01.

Figure 7-20. PPG Output Operation Timing

- Cautions**
- Do not rewrite CR00n during TM0n operation.
 - In the PPG output operation, change the pulse width (rewrite CR01n) during TM0n operation using the following procedure.
 - <1> Disable the timer output inversion operation by match of TM0n and CR01n (TOC0n4 = 0)
 - <2> Disable the INTTM01n interrupt (TMMK01n = 1)
 - <3> Rewrite CR01n
 - <4> Wait for 1 cycle of the TM0n count clock
 - <5> Enable the timer output inversion operation by match of TM0n and CR01n (TOC0n4 = 1)
 - <6> Clear the interrupt request flag of INTTM01n (TMIF01n = 0)
 - <7> Enable the INTTM01n interrupt (TMMK01n = 0)

- Remarks**
- $0000H \leq M < N \leq FFFFH$
 - $n = 0, 1$

7.4.3 Pulse width measurement operations

It is possible to measure the pulse width of the signals input to the TI00n pin and TI01n pin using 16-bit timer counter 0n (TM0n).

There are two measurement methods: measuring with TM0n used in free-running mode, and measuring by restarting the timer in synchronization with the edge of the signal input to the TI00n pin.

When an interrupt occurs, read the valid value of the capture register, check the overflow flag, and then calculate the necessary pulse width. Clear the overflow flag after checking it.

The capture operation is not performed until the signal pulse width is sampled in the count clock cycle selected by prescaler mode register 0n (PRM0n) and the valid level of the TI00n or TI01n pin is detected twice, thus eliminating noise with a short pulse width.

Figure 7-21. CR01n Capture Operation with Rising Edge Specified

Setting

The basic operation setting procedure is as follows.

- <1> Set the CRC0n register (see **Figures 7-22, 7-25, 7-27, and 7-29** for the set value).
- <2> Set the count clock by using the PRM0n register.
- <3> Set the TMC0n register to start the operation (see **Figures 7-22, 7-25, 7-27, and 7-29** for the set value).

Caution To use two capture registers, set the TI00n and TI01n pins.

- Remarks**
1. For the setting of the TI00n (or TI01n) pin, see **7.3 (5) Port mode register 0 (PM0)**.
 2. For how to enable the INTTM00n (or INTTM01n) interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.
 3. $n = 0, 1$

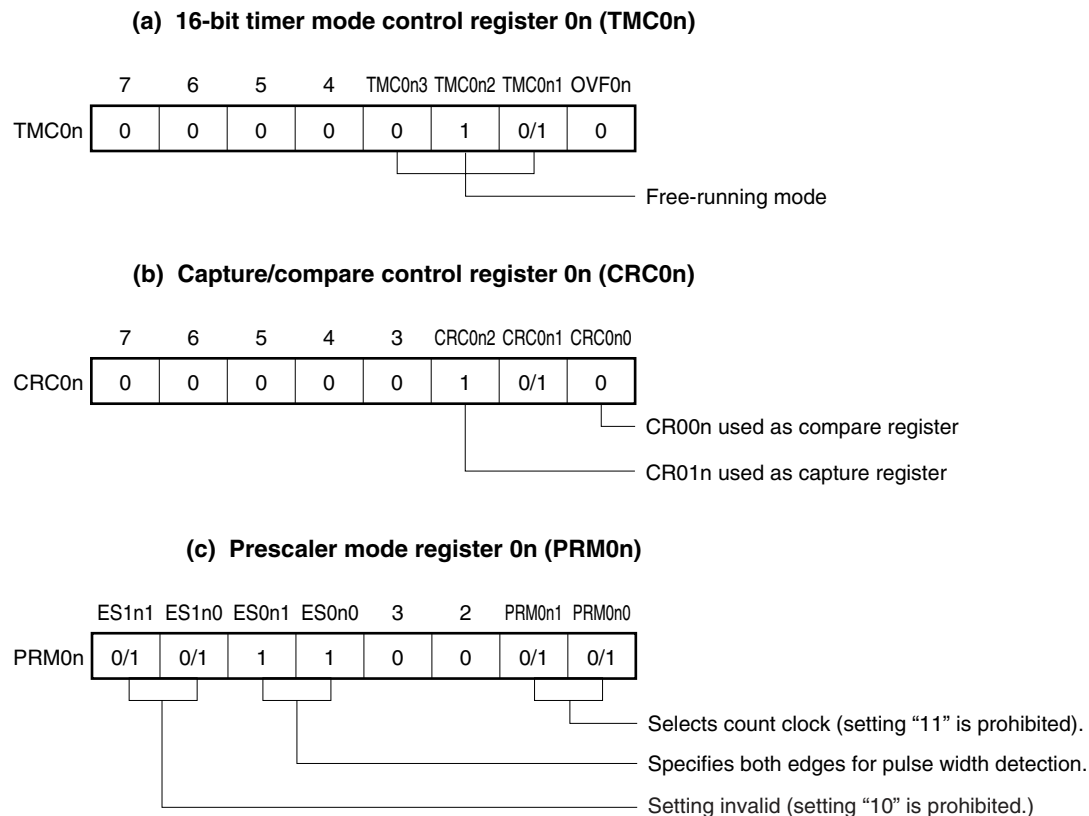

(1) Pulse width measurement with free-running counter and one capture register

When 16-bit timer counter 0n (TM0n) is operated in free-running mode, and the edge specified by prescaler mode register 0n (PRM0n) is input to the TI00n pin, the value of TM0n is taken into 16-bit timer capture/compare register 01n (CR01n) and an external interrupt request signal (INTTM01n) is set.

Specify both the rising and falling edges of the TI00n pin by using bits 4 and 5 (ES0n0 and ES0n1) of PRM0n.

Sampling is performed using the count clock selected by PRM0n, and a capture operation is only performed when a valid level of the TI00n pin is detected twice, thus eliminating noise with a short pulse width.

Figure 7-22. Control Register Settings for Pulse Width Measurement with Free-Running Counter and One Capture Register (When TI00n and CR01n Are Used)

Remark 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement.

See the description of the respective control registers for details.

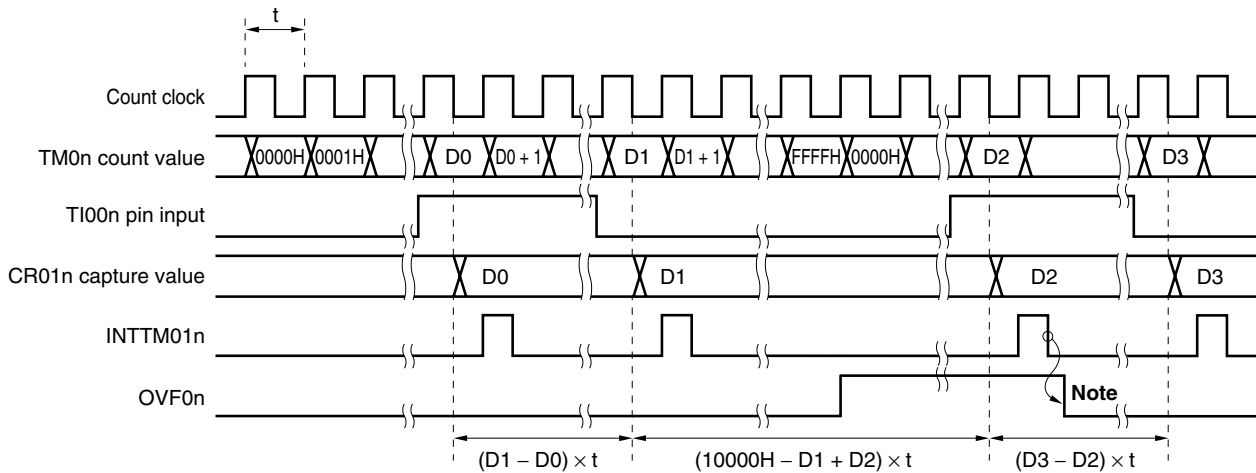

n = 0, 1

Figure 7-23. Configuration Diagram for Pulse Width Measurement with Free-Running Counter

Note Frequencies without parentheses are for 16-bit timer/event counter 00, and those in parentheses are for 16-bit timer/event counter 01.

Figure 7-24. Timing of Pulse Width Measurement Operation with Free-Running Counter and One Capture Register (with Both Edges Specified)

Note Clear OVF0n by software.

Remark n = 0, 1

(2) Measurement of two pulse widths with free-running counter

When 16-bit timer counter 0n (TM0n) is operated in free-running mode, it is possible to simultaneously measure the pulse widths of the two signals input to the TI00n pin and the TI01n pin.

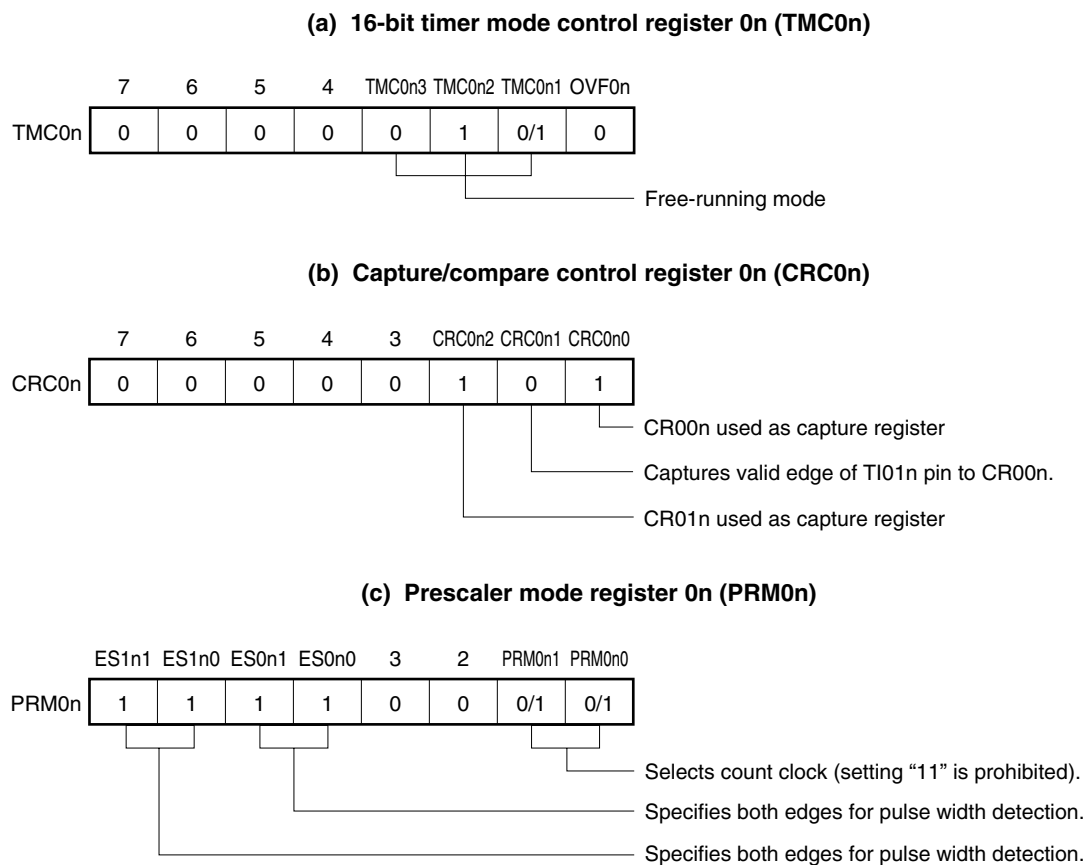

When the edge specified by bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n) is input to the TI00n pin, the value of TM0n is taken into 16-bit timer capture/compare register 01n (CR01n) and an interrupt request signal (INTTM01n) is set.

Also, when the edge specified by bits 6 and 7 (ES1n0 and ES1n1) of PRM0n is input to the TI01n pin, the value of TM0n is taken into 16-bit timer capture/compare register 00n (CR00n) and an interrupt request signal (INTTM00n) is set.

Specify both the rising and falling edges as the edges of the TI00n and TI01n pins, by using bits 4 and 5 (ES0n0 and ES0n1) and bits 6 and 7 (ES1n0 and ES1n1) of PRM0n.

Sampling is performed using the count clock cycle selected by prescaler mode register 0n (PRM0n), and a capture operation is only performed when a valid level of the TI00n or TI01n pin is detected twice, thus eliminating noise with a short pulse width.

Figure 7-25. Control Register Settings for Measurement of Two Pulse Widths with Free-Running Counter

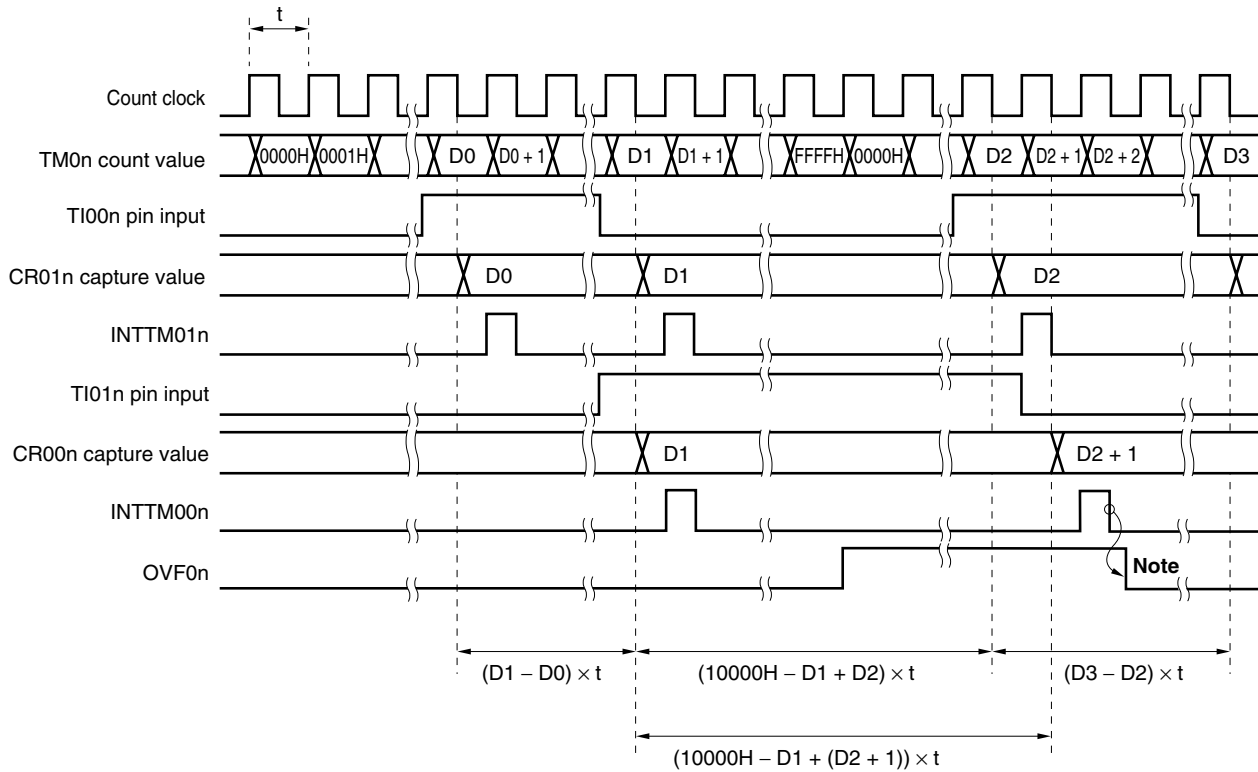

Remark 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement.

See the description of the respective control registers for details.

n = 0, 1

Figure 7-26. Timing of Pulse Width Measurement Operation with Free-Running Counter (with Both Edges Specified)

Note Clear OVF0n by software.

Remark $n = 0, 1$

(3) Pulse width measurement with free-running counter and two capture registers

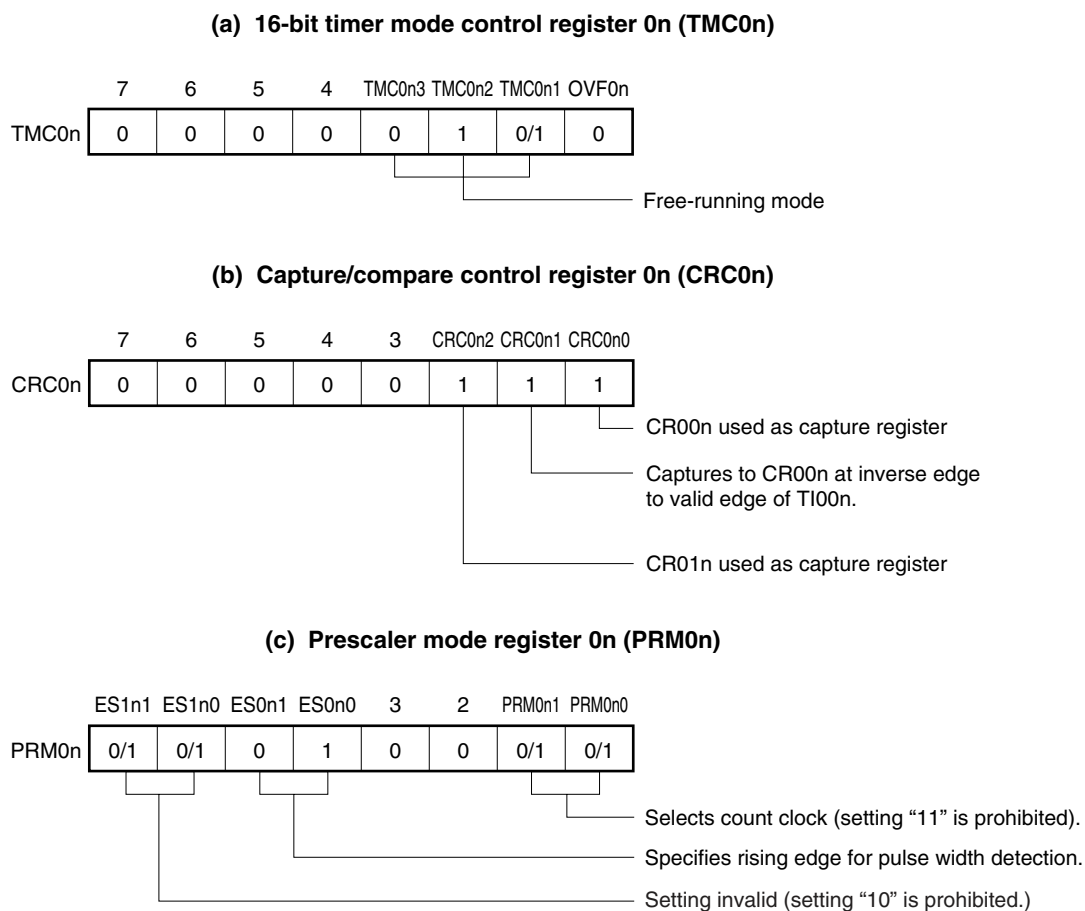

When 16-bit timer counter 0n (TM0n) is operated in free-running mode, it is possible to measure the pulse width of the signal input to the TI00n pin.

When the rising or falling edge specified by bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n) is input to the TI00n pin, the value of TM0n is taken into 16-bit timer capture/compare register 01n (CR01n) and an interrupt request signal (INTTM01n) is set.

Also, when the inverse edge to that of the capture operation is input into CR01n, the value of TM0n is taken into 16-bit timer capture/compare register 00n (CR00n).

Sampling is performed using the count clock cycle selected by prescaler mode register 0n (PRM0n), and a capture operation is only performed when a valid level of the TI00n pin is detected twice, thus eliminating noise with a short pulse width.

Figure 7-27. Control Register Settings for Pulse Width Measurement with Free-Running Counter and Two Capture Registers (with Rising Edge Specified)

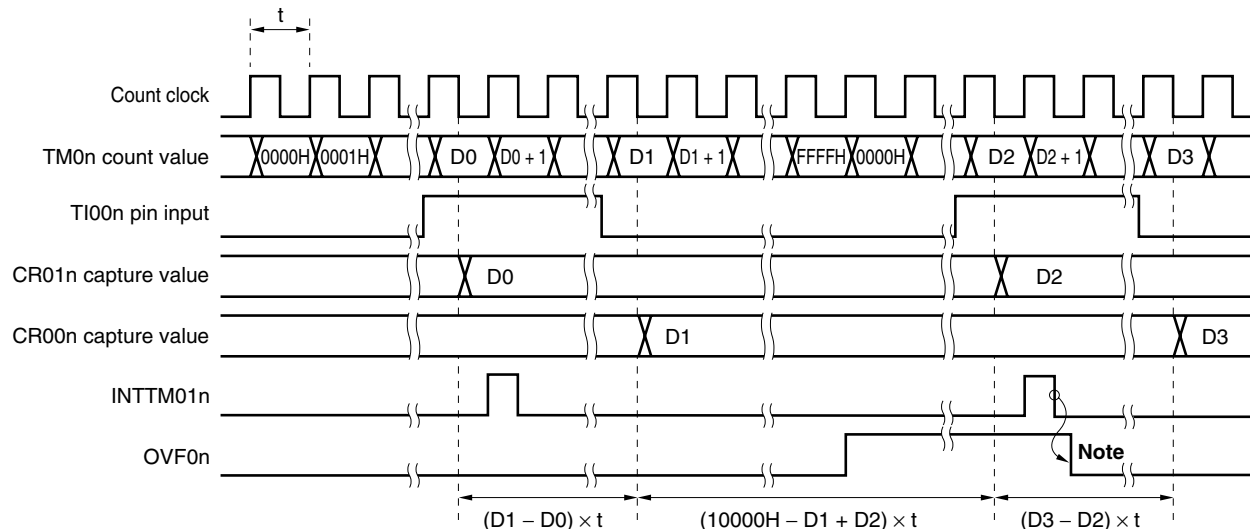

Remark 0/1: Setting 0 or 1 allows another function to be used simultaneously with pulse width measurement.

See the description of the respective control registers for details.

n = 0, 1

Figure 7-28. Timing of Pulse Width Measurement Operation with Free-Running Counter and Two Capture Registers (with Rising Edge Specified)

Note Clear OVF0n by software.

(4) Pulse width measurement by means of restart

When input of a valid edge to the TI00n pin is detected, the count value of 16-bit timer counter 0n (TM0n) is taken into 16-bit timer capture/compare register 01n (CR01n), and then the pulse width of the signal input to the TI00n pin is measured by clearing TM0n and restarting the count operation.

Either of two edges—rising or falling—can be selected using bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n).

Sampling is performed using the count clock cycle selected by prescaler mode register 0n (PRM0n) and a capture operation is only performed when a valid level of the TI00n pin is detected twice, thus eliminating noise with a short pulse width.

Remark $n = 0, 1$

Figure 7-29. Control Register Settings for Pulse Width Measurement by Means of Restart (with Rising Edge Specified)

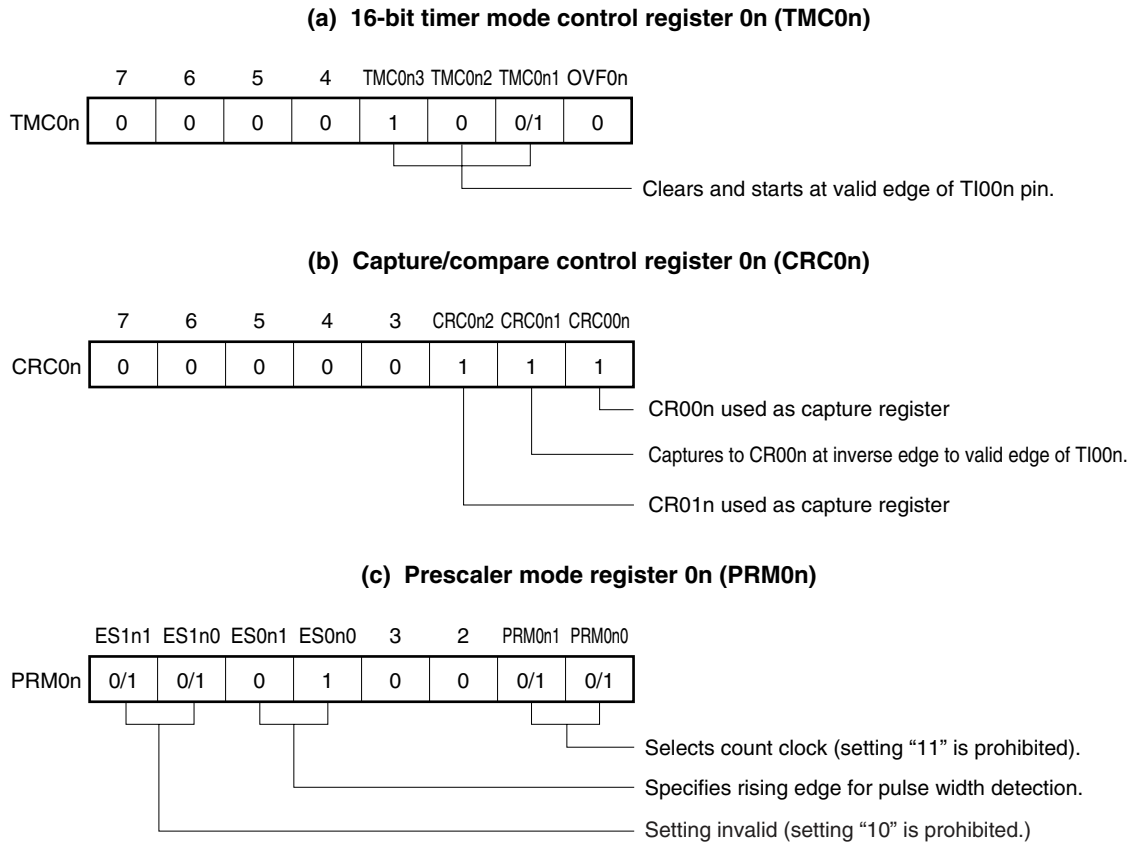

Figure 7-30. Timing of Pulse Width Measurement Operation by Means of Restart (with Rising Edge Specified)

Remark n = 0, 1

7.4.4 External event counter operation

Setting

The basic operation setting procedure is as follows.

- <1> Set the CRC0n register (see **Figure 7-31** for the set value).
- <2> Set the count clock by using the PRM0n register.
- <3> Set any value to the CR00n register (0000H cannot be set).
- <4> Set the TMC0n register to start the operation (see **Figure 7-31** for the set value).

Remarks 1. For the setting of the TI00n pin, see **7.3 (5) Port mode register 0 (PM0)**.

2. For how to enable the INTTM00n interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.

The external event counter counts the number of external clock pulses input to the TI00n pin using 16-bit timer counter 0n (TM0n).

TM0n is incremented each time the valid edge specified by prescaler mode register 0n (PRM0n) is input.

When the TM0n count value matches the 16-bit timer capture/compare register 00n (CR00n) value, TM0n is cleared to 0 and the interrupt request signal (INTTM00n) is generated.

Input a value other than 0000H to CR00n (a count operation with 1-bit pulse cannot be carried out).

Any of three edges—rising, falling, or both edges—can be selected using bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n).

Sampling is performed using the internal clock (fx) and an operation is only performed when a valid level of the TI00n pin is detected twice, thus eliminating noise with a short pulse width.

Figure 7-31. Control Register Settings in External Event Counter Mode (with Rising Edge Specified)

(a) 16-bit timer mode control register 0n (TMC0n)

(b) Capture/compare control register 0n (CRC0n)

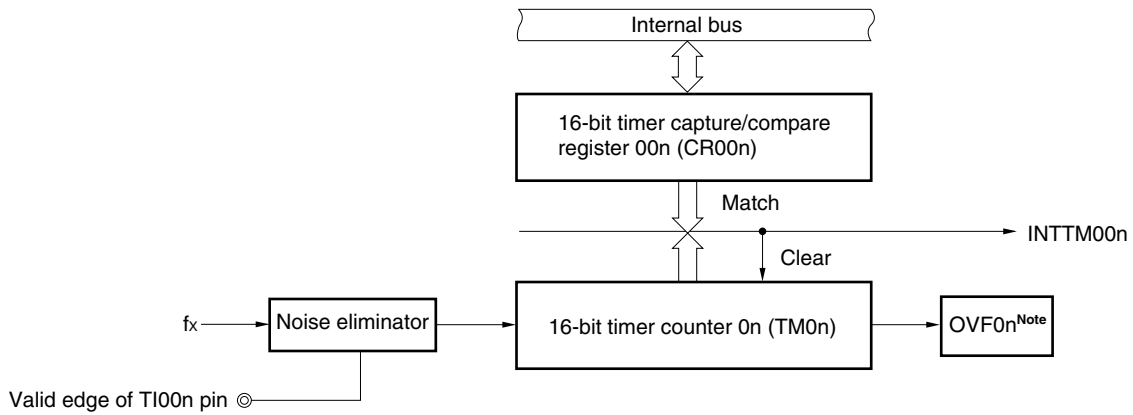

(c) Prescaler mode register 0n (PRM0n)

Remark 0/1: Setting 0 or 1 allows another function to be used simultaneously with the external event counter. See the description of the respective control registers for details.
 n = 0, 1

Figure 7-32. Configuration Diagram of External Event Counter

Note OVF0n is set to 1 only when CR00n is set to FFFFH.

Figure 7-33. External Event Counter Operation Timing (with Rising Edge Specified)

Caution When reading the external event counter count value, TM0n should be read.

Remark $n = 0, 1$

7.4.5 Square-wave output operation

Setting

The basic operation setting procedure is as follows.

- <1> Set the count clock by using the PRM0n register.
- <2> Set the CRC0n register (see **Figure 7-34** for the set value).
- <3> Set the TOC0n register (see **Figure 7-34** for the set value).
- <4> Set any value to the CR00n register (0000H cannot be set).
- <5> Set the TMC0n register to start the operation (see **Figure 7-34** for the set value).

Caution Do not rewrite CR00n during TM0n operation.

- Remarks 1.** For the setting of the TO0n pin, see **7.3 (5) Port mode register 0 (PM0)**.
2. For how to enable the INTTM00n interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.

A square wave with any selected frequency can be output at intervals determined by the count value preset to 16-bit timer capture/compare register 00n (CR00n).

The TO0n pin output status is reversed at intervals determined by the count value preset to CR00n + 1 by setting bit 0 (TOE0n) and bit 1 (TOC0n1) of 16-bit timer output control register 0n (TOC0n) to 1. This enables a square wave with any selected frequency to be output.

Figure 7-34. Control Register Settings in Square-Wave Output Mode (1/2)

(a) 16-bit timer mode control register 0n (TMC0n)

(b) Capture/compare control register 0n (CRC0n)

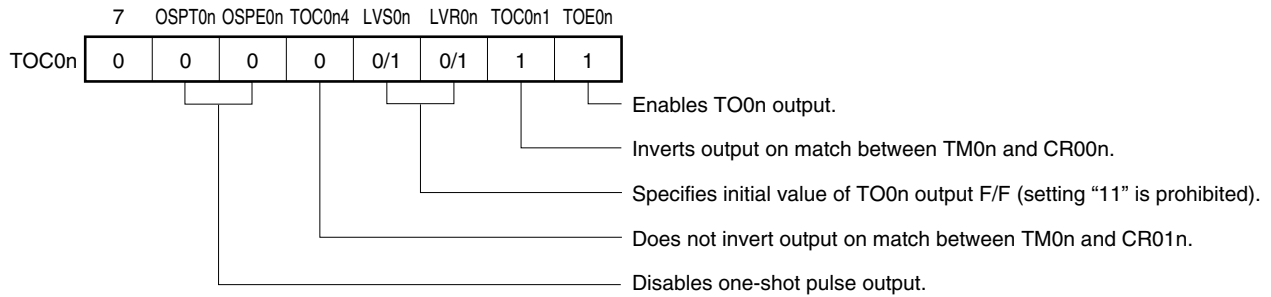

Figure 7-34. Control Register Settings in Square-Wave Output Mode (2/2)

(c) 16-bit timer output control register 0n (TOC0n)

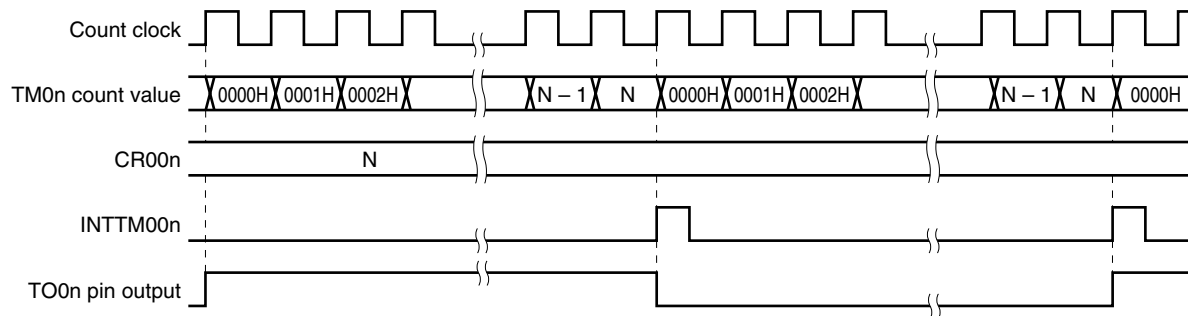

(d) Prescaler mode register 0n (PRM0n)

Remark 0/1: Setting 0 or 1 allows another function to be used simultaneously with square-wave output. See the description of the respective control registers for details.
 n = 0, 1

Figure 7-35. Square-Wave Output Operation Timing

Remark n = 0, 1

7.4.6 One-shot pulse output operation

16-bit timer/event counter 0n can output a one-shot pulse in synchronization with a software trigger or an external trigger (TI00n pin input).

Setting

The basic operation setting procedure is as follows.

- <1> Set the count clock by using the PRM0n register.
- <2> Set the CRC0n register (see **Figures 7-36** and **7-38** for the set value).
- <3> Set the TOC0n register (see **Figures 7-36** and **7-38** for the set value).
- <4> Set any value to the CR00n and CR01n registers (0000H cannot be set).
- <5> Set the TMC0n register to start the operation (see **Figures 7-36** and **7-38** for the set value).

Remarks 1. For the setting of the TO0n pin, see **7.3 (5) Port mode register 0 (PM0)**.

- 2. For how to enable the INTTM00n (if necessary, INTTM01n) interrupt, see **CHAPTER 19 INTERRUPT FUNCTIONS**.

(1) One-shot pulse output with software trigger

A one-shot pulse can be output from the TO0n pin by setting 16-bit timer mode control register 0n (TMC0n), capture/compare control register 0n (CRC0n), and 16-bit timer output control register 0n (TOC0n) as shown in Figure 7-36, and by setting bit 6 (OSPT0n) of the TOC0n register to 1 by software.

By setting the OSPT0n bit to 1, 16-bit timer/event counter 0n is cleared and started, and its output becomes active at the count value (N) set in advance to 16-bit timer capture/compare register 01n (CR01n). After that, the output becomes inactive at the count value (M) set in advance to 16-bit timer capture/compare register 00n (CR00n)^{Note}.

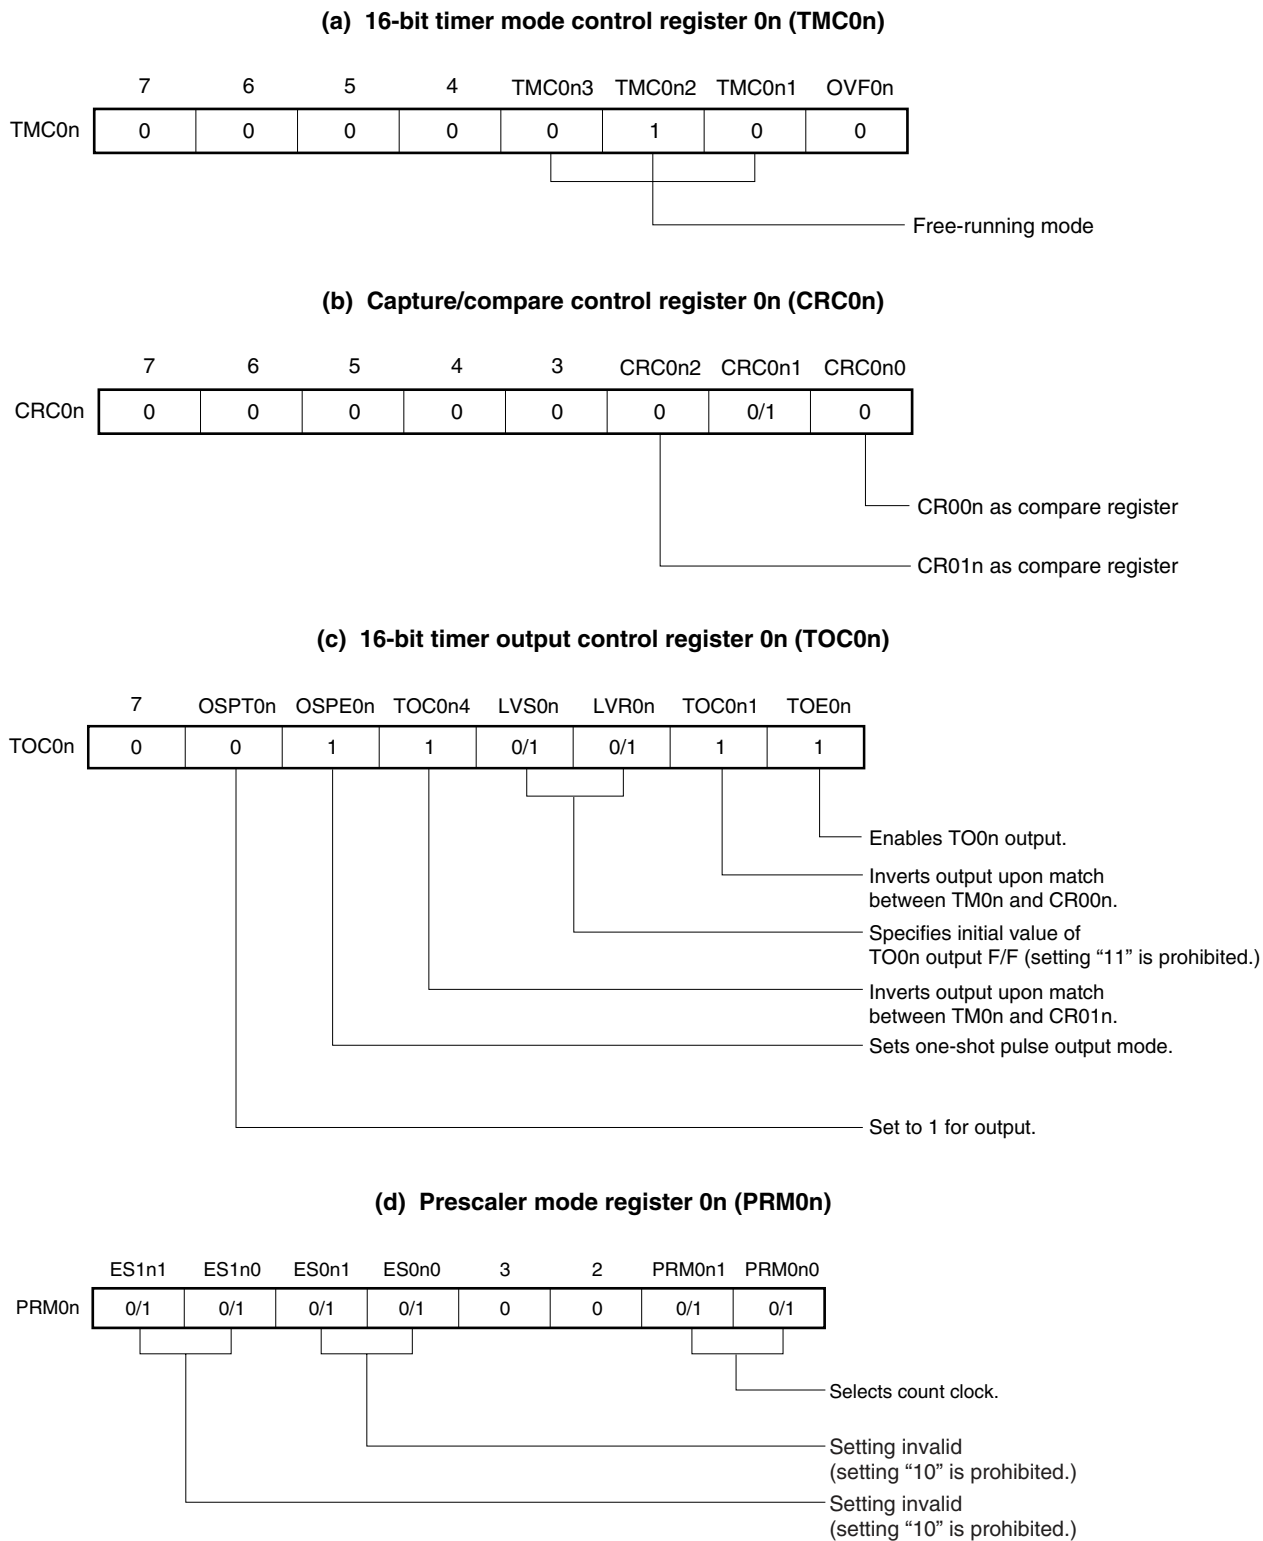

Even after the one-shot pulse has been output, the TM0n register continues its operation. To stop the TM0n register, the TMC0n3 and TMC0n2 bits of the TMC0n register must be set to 00.

Note The case where $N < M$ is described here. When $N > M$, the output becomes active with the CR00n register and inactive with the CR01n register. Do not set N to M .

- Cautions**
- 1. Do not set the OSPT0n bit to 1 again while the one-shot pulse is being output. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.
 - 2. When using the one-shot pulse output of 16-bit timer/event counter 0n with a software trigger, do not change the level of the TI00n pin or its alternate-function port pin. Because the external trigger is valid even in this case, the timer is cleared and started even at the level of the TI00n pin or its alternate-function port pin, resulting in the output of a pulse at an undesired timing.

Remark n = 0, 1

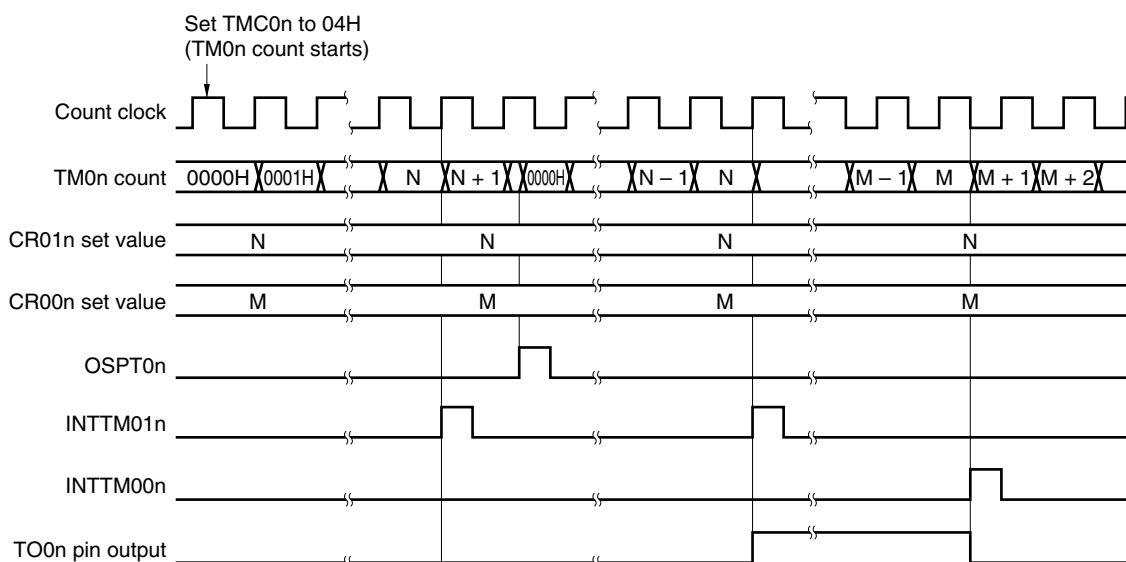

Figure 7-36. Control Register Settings for One-Shot Pulse Output with Software Trigger

Caution Do not set the CR00n and CR01n registers to 0000H.

Remark n = 0, 1

Figure 7-37. Timing of One-Shot Pulse Output Operation with Software Trigger

Caution 16-bit timer counter 0n starts operating as soon as a value other than 00 (operation stop mode) is set to the TMC0n3 and TMC0n2 bits.

Remark $N < M$

(2) One-shot pulse output with external trigger

A one-shot pulse can be output from the TO0n pin by setting 16-bit timer mode control register 0n (TMC0n), capture/compare control register 0n (CRC0n), and 16-bit timer output control register 0n (TOC0n) as shown in Figure 7-38, and by using the valid edge of the TI00n pin as an external trigger.

The valid edge of the TI00n pin is specified by bits 4 and 5 (ES0n0, ES0n1) of prescaler mode register 0n (PRM0n). The rising, falling, or both the rising and falling edges can be specified.

When the valid edge of the TI00n pin is detected, the 16-bit timer/event counter is cleared and started, and the output becomes active at the count value set in advance to 16-bit timer capture/compare register 01n (CR01n). After that, the output becomes inactive at the count value set in advance to 16-bit timer capture/compare register 00n (CR00n)^{Note}.

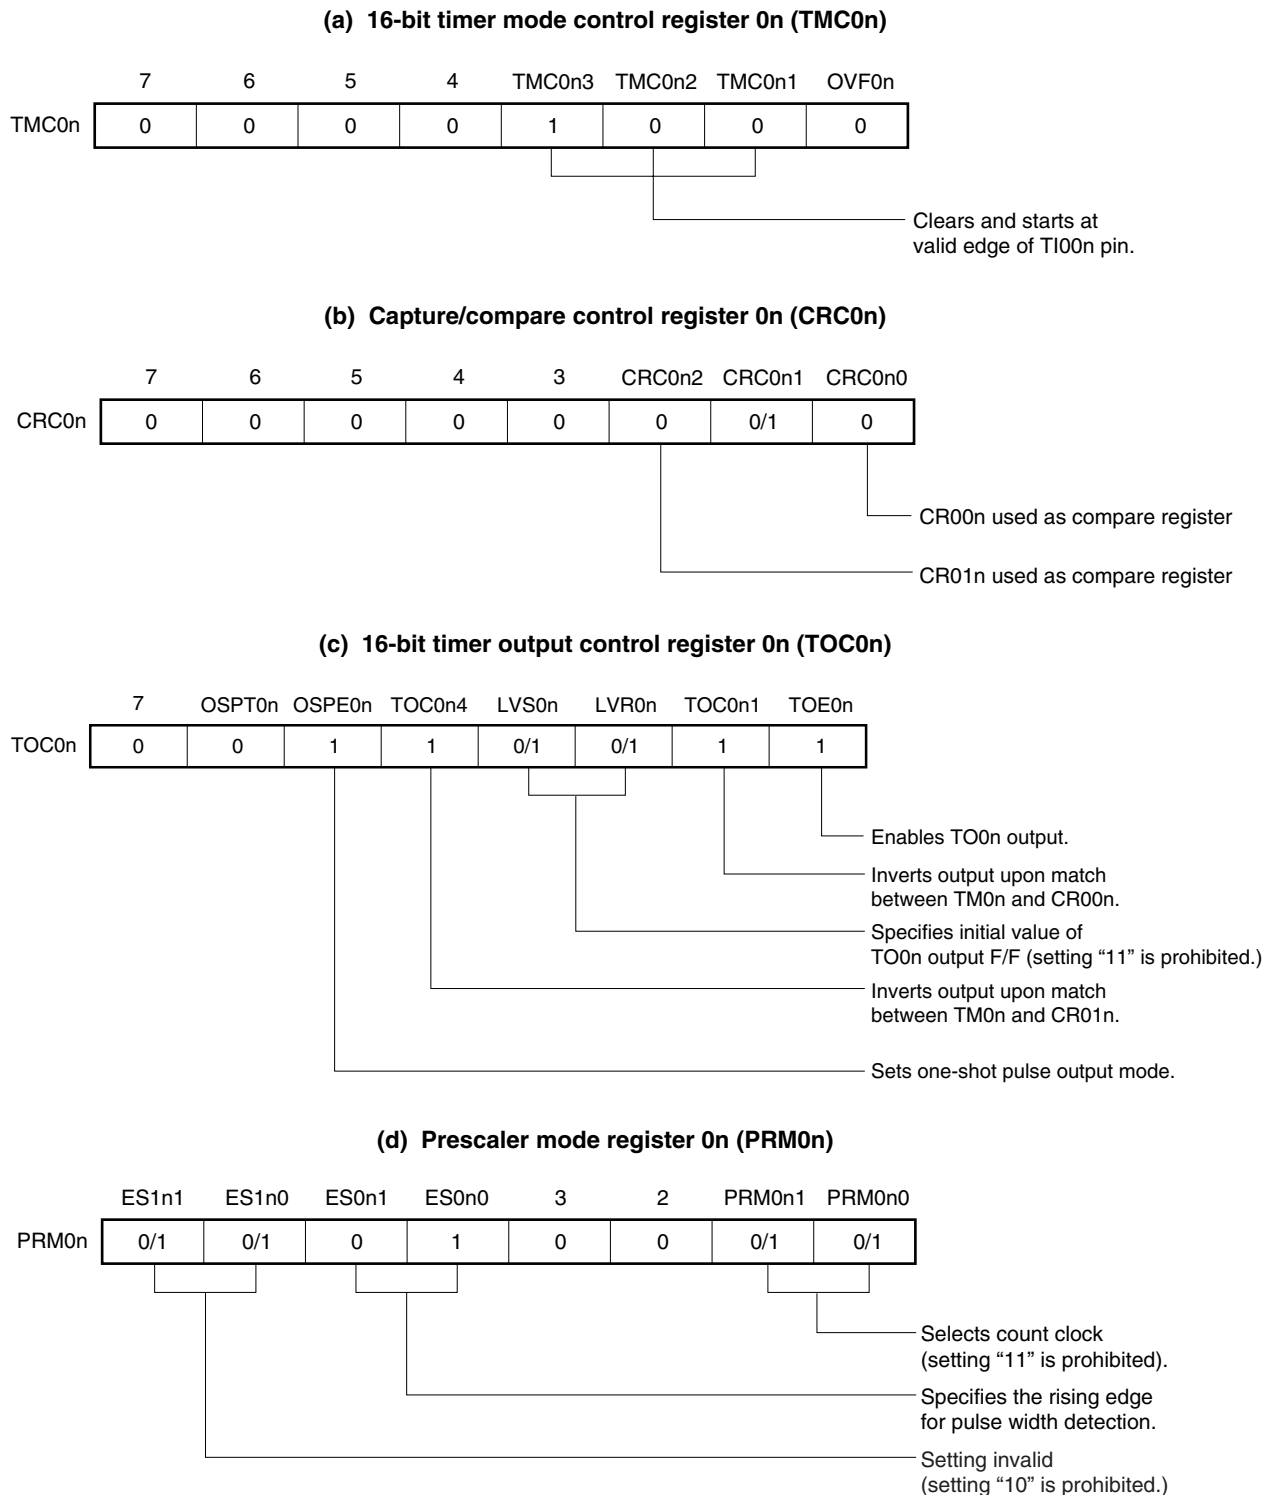

Note The case where $N < M$ is described here. When $N > M$, the output becomes active with the CR00n register and inactive with the CR01n register. Do not set N to M .

Caution Do not input the external trigger again while the one-shot pulse is output.

To output the one-shot pulse again, wait until the current one-shot pulse output is completed.

Remark $n = 0, 1$

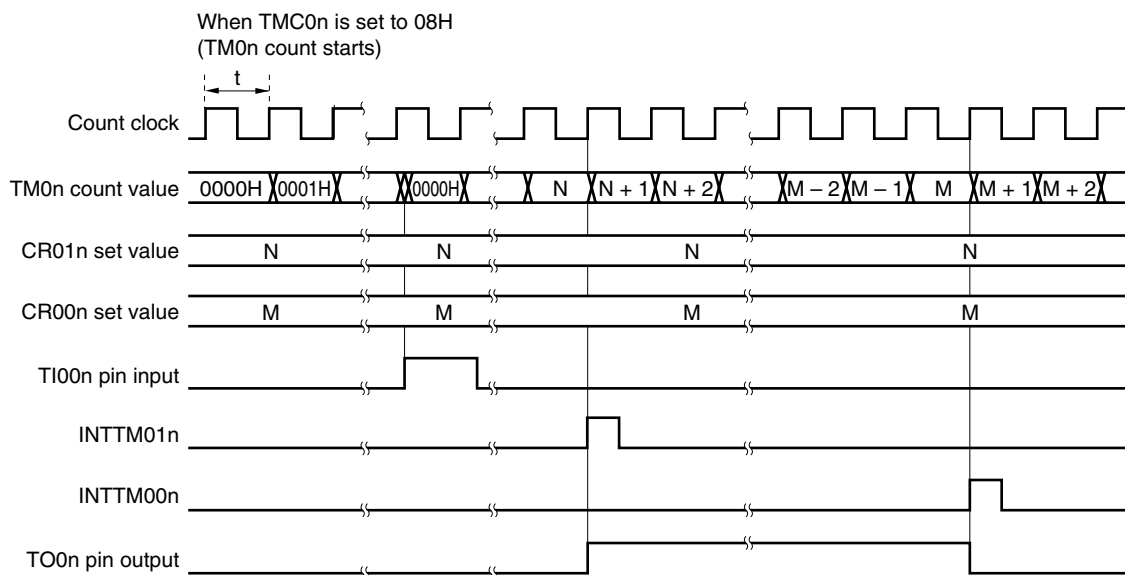

**Figure 7-38. Control Register Settings for One-Shot Pulse Output with External Trigger
(with Rising Edge Specified)**

Caution Do not set the CR00n and CR01n registers to 0000H.

Remark n = 0, 1

Figure 7-39. Timing of One-Shot Pulse Output Operation with External Trigger (with Rising Edge Specified)

Caution 16-bit timer counter 0n starts operating as soon as a value other than 00 (operation stop mode) is set to the TMC0n3 and TMC0n2 bits.

Remark $N < M$
 $n = 0, 1$

7.5 Cautions for 16-Bit Timer/Event Counters 00 and 01

(1) Timer start errors

An error of up to one clock may occur in the time required for a match signal to be generated after timer start. This is because 16-bit timer counter 0n (TM0n) is started asynchronously to the count clock.

Figure 7-40. Start Timing of 16-Bit Timer Counter 0n (TM0n)

(2) 16-bit timer capture/compare register 00n setting

In the mode in which clear & start occurs on a match between TM0n and CR00n, set 16-bit timer capture/compare register 00n (CR00n) to other than 0000H. This means a 1-pulse count operation cannot be performed when 16-bit timer/event counter 0n is used as an external event counter.

(3) Capture register data retention timing

The values of 16-bit timer capture/compare registers 00n and 01n (CR00n and CR01n) are not guaranteed after 16-bit timer/event counter 0n has been stopped.

(4) Valid edge setting

Set the valid edge of the TI00n pin after setting bits 2 and 3 (TMC0n2 and TMC0n3) of 16-bit timer mode control register 0n (TMC0n) to 0, 0, respectively, and then stopping timer operation. The valid edge is set using bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n).

(5) Re-triggering one-shot pulse

(a) One-shot pulse output by software

When a one-shot pulse is output, do not set the OSPT0n bit to 1 again. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.

(b) One-shot pulse output with external trigger

Do not input the external trigger again while a one-shot pulse is output. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.

(c) One-shot pulse output function

When using the one-shot pulse output of 16-bit timer/event counter 0n with a software trigger, do not change the level of the TI00n pin or its alternate function port pin.

Because the external trigger is valid even in this case, the timer is cleared and started even at the level of the TI00n pin or its alternate function port pin, resulting in the output of a pulse at an undesired timing.

Remark n = 0, 1

(6) Operation of OVF0n flag

<1> The OVF0n flag is also set to 1 in the following case.

When any of the following modes is selected: the mode in which clear & start occurs on a match between TM0n and CR00n, the mode in which clear & start occurs at the TIO0n valid edge, or the free-running mode

↓
 CR00n is set to FFFFH
 ↓
 TM0n is counted up from FFFFH to 0000H.

Figure 7-41. Operation Timing of OVF0n Flag

<2> Even if the OVF0n flag is cleared before the next count clock is counted (before TM0n becomes 0001H) after the occurrence of TM0n overflow, the OVF0n flag is re-set newly so this clear is not valid.

(7) Conflicting operations

When a read period of the 16-bit timer capture/compare register (CR00n/CR01n) and a capture trigger input (CR00n/CR01n used as capture register) conflict, the priority is given to the capture trigger input. The data read from CR00n/CR01n is undefined.

Figure 7-42. Capture Register Data Retention Timing

Remark n = 0, 1

(8) Timer operation

- <1> Even if 16-bit timer counter 0n (TM0n) is read, the value is not captured by 16-bit timer capture/compare register 01n (CR01n).
- <2> Regardless of the CPU's operation mode, when the timer stops, the input signals to the TI00n/TI01n pins are not acknowledged.
- <3> The one-shot pulse output mode operates correctly only in the free-running mode and the mode in which clear & start occurs at the TI00n valid edge. In the mode in which clear & start occurs on a match between the TM0n register and CR00n register, one-shot pulse output is not possible because an overflow does not occur.

(9) Capture operation

- <1> If the TI00n pin valid edge is specified as the count clock, a capture operation by the capture register specified as the trigger for the TI00n pin is not possible.
- <2> To ensure the reliability of the capture operation, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 0n (PRM0n).
- <3> The capture operation is performed at the falling edge of the count clock. An interrupt request input (INTTM00n/INTTM01n), however, is generated at the rise of the next count clock.

(10) Compare operation

A capture operation may not be performed for CR00n/CR01n set in compare mode even if a capture trigger has been input.

(11) Edge detection

- <1> If the TI00n or TI01n pin is high level immediately after system reset and the rising edge or both the rising and falling edges are specified as the valid edge of the TI00n or TI01n pin to enable the 16-bit timer counter 0n (TM0n) operation, a rising edge is detected immediately after the operation is enabled. Be careful therefore when pulling up the TI00n or TI01n pin. However, if the TI00n or TI01n pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.
- <2> The sampling clock used to remove noise differs when the TI00n pin valid edge is used as the count clock and when it is used as a capture trigger. In the former case, the count clock is f_x , and in the latter case the count clock is selected by prescaler mode register 0n (PRM0n). The capture operation is started only after a valid edge is detected twice by sampling, thus eliminating noise with a short pulse width.

Remark n = 0, 1

CHAPTER 8 8-BIT TIMER/EVENT COUNTERS 50 AND 51

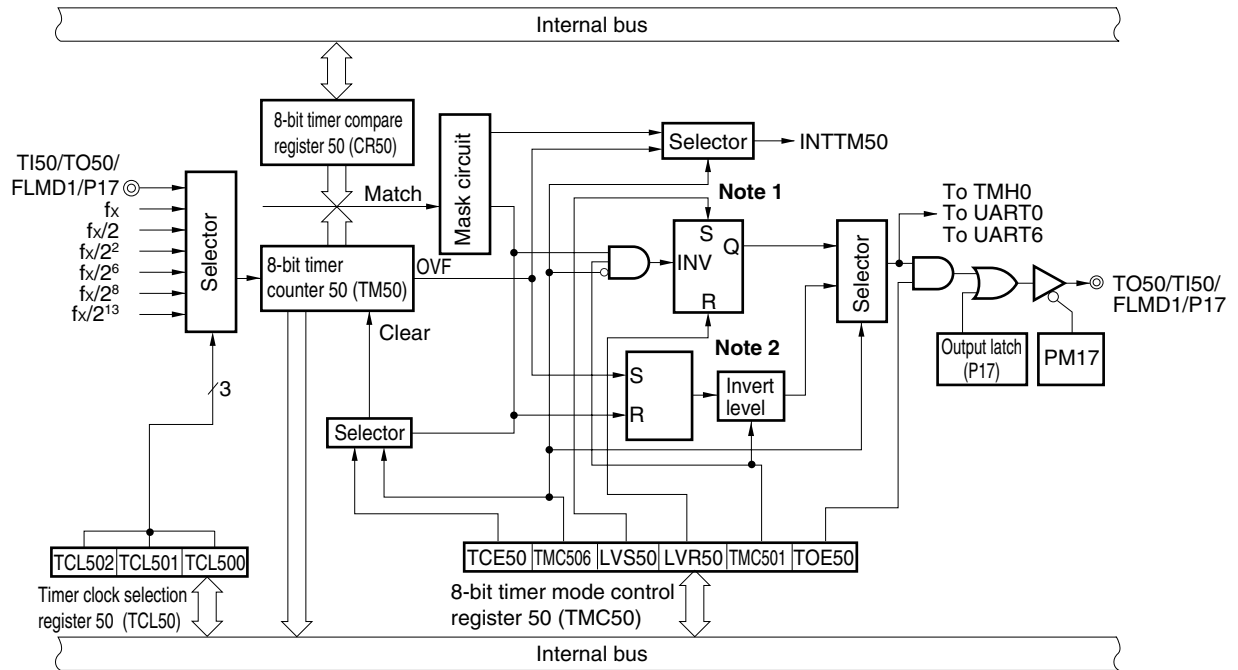

8.1 Functions of 8-Bit Timer/Event Counters 50 and 51

8-bit timer/event counters 50 and 51 have the following functions.

- Interval timer
- External event counter
- Square-wave output
- PWM output

Figures 8-1 and 8-2 show the block diagrams of 8-bit timer/event counters 50 and 51.

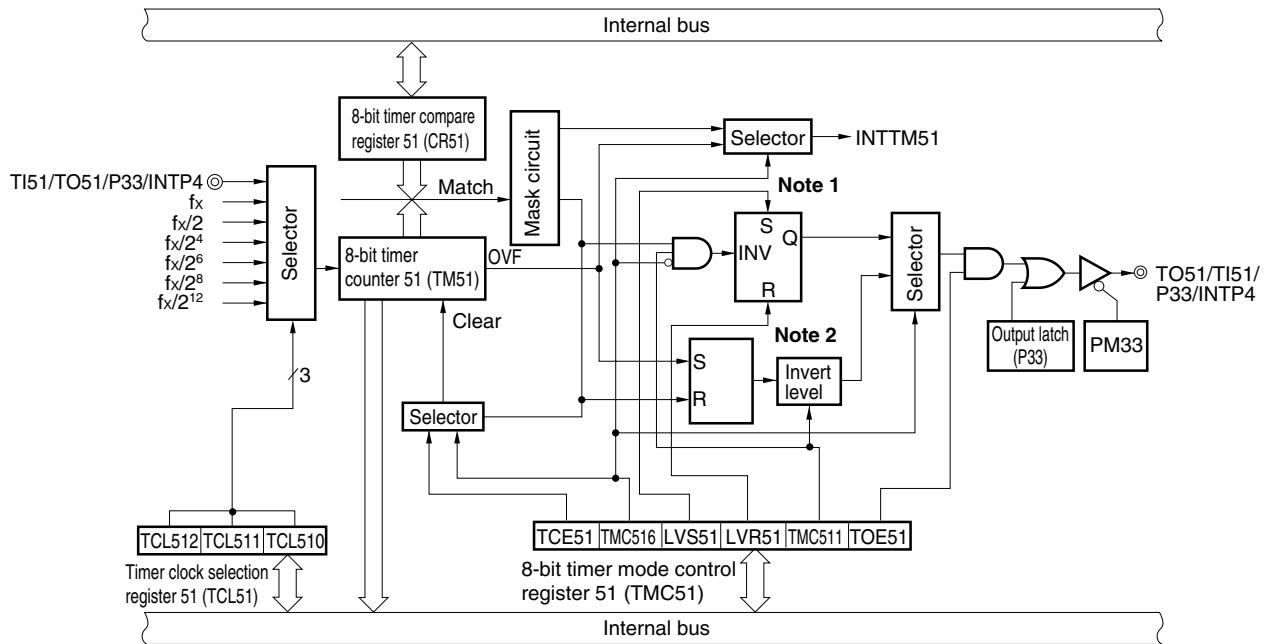

Figure 8-1. Block Diagram of 8-Bit Timer/Event Counter 50

Notes 1. Timer output F/F

2. PWM output F/F

Figure 8-2. Block Diagram of 8-Bit Timer/Event Counter 51

- Notes**
1. Timer output F/F
 2. PWM output F/F

8.2 Configuration of 8-Bit Timer/Event Counters 50 and 51

8-bit timer/event counters 50 and 51 include the following hardware.

Table 8-1. Configuration of 8-Bit Timer/Event Counters 50 and 51

Item	Configuration
Timer register	8-bit timer counter 5n (TM5n)
Register	8-bit timer compare register 5n (CR5n)
Timer input	TI5n
Timer output	TO5n
Control registers	Timer clock selection register 5n (TCL5n) 8-bit timer mode control register 5n (TMC5n) Port mode register 1 (PM1) or port mode register 3 (PM3) Port register 1 (P1) or port register 3 (P3)

(1) 8-bit timer counter 5n (TM5n)

TM5n is an 8-bit register that counts the count pulses and is read-only.

The counter is incremented in synchronization with the rising edge of the count clock.

Figure 8-3. Format of 8-Bit Timer Counter 5n (TM5n)

Address: FF16H (TM50), FF1FH (TM51) After reset: 00H R

In the following situations, the count value is cleared to 00H.

- <1> $\overline{\text{RESET}}$ input
- <2> When TCE5n is cleared
- <3> When TM5n and CR5n match in the mode in which clear & start occurs upon a match of the TM5n and CR5n.

Remark n = 0, 1

(2) 8-bit timer compare register 5n (CR5n)

CR5n can be read and written by an 8-bit memory manipulation instruction.

Except in PWM mode, the value set in CR5n is constantly compared with the 8-bit timer counter 5n (TM5n) count value, and an interrupt request (INTTM5n) is generated if they match.

In PWM mode, when the TO5n pin becomes active due to a TM5n overflow and the values of TM5n and CR5n match, the TO5n pin becomes inactive.

The value of CR5n can be set within 00H to FFH.

$\overline{\text{RESET}}$ input clears CR5n to 00H.

Figure 8-4. Format of 8-Bit Timer Compare Register 5n (CR5n)

- Cautions**
1. In the mode in which clear & start occurs on a match of TM5n and CR5n ($\text{TMC5n6} = 0$), do not write other values to CR5n during operation.
 2. In PWM mode, make the CR5n rewrite interval 3 count clocks of the count clock (clock selected by TCL5n) or more.

Remark n = 0, 1

8.3 Registers Controlling 8-Bit Timer/Event Counters 50 and 51

The following four registers are used to control 8-bit timer/event counters 50 and 51.

- Timer clock selection register 5n (TCL5n)
- 8-bit timer mode control register 5n (TMC5n)
- Port mode register 1 (PM1) or port mode register 3 (PM3)
- Port register 1 (P1) or port register 3 (P3)

(1) Timer clock selection register 5n (TCL5n)

This register sets the count clock of 8-bit timer/event counter 5n and the valid edge of the TI5n pin input.

TCL5n can be set by an 8-bit memory manipulation instruction.

RESET input clears TCL5n to 00H.

Remark n = 0, 1

Figure 8-5. Format of Timer Clock Selection Register 50 (TCL50)

Address: FF6AH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
TCL50	0	0	0	0	0	TCL502	TCL501	TCL500

TCL502	TCL501	TCL500	Count clock selection ^{Note}
0	0	0	TI50 pin falling edge
0	0	1	TI50 pin rising edge
0	1	0	f_x (10 MHz)
0	1	1	$f_x/2$ (5 MHz)
1	0	0	$f_x/2^2$ (2.5 MHz)
1	0	1	$f_x/2^3$ (156.25 kHz)
1	1	0	$f_x/2^3$ (39.06 kHz)
1	1	1	$f_x/2^{13}$ (1.22 kHz)

Note Be sure to set the count clock so that the following condition is satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Count clock ≤ 10 MHz
- $V_{DD} = 3.3$ to 4.0 V: Count clock ≤ 8.38 MHz
- $V_{DD} = 2.7$ to 3.3 V: Count clock ≤ 5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

<R>

Cautions 1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer/event counter 50 is not guaranteed.

2. When rewriting TCL50 to other data, stop the timer operation beforehand.

3. Be sure to clear bits 3 to 7 to 0.

Remarks 1. f_x : High-speed system clock oscillation frequency

2. Figures in parentheses apply to operation at $f_x = 10$ MHz.

Figure 8-6. Format of Timer Clock Selection Register 51 (TCL51)

Address: FF8CH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
TCL51	0	0	0	0	0	TCL512	TCL511	TCL510

TCL512	TCL511	TCL510	Count clock selection ^{Note}
0	0	0	TI51 falling edge
0	0	1	TI51 rising edge
0	1	0	fx (10 MHz)
0	1	1	fx/2 (5 MHz)
1	0	0	fx/2 ⁴ (625 kHz)
1	0	1	fx/2 ⁶ (156.25 kHz)
1	1	0	fx/2 ⁸ (39.06 kHz)
1	1	1	fx/2 ¹² (2.44 kHz)

Note Be sure to set the count clock so that the following condition is satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Count clock ≤ 10 MHz
- $V_{DD} = 3.3$ to 4.0 V: Count clock ≤ 8.38 MHz
- $V_{DD} = 2.7$ to 3.3 V: Count clock ≤ 5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer/event counter 51 is not guaranteed.
 2. When rewriting TCL51 to other data, stop the timer operation beforehand.
 3. Be sure to clear bits 3 to 7 to 0.

- Remarks**
1. fx: High-speed system clock oscillation frequency
 2. Figures in parentheses apply to operation at fx = 10 MHz.

(2) 8-bit timer mode control register 5n (TMC5n)

TMC5n is a register that performs the following five types of settings.

- <1> 8-bit timer counter 5n (TM5n) count operation control
- <2> 8-bit timer counter 5n (TM5n) operating mode selection
- <3> Timer output F/F (flip flop) status setting
- <4> Active level selection in timer F/F control or PWM (free-running) mode.
- <5> Timer output control

TMC5n can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Remark n = 0, 1

1	Inversion operation enabled				Active-low				
TOE51	Timer output control								
0	Output disabled (TM51 output is low level)								
1	Output enabled								

Note Bits 2 and 3 are write-only.

- Cautions**
- The settings of LVS5n and LVR5n are valid in other than PWM mode.
 - Perform <1> to <4> below in the following order, not at the same time.
 - <1> Set TMC5n1, TMC5n6: Operation mode setting
 - <2> Set TOE5n to enable output: Timer output enable
 - <3> Set LVS5n, LVR5n (see Caution 1): Timer F/F setting
 - <4> Set TCE5n
 - Stop operation before rewriting TMC5n6.

- Remarks**
- In PWM mode, PWM output is made inactive by clearing TCE5n to 0.
 - If LVS5n and LVR5n are read, the value is 0.
 - The values of the TMC5n6, LVS5n, LVR5n, TMC5n1, and TOE5n bits are reflected at the TO5n pin regardless of the value of TCE5n.
 - n = 0, 1

(3) Port mode registers 1 and 3 (PM1, PM3)

These registers set port 1 and 3 input/output in 1-bit units.

When using the P17/TO50/TI50/FLMD1 and P33/TO51/TI51/INTP4 pins for timer output, clear PM17 and PM33 and the output latches of P17 and P33 to 0.

When using the P17/TO50/TI50/FLMD1 and P33/TO51/TI51/INTP4 pins for timer input, set PM17 and PM33 to 1. The output latches of P17 and P33 at this time may be 0 or 1.

PM1 and PM3 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets these registers to FFH.

8.4 Operations of 8-Bit Timer/Event Counters 50 and 51

8.4.1 Operation as interval timer

8-bit timer/event counter 5n operates as an interval timer that generates interrupt requests repeatedly at intervals of the count value preset to 8-bit timer compare register 5n (CR5n).

When the count value of 8-bit timer counter 5n (TM5n) matches the value set to CR5n, counting continues with the TM5n value cleared to 0 and an interrupt request signal (INTTM5n) is generated.

The count clock of TM5n can be selected with bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock selection register 5n (TCL5n).

Setting

<1> Set the registers.

- TCL5n: Select the count clock.
- CR5n: Compare value
- TMC5n: Stop the count operation, select the mode in which clear & start occurs on a match of TM5n and CR5n.
(TMC5n = 0000xxx0B x = Don't care)

<2> After TCE5n = 1 is set, the count operation starts.

<3> If the values of TM5n and CR5n match, INTTM5n is generated (TM5n is cleared to 00H).

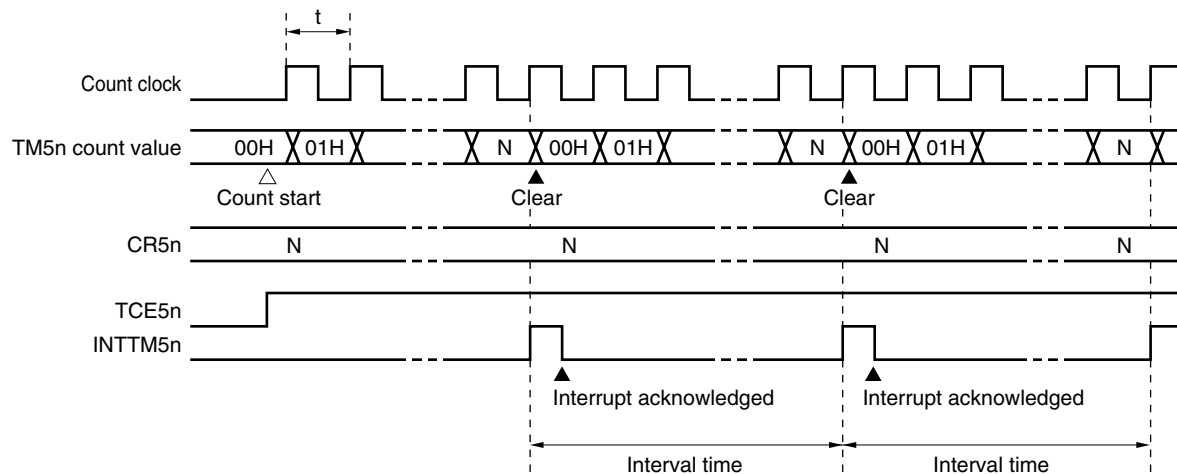

<4> INTTM5n is generated repeatedly at the same interval.

Set TCE5n to 0 to stop the count operation.

Caution Do not write other values to CR5n during operation.

Figure 8-11. Interval Timer Operation Timing (1/2)

(a) Basic operation

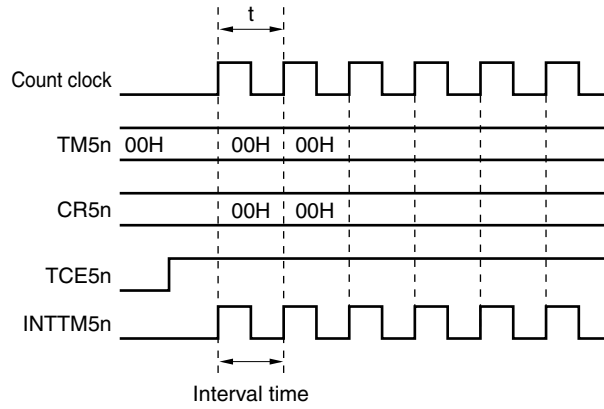

Remark Interval time = $(N + 1) \times t$

N = 01H to FEH

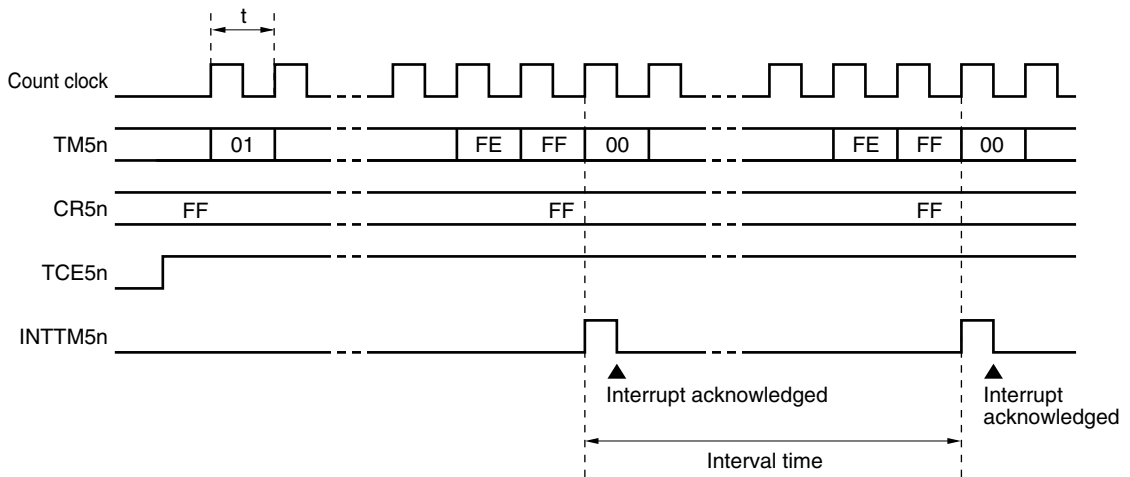

n = 0, 1

Figure 8-11. Interval Timer Operation Timing (2/2)

(b) When CR5n = 00H

(c) When CR5n = FFH

Remark n = 0, 1

8.4.2 Operation as external event counter

The external event counter counts the number of external clock pulses to be input to the TI5n pin by 8-bit timer counter 5n (TM5n).

TM5n is incremented each time the valid edge specified by timer clock selection register 5n (TCL5n) is input. Either the rising or falling edge can be selected.

When the TM5n count value matches the value of 8-bit timer compare register 5n (CR5n), TM5n is cleared to 0 and an interrupt request signal (INTTM5n) is generated.

Whenever the TM5n value matches the value of CR5n, INTTM5n is generated.

Setting

<1> Set each register.

- Set the port mode register (PM17 or PM33)^{Note} to 1.
- TCL5n: Select TI5n pin input edge.
TI5n pin falling edge → TCL5n = 00H
TI5n pin rising edge → TCL5n = 01H
- CR5n: Compare value
- TMC5n: Stop the count operation, select the mode in which clear & start occurs on match of TM5n and CR5n, disable the timer F/F inversion operation, disable timer output.
(TMC5n = 0000××00B × = Don't care)

<2> When TCE5n = 1 is set, the number of pulses input from the TI5n pin is counted.

<3> When the values of TM5n and CR5n match, INTTM5n is generated (TM5n is cleared to 00H).

<4> After these settings, INTTM5n is generated each time the values of TM5n and CR5n match.

Note 8-bit timer/event counter 50: PM17

8-bit timer/event counter 51: PM33

Figure 8-12. External Event Counter Operation Timing (with Rising Edge Specified)

Remark N = 00H to FFH

n = 0, 1

8.4.3 Square-wave output operation

A square wave with any selected frequency is output at intervals determined by the value preset to 8-bit timer compare register 5n (CR5n).

The TO5n pin output status is inverted at intervals determined by the count value preset to CR5n by setting bit 0 (TOE5n) of 8-bit timer mode control register 5n (TMC5n) to 1. This enables a square wave with any selected frequency to be output (duty = 50%).

Setting

<1> Set each register.

- Clear the port output latch (P17 or P33)^{Note} and port mode register (PM17 or PM33)^{Note} to 0.
- TCL5n: Select the count clock.
- CR5n: Compare value
- TMC5n: Stop the count operation, select the mode in which clear & start occurs on a match of TM5n and CR5n.

LVS5n	LVR5n	Timer Output F/F Status Setting
1	0	High-level output
0	1	Low-level output

Timer output F/F inversion enabled

Timer output enabled

(TMC5n = 00001011B or 00000111B)

<2> After TCE5n = 1 is set, the count operation starts.

<3> The timer output F/F is inverted by a match of TM5n and CR5n. After INTTM5n is generated, TM5n is cleared to 00H.

<4> After these settings, the timer output F/F is inverted at the same interval and a square wave is output from TO5n.

The frequency is as follows.

$$\text{Frequency} = 1/2t (N + 1)$$

(N: 00H to FFH)

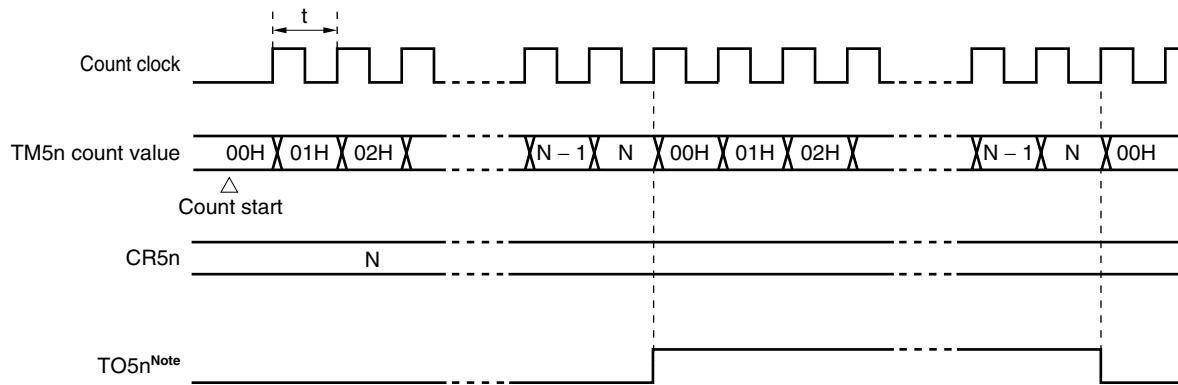

Note 8-bit timer/event counter 50: P17, PM17

8-bit timer/event counter 51: P33, PM33

Caution Do not write other values to CR5n during operation.

Remark n = 0, 1

Figure 8-13. Square-Wave Output Operation Timing

Note The initial value of TO5n output can be set by bits 2 and 3 (LVR5n, LVS5n) of 8-bit timer mode control register 5n (TMC5n).

8.4.4 PWM output operation

8-bit timer/event counter 5n operates as a PWM output when bit 6 (TMC5n6) of 8-bit timer mode control register 5n (TMC5n) is set to 1.

The duty pulse determined by the value set to 8-bit timer compare register 5n (CR5n) is output from TO5n.

Set the active level width of the PWM pulse to CR5n; the active level can be selected with bit 1 (TMC5n1) of TMC5n.

The count clock can be selected with bits 0 to 2 (TCL5n0 to TCL5n2) of timer clock selection register 5n (TCL5n).

PWM output can be enabled/disabled with bit 0 (TOE5n) of TMC5n.

Caution In PWM mode, make the CR5n rewrite interval 3 count clocks of the count clock (clock selected by TCL5n) or more.

Remark n = 0, 1

(1) PWM output basic operation**Setting**

<1> Set each register.

- Clear the port output latch (P17 or P33)^{Note} and port mode register (PM17 or PM33)^{Note} to 0.
- TCL5n: Select the count clock.
- CR5n: Compare value
- TMC5n: Stop the count operation, select PWM mode.

The timer output F/F is not changed.

TMC5n1	Active Level Selection
0	Active-high
1	Active-low

Timer output enabled

(TMC5n = 01000001B or 01000011B)

- <2> The count operation starts when TCE5n = 1.
Clear TCE5n to 0 to stop the count operation.

Note 8-bit timer/event counter 50: P17, PM17
8-bit timer/event counter 51: P33, PM33

PWM output operation

- <1> PWM output (output from TO5n) outputs an inactive level until an overflow occurs.
<2> When an overflow occurs, the active level is output. The active level is output until CR5n matches the count value of 8-bit timer counter 5n (TM5n).
<3> After the CR5n matches the count value, the inactive level is output until an overflow occurs again.
<4> Operations <2> and <3> are repeated until the count operation stops.
<5> When the count operation is stopped with TCE5n = 0, PWM output becomes inactive.

For details of timing, see **Figures 8-14** and **8-15**.

The cycle, active-level width, and duty are as follows.

- Cycle = $2^8 t$
- Active-level width = Nt
- Duty = $N/2^8$

(N = 00H to FFH)

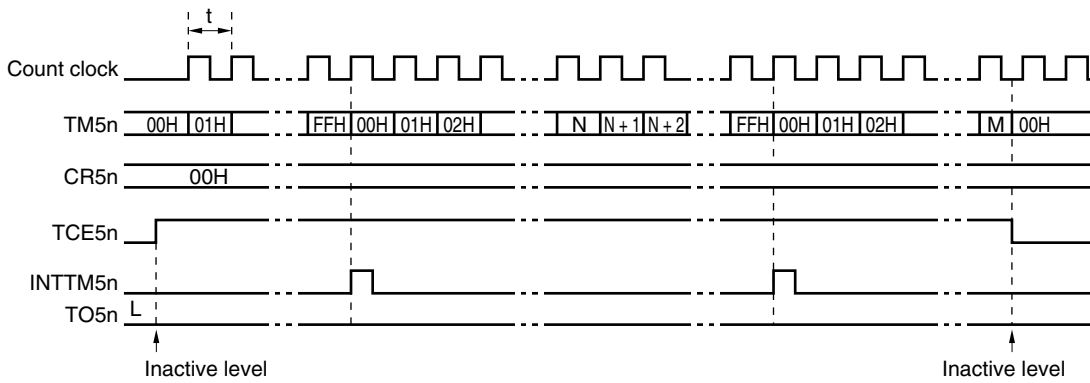

Remark n = 0, 1

Figure 8-14. PWM Output Operation Timing

(a) Basic operation (active level = H)

(b) CR5n = 00H

(c) CR5n = FFH

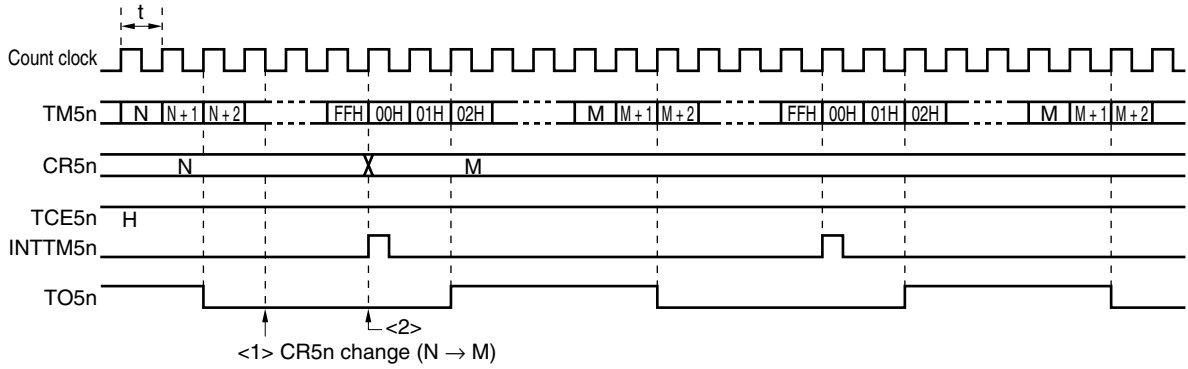

Remarks 1. <1> to <3> and <5> in Figure 8-14 (a) correspond to <1> to <3> and <5> in PWM output operation in **8.4.4 (1) PWM output basic operation.**

2. n = 0, 1

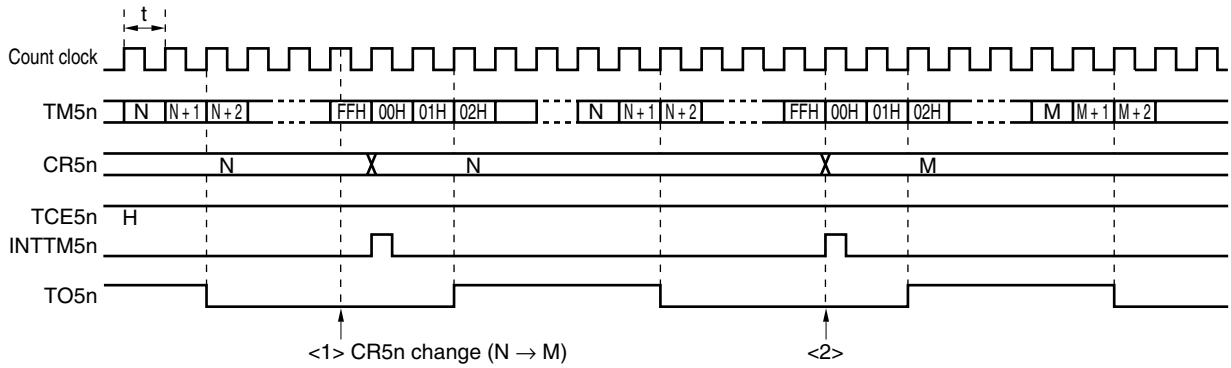

(2) Operation with CR5n changed

Figure 8-15. Timing of Operation with CR5n Changed

- (a) CR5n value is changed from N to M before clock rising edge of FFH
 → Value is transferred to CR5n at overflow immediately after change.

- (b) CR5n value is changed from N to M after clock rising edge of FFH
 → Value is transferred to CR5n at second overflow.

Caution When reading from CR5n between <1> and <2> in Figure 8-15, the value read differs from the actual value (read value: M, actual value of CR5n: N).

8.5 Cautions for 8-Bit Timer/Event Counters 50 and 51

(1) Timer start error

An error of up to one clock may occur in the time required for a match signal to be generated after timer start. This is because 8-bit timer counters 50 and 51 (TM50, TM51) are started asynchronously to the count clock.

Figure 8-16. 8-Bit Timer Counter 5n Start Timing

Remark $n = 0, 1$

CHAPTER 9 8-BIT TIMERS H0 AND H1

9.1 Functions of 8-Bit Timers H0 and H1

8-bit timers H0 and H1 have the following functions.

- Interval timer
- PWM output mode
- Square-wave output
- Carrier generator mode (8-bit timer H1 only)

9.2 Configuration of 8-Bit Timers H0 and H1

8-bit timers H0 and H1 include the following hardware.

Table 9-1. Configuration of 8-Bit Timers H0 and H1

Item	Configuration
Timer register	8-bit timer counter Hn
Registers	8-bit timer H compare register 0n (CMP0n) 8-bit timer H compare register 1n (CMP1n)
Timer output	TOHn
Control registers	8-bit timer H mode register n (TMHMDn) 8-bit timer H carrier control register 1 (TMCYC1) ^{Note} Port mode register 1 (PM1) Port register 1 (P1)

Note 8-bit timer H1 only

Remark n = 0, 1

Figures 9-1 and 9-2 show the block diagrams.

Figure 9-1. Block Diagram of 8-Bit Timer H0

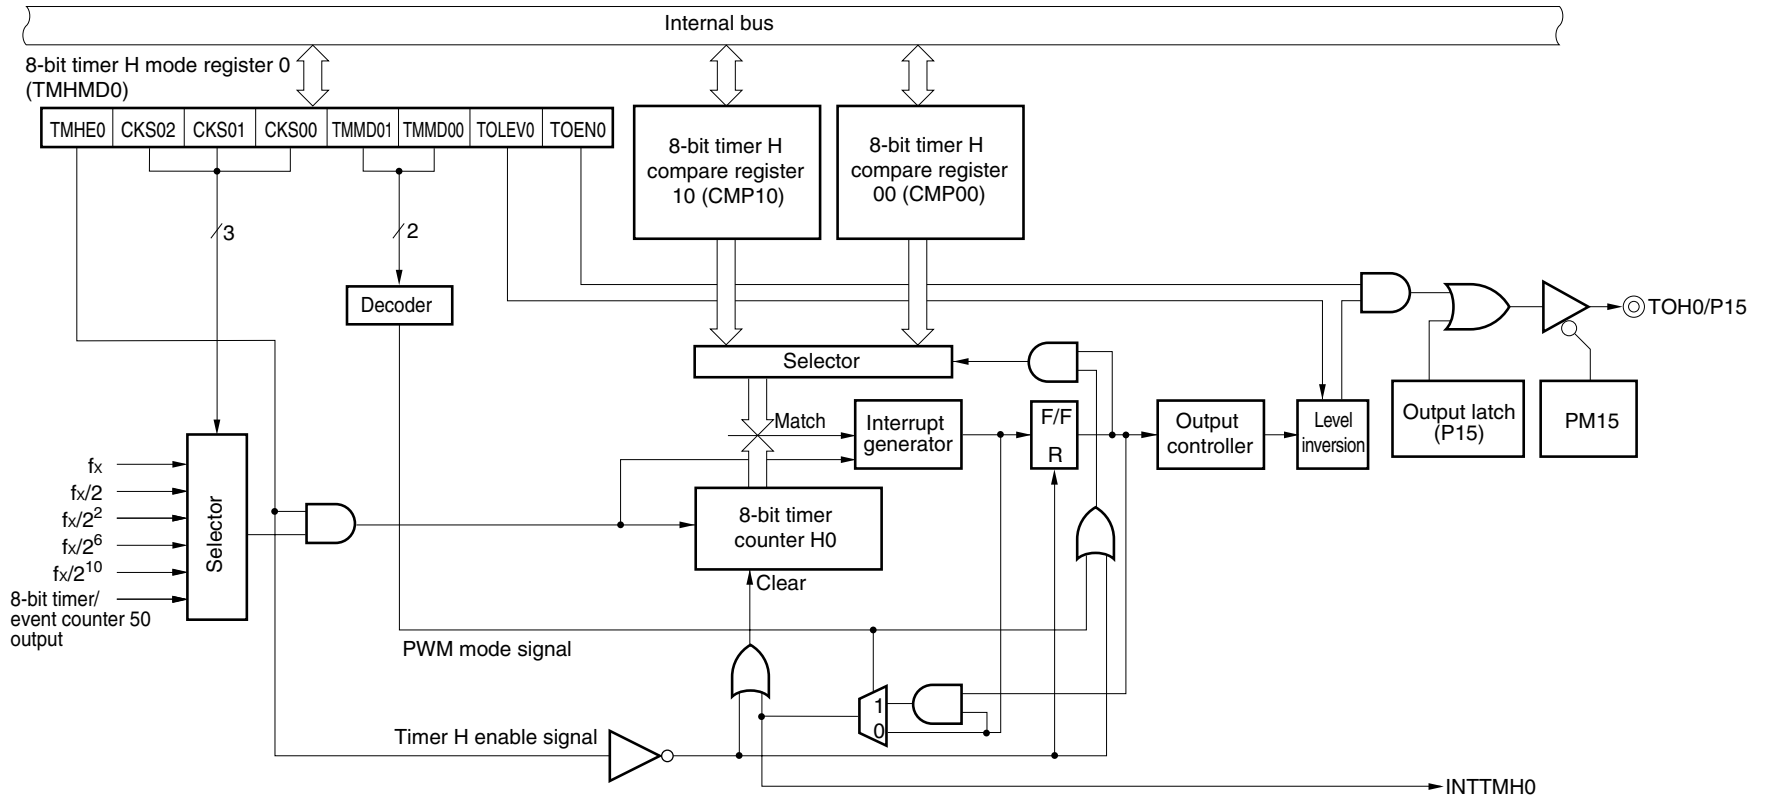

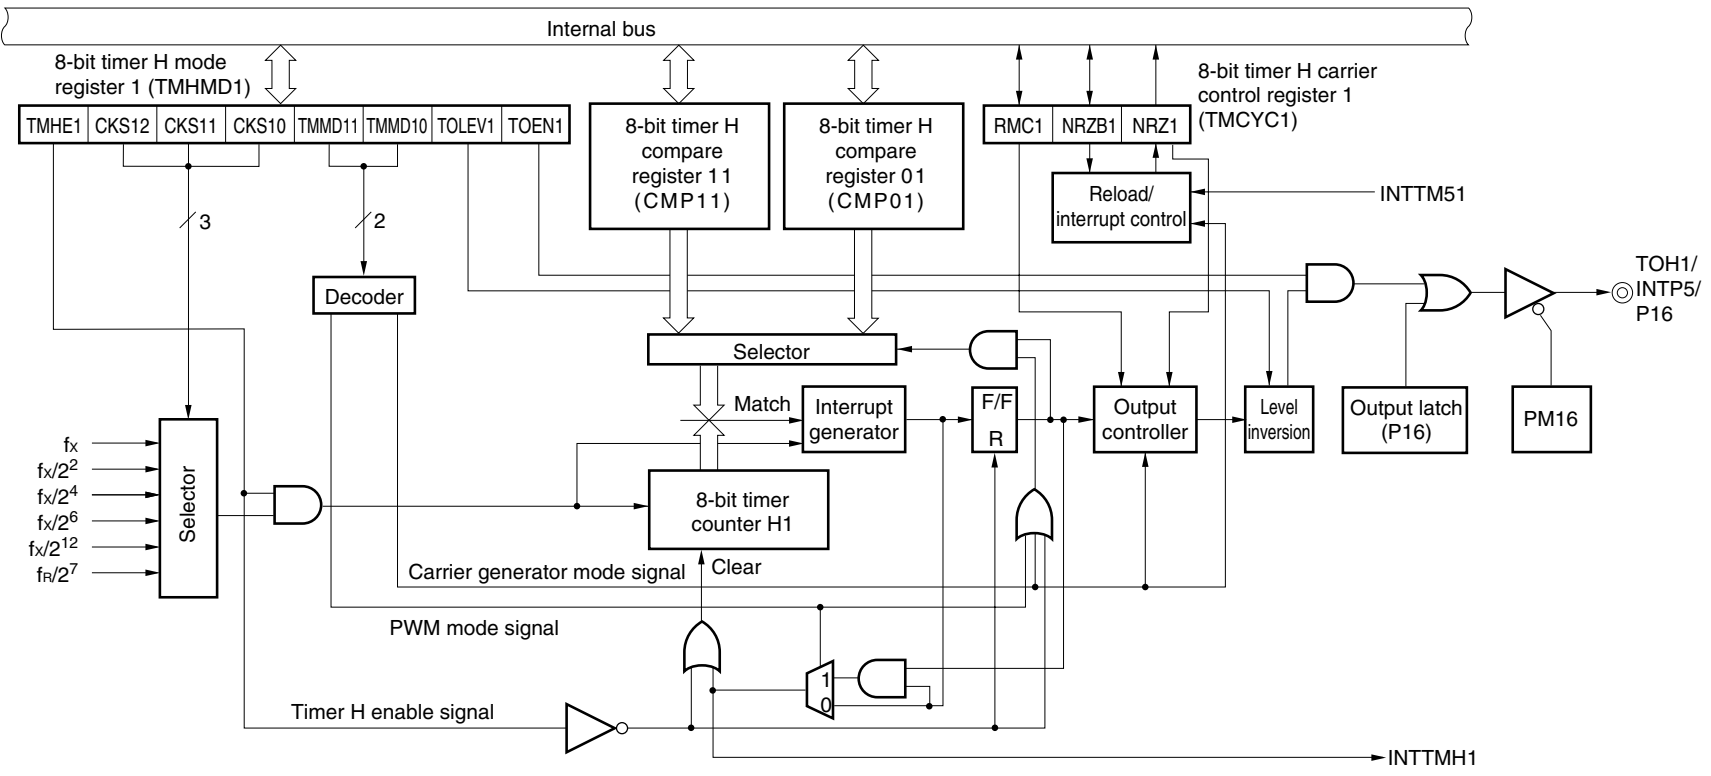

Figure 9-2. Block Diagram of 8-Bit Timer H1

(1) 8-bit timer H compare register 0n (CMP0n)

This register can be read or written by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 9-3. Format of 8-Bit Timer H Compare Register 0n (CMP0n)

Caution CMP0n cannot be rewritten during timer count operation.

(2) 8-bit timer H compare register 1n (CMP1n)

This register can be read or written by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 9-4. Format of 8-Bit Timer H Compare Register 1n (CMP1n)

CMP1n can be rewritten during timer count operation.

An interrupt request signal (INTTMHn) is generated if the timer count values and CMP1n match after setting CMP1n in carrier generator mode. The timer count value is cleared at the same time. If the CMP1n value is rewritten during timer operation, transferring is performed at the timing at which the count value and CMP1n value match. If the transfer timing and writing from CPU to CMP1n conflict, transfer is not performed.

Caution In the PWM output mode and carrier generator mode, be sure to set CMP1n when starting the timer count operation (TMHEn = 1) after the timer count operation was stopped (TMHEn = 0) (be sure to set again even if setting the same value to CMP1n).

Remark n = 0, 1

9.3 Registers Controlling 8-Bit Timers H0 and H1

The following four registers are used to control 8-bit timers H0 and H1.

- 8-bit timer H mode register n (TMHMDn)
- 8-bit timer H carrier control register 1 (TMCYC1)^{Note}
- Port mode register 1 (PM1)
- Port register 1 (P1)

Note 8-bit timer H1 only

(1) 8-bit timer H mode register n (TMHMDn)

This register controls the mode of timer H.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Remark n = 0, 1

Figure 9-5. Format of 8-Bit Timer H Mode Register 0 (TMHMD0)

Address: FF69H After reset: 00H R/W

	<7>	6	5	4	3	2	<1>	<0>

Other than above		Setting prohibited

TOLEV0	Timer output level control (in default mode)
0	Low level
1	High level

TOEN0	Timer output control
0	Disables output
1	Enables output

Notes 1. Be sure to set the count clock so that the following condition is satisfied.

- V_{DD} = 4.0 to 5.5 V: Count clock ≤ 10 MHz
- V_{DD} = 3.3 to 4.0 V: Count clock ≤ 9.38 MHz
- V_{DD} = 2.7 to 3.3 V: Count clock ≤ 5 MHz
- V_{DD} = 2.5 to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

<R>

2. Note the following points when selecting the TM50 output as the count clock.

- PWM mode (TMC506 = 1)
Start the operation of 8-bit timer/event counter 50 first and then set the count clock to make the duty = 50%.
- Mode in which the count clock is cleared and started upon a match of TM50 and CR50 (TMC506 = 0)
Start the operation of 8-bit timer/event counter 50 first and then enable the timer F/F inversion operation (TMC501 = 1).

It is not necessary to enable the TO50 pin as a timer output pin in any mode.

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer H0 is not guaranteed.
 2. When $TMHE0 = 1$, setting the other bits of $TMHMD0$ is prohibited.
 3. In the PWM output mode, be sure to set 8-bit timer H compare register 10 ($CMP10$) when starting the timer count operation ($TMHE0 = 1$) after the timer count operation was stopped ($TMHE0 = 0$) (be sure to set again even if setting the same value to $CMP10$).

- Remarks**
1. f_x : High-speed system clock oscillation frequency
 2. Figures in parentheses apply to operation at $f_x = 10$ MHz
 3. TMC506: Bit 6 of 8-bit timer mode control register 50 (TMC50)
TMC501: Bit 1 of TMC50

Figure 9-6. Format of 8-Bit Timer H Mode Register 1 (TMHMD1)

0	Stops timer count operation (counter is cleared to 0)
1	Enables timer count operation (count operation started by inputting clock)

CKS12	CKS11	CKS10	Count clock (f_{CNT}) selection ^{Note}
0	0	0	f_x (10 MHz)
0	0	1	$f_x/2^2$ (2.5 MHz)
0	1	0	$f_x/2^4$ (625 kHz)
0	1	1	$f_x/2^6$ (156.25 kHz)
1	0	0	$f_x/2^{12}$ (2.44 kHz)
1	0	1	$f_R/2^7$ (1.88 kHz (TYP.))
Other than above			Setting prohibited

TMMD11	TMMD10	Timer operation mode
0	0	Interval timer mode
0	1	Carrier generator mode
1	0	PWM output mode
Other than above		Setting prohibited

TOLEV1	Timer output level control (in default mode)
0	Low level
1	High level

TOEN1	Timer output control
0	Disables output
1	Enables output

Note Be sure to set the count clock so that the following condition is satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Count clock ≤ 10 MHz
- $V_{DD} = 3.3$ to 4.0 V: Count clock ≤ 9.38 MHz
- $V_{DD} = 2.7$ to 3.3 V: Count clock ≤ 5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Count clock ≤ 2.5 MHz (standard products, (A) grade products only)

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer H1 is not guaranteed (except when $CKS12, CKS11, CKS10 = 1, 0, 1 (f_R/2^7)$).
 2. When $TMHE1 = 1$, setting the other bits of $TMHMD1$ is prohibited.
 3. In the PWM output mode and carrier generator mode, be sure to set 8-bit timer H compare register 11 ($CMP11$) when starting the timer count operation ($TMHE1 = 1$) after the timer count operation was stopped ($TMHE1 = 0$) (be sure to set again even if setting the same value to $CMP11$).
 4. When the carrier generator mode is used, set so that the count clock frequency of $TMH1$ becomes more than 6 times the count clock frequency of $TM51$.

- Remarks**
1. f_x : High-speed system clock oscillation frequency
 2. f_R : Internal oscillation clock frequency
 3. Figures in parentheses apply to operation at $f_x = 10$ MHz, $f_R = 240$ kHz (TYP.).

(2) 8-bit timer H carrier control register 1 (TMCYC1)

This register controls the remote control output and carrier pulse output status of 8-bit timer H1. This register can be set by a 1-bit or 8-bit memory manipulation instruction. \overline{RESET} input clears this register to 00H.

Figure 9-7. Format of 8-Bit Timer H Carrier Control Register 1 (TMCYC1)

Address: FF6DH After reset: 00H R/W^{Note}

	7	6	5	4	3	2	1	<0>
TMCYC1	0	0	0	0	0	RMC1	NRZB1	NRZ1

RMC1	NRZB1	Remote control output
0	0	Low-level output
0	1	High-level output
1	0	Low-level output
1	1	Carrier pulse output

NRZ1	Carrier pulse output status flag
0	Carrier output disabled status (low-level status)
1	Carrier output enabled status (RMC1 = 1: Carrier pulse output, RMC1 = 0: High-level status)

Note Bit 0 is read-only.

(3) Port mode register 1 (PM1)

This register sets port 1 input/output in 1-bit units.

When using the P15/TOH0 and P16/TOH1/INTP5 pins for timer output, clear PM15 and PM16 and the output latches of P15 and P16 to 0.

PM1 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Figure 9-8. Format of Port Mode Register 1 (PM1)

Address: FF21H After reset: FFH R/W

0	Output mode (output buffer on)
1	Input mode (output buffer off)

9.4 Operation of 8-Bit Timers H0 and H1

9.4.1 Operation as interval timer/square-wave output

When 8-bit timer counter Hn and compare register 0n (CMP0n) match, an interrupt request signal (INTTMHn) is generated and 8-bit timer counter Hn is cleared to 00H.

Compare register 1n (CMP1n) is not used in interval timer mode. Since a match of 8-bit timer counter Hn and the CMP1n register is not detected even if the CMP1n register is set, timer output is not affected.

By setting bit 0 (TOENn) of timer H mode register n (TMHMDn) to 1, a square wave of any frequency (duty = 50%) is output from TOHn.

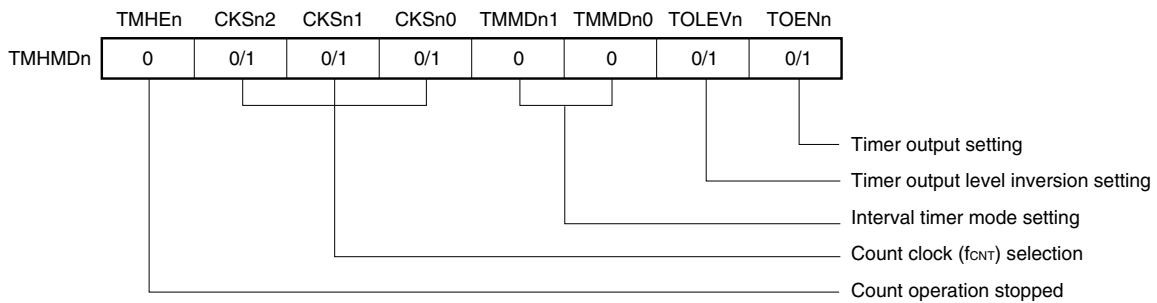

(1) Usage

Generates the INTTMHn signal repeatedly at the same interval.

<1> Set each register.

Figure 9-9. Register Setting During Interval Timer/Square-Wave Output Operation

(i) Setting timer H mode register n (TMHMDn)

(ii) CMP0n register setting

- Compare value (N)

<2> Count operation starts when TMHEn = 1.

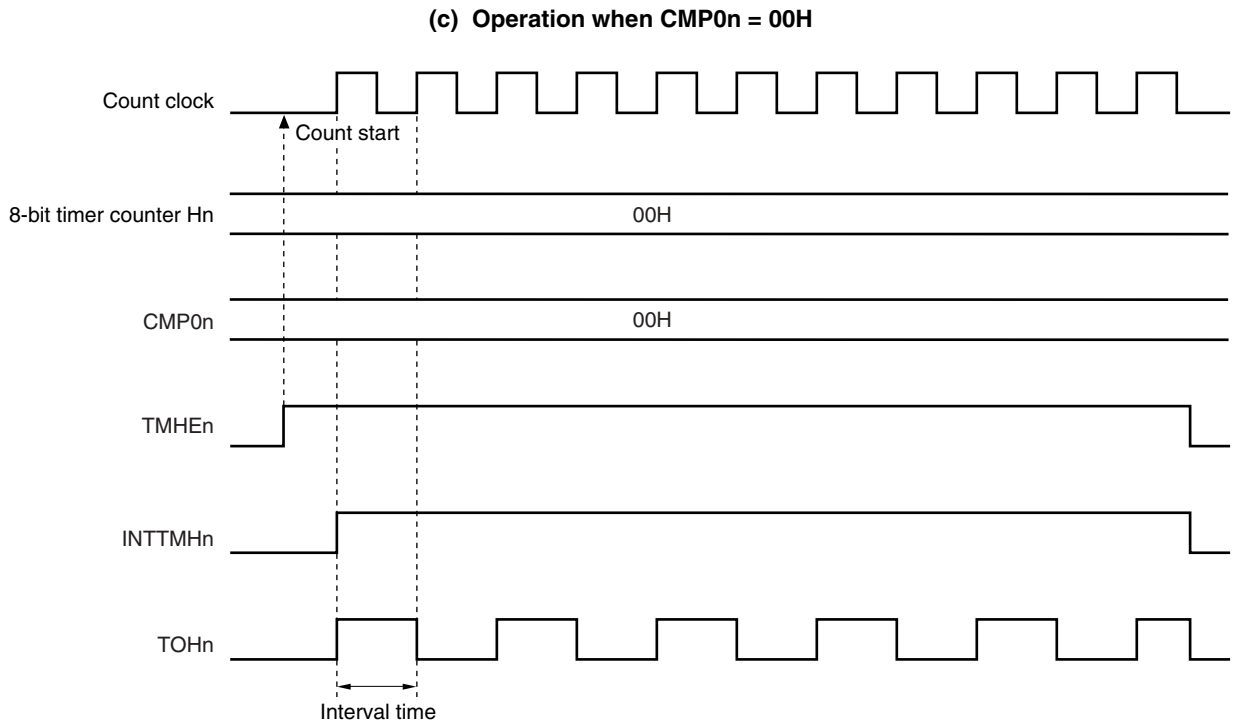

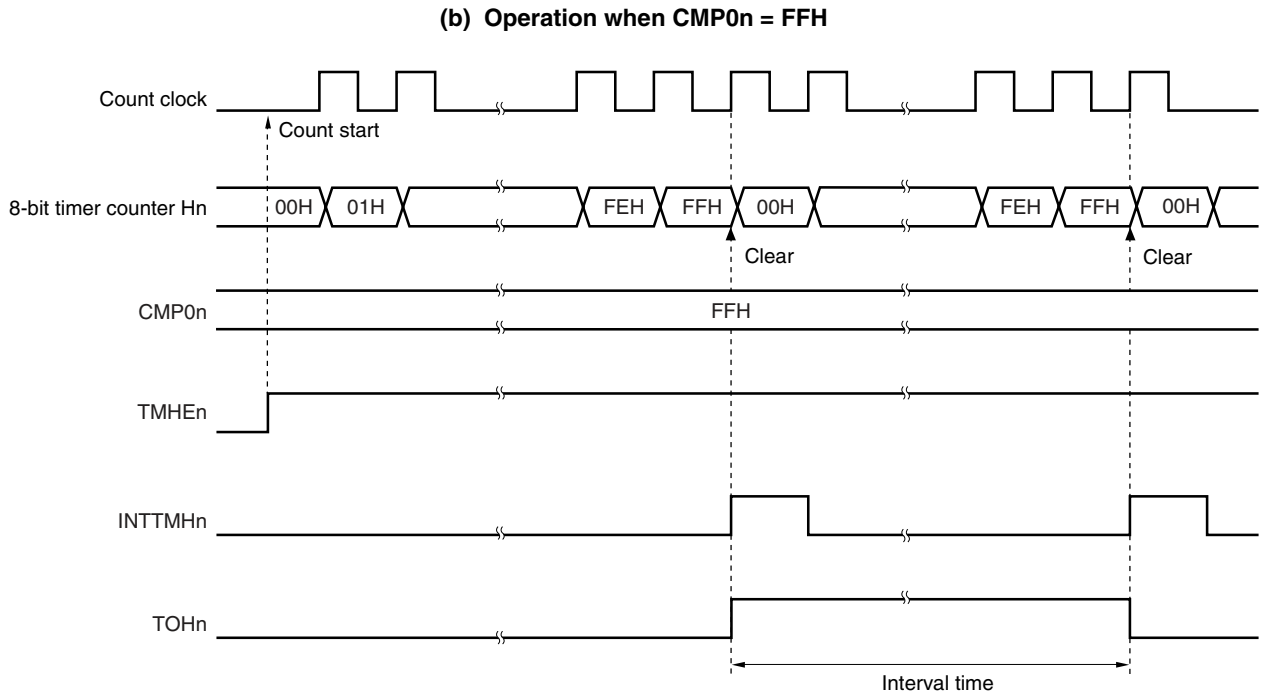

<3> When the values of 8-bit timer counter Hn and the CMP0n register match, the INTTMHn signal is generated and 8-bit timer counter Hn is cleared to 00H.

$$\text{Interval time} = (N + 1)/f_{\text{CNT}}$$

<4> Subsequently, the INTTMHn signal is generated at the same interval. To stop the count operation, clear TMHEn to 0.

Remark n = 0, 1

Figure 9-10. Timing of Interval Timer/Square-Wave Output Operation (2/2)

Remark n = 0, 1

9.4.2 Operation as PWM output mode

In PWM output mode, a pulse with an arbitrary duty and arbitrary cycle can be output.

8-bit timer compare register 0n (CMP0n) controls the cycle of timer output (TOHn). Rewriting the CMP0n register during timer operation is prohibited.

8-bit timer compare register 1n (CMP1n) controls the duty of timer output (TOHn). Rewriting the CMP1n register during timer operation is possible.

The operation in PWM output mode is as follows.

TOHn output becomes active and 8-bit timer counter Hn is cleared to 0 when 8-bit timer counter Hn and the CMP0n register match after the timer count is started. TOHn output becomes inactive when 8-bit timer counter Hn and the CMP1n register match.

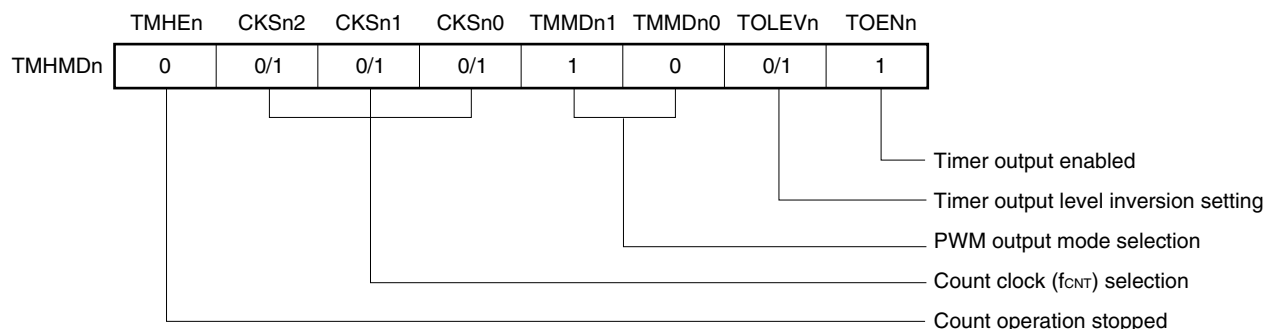

(1) Usage

In PWM output mode, a pulse for which an arbitrary duty and arbitrary cycle can be set is output.

<1> Set each register.

Figure 9-11. Register Setting in PWM Output Mode

(i) Setting timer H mode register n (TMHMDn)

(ii) Setting CMP0n register

- Compare value (N): Cycle setting

(iii) Setting CMP1n register

- Compare value (M): Duty setting

Remarks 1. n = 0, 1

2. 00H ≤ CMP1n (M) < CMP0n (N) ≤ FFH

- <2> The count operation starts when $TMHE_n = 1$.
- <3> The $CMP0_n$ register is the compare register that is to be compared first after the count operation is enabled. When the values of 8-bit timer counter H_n and the $CMP0_n$ register match, 8-bit timer counter H_n is cleared, an interrupt request signal ($INTTMH_n$) is generated, and TOH_n output becomes active. At the same time, the compare register to be compared with 8-bit timer counter H_n is changed from the $CMP0_n$ register to the $CMP1_n$ register.
- <4> When 8-bit timer counter H_n and the $CMP1_n$ register match, TOH_n output becomes inactive and the compare register to be compared with 8-bit timer counter H_n is changed from the $CMP1_n$ register to the $CMP0_n$ register. At this time, 8-bit timer counter H_n is not cleared and the $INTTMH_n$ signal is not generated.
- <5> By performing procedures <3> and <4> repeatedly, a pulse with an arbitrary duty can be obtained.
- <6> To stop the count operation, set $TMHE_n = 0$.

If the setting value of the $CMP0_n$ register is N , the setting value of the $CMP1_n$ register is M , and the count clock frequency is f_{CNT} , the PWM pulse output cycle and duty are as follows.

$$\begin{aligned} \text{PWM pulse output cycle} &= (N + 1)/f_{CNT} \\ \text{Duty} = \text{Active width} : \text{Total width of PWM} &= (M + 1) : (N + 1) \end{aligned}$$

- Cautions**
1. In PWM output mode, three operation clocks (signal selected using the $CKSn_2$ to $CKSn_0$ bits of the $TMHMD_n$ register) are required to transfer the $CMP1_n$ register value after rewriting the register.
 2. Be sure to set the $CMP1_n$ register when starting the timer count operation ($TMHE_n = 1$) after the timer count operation was stopped ($TMHE_n = 0$) (be sure to set again even if setting the same value to the $CMP1_n$ register).

Remark $n = 0, 1$

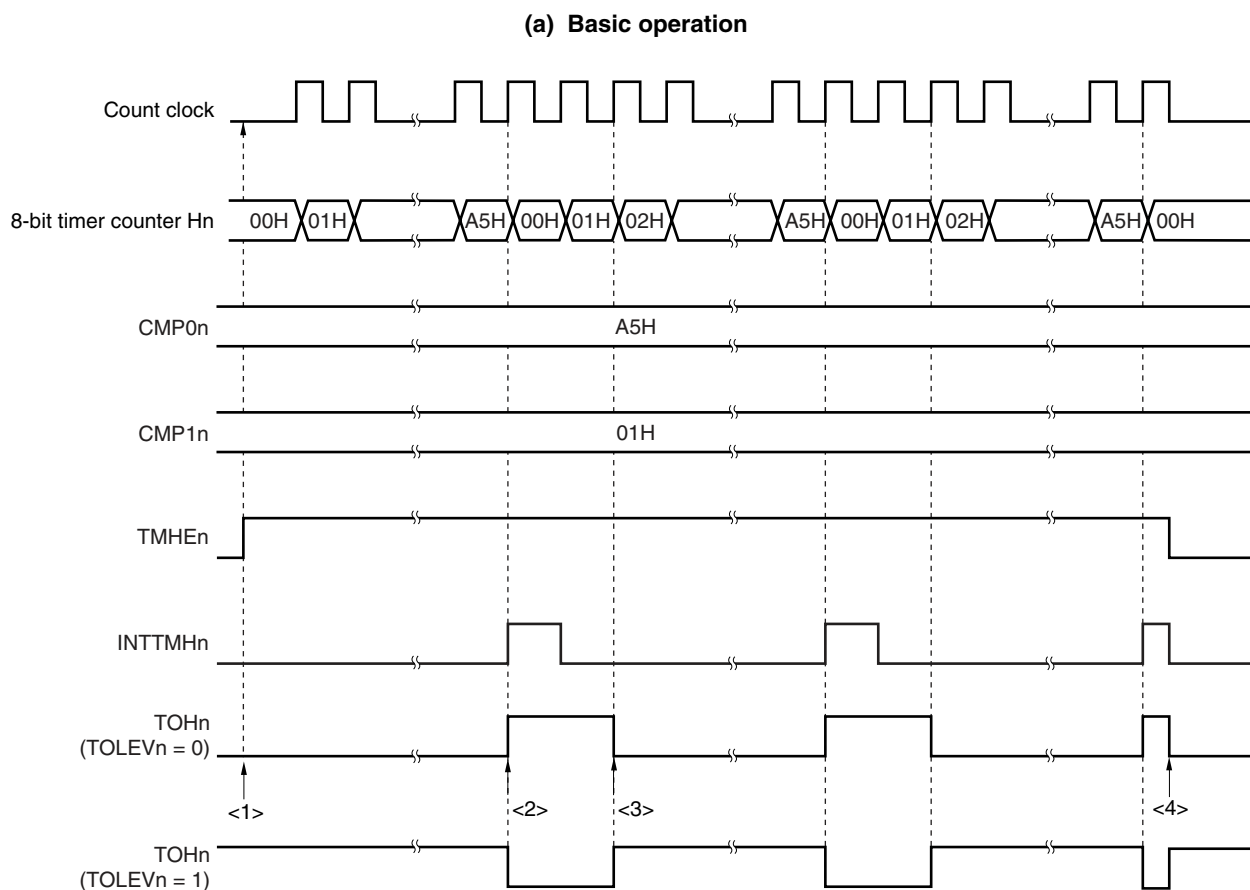

(2) Timing chart

The operation timing in PWM output mode is shown below.

Caution Make sure that the CMP1n register setting value (M) and CMP0n register setting value (N) are within the following range.

$$00H \leq \text{CMP1n (M)} < \text{CMP0n (N)} \leq \text{FFH}$$

Figure 9-12. Operation Timing in PWM Output Mode (1/4)

- <1> The count operation is enabled by setting the TMHEn bit to 1. Start 8-bit timer counter Hn by masking one count clock to count up. At this time, TOHn output remains inactive (when TOLEVn = 0).
- <2> When the values of 8-bit timer counter Hn and the CMP0n register match, the TOHn output level is inverted, the value of 8-bit timer counter Hn is cleared, and the INTTMHn signal is output.
- <3> When the values of 8-bit timer counter Hn and the CMP1n register match, the level of the TOHn output is returned. At this time, the 8-bit timer counter value is not cleared and the INTTMHn signal is not output.
- <4> Clearing the TMHEn bit to 0 during timer Hn operation makes the INTTMHn signal and TOHn output inactive.

Remark n = 0, 1

Figure 9-12. Operation Timing in PWM Output Mode (2/4)

(b) Operation when $CMP0n = FFH$, $CMP1n = 00H$

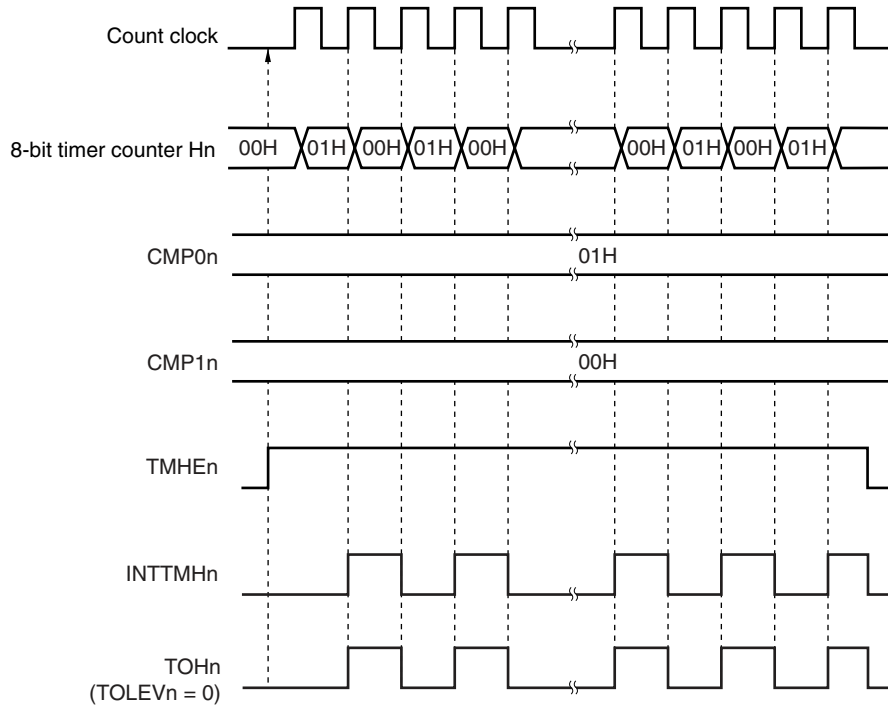

(c) Operation when $CMP0n = FFH$, $CMP1n = FEH$

Remark n = 0, 1

Figure 9-12. Operation Timing in PWM Output Mode (3/4)

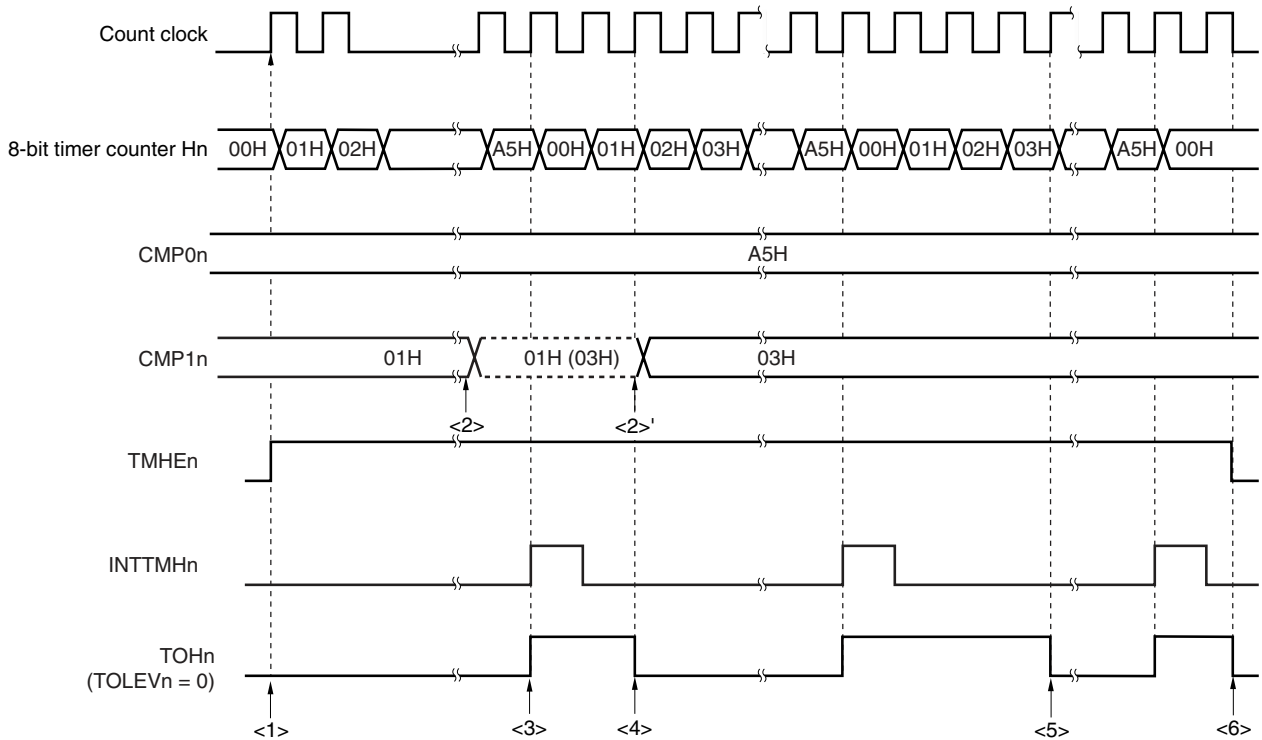

(d) Operation when $CMP0n = 01H$, $CMP1n = 00H$

Remark n = 0, 1

Figure 9-12. Operation Timing in PWM Output Mode (4/4)

(e) Operation by changing CMP1n (CMP1n = 01H → 03H, CMP0n = A5H)

- <1> The count operation is enabled by setting TMHEn = 1. Start 8-bit timer counter Hn by masking one count clock to count up. At this time, the TOHn output remains inactive (when TOLEVn = 0).
- <2> The CMP1n register value can be changed during timer counter operation. This operation is asynchronous to the count clock.
- <3> When the values of 8-bit timer counter Hn and the CMP0n register match, the value of 8-bit timer counter Hn is cleared, the TOHn output becomes active, and the INTTMHn signal is output.
- <4> If the CMP1n register value is changed, the value is latched and not transferred to the register. When the values of 8-bit timer counter Hn and the CMP1n register before the change match, the value is transferred to the CMP1n register and the CMP1n register value is changed (<2>'). However, three count clocks or more are required from when the CMP1n register value is changed to when the value is transferred to the register. If a match signal is generated within three count clocks, the changed value cannot be transferred to the register.
- <5> When the values of 8-bit timer counter Hn and the CMP1n register after the change match, the TOHn output becomes inactive. 8-bit timer counter Hn is not cleared and the INTTMHn signal is not generated.
- <6> Clearing the TMHEn bit to 0 during timer Hn operation makes the INTTMHn signal and TOHn output inactive.

Remark n = 0, 1

9.4.3 Carrier generator mode operation (8-bit timer H1 only)

The carrier clock generated by 8-bit timer H1 is output in the cycle set by 8-bit timer/event counter 51.

In carrier generator mode, the output of the 8-bit timer H1 carrier pulse is controlled by 8-bit timer/event counter 51, and the carrier pulse is output from the TOH1 output.

(1) Carrier generation

In carrier generator mode, 8-bit timer H compare register 01 (CMP01) generates a low-level width carrier pulse waveform and 8-bit timer H compare register 11 (CMP11) generates a high-level width carrier pulse waveform.

Rewriting the CMP11 register during 8-bit timer H1 operation is possible but rewriting the CMP01 register is prohibited.

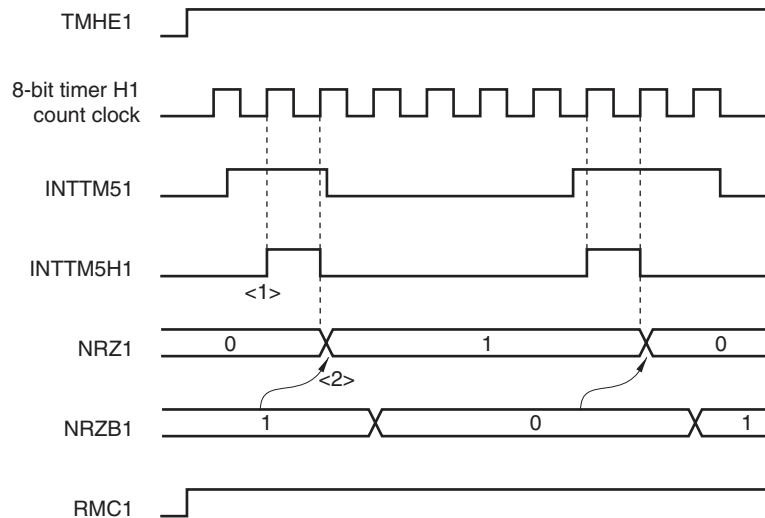

(2) Carrier output control

Carrier output is controlled by the interrupt request signal (INTTM51) of 8-bit timer/event counter 51 and the NRZB1 and RMC1 bits of the 8-bit timer H carrier control register (TMCYC1). The relationship between the outputs is shown below.

RMC1 Bit	NRZB1 Bit	Output
0	0	Low-level output
0	1	High-level output
1	0	Low-level output
1	1	Carrier pulse output

To control the carrier pulse output during a count operation, the NRZ1 and NRZB1 bits of the TMCYC1 register have a master and slave bit configuration. The NRZ1 bit is read-only but the NRZB1 bit can be read and written. The INTTM51 signal is synchronized with the 8-bit timer H1 count clock and output as the INTTM5H1 signal. The INTTM5H1 signal becomes the data transfer signal of the NRZ1 bit, and the NRZB1 bit value is transferred to the NRZ1 bit. The timing for transfer from the NRZB1 bit to the NRZ1 bit is as shown below.

Figure 9-13. Transfer Timing

- <1> The INTTM51 signal is synchronized with the count clock of 8-bit timer H1 and is output as the INTTM5H1 signal.
- <2> The value of the NRZB1 bit is transferred to the NRZ1 bit at the second clock from the rising edge of the INTTM5H1 signal.

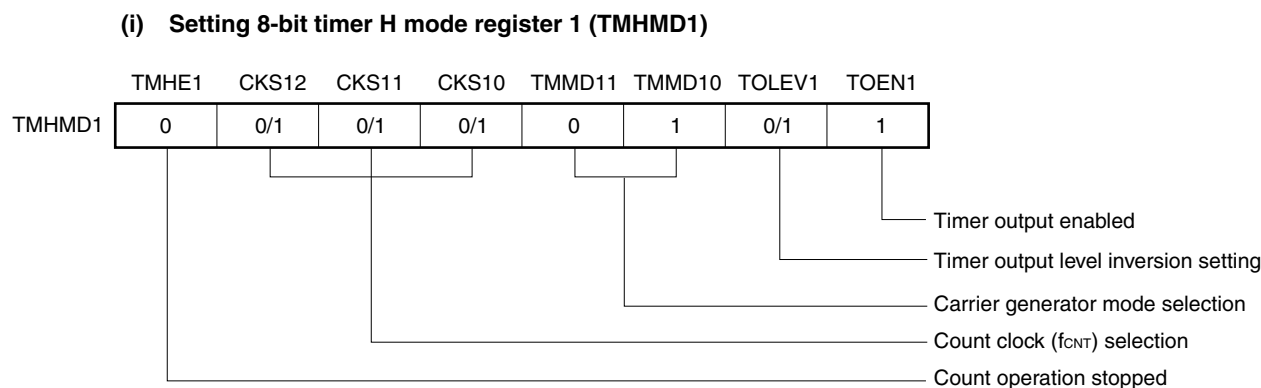

- Cautions**
1. Do not rewrite the NRZB1 bit again until at least the second clock after it has been rewritten, or else the transfer from the NRZB1 bit to the NRZ1 bit is not guaranteed.
 2. When 8-bit timer/event counter 51 is used in the carrier generator mode, an interrupt is generated at the timing of <1>. When 8-bit timer/event counter 51 is used in a mode other than the carrier generator mode, the timing of the interrupt generation differs.

(3) Usage

Outputs an arbitrary carrier clock from the TOH1 pin.

<1> Set each register.

Figure 9-14. Register Setting in Carrier Generator Mode

**(ii) CMP01 register setting**

- Compare value

(iii) CMP11 register setting

- Compare value

(iv) TMCYC1 register setting

- RMC1 = 1 ... Remote control output enable bit
- NRZB1 = 0/1 ... carrier output enable bit

(v) TCL51 and TMC51 register setting

- See 8.3 Registers Controlling 8-Bit Timer/Event Counters 50 and 51.

<2> When TMHE1 = 1, 8-bit timer H1 starts counting.

<3> When TCE51 of 8-bit timer mode control register 51 (TMC51) is set to 1, 8-bit timer/event counter 51 starts counting.

<4> After the count operation is enabled, the first compare register to be compared is the CMP01 register. When the count value of 8-bit timer counter H1 and the CMP01 register value match, the INTTMH1 signal is generated, 8-bit timer counter H1 is cleared, and at the same time, the compare register to be compared with 8-bit timer counter H1 is switched from the CMP01 register to the CMP11 register.

<5> When the count value of 8-bit timer counter H1 and the CMP11 register value match, the INTTMH1 signal is generated, 8-bit timer counter H1 is cleared, and at the same time, the compare register to be compared with 8-bit timer counter H1 is switched from the CMP11 register to the CMP01 register.

<6> By performing procedures <4> and <5> repeatedly, a carrier clock is generated.

<7> The INTTM51 signal is synchronized with count clock of 8-bit timer H1 and output as the INTTM5H1 signal. The INTTM5H1 signal becomes the data transfer signal for the NRZB1 bit, and the NRZB1 bit value is transferred to the NRZ1 bit.

<8> When the NRZ1 bit is high level, a carrier clock is output from the TOH1 pin.

<9> By performing the procedures above, an arbitrary carrier clock is obtained. To stop the count operation, clear TMHE1 to 0.

If the setting value of the CMP01 register is N, the setting value of the CMP11 register is M, and the count clock frequency is f_{CNT} , the carrier clock output cycle and duty are as follows.

$\text{Carrier clock output cycle} = (N + M + 2)/f_{CNT}$ $\text{Duty} = \text{High-level width} : \text{Carrier clock output width} = (M + 1) : (N + M + 2)$

- Cautions**
1. Be sure to set the CMP11 register when starting the timer count operation (TMHE1 = 1) after the timer count operation was stopped (TMHE1 = 0) (be sure to set again even if setting the same value to the CMP11 register).
 2. Set so that the count clock frequency of TMH1 becomes more than 6 times the count clock frequency of TM51.

(4) Timing chart

The carrier output control timing is shown below.

- Cautions**
1. Set the values of the CMP01 and CMP11 registers in a range of 01H to FFH.
 2. In the carrier generator mode, three operating clocks (signal selected by CKS12 to CKS10 bits of TMHMD1 register) or more are required from when the CMP11 register value is changed to when the value is transferred to the register.
 3. Be sure to set the RMC1 bit before the count operation is started.

Figure 9-15. Carrier Generator Mode Operation Timing (1/3)

- <1> When $TMHE1 = 0$ and $TCE51 = 0$, 8-bit timer counter H1 operation is stopped.
- <2> When $TMHE1 = 1$ is set, 8-bit timer counter H1 starts a count operation. At that time, the carrier clock is held at the inactive level.
- <3> When the count value of 8-bit timer counter H1 matches the CMP01 register value, the first INTTMH1 signal is generated, the carrier clock signal is inverted, and the compare register to be compared with 8-bit timer counter H1 is switched from the CMP01 register to the CMP11 register. 8-bit timer counter H1 is cleared to 00H.
- <4> When the count value of 8-bit timer counter H1 matches the CMP11 register value, the INTTMH1 signal is generated, the carrier clock signal is inverted, and the compare register to be compared with 8-bit timer counter H1 is switched from the CMP11 register to the CMP01 register. 8-bit timer counter H1 is cleared to 00H. By performing procedures <3> and <4> repeatedly, a carrier clock with duty fixed to 50% is generated.
- <5> When the INTTM51 signal is generated, it is synchronized with 8-bit timer H1 count clock and output as the INTTM5H1 signal.
- <6> The INTTM5H1 signal becomes the data transfer signal for the NRZB1 bit, and the NRZB1 bit value is transferred to the NRZ1 bit.
- <7> When $NRZ1 = 0$ is set, the TOH1 output becomes low level.

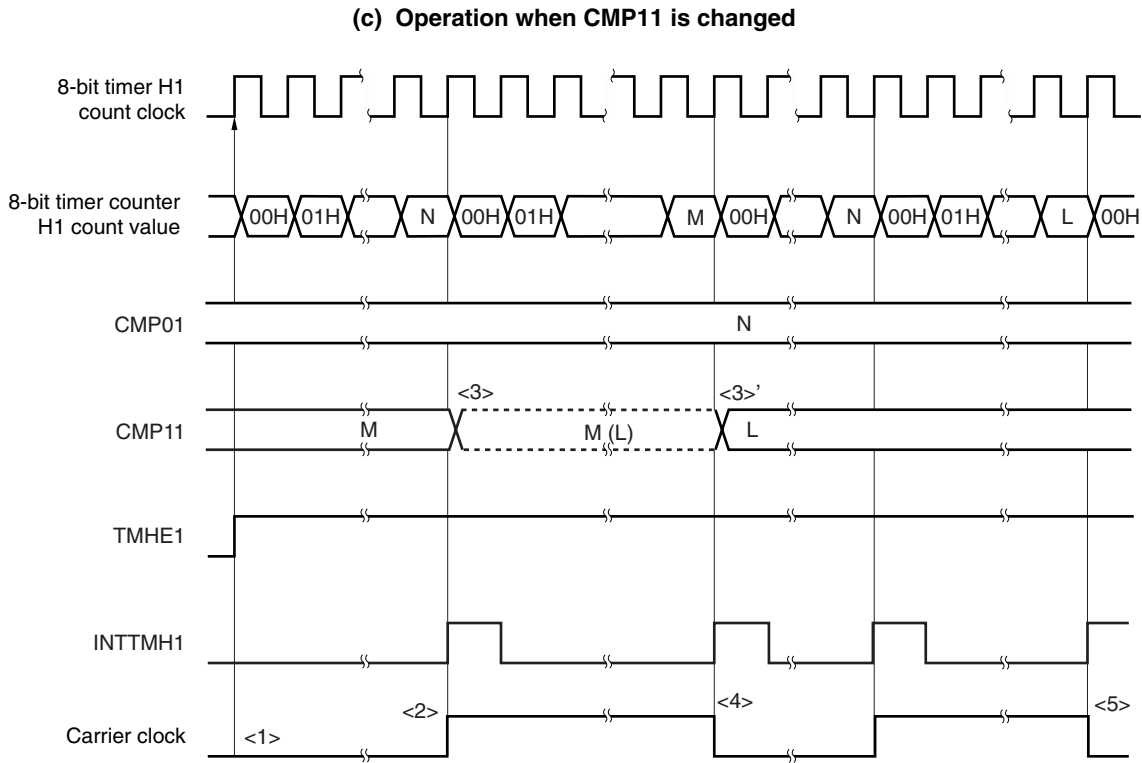

Figure 9-15. Carrier Generator Mode Operation Timing (2/3)

(b) Operation when CMP01 = N, CMP11 = M

- <1> When $TMHE1 = 0$ and $TCE51 = 0$, 8-bit timer counter H1 operation is stopped.
- <2> When $TMHE1 = 1$ is set, 8-bit timer counter H1 starts a count operation. At that time, the carrier clock is held at the inactive level.
- <3> When the count value of 8-bit timer counter H1 matches the CMP01 register value, the first INTTMH1 signal is generated, the carrier clock signal is inverted, and the compare register to be compared with 8-bit timer counter H1 is switched from the CMP01 register to the CMP11 register. 8-bit timer counter H1 is cleared to 00H.
- <4> When the count value of 8-bit timer counter H1 matches the CMP11 register value, the INTTMH1 signal is generated, the carrier clock signal is inverted, and the compare register to be compared with 8-bit timer counter H1 is switched from the CMP11 register to the CMP01 register. 8-bit timer counter H1 is cleared to 00H. By performing procedures <3> and <4> repeatedly, a carrier clock with duty fixed to other than 50% is generated.
- <5> When the INTTM51 signal is generated, it is synchronized with 8-bit timer H1 count clock and output as the INTTM5H1 signal.
- <6> A carrier signal is output at the first rising edge of the carrier clock if NRZ1 is set to 1.
- <7> When NRZ1 = 0, the TOH1 output is held at the high level and is not changed to low level while the carrier clock is high level (from <6> and <7>, the high-level width of the carrier clock waveform is guaranteed).

Figure 9-15. Carrier Generator Mode Operation Timing (3/3)

- <1> When TMHE1 = 1 is set, 8-bit timer H1 starts a count operation. At that time, the carrier clock is held at the inactive level.
- <2> When the count value of 8-bit timer counter H1 matches the CMP01 register value, 8-bit timer counter H1 is cleared and the INTTMH1 signal is output.
- <3> The CMP11 register can be rewritten during 8-bit timer H1 operation, however, the changed value (L) is latched. The CMP11 register is changed when the count value of 8-bit timer counter H1 and the CMP11 register value before the change (M) match (<3>').
- <4> When the count value of 8-bit timer counter H1 and the CMP11 register value before the change (M) match, the INTTMH1 signal is output, the carrier signal is inverted, and 8-bit timer counter H1 is cleared to 00H.
- <5> The timing at which the count value of 8-bit timer counter H1 and the CMP11 register value match again is indicated by the value after the change (L).

CHAPTER 10 WATCH TIMER

10.1 Functions of Watch Timer

The watch timer has the following functions.

- Watch timer
- Interval timer

The watch timer and the interval timer can be used simultaneously.

Figure 10-1 shows the watch timer block diagram.

Figure 10-1. Block Diagram of Watch Timer

- Remark**
- f_x : High-speed system clock oscillation frequency
 - f_{XT} : Subsystem clock oscillation frequency
 - f_w : Watch timer clock frequency
 - f_{wx} : f_w or $f_w/2^9$

(1) Watch timer

When the high-speed system clock or subsystem clock is used, interrupt requests (INTWT) are generated at preset intervals.

Table 10-1. Watch Timer Interrupt Time

Interrupt Time	When Operated at $f_{XT} = 32.768$ kHz	When Operated at $f_x = 10$ MHz
$2^4/f_w$	488 μ s	205 μ s
$2^5/f_w$	977 μ s	410 μ s
$2^{13}/f_w$	0.25 s	0.105 s
$2^{14}/f_w$	0.5 s	0.210 s

Remark f_x : High-speed system clock oscillation frequency
 f_{XT} : Subsystem clock oscillation frequency
 f_w : Watch timer clock frequency

(2) Interval timer

Interrupt requests (INTWTI) are generated at preset time intervals.

Table 10-2. Interval Timer Interval Time

Interval Time	When Operated at $f_{XT} = 32.768$ kHz	When Operated at $f_x = 10$ MHz
$2^4/f_w$	488 μ s	205 μ s
$2^5/f_w$	977 μ s	410 μ s
$2^6/f_w$	1.95 ms	820 μ s
$2^7/f_w$	3.91 ms	1.64 ms
$2^8/f_w$	7.81 ms	3.28 ms
$2^9/f_w$	15.6 ms	6.55 ms
$2^{10}/f_w$	31.3 ms	13.1 ms
$2^{11}/f_w$	62.5 ms	26.2 ms

Remark f_x : High-speed system clock oscillation frequency
 f_{XT} : Subsystem clock oscillation frequency
 f_w : Watch timer clock frequency

10.2 Configuration of Watch Timer

The watch timer includes the following hardware.

Table 10-3. Watch Timer Configuration

Item	Configuration
Counter	5 bits × 1
Prescaler	11 bits × 1
Control register	Watch timer operation mode register (WTM)

10.3 Register Controlling Watch Timer

The watch timer is controlled by the watch timer operation mode register (WTM).

- **Watch timer operation mode register (WTM)**

This register sets the watch timer count clock, enables/disables operation, prescaler interval time, and 5-bit counter operation control.

WTM is set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears WTM to 00H.

Figure 10-2. Format of Watch Timer Operation Mode Register (WTM)

Address: FF6FH After reset: 00H R/W

Symbol	7	6	5	4	3	2	<1>	<0>
WTM	WTM7	WTM6	WTM5	WTM4	WTM3	WTM2	WTM1	WTM0
	Watch timer count clock selection							
	0	$f_x/2^7$ (78.125 kHz)						
	1	f_{XT} (32.768 kHz)						
	Prescaler interval time selection							
	0	0	0	$2^4/f_w$				
	0	0	1	$2^5/f_w$				
	0	1	0	$2^6/f_w$				
	0	1	1	$2^7/f_w$				
	1	0	0	$2^8/f_w$				
	1	0	1	$2^9/f_w$				
	1	1	0	$2^{10}/f_w$				
	1	1	1	$2^{11}/f_w$				
	Interrupt time selection							
	0	0	$2^{14}/f_w$					
	0	1	$2^{13}/f_w$					
	1	0	$2^9/f_w$					
	1	1	$2^4/f_w$					
	5-bit counter operation control							
	0	Clear after operation stop						
	1	Start						
	Watch timer operation enable							
	0	Operation stop (clear both prescaler and timer)						
	1	Operation enable						

Caution Do not change the count clock and interval time (by setting bits 4 to 7 (WTM4 to WTM7) of WTM) during watch timer operation.

- Remarks**
1. f_w : Watch timer clock frequency ($f_x/2^7$ or f_{XT})
 2. f_x : High-speed system clock oscillation frequency
 3. f_{XT} : Subsystem clock oscillation frequency
 4. Figures in parentheses apply to operation with $f_x = 10$ MHz, $f_{XT} = 32.768$ kHz.

10.4 Watch Timer Operations

10.4.1 Watch timer operation

The watch timer generates an interrupt request (INTWT) at a specific time interval by using the high-speed system clock or subsystem clock.

When bit 0 (WTM0) and bit 1 (WTM1) of the watch timer operation mode register (WTM) are set to 1, the count operation starts. When these bits are set to 0, the 5-bit counter is cleared and the count operation stops.

When the interval timer is simultaneously operated, zero-second start can be achieved only for the watch timer by setting WTM1 to 0. In this case, however, the 11-bit prescaler is not cleared. Therefore, an error up to $2^9 \times 1/f_w$ seconds occurs in the first overflow (INTWT) after zero-second start.

The interrupt request is generated at the following time intervals.

Table 10-4. Watch Timer Interrupt Time

WTM3	WTM2	Interrupt Time Selection	When Operated at $f_{XT} = 32.768$ kHz (WTM7 = 1)	When Operated at $f_x = 10$ MHz (WTM7 = 0)
0	0	$2^{14}/f_w$	0.5 s	0.210 s
0	1	$2^{13}/f_w$	0.25 s	0.105 s
1	0	$2^5/f_w$	977 μ s	410 μ s
1	1	$2^1/f_w$	488 μ s	205 μ s

Remark f_x : High-speed system clock oscillation frequency
 f_{XT} : Subsystem clock oscillation frequency
 f_w : Watch timer clock frequency

10.4.2 Interval timer operation

The watch timer operates as interval timer which generates interrupt requests (INTWTI) repeatedly at an interval of the preset count value.

The interval time can be selected with bits 4 to 6 (WTM4 to WTM6) of the watch timer operation mode register (WTM).

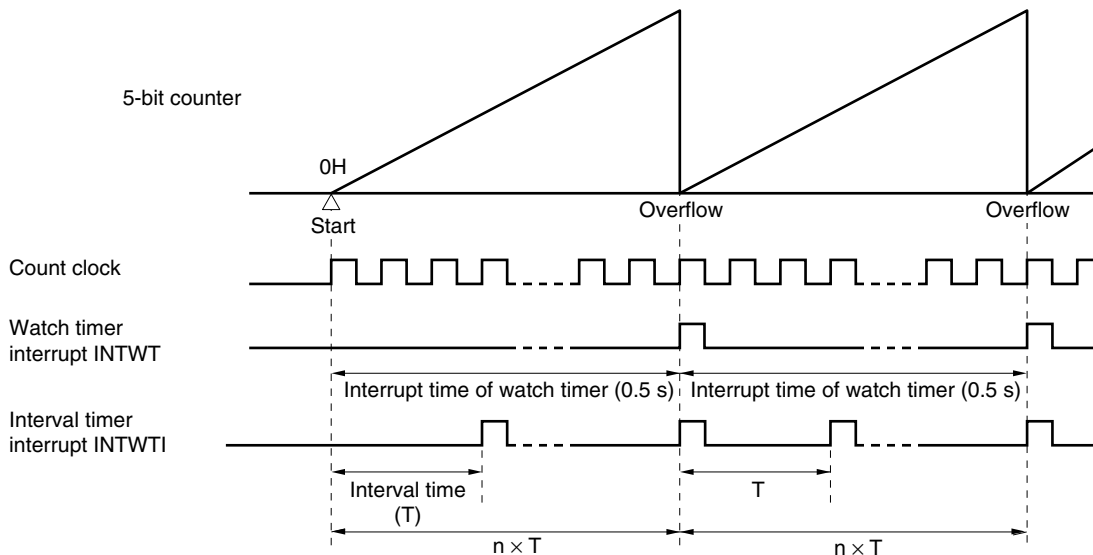

When bit 0 (WTM0) of the WTM is set to 1, the count operation starts. When this bit is set to 0, the count operation stops.

Table 10-5. Interval Timer Interval Time

WTM6	WTM5	WTM4	Interval Time	When Operated at $f_{XT} = 32.768 \text{ kHz (WTM7 = 1)}$	When Operated at $f_X = 10 \text{ MHz (WTM7 = 0)}$
0	0	0	$2^1/f_w$	488 μs	205 μs
0	0	1	$2^5/f_w$	977 μs	410 μs
0	1	0	$2^9/f_w$	1.95 ms	820 μs
0	1	1	$2^7/f_w$	3.91 ms	1.64 ms
1	0	0	$2^9/f_w$	7.81 ms	3.28 ms
1	0	1	$2^9/f_w$	15.6 ms	6.55 ms
1	1	0	$2^{10}/f_w$	31.3 ms	13.1 ms
1	1	1	$2^{11}/f_w$	62.5 ms	26.2 ms

Remark f_X : High-speed system clock oscillation frequency
 f_{XT} : Subsystem clock oscillation frequency
 f_w : Watch timer clock frequency

Figure 10-3. Operation Timing of Watch Timer/Interval Timer

Remark f_w : Watch timer clock frequency
 n : The number of times of interval timer operations
 Figures in parentheses are for operation with $f_w = 32.768 \text{ kHz (WTM7 = 1, WTM3, WTM2 = 0, 0)}$

10.5 Cautions for Watch Timer

When operation of the watch timer and 5-bit counter is enabled by the watch timer mode control register (WTM) (by setting bits 0 (WTM0) and 1 (WTM1) of WTM to 1), the interval until the first interrupt request (INTWT) is generated after the register is set does not exactly match the specification made with bits 2 and 3 (WTM2 and WTM3) of WTM. Subsequently, however, the INTWT signal is generated at the specified intervals.

Figure 10-4. Example of Generation of Watch Timer Interrupt Request (INTWT) (When Interrupt Period = 0.5 s)

It takes 0.515625 seconds (max.) for the first INTWT to be generated ($2^9 \times 1/32768 = 0.015625$ s longer). INTWT is then generated every 0.5 seconds.

CHAPTER 11 WATCHDOG TIMER

11.1 Functions of Watchdog Timer

The watchdog timer is used to detect an inadvertent program loop. If a program loop is detected, an internal reset signal is generated.

When a reset occurs due to the watchdog timer, bit 4 (WDTRF) of the reset control flag register (RESF) is set to 1. For details of RESF, refer to **CHAPTER 22 RESET FUNCTION**.

Table 11-1. Loop Detection Time of Watchdog Timer

Loop Detection Time	
During Internal Oscillation Clock Operation	During High-Speed System Clock Operation
$2^{11}/f_R$ (4.27 ms)	$2^{13}/f_{XP}$ (819.2 μ s)
$2^{12}/f_R$ (8.53 ms)	$2^{14}/f_{XP}$ (1.64 ms)
$2^{13}/f_R$ (17.07 ms)	$2^{15}/f_{XP}$ (3.28 ms)
$2^{14}/f_R$ (34.13 ms)	$2^{16}/f_{XP}$ (6.55 ms)
$2^{15}/f_R$ (68.27 ms)	$2^{17}/f_{XP}$ (13.11 ms)
$2^{16}/f_R$ (136.53 ms)	$2^{18}/f_{XP}$ (26.21 ms)
$2^{17}/f_R$ (273.07 ms)	$2^{19}/f_{XP}$ (52.43 ms)
$2^{18}/f_R$ (546.13 ms)	$2^{20}/f_{XP}$ (104.86 ms)

- Remarks**
1. f_R : Internal oscillation clock frequency
 2. f_{XP} : High-speed system clock oscillation frequency
 3. Figures in parentheses apply to operation at $f_R = 480$ kHz (MAX.), $f_{XP} = 10$ MHz

The operation mode of the watchdog timer (WDT) is switched according to the option byte setting of the internal oscillator as shown in Table 11-2.

Table 11-2. Option Byte Setting and Watchdog Timer Operation Mode

	Option Byte	
	Internal Oscillator Cannot Be Stopped	Internal Oscillator Can Be Stopped by Software
Watchdog timer clock source	Fixed to f_R ^{Note 1} .	<ul style="list-style-type: none"> • Selectable by software (f_{XP}, f_R or stopped) • When reset is released: f_R
Operation after reset	Operation starts with the maximum interval ($2^{18}/f_R$).	Operation starts with maximum interval ($2^{18}/f_R$).
Operation mode selection	The interval can be changed only once.	The clock selection/interval can be changed only once.
Features	The watchdog timer cannot be stopped.	The watchdog timer can be stopped in standby mode ^{Note 2} .

- Notes**
1. As long as power is being supplied, the internal oscillator cannot be stopped (except in the reset period).
 2. The conditions under which clock supply to the watchdog timer is stopped differ depending on the clock source of the watchdog timer.
 - <1> If the clock source is f_{XP} , clock supply to the watchdog timer is stopped under the following conditions.
 - When f_{XP} is stopped
 - In HALT/STOP mode
 - During oscillation stabilization time
 - <2> If the clock source is f_R , clock supply to the watchdog timer is stopped under the following conditions.
 - If the CPU clock is f_{XP} and if f_R is stopped by software before execution of the STOP instruction
 - In HALT/STOP mode

- Remarks**
1. f_R : Internal oscillation clock frequency
 2. f_{XP} : High-speed system clock oscillation frequency

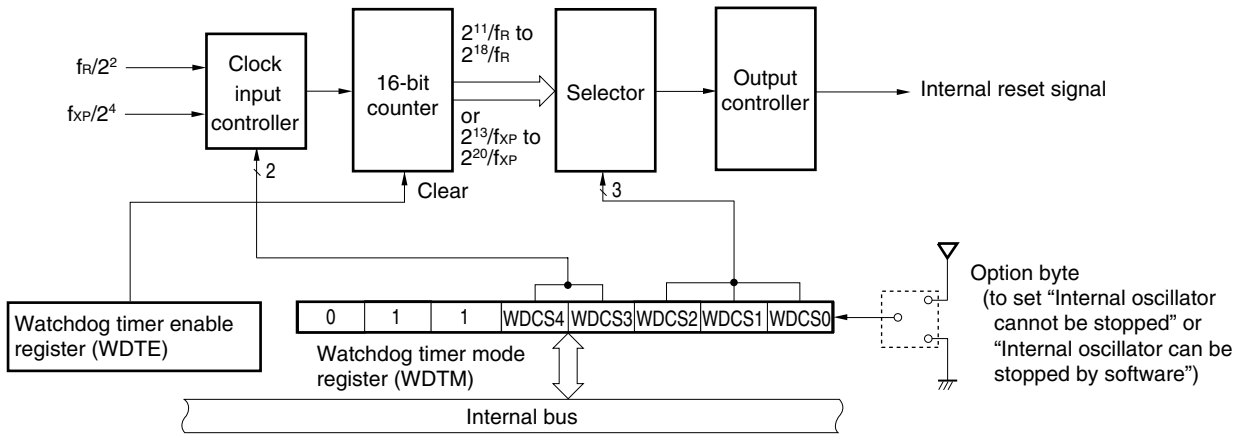

11.2 Configuration of Watchdog Timer

The watchdog timer includes following hardware.

Table 11-3. Configuration of Watchdog Timer

Item	Configuration
Control registers	Watchdog timer mode register (WDTM) Watchdog timer enable register (WDTE)

Figure 11-1. Block Diagram of Watchdog Timer

11.3 Registers Controlling Watchdog Timer

The watchdog timer is controlled by the following two registers.

- Watchdog timer mode register (WDTM)
- Watchdog timer enable register (WDTE)

(1) Watchdog timer mode register (WDTM)

This register sets the overflow time and operation clock of the watchdog timer.

This register can be set by an 8-bit memory manipulation instruction and can be read many times, but can be written only once after reset is released.

$\overline{\text{RESET}}$ input sets this register to 67H.

Figure 11-2. Format of Watchdog Timer Mode Register (WDTM)

Address: FF98H After reset: 67H R/W

Symbol	7	6	5	4	3	2	1	0
WDTM	0	1	1	WDCS4	WDCS3	WDCS2	WDCS1	WDCS0

WDCS4 ^{Note 1}	WDCS3 ^{Note 1}	Operation clock selection
0	0	Internal oscillation clock (f_R)
0	1	High-speed system clock (f_{XP})
1	×	Watchdog timer operation stopped

WDCS2 ^{Note 2}	WDCS1 ^{Note 2}	WDCS0 ^{Note 2}	Overflow time setting	
			During internal oscillation clock operation	During high-speed system clock operation
0	0	0	$2^{11}/f_R$ (4.27 ms)	$2^{13}/f_{XP}$ (819.2 μs)
0	0	1	$2^{12}/f_R$ (8.53 ms)	$2^{14}/f_{XP}$ (1.64 ms)
0	1	0	$2^{13}/f_R$ (17.07 ms)	$2^{15}/f_{XP}$ (3.28 ms)
0	1	1	$2^{14}/f_R$ (34.13 ms)	$2^{16}/f_{XP}$ (6.55 ms)
1	0	0	$2^{15}/f_R$ (68.27 ms)	$2^{17}/f_{XP}$ (13.11 ms)
1	0	1	$2^{16}/f_R$ (136.53 ms)	$2^{18}/f_{XP}$ (26.21 ms)
1	1	0	$2^{17}/f_R$ (273.07 ms)	$2^{19}/f_{XP}$ (52.43 ms)
1	1	1	$2^{18}/f_R$ (546.13 ms)	$2^{20}/f_{XP}$ (104.86 ms)

- Notes**
1. If “Internal oscillator cannot be stopped” is specified by the option byte, this cannot be set. The internal oscillation clock will be selected no matter what value is written.
 2. Reset is released at the maximum cycle (WDCS2, 1, 0 = 1, 1, 1).

- Cautions**
1. If data is written to WDTM, a wait cycle is generated. Do not write data to WDTM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.
 2. Set bits 7, 6, and 5 to 0, 1, and 1, respectively (when “Internal oscillator cannot be stopped” is selected by the option byte, other values are ignored).
 3. After reset is released, WDTM can be written only once by an 8-bit memory manipulation instruction. If writing attempted a second time, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.
 4. WDTM cannot be set by a 1-bit memory manipulation instruction.
 5. If “Internal oscillator can be stopped by software” is selected by the option byte and the watchdog timer is stopped by setting WDCS4 to 1, the watchdog timer does not resume operation even if WDCS4 is cleared to 0. In addition, the internal reset signal is not generated.

- Remarks**
1. f_R : Internal oscillation clock frequency
 2. f_{XP} : High-speed system clock oscillation frequency
 3. \times : Don't care
 4. Figures in parentheses apply to operation at $f_R = 480$ kHz (MAX.), $f_{XP} = 10$ MHz

(2) Watchdog timer enable register (WDTE)

Writing ACH to WDTE clears the watchdog timer counter and starts counting again.

This register can be set by an 8-bit memory manipulation instruction.

\overline{RESET} input sets this register to 9AH.

Figure 11-3. Format of Watchdog Timer Enable Register (WDTE)

Address: FF99H After reset: 9AH R/W

Symbol	7	6	5	4	3	2	1	0
WDTE								

- Cautions**
1. If a value other than ACH is written to WDTE, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.
 2. If a 1-bit memory manipulation instruction is executed for WDTE, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.
 3. The value read from WDTE is 9AH (this differs from the written value (ACH)).

The relationship between the watchdog timer operation and the internal reset signal generated by the watchdog timer is shown below.

Table 11-4. Relationship Between Watchdog Timer Operation and Internal Reset Signal Generated by Watchdog Timer

Internal Reset Signal Generation Cause	Watchdog Timer Operation	“Internal Oscillator Cannot Be Stopped by Software” Is Selected by Option Byte (Watchdog Timer Is Always Operating)	“Internal Oscillator Can Be Stopped by Software” Is Selected by Option Byte		
			Watchdog Timer Is Operating	Watchdog Timer Stopped	
				WDCS4 Is Set to 1	Source Clock to Watchdog Timer Is Stopped
Watchdog timer overflows		Internal reset signal is generated.	Internal reset signal is generated.	–	–
Write to WDTM for the second time		Internal reset signal is generated.	Internal reset signal is generated.	Internal reset signal is not generated and the watchdog timer does not resume operation.	Internal reset signal is generated when the source clock to the watchdog timer resumes operation.
Write other than “ACH” to WDTE		Internal reset signal is generated.	Internal reset signal is generated.	Internal reset signal is not generated.	Internal reset signal is generated when the source clock to the watchdog timer resumes operation.
Access WDTE by 1-bit memory manipulation instruction					

11.4 Operation of Watchdog Timer

11.4.1 Watchdog timer operation when “Internal oscillator cannot be stopped” is selected by option byte

The operation clock of watchdog timer is fixed to the internal oscillation clock.

After reset is released, operation is started at the maximum cycle (bits 2, 1, and 0 (WDCS2, WDCS1, WDCS0) of the watchdog timer mode register (WDTM) = 1, 1, 1). The watchdog timer operation cannot be stopped.

The following shows the watchdog timer operation after reset release.

1. The status after reset release is as follows.
 - Operation clock: Internal oscillation clock
 - Cycle: $2^{19}/f_R$ (546.13 ms: At operation with $f_R = 480$ kHz (MAX.))
 - Counting starts
2. The following should be set in the watchdog timer mode register (WDTM) by an 8-bit memory manipulation instruction^{Notes 1, 2}.
 - Cycle: Set using bits 2 to 0 (WDCS2 to WDCS0)
3. After the above procedures are executed, writing ACH to WDTE clears the count to 0, enabling recounting.

- Notes**
1. The operation clock (internal oscillation clock) cannot be changed. If any value is written to bits 3 and 4 (WDCS3, WDCS4) of WDTM, it is ignored.
 2. As soon as WDTM is written, the counter of the watchdog timer is cleared.

Caution In this mode, operation of the watchdog timer absolutely cannot be stopped even during STOP instruction execution. For 8-bit timer H1 (TMH1), a division of the internal oscillation clock can be selected as the count source, so clear the watchdog timer using the interrupt request of TMH1 before the watchdog timer overflows after STOP instruction execution. If this processing is not performed, an internal reset signal is generated when the watchdog timer overflows after STOP instruction execution.

11.4.2 Watchdog timer operation when “Internal oscillator can be stopped by software” is selected by option byte

The operation clock of the watchdog timer can be selected as either the internal oscillation clock or the high-speed system clock.

After reset is released, operation is started at the maximum cycle (bits 2, 1, and 0 (WDCS2, WDCS1, WDCS0) of the watchdog timer mode register (WDTM) = 1, 1, 1).

The following shows the watchdog timer operation after reset release.

1. The status after reset release is as follows.
 - Operation clock: Internal oscillation clock
 - Cycle: $2^{18}/f_R$ (546.13 ms: At operation with $f_R = 480$ kHz (MAX.))
 - Counting starts
2. The following should be set in the watchdog timer mode register (WDTM) by an 8-bit memory manipulation instruction^{Notes 1, 2, 3}.
 - Operation clock: Any of the following can be selected using bits 3 and 4 (WDCS3 and WDCS4).
 - Internal oscillation clock (f_R)
 - High-speed system clock (f_{XP})
 - Watchdog timer operation stopped
 - Cycle: Set using bits 2 to 0 (WDCS2 to WDCS0)
3. After the above procedures are executed, writing ACH to WDTE clears the count to 0, enabling recounting.

- Notes**
1. As soon as WDTM is written, the counter of the watchdog timer is cleared.
 2. Set bits 7, 6, and 5 to 0, 1, 1, respectively. Do not set the other values.
 3. If the watchdog timer is stopped by setting WDCS4 and WDCS3 to 1 and \times , respectively, an internal reset signal is not generated even if the following processing is performed.
 - WDTM is written a second time.
 - A 1-bit memory manipulation instruction is executed to WDTE.
 - A value other than ACH is written to WDTE.

Caution In this mode, watchdog timer operation is stopped during HALT/STOP instruction execution. After HALT/STOP mode is released, counting is started again using the operation clock of the watchdog timer set before HALT/STOP instruction execution by WDTM. At this time, the counter is not cleared to 0 but holds its value.

For the watchdog timer operation during STOP mode and HALT mode in each status, refer to 11.4.3 Watchdog timer operation in STOP mode and 11.4.4 Watchdog timer operation in HALT mode.

11.4.3 Watchdog timer operation in STOP mode (when “Internal oscillator can be stopped by software” is selected by option byte)

The watchdog timer stops counting during STOP instruction execution regardless of whether the high-speed system clock or internal oscillation clock is being used.

(1) When the CPU clock and the watchdog timer operation clock are the high-speed system clock (f_{XP}) when the STOP instruction is executed

When STOP instruction is executed, operation of the watchdog timer is stopped. After STOP mode is released, counting stops for the oscillation stabilization time set by the oscillation stabilization time select register (OSTS) and then counting is started again using the operation clock before the operation was stopped. At this time, the counter is not cleared to 0 but holds its value.

Figure 11-4. Operation in STOP Mode (CPU Clock and WDT Operation Clock: High-Speed System Clock)

(2) When the CPU clock is the high-speed system clock (f_{XP}) and the watchdog timer operation clock is the internal oscillation clock (f_R) when the STOP instruction is executed

When the STOP instruction is executed, operation of the watchdog timer is stopped. After STOP mode is released, counting is started again using the operation clock before the operation was stopped. At this time, the counter is not cleared to 0 but holds its value.

Figure 11-5. Operation in STOP Mode (CPU Clock: High-Speed System Clock, WDT Operation Clock: Internal Oscillation Clock)

(3) When the CPU clock is the internal oscillation clock (f_R) and the watchdog timer operation clock is the high-speed system clock (f_{XP}) when the STOP instruction is executed

When the STOP instruction is executed, operation of the watchdog timer is stopped. After STOP mode is released, counting is stopped until the timing of <1> or <2>, whichever is earlier, and then counting is started using the operation clock before the operation was stopped. At this time, the counter is not cleared to 0 but holds its value.

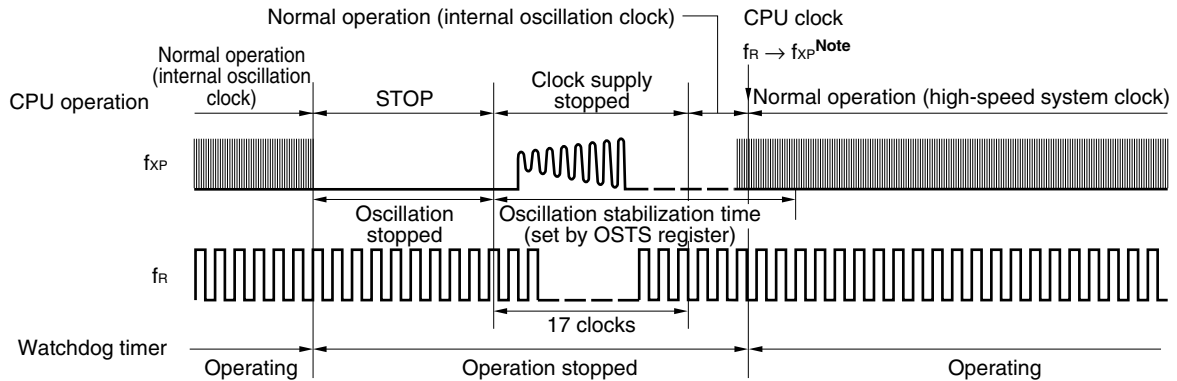

- <1> The oscillation stabilization time set by the oscillation stabilization time select register (OSTS) elapses.
- <2> The CPU clock is switched to the high-speed system clock (f_{XP}).

Figure 11-6. Operation in STOP Mode
(CPU Clock: Internal Oscillation Clock, WDT Operation Clock: High-Speed System Clock)

- <1> Timing when counting is started after the oscillation stabilization time set by the oscillation stabilization time select register (OSTS) has elapsed

- <2> Timing when counting is started after the CPU clock is switched to the high-speed system clock (f_{XP})

Note Confirm the oscillation stabilization time of f_{XP} using the oscillation stabilization time counter status register (OSTC).

(4) When CPU clock and watchdog timer operation clock are the internal oscillation clocks (f_R) during STOP instruction execution

When the STOP instruction is executed, operation of the watchdog timer is stopped. After STOP mode is released, counting is started again using the operation clock before the operation was stopped. At this time, the counter is not cleared to 0 but holds its value.

Figure 11-7. Operation in STOP Mode (CPU Clock and WDT Operation Clock: Internal Oscillation Clock)

11.4.4 Watchdog timer operation in HALT mode (when “Internal oscillator can be stopped by software” is selected by option byte)

The watchdog timer stops counting during HALT instruction execution regardless of whether the CPU clock is the high-speed system clock (f_{XP}), internal oscillation clock (f_R), or subsystem clock (f_{XT}), or whether the operation clock of the watchdog timer is the high-speed system clock (f_{XP}) or internal oscillation clock (f_R). After HALT mode is released, counting is started again using the operation clock before the operation was stopped. At this time, the counter is not cleared to 0 but holds its value.

Figure 11-8. Operation in HALT Mode

CHAPTER 12 CLOCK OUTPUT/BUZZER OUTPUT CONTROLLER

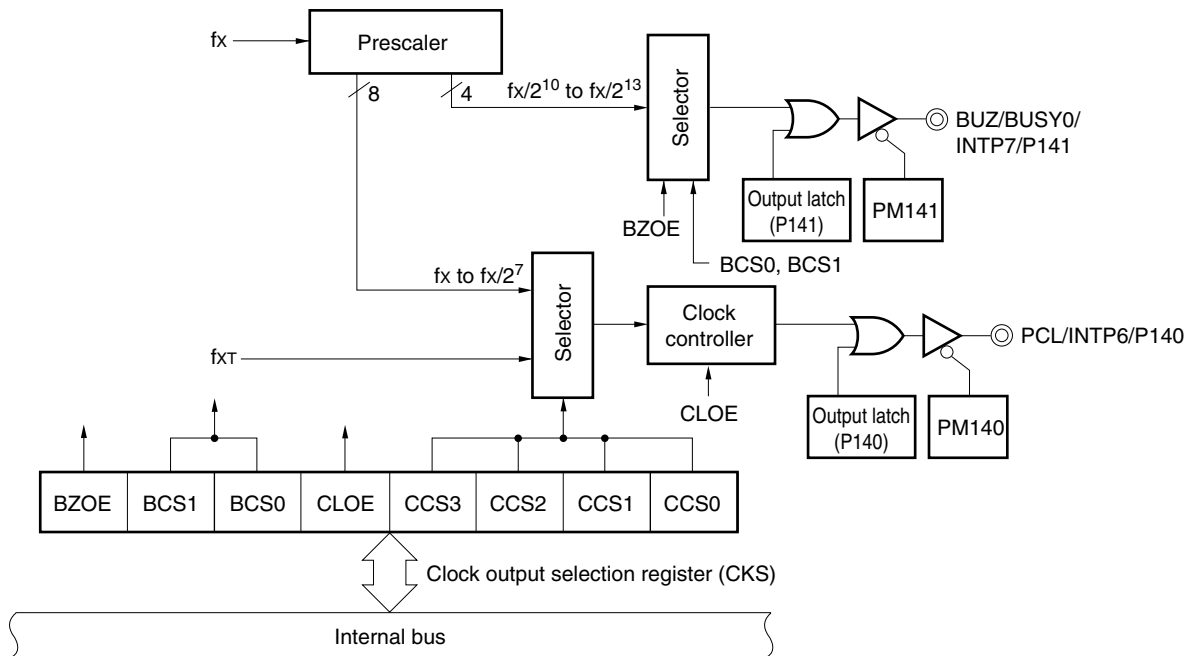

12.1 Functions of Clock Output/Buzzer Output Controller

The clock output controller is intended for carrier output during remote controlled transmission and clock output for supply to peripheral LSIs. The clock selected with the clock output selection register (CKS) is output.

In addition, the buzzer output is intended for square-wave output of buzzer frequency selected with CKS.

Figure 12-1 shows the block diagram of clock output/buzzer output controller.

Figure 12-1. Block Diagram of Clock Output/Buzzer Output Controller

12.2 Configuration of Clock Output/Buzzer Output Controller

The clock output/buzzer output controller includes the following hardware.

Table 12-1. Clock Output/Buzzer Output Controller Configuration

Item	Configuration
Control registers	Clock output selection register (CKS) Port mode register 14 (PM14) Port register 14 (P14)

12.3 Register Controlling Clock Output/Buzzer Output Controller

The following two registers are used to control the clock output/buzzer output controller.

- Clock output selection register (CKS)
- Port mode register 14 (PM14)

(1) Clock output selection register (CKS)

This register sets output enable/disable for clock output (PCL) and for the buzzer frequency output (BUZ), and sets the output clock.

CKS is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears CKS to 00H.

Figure 12-2. Format of Clock Output Selection Register (CKS)

Address: FF40H After reset: 00H R/W

Symbol	<7>	6	5	<4>	3	2	1	0
CKS	BZOE	BCS1	BCS0	CLOE	CCS3	CCS2	CCS1	CCS0

BZOE	BUZ output enable/disable specification
0	Clock division circuit operation stopped. BUZ fixed to low level.
1	Clock division circuit operation enabled. BUZ output enabled.

BCS1	BCS0	BUZ output clock selection
0	0	$f_x/2^{10}$ (9.77 kHz)
0	1	$f_x/2^{11}$ (4.88 kHz)
1	0	$f_x/2^{12}$ (2.44 kHz)
1	1	$f_x/2^{13}$ (1.22 kHz)

CLOE	PCL output enable/disable specification
0	Clock division circuit operation stopped. PCL fixed to low level.
1	Clock division circuit operation enabled. PCL output enabled.

CCS3	CCS2	CCS1	CCS0	PCL output clock selection ^{Note}
0	0	0	0	f_x (10 MHz)
0	0	0	1	$f_x/2$ (5 MHz)
0	0	1	0	$f_x/2^2$ (2.5 MHz)
0	0	1	1	$f_x/2^3$ (1.25 MHz)
0	1	0	0	$f_x/2^4$ (625 kHz)
0	1	0	1	$f_x/2^5$ (312.5 kHz)
0	1	1	0	$f_x/2^6$ (156.25 kHz)
0	1	1	1	$f_x/2^7$ (78.125 kHz)
1	0	0	0	f_{XT} (32.768 kHz)
Other than above				Setting prohibited

Note Set the PCL output clock so that the following condition is satisfied.

- PCL output clock \leq 10 MHz

Remarks 1. f_x : High-speed system clock oscillation frequency

2. f_{XT} : Subsystem clock oscillation frequency

3. Figures in parentheses are for operation with $f_x = 10$ MHz or $f_{XT} = 32.768$ kHz.

(2) Port mode register 14 (PM14)

This register sets port 14 input/output in 1-bit units.

When using the P140/INTP6/PCL pin for clock output and the P141/BUSY0/INTP7/BUZ pin for buzzer output, set PM140, PM141 and the output latch of P140, P141 to 0.

PM14 is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets PM14 to FFH.

Figure 12-3. Format of Port Mode Register 14 (PM14)

Address: FF2EH After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM14	1	1	PM145	PM144	PM143	PM142	PM141	PM140

PM14n	P14n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

12.4 Clock Output/Buzzer Output Controller Operations

12.4.1 Clock output operation

The clock pulse is output as the following procedure.

- <1> Select the clock pulse output frequency with bits 0 to 3 (CCS0 to CCS3) of the clock output selection register (CKS) (clock pulse output in disabled status).
- <2> Set bit 4 (CLOE) of CKS to 1 to enable clock output.

Remark The clock output controller is designed not to output pulses with a small width during output enable/disable switching of the clock output. As shown in Figure 12-4, be sure to start output from the low period of the clock (marked with * in the figure). When stopping output, do so after securing high level of the clock.

Figure 12-4. Remote Control Output Application Example

12.4.2 Operation as buzzer output

The buzzer frequency is output as the following procedure.

- <1> Select the buzzer output frequency with bits 5 and 6 (BCS0, BCS1) of the clock output selection register (CKS) (buzzer output in disabled status).
- <2> Set bit 7 (BZOE) of CKS to 1 to enable buzzer output.

CHAPTER 13 A/D CONVERTER

13.1 Functions of A/D Converter

The A/D converter converts an analog input signal into a digital value, and consists of up to eight channels (ANI0 to ANI7) with a resolution of 10 bits.

The A/D converter has the following two functions.

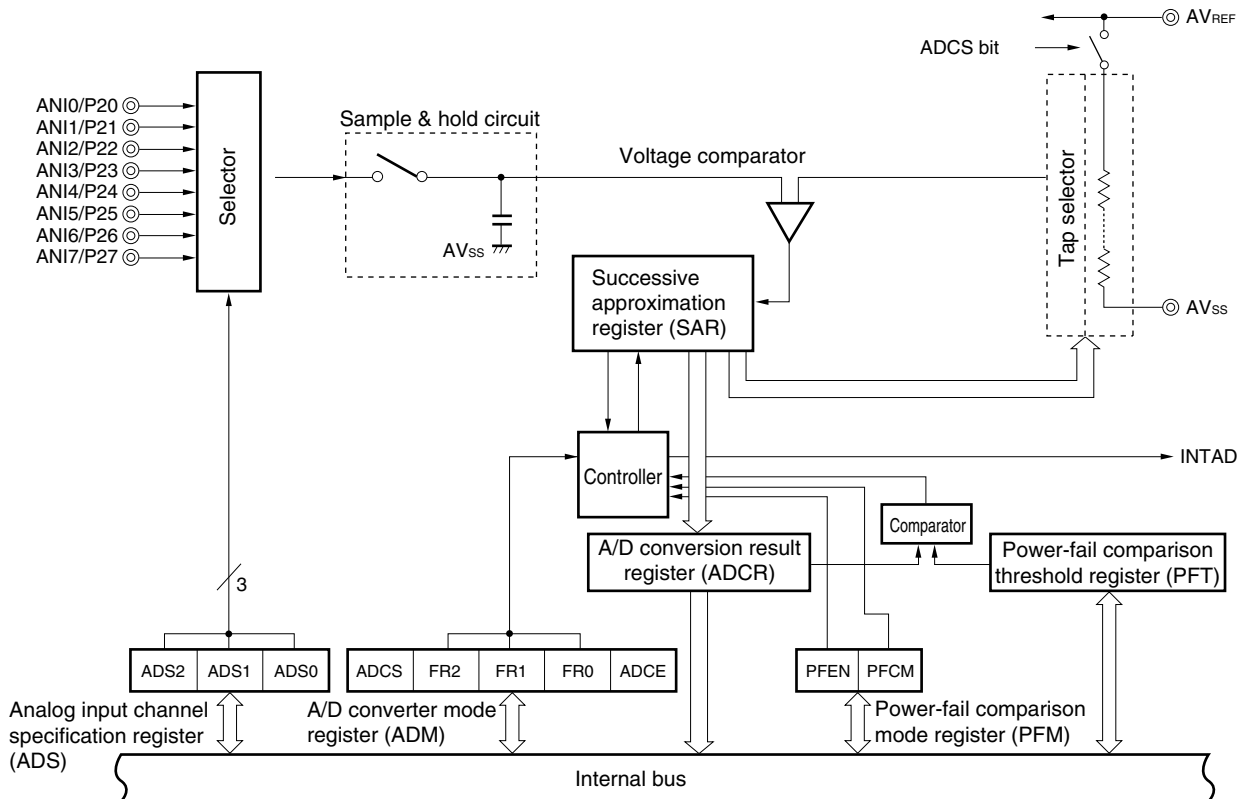

(1) 10-bit resolution A/D conversion

10-bit resolution A/D conversion is carried out repeatedly for one channel selected from analog inputs ANI0 to ANI7. Each time an A/D conversion operation ends, an interrupt request (INTAD) is generated.

(2) Power-fail detection function

This function is used to detect a voltage drop in a battery. The A/D conversion result (ADCR register value) and power-fail comparison threshold register (PFT) value are compared. INTAD is generated only when a comparative condition has been matched.

Figure 13-1. Block Diagram of A/D Converter

13.2 Configuration of A/D Converter

The A/D converter includes the following hardware.

Table 13-1. Registers of A/D Converter Used on Software

Item	Configuration
Registers	A/D conversion result register (ADCR) A/D converter mode register (ADM) Analog input channel specification register (ADS) Power-fail comparison mode register (PFM) Power-fail comparison threshold register (PFT)

(1) ANI0 to ANI7 pins

These are the analog input pins of the 8-channel A/D converter. They input analog signals to be converted into digital signals. Pins other than the one selected as the analog input pin by the analog input channel specification register (ADS) can be used as input port pins.

(2) Sample & hold circuit

The sample & hold circuit samples the input signal of the analog input pin selected by the selector when A/D conversion is started, and holds the sampled analog input voltage value during A/D conversion.

(3) Series resistor string

The series resistor string is connected between AV_{REF} and AV_{SS} , and generates a voltage to be compared with the analog input signal.

Figure 13-2. Circuit Configuration of Series Resistor String

(4) Voltage comparator

The voltage comparator compares the sampled analog input voltage and the output voltage of the series resistor string.

(5) Successive approximation register (SAR)

This register compares the sampled analog voltage and the voltage of the series resistor string, and converts the result, starting from the most significant bit (MSB).

When the voltage value is converted into a digital value down to the least significant bit (LSB) (end of A/D conversion), the contents of the SAR register are transferred to the A/D conversion result register (ADCR).

(6) A/D conversion result register (ADCR)

The result of A/D conversion is loaded from the successive approximation register (SAR) to this register each time A/D conversion is completed, and the ADCR register holds the result of A/D conversion in its higher 10 bits (the lower 6 bits are fixed to 0).

(7) Controller

When A/D conversion has been completed or when the power-fail detection function is used, this controller compares the result of A/D conversion (value of the ADCR register) and the value of the power-fail comparison threshold register (PFT). It generates the interrupt INTAD only if a specified comparison condition is satisfied as a result.

(8) AV_{REF} pin

This pin inputs an analog power/reference voltage to the A/D converter. Always use this pin at the same potential as that of the V_{DD} pin even when the A/D converter is not used.

The signal input to AN10 to AN17 is converted into a digital signal, based on the voltage applied across AV_{REF} and AV_{SS}.

(9) AV_{SS} pin

This is the ground potential pin of the A/D converter. Always use this pin at the same potential as that of the V_{SS} pin even when the A/D converter is not used.

(10) A/D converter mode register (ADM)

This register is used to set the conversion time of the analog input signal to be converted, and to start or stop the conversion operation.

(11) Analog input channel specification register (ADS)

This register is used to specify the port that inputs the analog voltage to be converted into a digital signal.

(12) Power-fail comparison mode register (PFM)

This register is used to set the power-fail monitor mode.

(13) Power-fail comparison threshold register (PFT)

This register is used to set the threshold value that is to be compared with the value of the A/D conversion result register (ADCR).

13.3 Registers Used in A/D Converter

The A/D converter uses the following five registers.

- A/D converter mode register (ADM)
- Analog input channel specification register (ADS)
- A/D conversion result register (ADCR)
- Power-fail comparison mode register (PFM)
- Power-fail comparison threshold register (PFT)

(1) A/D converter mode register (ADM)

This register sets the conversion time for analog input to be A/D converted, and starts/stops conversion.

ADM can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 13-3. Format of A/D Converter Mode Register (ADM)

Address: FF28H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	<0>
ADM	ADCS	0	FR2	FR1	FR0	0	0	ADCE

ADCS	A/D conversion operation control
0	Stops conversion operation
1	Enables conversion operation

FR2	FR1	FR0	Conversion time selection ^{Note 1}				
			$f_x = 2 \text{ MHz}$	$f_x = 8.38 \text{ MHz}$	$f_x = 10 \text{ MHz}$	$f_x = 16 \text{ MHz}$	
0	0	0	$288/f_x$	144 μs	34.3 μs	28.8 μs	18 μs
0	0	1	$240/f_x$	120 μs	28.6 μs	24.0 μs	15 μs
0	1	0	$192/f_x$	96 μs	22.9 μs	19.2 μs	12 μs
1	0	0	$144/f_x$	72 μs	17.2 μs	14.4 μs	9 μs
1	0	1	$120/f_x$	60 μs	14.3 μs	12.0 μs	7.5 μs
1	1	0	$96/f_x$	48 μs	11.5 μs	9.6 μs	6 μs
Other than above			Setting prohibited				

ADCE	Boost reference voltage generator operation control ^{Note 2}
0	Stops operation of reference voltage generator
1	Enables operation of reference voltage generator

- <R> **Notes**
1. Set so that the A/D conversion time is as follows.
 - Standard products, (A) grade products: 14 μs or longer but less than 100 μs
 - (A1) grade products: 14 μs or longer but less than 60 μs
 2. A booster circuit is incorporated to realize low-voltage operation. The operation of the circuit that generates the reference voltage for boosting is controlled by ADCE, and it takes 14 μs from operation start to operation stabilization. Therefore, when ADCS is set to 1 after 14 μs or more has elapsed from the time ADCE is set to 1, the conversion result at that time has priority over the first conversion result.

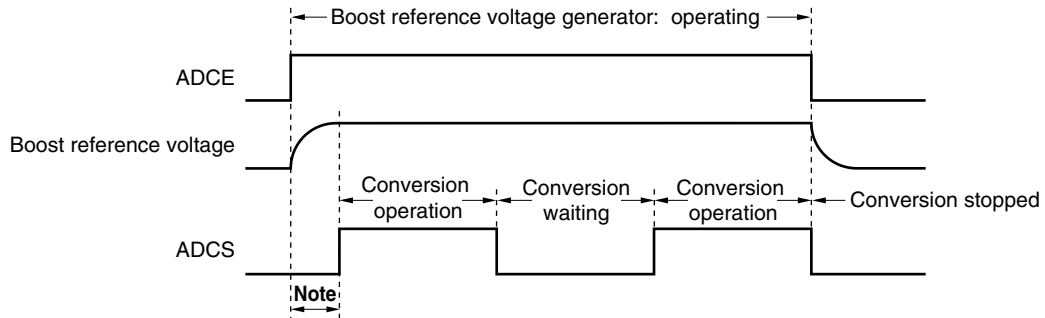

Remark f_x : High-speed system clock oscillation frequency

Table 13-2. Settings of ADCS and ADCE

ADCS	ADCE	A/D Conversion Operation
0	0	Stop status (DC power consumption path does not exist)
0	1	Conversion waiting mode (only reference voltage generator consumes power)
1	0	Conversion mode (reference voltage generator operation stopped ^{Note})
1	1	Conversion mode (reference voltage generator operates)

Note Data of first conversion cannot be used.

Figure 13-4. Timing Chart When Boost Reference Voltage Generator Is Used

Note The time from the rising of the ADCE bit to the falling of the ADCS bit must be 14 μ s or longer to stabilize the reference voltage.

- Cautions**
1. A/D conversion must be stopped before rewriting bits FR0 to FR2 to values other than the identical data.
 2. For the sampling time of the A/D converter and the A/D conversion start delay time, see (11) in 13.6 Cautions for A/D Converter.
 3. If data is written to ADM, a wait cycle is generated. Do not write data to ADM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(2) Analog input channel specification register (ADS)

This register specifies the input port of the analog voltage to be A/D converted.

ADS can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 13-5. Format of Analog Input Channel Specification Register (ADS)

Address: FF29H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
ADS	0	0	0	0	0	ADS2	ADS1	ADS0

ADS2	ADS1	ADS0	Analog input channel specification
0	0	0	ANI0
0	0	1	ANI1
0	1	0	ANI2
0	1	1	ANI3
1	0	0	ANI4
1	0	1	ANI5
1	1	0	ANI6
1	1	1	ANI7

Cautions 1. Be sure to clear bits 3 to 7 of ADS to 0.

2. If data is written to ADS, a wait cycle is generated. Do not write data to ADS when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(3) A/D conversion result register (ADCR)

This register is a 16-bit register that stores the A/D conversion result. The lower six bits are fixed to 0. Each time A/D conversion ends, the conversion result is loaded from the successive approximation register, and is stored in ADCR in order starting from the most significant bit (MSB). FF09H indicates the higher 8 bits of the conversion result, and FF08H indicates the lower 2 bits of the conversion result.

ADCR can be read by a 16-bit memory manipulation instruction.

RESET input makes ADCR undefined.

Figure 13-6. Format of A/D Conversion Result Register (ADCR)

- Cautions**
1. When writing to the A/D converter mode register (ADM) and analog input channel specification register (ADS), the contents of ADCR may become undefined. Read the conversion result following conversion completion before writing to ADM and ADS. Using timing other than the above may cause an incorrect conversion result to be read.
 2. If data is read from ADCR, a wait cycle is generated. Do not read data from ADCR when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(4) Power-fail comparison mode register (PFM)

The power-fail comparison mode register (PFM) is used to compare the A/D conversion result (value of the ADCR register) and the value of the power-fail comparison threshold register (PFT).

PFM can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 13-7. Format of Power-Fail Comparison Mode Register (PFM)

Address: FF2AH After reset: 00H R/W

Symbol	<7>	<6>	5	4	3	2	1	0
PFM	PFEN	PFCM	0	0	0	0	0	0

PFEN	Power-fail comparison enable
0	Stops power-fail comparison (used as a normal A/D converter)
1	Enables power-fail comparison (used for power-fail detection)

PFCM		Power-fail comparison mode selection
0	Higher 8 bits of ADCR \geq PFT	Interrupt request signal (INTAD) generation
	Higher 8 bits of ADCR $<$ PFT	No INTAD generation
1	Higher 8 bits of ADCR \geq PFT	No INTAD generation
	Higher 8 bits of ADCR $<$ PFT	INTAD generation

Caution If data is written to PFM, a wait cycle is generated. Do not write data to PFM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(5) Power-fail comparison threshold register (PFT)

The power-fail comparison threshold register (PFT) is a register that sets the threshold value when comparing the values with the A/D conversion result.

8-bit data in PFT is compared to the higher 8 bits (FF09H) of the 10-bit A/D conversion result.

PFT can be set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 13-8. Format of Power-Fail Comparison Threshold Register (PFT)

Address: FF2BH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
PFT	PFT7	PFT6	PFT5	PFT4	PFT3	PFT2	PFT1	PFT0

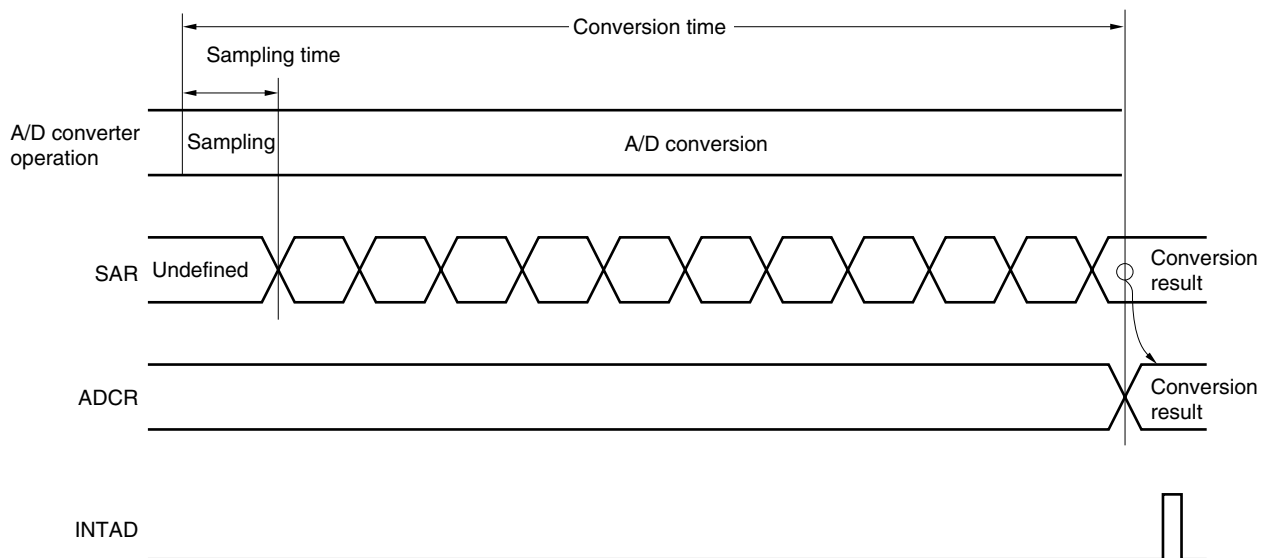

Caution If data is written to PFT, a wait cycle is generated. Do not write data to PFT when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

13.4 A/D Converter Operations

13.4.1 Basic operations of A/D converter

- <1> Select one channel for A/D conversion using the analog input channel specification register (ADS).
- <2> Set ADCE to 1 and wait for 14 μ s or longer.
- <3> Set ADCS to 1 and start the conversion operation.
(<4> to <10> are operations performed by hardware.)
- <4> The voltage input to the selected analog input channel is sampled by the sample & hold circuit.
- <5> When sampling has been done for a certain time, the sample & hold circuit is placed in the hold state and the input analog voltage is held until the A/D conversion operation has ended.
- <6> Bit 9 of the successive approximation register (SAR) is set. The series resistor string voltage tap is set to $(1/2) AV_{REF}$ by the tap selector.
- <7> The voltage difference between the series resistor string voltage tap and analog input is compared by the voltage comparator. If the analog input is greater than $(1/2) AV_{REF}$, the MSB of SAR remains set to 1. If the analog input is smaller than $(1/2) AV_{REF}$, the MSB is reset to 0.
- <8> Next, bit 8 of SAR is automatically set to 1, and the operation proceeds to the next comparison. The series resistor string voltage tap is selected according to the preset value of bit 9, as described below.
 - Bit 9 = 1: $(3/4) AV_{REF}$
 - Bit 9 = 0: $(1/4) AV_{REF}$
 The voltage tap and analog input voltage are compared and bit 8 of SAR is manipulated as follows.
 - Analog input voltage \geq Voltage tap: Bit 8 = 1
 - Analog input voltage $<$ Voltage tap: Bit 8 = 0
- <9> Comparison is continued in this way up to bit 0 of SAR.
- <10> Upon completion of the comparison of 10 bits, an effective digital result value remains in SAR, and the result value is transferred to the A/D conversion result register (ADCR) and then latched.
At the same time, the A/D conversion end interrupt request (INTAD) can also be generated.
- <11> Repeat steps <4> to <10>, until ADCS is cleared to 0.
To stop the A/D converter, clear ADCS to 0.
To restart A/D conversion from the status of ADCE = 1, start from <3>. To restart A/D conversion from the status of ADCE = 0, however, start from <2>.

Figure 13-9. Basic Operation of A/D Converter

A/D conversion operations are performed continuously until bit 7 (ADCS) of the A/D converter mode register (ADM) is reset (0) by software.

If a write operation is performed to one of the ADM, analog input channel specification register (ADS), power-fail comparison mode register (PFM), or power-fail comparison threshold register (PFT) during an A/D conversion operation, the conversion operation is initialized, and if the ADCS bit is set (1), conversion starts again from the beginning.

$\overline{\text{RESET}}$ input makes the A/D conversion result register (ADCR) undefined.

13.4.2 Input voltage and conversion results

The relationship between the analog input voltage input to the analog input pins (ANI0 to ANI7) and the theoretical A/D conversion result (stored in the A/D conversion result register (ADCR)) is shown by the following expression.

$$SAR = INT \left(\frac{V_{AIN}}{AV_{REF}} \times 1024 + 0.5 \right)$$

$$ADCR = SAR \times 64$$

or

$$(ADCR - 0.5) \times \frac{AV_{REF}}{1024} \leq V_{AIN} < (ADCR + 0.5) \times \frac{AV_{REF}}{1024}$$

where, INT(): Function which returns integer part of value in parentheses

V_{AIN} : Analog input voltage

AV_{REF} : AV_{REF} pin voltage

ADCR: A/D conversion result register (ADCR) value

SAR: Successive approximation register

Figure 13-10 shows the relationship between the analog input voltage and the A/D conversion result.

Figure 13-10. Relationship Between Analog Input Voltage and A/D Conversion Result

13.4.3 A/D converter operation mode

The operation mode of the A/D converter is the select mode. One channel of analog input is selected from ANI0 to ANI7 by the analog input channel specification register (ADS) and A/D conversion is executed.

In addition, the following two functions can be selected by setting of bit 7 (PFEN) of the power-fail comparison mode register (PFM).

- Normal 10-bit A/D converter (PFEN = 0)
- Power-fail detection function (PFEN = 1)

(1) A/D conversion operation (when PFEN = 0)

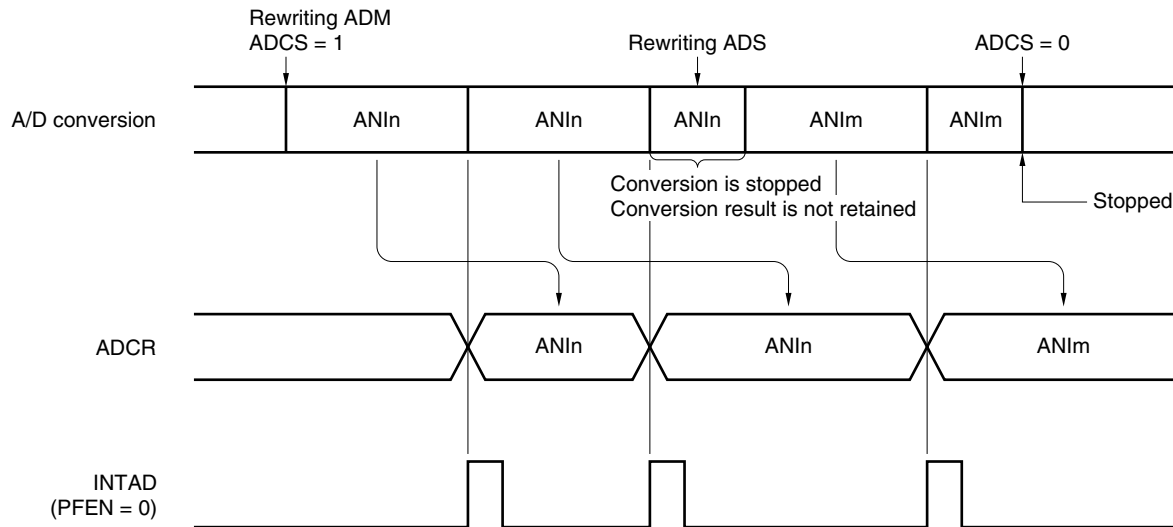

By setting bit 7 (ADCS) of the A/D converter mode register (ADM) to 1 and bit 7 (PFEN) of the power-fail comparison mode register (PFM) to 0, the A/D conversion operation of the voltage, which is applied to the analog input pin specified by the analog input channel specification register (ADS), is started.

When A/D conversion has been completed, the result of the A/D conversion is stored in the A/D conversion result register (ADCR), and an interrupt request signal (INTAD) is generated. Once the A/D conversion has started and when one A/D conversion has been completed, the next A/D conversion operation is immediately started. The A/D conversion operations are repeated until new data is written to ADS.

If ADM, ADS, the power-fail comparison mode register (PFM), and the power-fail comparison threshold register (PFT) are rewritten during A/D conversion, the A/D conversion operation under execution is stopped and restarted from the beginning.

If 0 is written to ADCS during A/D conversion, A/D conversion is immediately stopped. At this time, the conversion result is undefined.

Figure 13-11. A/D Conversion Operation

Remarks 1. n = 0 to 7

2. m = 0 to 7

(2) Power-fail detection function (when PFEN = 1)

By setting bit 7 (ADCS) of the A/D converter mode register (ADM) to 1 and bit 7 (PFEN) of the power-fail comparison mode register (PFM) to 1, the A/D conversion operation of the voltage applied to the analog input pin specified by the analog input channel specification register (ADS) is started.

When the A/D conversion has been completed, the result of the A/D conversion is stored in the A/D conversion result register (ADCR), the values are compared with power-fail comparison threshold register (PFT), and an interrupt request signal (INTAD) is generated under the condition specified by bit 6 (PFCM) of PFM.

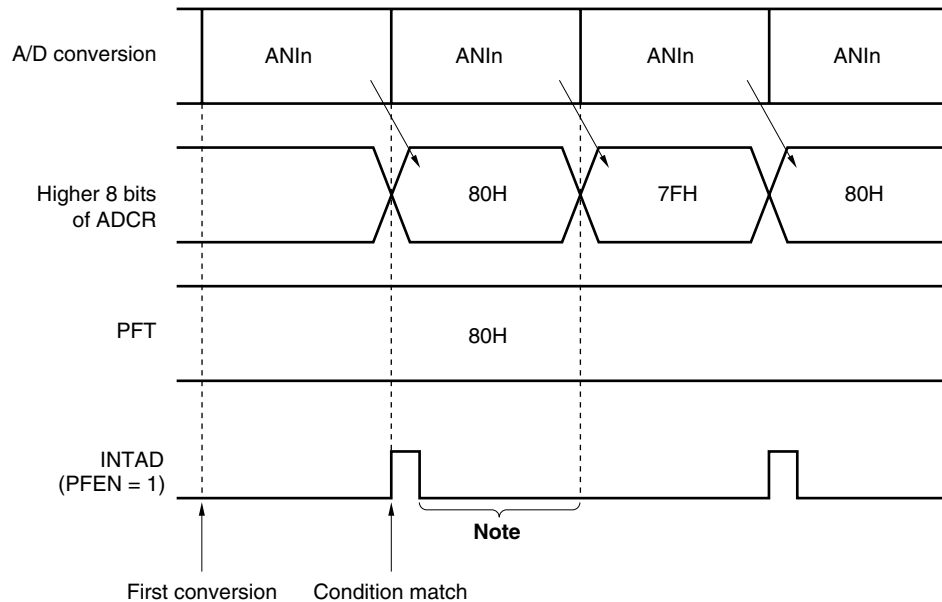

<1> When PFEN = 1 and PFCM = 0

The higher 8 bits of ADCR and PFT values are compared when A/D conversion ends and INTAD is only generated when the higher 8 bits of ADCR \geq PFT.

<2> When PFEN = 1 and PFCM = 1

The higher 8 bits of ADCR and PFT values are compared when A/D conversion ends and INTAD is only generated when the higher 8 bits of ADCR $<$ PFT.

Figure 13-12. Power-Fail Detection (When PFEN = 1 and PFCM = 0)

Note If the conversion result is not read before the end of the next conversion after INTAD is output, the result is replaced by the next conversion result.

Remark n = 0 to 7

The setting methods are described below.

- When used as A/D conversion operation
 - <1> Set bit 0 (ADCE) of the A/D converter mode register (ADM) to 1.
 - <2> Select the channel and conversion time using bits 2 to 0 (ADS2 to ADS0) of the analog input channel specification register (ADS) and bits 5 to 3 (FR2 to FR0) of ADM.
 - <3> Set bit 7 (ADCS) of ADM to 1 to start A/D conversion.
 - <4> An interrupt request signal (INTAD) is generated.
 - <5> Transfer the A/D conversion data to the A/D conversion result register (ADCR).
- <Change the channel>
 - <6> Change the channel using bits 2 to 0 (ADS2 to ADS0) of ADS to start A/D conversion.
 - <7> An interrupt request signal (INTAD) is generated.
 - <8> Transfer the A/D conversion data to the A/D conversion result register (ADCR).
- <Complete A/D conversion>
 - <9> Clear ADCS to 0.
 - <10> Clear ADCE to 0.

- Cautions**
1. Make sure the period of <1> to <3> is 14 μ s or more.
 2. It is no problem if the order of <1> and <2> is reversed.
 3. <1> can be omitted. However, do not use the first conversion result after <3> in this case.
 4. The period from <4> to <7> differs from the conversion time set using bits 5 to 3 (FR2 to FR0) of ADM. The period from <6> to <7> is the conversion time set using FR2 to FR0.

- When used as power-fail detection function
 - <1> Set bit 7 (PFEN) of the power-fail comparison mode register (PFM).
 - <2> Set power-fail comparison condition using bit 6 (PFCM) of PFM.
 - <3> Set bit 0 (ADCE) of the A/D converter mode register (ADM) to 1.
 - <4> Select the channel and conversion time using bits 2 to 0 (ADS2 to ADS0) of the analog input channel specification register (ADS) and bits 5 to 3 (FR2 to FR0) of ADM.
 - <5> Set a threshold value to the power-fail comparison threshold register (PFT).
 - <6> Set bit 7 (ADCS) of ADM to 1.
 - <7> Transfer the A/D conversion data to the A/D conversion result register (ADCR).
 - <8> The higher 8 bits of ADCR and PFT are compared and an interrupt request signal (INTAD) is generated if the conditions match.
- <Change the channel>
 - <9> Change the channel using bits 2 to 0 (ADS2 to ADS0) of ADS.
 - <10> Transfer the A/D conversion data to the A/D conversion result register (ADCR).
 - <11> The higher 8 bits of ADCR and the power-fail comparison threshold register (PFT) are compared and an interrupt request signal (INTAD) is generated if the conditions match.
- <Complete A/D conversion>
 - <12> Clear ADCS to 0.
 - <13> Clear ADCE to 0.

- Cautions**
1. Make sure the period of <3> to <6> is 14 μ s or more.
 2. It is no problem if the order of <3>, <4>, and <5> is changed.
 3. <3> must not be omitted if the power-fail function is used.
 4. The period from <7> to <11> differs from the conversion time set using bits 5 to 3 (FR2 to FR0) of ADM. The period from <9> to <11> is the conversion time set using FR2 to FR0.

13.5 How to Read A/D Converter Characteristics Table

Here, special terms unique to the A/D converter are explained.

(1) Resolution

This is the minimum analog input voltage that can be identified. That is, the percentage of the analog input voltage per bit of digital output is called 1LSB (Least Significant Bit). The percentage of 1LSB with respect to the full scale is expressed by %FSR (Full Scale Range).

1LSB is as follows when the resolution is 10 bits.

$$\begin{aligned} 1\text{LSB} &= 1/2^{10} = 1/1024 \\ &= 0.098\%\text{FSR} \end{aligned}$$

Accuracy has no relation to resolution, but is determined by overall error.

(2) Overall error

This shows the maximum error value between the actual measured value and the theoretical value.

Zero-scale error, full-scale error, integral linearity error, and differential linearity errors that are combinations of these express the overall error.

Note that the quantization error is not included in the overall error in the characteristics table.

(3) Quantization error

When analog values are converted to digital values, a $\pm 1/2\text{LSB}$ error naturally occurs. In an A/D converter, an analog input voltage in a range of $\pm 1/2\text{LSB}$ is converted to the same digital code, so a quantization error cannot be avoided.

Note that the quantization error is not included in the overall error, zero-scale error, full-scale error, integral linearity error, and differential linearity error in the characteristics table.

Figure 13-13. Overall Error

Figure 13-14. Quantization Error

(4) Zero-scale error

This shows the difference between the actual measurement value of the analog input voltage and the theoretical value ($1/2\text{LSB}$) when the digital output changes from $0.....000$ to $0.....001$.

If the actual measurement value is greater than the theoretical value, it shows the difference between the actual measurement value of the analog input voltage and the theoretical value ($3/2\text{LSB}$) when the digital output changes from $0.....001$ to $0.....010$.

(5) Full-scale error

This shows the difference between the actual measurement value of the analog input voltage and the theoretical value (Full-scale – 3/2LSB) when the digital output changes from 1.....110 to 1.....111.

(6) Integral linearity error

This shows the degree to which the conversion characteristics deviate from the ideal linear relationship. It expresses the maximum value of the difference between the actual measurement value and the ideal straight line when the zero-scale error and full-scale error are 0.

(7) Differential linearity error

While the ideal width of code output is 1LSB, this indicates the difference between the actual measurement value and the ideal value.

Figure 13-15. Zero-Scale Error

Figure 13-16. Full-Scale Error

Figure 13-17. Integral Linearity Error

Figure 13-18. Differential Linearity Error

(8) Conversion time

This expresses the time from the start of sampling to when the digital output is obtained. The sampling time is included in the conversion time in the characteristics table.

(9) Sampling time

This is the time the analog switch is turned on for the analog voltage to be sampled by the sample & hold circuit.

13.6 Cautions for A/D Converter

(1) Operating current in standby mode

The A/D converter stops operating in the standby mode. At this time, the operating current can be reduced by clearing bit 7 (ADCS) of the A/D converter mode register (ADM) to 0 (see **Figure 13-2**).

(2) Input range of ANI0 to ANI7

Observe the rated range of the ANI0 to ANI7 input voltage. If a voltage of AV_{REF} or higher and AV_{SS} or lower (even in the range of absolute maximum ratings) is input to an analog input channel, the converted value of that channel becomes undefined. In addition, the converted values of the other channels may also be affected.

(3) Conflicting operations

<1> Conflict between A/D conversion result register (ADCR) write and ADCR read by instruction upon the end of conversion

ADCR read has priority. After the read operation, the new conversion result is written to ADCR.

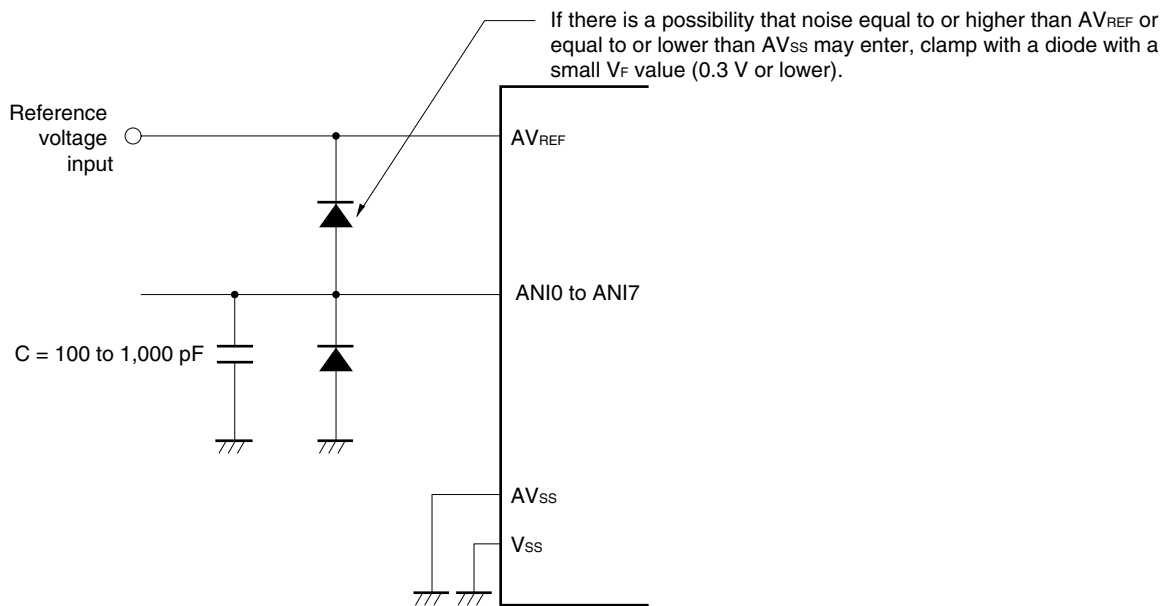

<2> Conflict between ADCR write and A/D converter mode register (ADM) write or analog input channel specification register (ADS) write upon the end of conversion

ADM or ADS write has priority. ADCR write is not performed, nor is the conversion end interrupt signal (INTAD) generated.

(4) Noise countermeasures

To maintain the 10-bit resolution, attention must be paid to noise input to the AV_{REF} pin and pins ANI0 to ANI7. Because the effect increases in proportion to the output impedance of the analog input source, it is recommended that a capacitor be connected externally, as shown in Figure 13-19, to reduce noise.

Figure 13-19. Analog Input Pin Connection

(5) ANI0/P20 to ANI7/P27

- <1> The analog input pins (ANI0 to ANI7) are also used as input port pins (P20 to P27).
When A/D conversion is performed with any of ANI0 to ANI7 selected, do not access port 2 while conversion is in progress; otherwise the conversion resolution may be degraded.
- <2> If a digital pulse is applied to the pins adjacent to the pins currently used for A/D conversion, the expected value of the A/D conversion may not be obtained due to coupling noise. Therefore, do not apply a pulse to the pins adjacent to the pin undergoing A/D conversion.

(6) Input impedance of ANI0 to ANI7 pins

In this A/D converter, the internal sampling capacitor is charged and sampling is performed for approx. one sixth of the conversion time.

Since only the leakage current flows other than during sampling and the current for charging the capacitor also flows during sampling, the input impedance fluctuates and has no meaning.

To perform sufficient sampling, however, it is recommended to make the output impedance of the analog input source 10 k Ω or lower, or connect a capacitor of around 100 pF to the ANI0 to ANI7 pins (see **Figure 13-19**).

(7) AV_{REF} pin input impedance

A series resistor string of several tens of k Ω is connected between the AV_{REF} and AV_{SS} pins.

Therefore, if the output impedance of the reference voltage source is high, this will result in a series connection to the series resistor string between the AV_{REF} and AV_{SS} pins, resulting in a large reference voltage error.

(8) Interrupt request flag (ADIF)

The interrupt request flag (ADIF) is not cleared even if the analog input channel specification register (ADS) is changed.

Therefore, if an analog input pin is changed during A/D conversion, the A/D conversion result and ADIF for the pre-change analog input may be set just before the ADS rewrite. Caution is therefore required since, at this time, when ADIF is read immediately after the ADS rewrite, ADIF is set despite the fact A/D conversion for the post-change analog input has not ended.

When A/D conversion is stopped and then resumed, clear ADIF before the A/D conversion operation is resumed.

Figure 13-20. Timing of A/D Conversion End Interrupt Request Generation

- Remarks 1.** $n = 0$ to 7
2. $m = 0$ to 7

(9) Conversion results just after A/D conversion start

The A/D conversion value immediately after A/D conversion starts may not fall within the rating range if the ADCS bit is set to 1 within $14 \mu\text{s}$ after the ADCE bit was set to 1, or if the ADCS bit is set to 1 with the ADCE bit = 0. Take measures such as polling the A/D conversion end interrupt request (INTAD) and removing the first conversion result.

(10) A/D conversion result register (ADCR) read operation

When a write operation is performed to the A/D converter mode register (ADM) and analog input channel specification register (ADS), the contents of ADCR may become undefined. Read the conversion result following conversion completion before writing to ADM and ADS. Using a timing other than the above may cause an incorrect conversion result to be read.

(11) A/D converter sampling time and A/D conversion start delay time

The A/D converter sampling time differs depending on the set value of the A/D converter mode register (ADM). The delay time exists until actual sampling is started after A/D converter operation is enabled. When using a set in which the A/D conversion time must be strictly observed, care is required for the contents shown in Figure 13-21 and Table 13-3.

Figure 13-21. Timing of A/D Converter Sampling and A/D Conversion Start Delay

Table 13-3. A/D Converter Sampling Time and A/D Conversion Start Delay Time (ADM Set Value)

FR2	FR1	FR0	Conversion Time	Sampling Time	A/D Conversion Start Delay Time ^{Note}	
					MIN.	MAX.
0	0	0	288/f _x	40/f _x	32/f _x	36/f _x
0	0	1	240/f _x	32/f _x	28/f _x	32/f _x
0	1	0	192/f _x	24/f _x	24/f _x	28/f _x
1	0	0	144/f _x	20/f _x	16/f _x	18/f _x
1	0	1	120/f _x	16/f _x	14/f _x	16/f _x
1	1	0	96/f _x	12/f _x	12/f _x	14/f _x
Other than above			Setting prohibited	—	—	—

Note The A/D conversion start delay time is the time after wait period. For the wait function, see **CHAPTER 34 CAUTIONS FOR WAIT.**

Remark f_x: High-speed system clock oscillation frequency

(12) Register generating wait cycle

Do not read data from the ADCR register and do not write data to the ADM, ADS, PFM, and PFT registers while the CPU is operating on the subsystem clock and while high-speed system clock oscillation is stopped.

(13) Internal equivalent circuit

The equivalent circuit of the analog input block is shown below.

Figure 13-22. Internal Equivalent Circuit of ANIn Pin

Table 13-4. Resistance and Capacitance Values of Equivalent Circuit (Reference Values)

AV_{REF}	R1	R2	C1	C2	C3
2.7 V	12 k Ω	8 k Ω	8 pF	3 pF	0.6 pF
4.5 V	4 k Ω	2.7 k Ω	8 pF	1.4 pF	0.6 pF

Remarks 1. The resistance and capacitance values shown in Table 13-4 are not guaranteed values.

2. n = 0 to 7

CHAPTER 14 SERIAL INTERFACE UART0

14.1 Functions of Serial Interface UART0

Serial interface UART0 has the following two modes.

(1) Operation stop mode

This mode is used when serial communication is not executed and can enable a reduction in the power consumption.

For details, see **14.4.1 Operation stop mode**.

(2) Asynchronous serial interface (UART) mode

The functions of this mode are outlined below.

For details, see **14.4.2 Asynchronous serial interface (UART) mode** and **14.4.3 Dedicated baud rate generator**.

- Two-pin configuration
TxD0: Transmit data output pin
RxD0: Receive data input pin
- Length of communication data can be selected from 7 or 8 bits.
- Dedicated on-chip 5-bit baud rate generator allowing any baud rate to be set
- Transmission and reception can be performed independently.
- Four operating clock inputs selectable
- Fixed to LSB-first communication

- Cautions**
- 1. If clock supply to serial interface UART0 is not stopped (e.g., in the HALT mode), normal operation continues. If clock supply to serial interface UART0 is stopped (e.g., in the STOP mode), each register stops operating, and holds the value immediately before clock supply was stopped. The TxD0 pin also holds the value immediately before clock supply was stopped and outputs it. However, the operation is not guaranteed after clock supply is resumed. Therefore, reset the circuit so that POWER0 = 0, RXE0 = 0, and TXE0 = 0.**
 - 2. Set POWER0 = 1 and then set TXE0 = 1 (transmission) or RXE0 = 1 (reception) to start communication.**
 - 3. TXE0 and RXE0 are synchronized by the base clock (f_{CLK0}) set by BRGC0. To enable transmission or reception again, set TXE0 or RXE0 to 1 at least two clocks of base clock after TXE0 or RXE0 has been cleared to 0. If TXE0 or RXE0 is set within two clocks of base clock, the transmission circuit or reception circuit may not be initialized.**

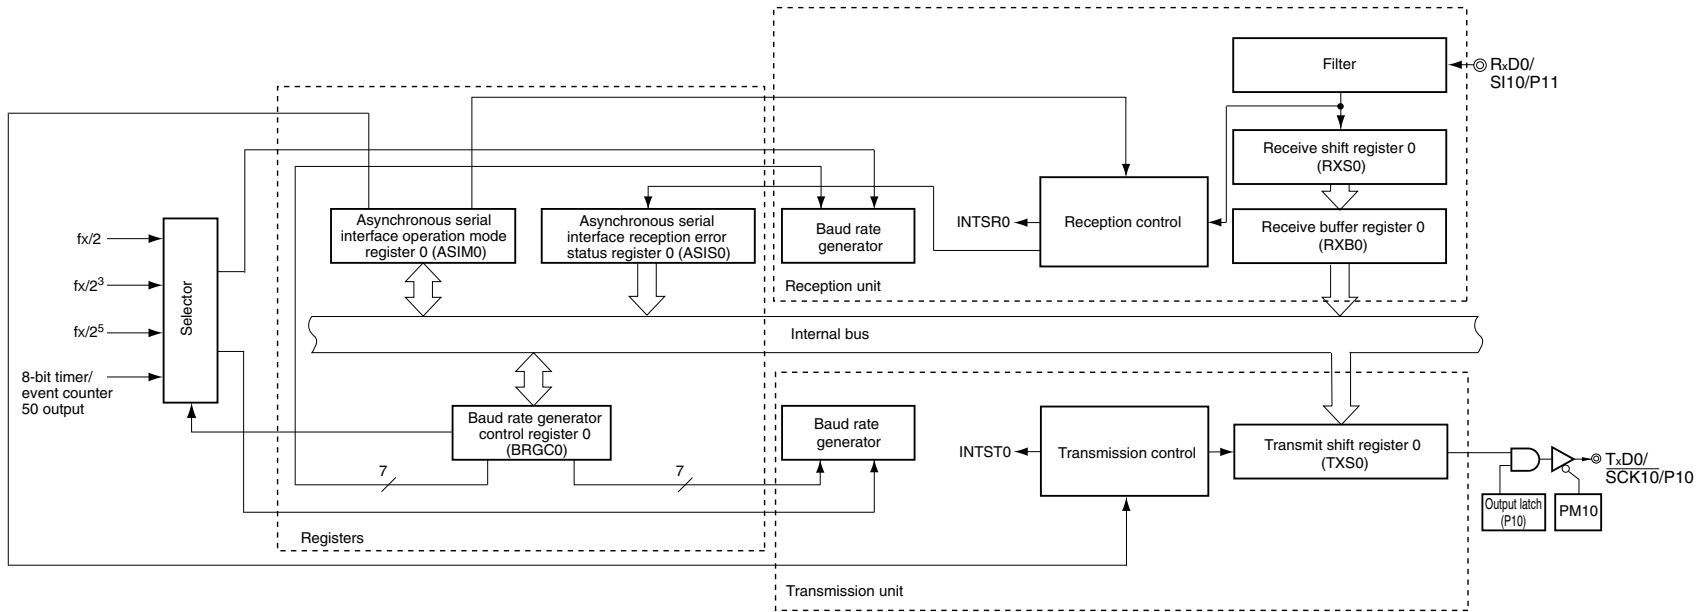

14.2 Configuration of Serial Interface UART0

Serial interface UART0 includes the following hardware.

Table 14-1. Configuration of Serial Interface UART0

Item	Configuration
Registers	Receive buffer register 0 (RXB0) Receive shift register 0 (RXS0) Transmit shift register 0 (TXS0)
Control registers	Asynchronous serial interface operation mode register 0 (ASIM0) Asynchronous serial interface reception error status register 0 (ASIS0) Baud rate generator control register 0 (BRGC0) Port mode register 1 (PM1) Port register 1 (P1)

Figure 14-1. Block Diagram of Serial Interface UART0

(1) Receive buffer register 0 (RXB0)

This 8-bit register stores parallel data converted by receive shift register 0 (RXS0).

Each time 1 byte of data has been received, new receive data is transferred to this register from receive shift register 0 (RXS0).

If the data length is set to 7 bits the receive data is transferred to bits 0 to 6 of RXB0 and the MSB of RXB0 is always 0.

If an overrun error (OVE0) occurs, the receive data is not transferred to RXB0.

RXB0 can be read by an 8-bit memory manipulation instruction. No data can be written to this register.

$\overline{\text{RESET}}$ input or POWER0 = 0 sets this register to FFH.

(2) Receive shift register 0 (RXS0)

This register converts the serial data input to the RxD0 pin into parallel data.

RXS0 cannot be directly manipulated by a program.

(3) Transmit shift register 0 (TXS0)

This register is used to set transmit data. Transmission is started when data is written to TXS0, and serial data is transmitted from the TxD0 pins.

TXS0 can be written by an 8-bit memory manipulation instruction. This register cannot be read.

$\overline{\text{RESET}}$ input, POWER0 = 0, or TXE0 = 0 sets this register to FFH.

Caution Do not write the next transmit data to TXS0 before the transmission completion interrupt signal (INTST0) is generated.

14.3 Registers Controlling Serial Interface UART0

Serial interface UART0 is controlled by the following five registers.

- Asynchronous serial interface operation mode register 0 (ASIM0)
- Asynchronous serial interface reception error status register 0 (ASIS0)
- Baud rate generator control register 0 (BRGC0)
- Port mode register 1 (PM1)
- Port register 1 (P1)

(1) Asynchronous serial interface operation mode register 0 (ASIM0)

This 8-bit register controls the serial communication operations of serial interface UART0.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to 01H.

Figure 14-2. Format of Asynchronous Serial Interface Operation Mode Register 0 (ASIM0) (1/2)

Address: FF70H After reset: 01H R/W

Symbol	<7>	<6>	<5>	4	3	2	1	0
ASIM0	POWER0	TXE0	RXE0	PS01	PS00	CL0	SL0	1

POWER0	Enables/disables operation of internal operation clock
0 ^{Note 1}	Disables operation of the internal operation clock (fixes the clock to low level) and asynchronously resets the internal circuit ^{Note 2} .
1	Enables operation of the internal operation clock.

TXE0	Enables/disables transmission
0	Disables transmission (synchronously resets the transmission circuit).
1	Enables transmission.

RXE0	Enables/disables reception
0	Disables reception (synchronously resets the reception circuit).
1	Enables reception.

- Notes**
1. The input from the RxD0 pin is fixed to high level when POWER0 = 0.
 2. Asynchronous serial interface reception error status register 0 (ASIS0), transmit shift register 0 (TXS0), and receive buffer register 0 (RXB0) are reset.

Figure 14-2. Format of Asynchronous Serial Interface Operation Mode Register 0 (ASIM0) (2/2)

PS01	PS00	Transmission operation	Reception operation
0	0	Does not output parity bit.	Reception without parity
0	1	Outputs 0 parity.	Reception as 0 parity ^{Note}
1	0	Outputs odd parity.	Judges as odd parity.
1	1	Outputs even parity.	Judges as even parity.

CL0	Specifies character length of transmit/receive data
0	Character length of data = 7 bits
1	Character length of data = 8 bits

SL0	Specifies number of stop bits of transmit data
0	Number of stop bits = 1
1	Number of stop bits = 2

Note If “reception as 0 parity” is selected, the parity is not judged. Therefore, bit 2 (PE0) of asynchronous serial interface reception error status register 0 (ASIS0) is not set and the error interrupt does not occur.

- Cautions**
1. At startup, set POWER0 to 1 and then set TXE0 to 1. To stop the operation, clear TXE0 to 0, and then clear POWER0 to 0.
 2. At startup, set POWER0 to 1 and then set RXE0 to 1. To stop the operation, clear RXE0 to 0, and then clear POWER0 to 0.
 3. Set POWER0 to 1 and then set RXE0 to 1 while a high level is input to the RxD0 pin. If POWER0 is set to 1 and RXE0 is set to 1 while a low level is input, reception is started.
 4. TXE0 and RXE0 are synchronized by the base clock (f_{XCLK0}) set by BRGC0. To enable transmission or reception again, set TXE0 or RXE0 to 1 at least two clocks of base clock after TXE0 or RXE0 has been cleared to 0. If TXE0 or RXE0 is set within two clocks of base clock, the transmission circuit or reception circuit may not be initialized.
 5. Clear the TXE0 and RXE0 bits to 0 before rewriting the PS01, PS00, and CL0 bits.
 6. Make sure that TXE0 = 0 when rewriting the SL0 bit. Reception is always performed with “number of stop bits = 1”, and therefore, is not affected by the set value of the SL0 bit.
 7. Be sure to set bit 0 to 1.

(2) Asynchronous serial interface reception error status register 0 (ASIS0)

This register indicates an error status on completion of reception by serial interface UART0. It includes three error flag bits (PE0, FE0, OVE0).

This register is read-only by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input or clearing bit 7 (POWER0) or bit 5 (RXE0) of ASIM0 to 0 clears this register to 00H. 00H is read when this register is read.

Figure 14-3. Format of Asynchronous Serial Interface Reception Error Status Register 0 (ASIS0)

Address: FF73H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIS0	0	0	0	0	0	PE0	FE0	OVE0

PE0	Status flag indicating parity error
0	If POWER0 = 0 and RXE0 = 0, or if ASIS0 register is read.
1	If the parity of transmit data does not match the parity bit on completion of reception.

FE0	Status flag indicating framing error
0	If POWER0 = 0 and RXE0 = 0, or if ASIS0 register is read.
1	If the stop bit is not detected on completion of reception.

OVE0	Status flag indicating overrun error
0	If POWER0 = 0 and RXE0 = 0, or if ASIS0 register is read.
1	If receive data is set to the RXB0 register and the next reception operation is completed before the data is read.

- Cautions**
1. The operation of the PE0 bit differs depending on the set values of the PS01 and PS00 bits of asynchronous serial interface operation mode register 0 (ASIM0).
 2. Only the first bit of the receive data is checked as the stop bit, regardless of the number of stop bits.
 3. If an overrun error occurs, the next receive data is not written to receive buffer register 0 (RXB0) but discarded.
 4. If data is read from ASIS0, a wait cycle is generated. Do not read data from ASIS0 when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(3) Baud rate generator control register 0 (BRGC0)

This register selects the base clock of serial interface UART0 and the division value of the 5-bit counter.

BRGC0 can be set by an 8-bit memory manipulation instruction.

RESET input sets this register to 1FH.

Figure 14-4. Format of Baud Rate Generator Control Register 0 (BRGC0)

Address: FF71H After reset: 1FH R/W

Symbol	7	6	5	4	3	2	1	0
BRGC0	TPS01	TPS00	0	MDL04	MDL03	MDL02	MDL01	MDL00

TPS01	TPS00	Base clock (f _{XCLK0}) selection ^{Note 1}
0	0	TM50 output ^{Note 2}
0	1	f _X /2 (5 MHz)
1	0	f _X /2 ³ (1.25 MHz)
1	1	f _X /2 ⁵ (312.5 kHz)

MDL04	MDL03	MDL02	MDL01	MDL00	k	Selection of 5-bit counter output clock
0	0	×	×	×	×	Setting prohibited
0	1	0	0	0	8	f _{XCLK0} /8
0	1	0	0	1	9	f _{XCLK0} /9
0	1	0	1	0	10	f _{XCLK0} /10
•	•	•	•	•	•	•
•	•	•	•	•	•	•
•	•	•	•	•	•	•
1	1	0	1	0	26	f _{XCLK0} /26
1	1	0	1	1	27	f _{XCLK0} /27
1	1	1	0	0	28	f _{XCLK0} /28
1	1	1	0	1	29	f _{XCLK0} /29
1	1	1	1	0	30	f _{XCLK0} /30
1	1	1	1	1	31	f _{XCLK0} /31

Notes 1. Be sure to set the base clock so that the following condition is satisfied.

- V_{DD} = 4.0 to 5.5 V: Base clock ≤ 10 MHz
- V_{DD} = 3.3 to 4.0 V: Base clock ≤ 8.38 MHz
- V_{DD} = 2.7 to 3.3 V: Base clock ≤ 5 MHz
- V_{DD} = 2.5 to 2.7 V: Base clock ≤ 2.5 MHz (standard products, (A) grade products only)

2. Note the following points when selecting the TM50 output as the base clock.

- PWM mode (TMC506 = 1)
Start the operation of 8-bit timer/event counter 50 first and then set the count clock to make the duty = 50%.
- Mode in which the count clock is cleared and started upon a match of TM50 and CR50 (TMC506 = 0)
Start the operation of 8-bit timer/event counter 50 first and then enable the timer F/F inversion operation (TMC501 = 1).

It is not necessary to enable the TO50 pin as a timer output pin in any mode.

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the base clock is the internal oscillation clock, the operation of serial interface UART0 is not guaranteed.
 2. Make sure that bit 6 (TXE0) and bit 5 (RXE0) of the ASIM0 register = 0 when rewriting the MDL04 to MDL00 bits.
 3. The baud rate value is the output clock of the 5-bit counter divided by 2.

- Remarks**
1. f_{CLK0} : Frequency of base clock selected by the TPS01 and TPS00 bits
 2. f_x : High-speed system clock oscillation frequency
 3. k : Value set by the MDL04 to MDL00 bits ($k = 8, 9, 10, \dots, 31$)
 4. \times : Don't care
 5. Figures in parentheses apply to operation at $f_x = 10$ MHz
 6. TMC506: Bit 6 of 8-bit timer mode control register 50 (TMC50)
TMC501: Bit 1 of TMC50

(4) Port mode register 1 (PM1)

This register sets port 1 input/output in 1-bit units.

When using the P10/TxD0/SCK10 pin for serial interface data output, clear PM10 to 0 and set the output latch of P10 to 1.

When using the P11/RxD0/SI10 pin for serial interface data input, set PM11 to 1. The output latch of P11 at this time may be 0 or 1.

PM1 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Figure 14-5. Format of Port Mode Register 1 (PM1)

Address: FF21H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM1	PM17	PM16	PM15	PM14	PM13	PM12	PM11	PM10
PM1n	P1n pin I/O mode selection (n = 0 to 7)							
0	Output mode (output buffer on)							
1	Input mode (output buffer off)							

14.4 Operation of Serial Interface UART0

Serial interface UART0 has the following two modes.

- Operation stop mode
- Asynchronous serial interface (UART) mode

14.4.1 Operation stop mode

In this mode, serial communication cannot be executed, thus reducing the power consumption. In addition, the pins can be used as ordinary port pins in this mode. To set the operation stop mode, clear bits 7, 6, and 5 (POWER0, TXE0, and RXE0) of ASIM0 to 0.

(1) Register used

The operation stop mode is set by asynchronous serial interface operation mode register 0 (ASIM0).

ASIM0 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to 01H.

Address: FF70H After reset: 01H R/W

Symbol	<7>	<6>	<5>	4	3	2	1	0
ASIM0	POWER0	TXE0	RXE0	PS01	PS00	CL0	SL0	1

POWER0	Enables/disables operation of internal operation clock
0 ^{Note 1}	Disables operation of the internal operation clock (fixes the clock to low level) and asynchronously resets the internal circuit ^{Note 2} .

TXE0	Enables/disables transmission
0	Disables transmission (synchronously resets the transmission circuit).

RXE0	Enables/disables reception
0	Disables reception (synchronously resets the reception circuit).

- Notes**
1. The input from the RxD0 pin is fixed to high level when POWER0 = 0.
 2. Asynchronous serial interface reception error status register 0 (ASIS0), transmit shift register 0 (TXS0), and receive buffer register 0 (RXB0) are reset.

Caution Clear POWER0 to 0 after clearing TXE0 and RXE0 to 0 to set the operation stop mode. To start the operation, set POWER0 to 1, and then set TXE0 and RXE0 to 1.

Remark To use the RxD0/SI10/P11 and TxD0/ $\overline{\text{SCK}}10$ /P10 pins as general-purpose port pins, see **CHAPTER 4 PORT FUNCTIONS**.

14.4.2 Asynchronous serial interface (UART) mode

In this mode, 1-byte data is transmitted/received following a start bit, and a full-duplex operation can be performed.

A dedicated UART baud rate generator is incorporated, so that communication can be executed at a wide range of baud rates.

(1) Registers used

- Asynchronous serial interface operation mode register 0 (ASIM0)
- Asynchronous serial interface reception error status register 0 (ASIS0)
- Baud rate generator control register 0 (BRGC0)
- Port mode register 1 (PM1)
- Port register 1 (P1)

The basic procedure of setting an operation in the UART mode is as follows.

- <1> Set the BRGC0 register (see **Figure 14-4**).
- <2> Set bits 1 to 4 (SL0, CL0, PS00, and PS01) of the ASIM0 register (see **Figure 14-2**).
- <3> Set bit 7 (POWER0) of the ASIM0 register to 1.
- <4> Set bit 6 (TXE0) of the ASIM0 register to 1. → Transmission is enabled.
Set bit 5 (RXE0) of the ASIM0 register to 1. → Reception is enabled.
- <5> Write data to the TXS0 register. → Data transmission is started.

Caution Take relationship with the other party of communication when setting the port mode register and port register.

The relationship between the register settings and pins is shown below.

Table 14-2. Relationship Between Register Settings and Pins

POWER0	TXE0	RXE0	PM10	P10	PM11	P11	UART0 Operation	Pin Function	
								TxD0/ $\overline{\text{SCK10}}$ /P10	RxD0/SI10/P11
0	0	0	x ^{Note}	x ^{Note}	x ^{Note}	x ^{Note}	Stop	$\overline{\text{SCK10}}$ /P10	SI10/P11
1	0	1	x ^{Note}	x ^{Note}	1	x	Reception	$\overline{\text{SCK10}}$ /P10	RxD0
	1	0	0	1	x ^{Note}	x ^{Note}	Transmission	TxD0	SI10/P11
	1	1	0	1	1	x	Transmission/ reception	TxD0	RxD0

Note Can be set as port function.

Remark x: don't care
 POWER0: Bit 7 of asynchronous serial interface operation mode register 0 (ASIM0)
 TXE0: Bit 6 of ASIM0
 RXE0: Bit 5 of ASIM0
 PM1x: Port mode register
 P1x: Port output latch

(2) Communication operation

(a) Format and waveform example of normal transmit/receive data

Figures 14-6 and 14-7 show the format and waveform example of the normal transmit/receive data.

Figure 14-6. Format of Normal UART Transmit/Receive Data

One data frame consists of the following bits.

- Start bit ... 1 bit
- Character bits ... 7 or 8 bits (LSB first)
- Parity bit ... Even parity, odd parity, 0 parity, or no parity
- Stop bit ... 1 or 2 bits

The character bit length, parity, and stop bit length in one data frame are specified by asynchronous serial interface operation mode register 0 (ASIM0).

Figure 14-7. Example of Normal UART Transmit/Receive Data Waveform

1. Data length: 8 bits, Parity: Even parity, Stop bit: 1 bit, Communication data: 55H

2. Data length: 7 bits, Parity: Odd parity, Stop bit: 2 bits, Communication data: 36H

3. Data length: 8 bits, Parity: None, Stop bit: 1 bit, Communication data: 87H

(b) Parity types and operation

The parity bit is used to detect a bit error in communication data. Usually, the same type of parity bit is used on both the transmission and reception sides. With even parity and odd parity, a 1-bit (odd number) error can be detected. With zero parity and no parity, an error cannot be detected.

(i) Even parity

- Transmission

Transmit data, including the parity bit, is controlled so that the number of bits that are “1” is even.

The value of the parity bit is as follows.

If transmit data has an odd number of bits that are “1”: 1

If transmit data has an even number of bits that are “1”: 0

- Reception

The number of bits that are “1” in the receive data, including the parity bit, is counted. If it is odd, a parity error occurs.

(ii) Odd parity

- Transmission

Unlike even parity, transmit data, including the parity bit, is controlled so that the number of bits that are “1” is odd.

If transmit data has an odd number of bits that are “1”: 0

If transmit data has an even number of bits that are “1”: 1

- Reception

The number of bits that are “1” in the receive data, including the parity bit, is counted. If it is even, a parity error occurs.

(iii) 0 parity

The parity bit is cleared to 0 when data is transmitted, regardless of the transmit data.

The parity bit is not detected when the data is received. Therefore, a parity error does not occur regardless of whether the parity bit is “0” or “1”.

(iv) No parity

No parity bit is appended to the transmit data.

Reception is performed assuming that there is no parity bit when data is received. Because there is no parity bit, a parity error does not occur.

(c) Transmission

The TxD0 pin outputs a high level when bit 7 (POWER0) of asynchronous serial interface operation mode register 0 (ASIM0) is set to 1. If bit 6 (TXE0) of ASIM0 is then set to 1, transmission is enabled. Transmission can be started by writing transmit data to transmit shift register 0 (TXS0). The start bit, parity bit, and stop bit are automatically appended to the data.

When transmission is started, the start bit is output from the TxD0 pin, followed by the rest of the data in order starting from the LSB. When transmission is completed, the parity and stop bits set by ASIM0 are appended and a transmission completion interrupt request (INTST0) is generated.

Transmission is stopped until the data to be transmitted next is written to TXS0.

Figure 14-8 shows the timing of the transmission completion interrupt request (INTST0). This interrupt occurs as soon as the last stop bit has been output.

Caution After transmit data is written to TXS0, do not write the next transmit data before the transmission completion interrupt signal (INTST0) is generated.

Figure 14-8. Transmission Completion Interrupt Request Timing

1. Stop bit length: 1

2. Stop bit length: 2

(d) Reception

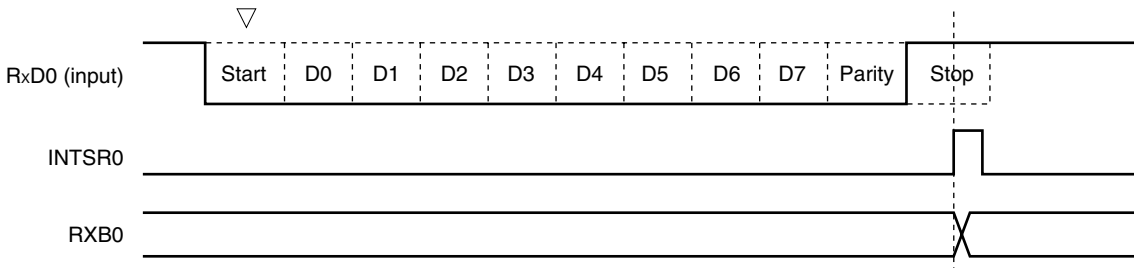

Reception is enabled and the RxD0 pin input is sampled when bit 7 (POWER0) of asynchronous serial interface operation mode register 0 (ASIM0) is set to 1 and then bit 5 (RXE0) of ASIM0 is set to 1.

The 5-bit counter of the baud rate generator starts counting when the falling edge of the RxD0 pin input is detected. When the set value of baud rate generator control register 0 (BRGC0) has been counted, the RxD0 pin input is sampled again (▽ in Figure 14-9). If the RxD0 pin is low level at this time, it is recognized as a start bit.

When the start bit is detected, reception is started, and serial data is sequentially stored in receive shift register 0 (RXS0) at the set baud rate. When the stop bit has been received, the reception completion interrupt (INTSR0) is generated and the data of RXS0 is written to receive buffer register 0 (RXB0). If an overrun error (OVE0) occurs, however, the receive data is not written to RXB0.

Even if a parity error (PE0) occurs while reception is in progress, reception continues to the reception position of the stop bit, and an error interrupt (INTSR0) is generated after completion of reception.

Figure 14-9. Reception Completion Interrupt Request Timing

- Cautions**
1. Be sure to read receive buffer register 0 (RXB0) even if a reception error occurs. Otherwise, an overrun error will occur when the next data is received, and the reception error status will persist.
 2. Reception is always performed with the “number of stop bits = 1”. The second stop bit is ignored.
 3. Be sure to read asynchronous serial interface reception error status register 0 (ASIS0) before reading RXB0.

(e) Reception error

Three types of errors may occur during reception: a parity error, framing error, or overrun error. If the error flag of asynchronous serial interface reception error status register 0 (ASIS0) is set as a result of data reception, a reception error interrupt request (INTSR0) is generated.

Which error has occurred during reception can be identified by reading the contents of ASIS0 in the reception error interrupt servicing (INTSR0) (see **Figure 14-3**).

The contents of ASIS0 are reset to 0 when ASIS0 is read.

Table 14-3. Cause of Reception Error

Reception Error	Cause
Parity error	The parity specified for transmission does not match the parity of the receive data.
Framing error	Stop bit is not detected.
Overrun error	Reception of the next data is completed before data is read from receive buffer register 0 (RXB0).

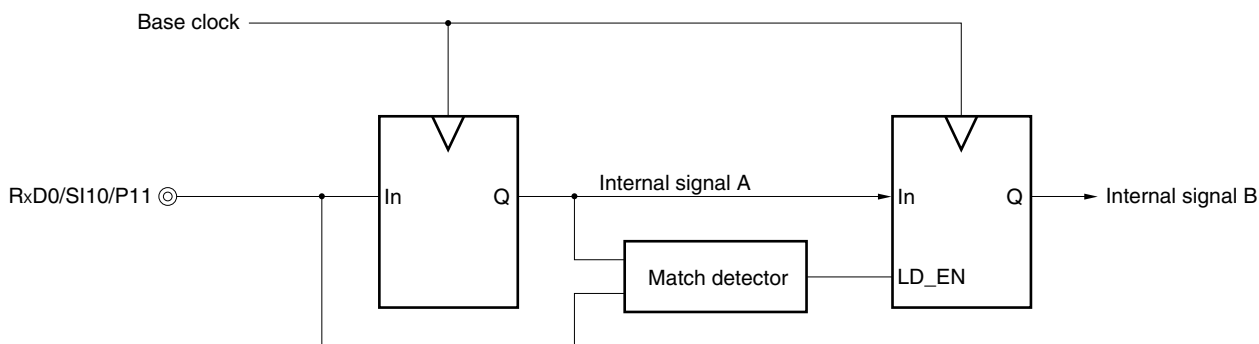

(f) Noise filter of receive data

The RxD0 signal is sampled using the base clock output by the prescaler block.

If two sampled values are the same, the output of the match detector changes, and the data is sampled as input data.

Because the circuit is configured as shown in Figure 14-10, the internal processing of the reception operation is delayed by two clocks from the external signal status.

Figure 14-10. Noise Filter Circuit

14.4.3 Dedicated baud rate generator

The dedicated baud rate generator consists of a source clock selector and a 5-bit programmable counter, and generates a serial clock for transmission/reception of UART0.

Separate 5-bit counters are provided for transmission and reception.

(1) Configuration of baud rate generator

- Base clock

The clock selected by bits 7 and 6 (TPS01 and TPS00) of baud rate generator control register 0 (BRGC0) is supplied to each module when bit 7 (POWER0) of asynchronous serial interface operation mode register 0 (ASIM0) is 1. This clock is called the base clock and its frequency is called f_{CLK0} . The base clock is fixed to low level when $POWER0 = 0$.

- Transmission counter

This counter stops operation, cleared to 0, when bit 7 (POWER0) or bit 6 (TXE0) of asynchronous serial interface operation mode register 0 (ASIM0) is 0.

It starts counting when $POWER0 = 1$ and $TXE0 = 1$.

The counter is cleared to 0 when the first data transmitted is written to transmit shift register 0 (TXS0).

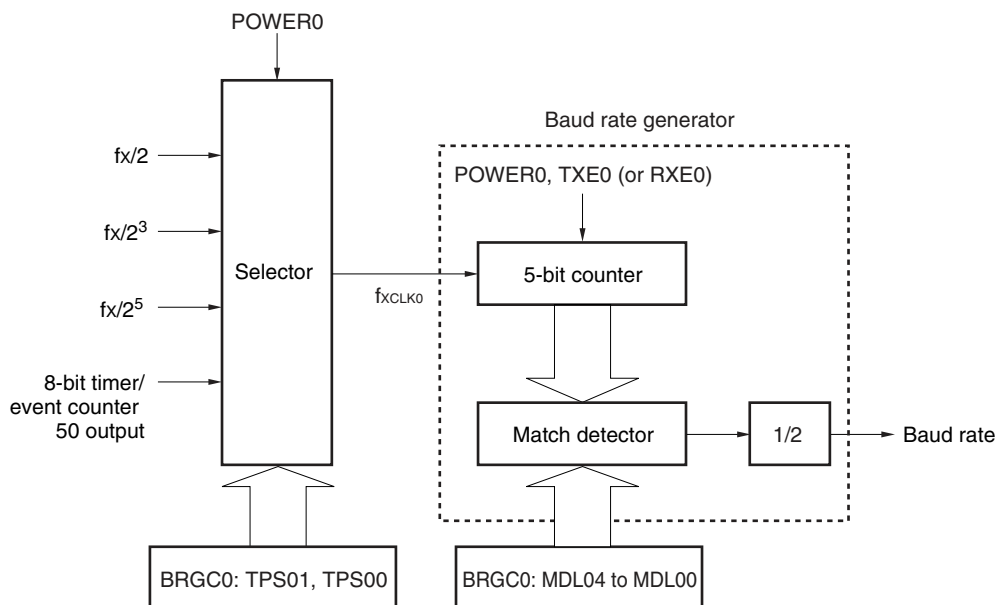

- Reception counter

This counter stops operation, cleared to 0, when bit 7 (POWER0) or bit 5 (RXE0) of asynchronous serial interface operation mode register 0 (ASIM0) is 0.

It starts counting when the start bit has been detected.

The counter stops operation after one frame has been received, until the next start bit is detected.

Figure 14-11. Configuration of Baud Rate Generator

Remark POWER0: Bit 7 of asynchronous serial interface operation mode register 0 (ASIM0)
 TXE0: Bit 6 of ASIM0
 RXE0: Bit 5 of ASIM0
 BRGC0: Baud rate generator control register 0

(2) Generation of serial clock

A serial clock can be generated by using baud rate generator control register 0 (BRGC0). Select the clock to be input to the 5-bit counter by using bits 7 and 6 (TPS01 and TPS00) of BRGC0. Bits 4 to 0 (MDL04 to MDL00) of BRGC0 can be used to select the division value of the 5-bit counter.

(a) Baud rate

The baud rate can be calculated by the following expression.

- Baud rate = $\frac{f_{XCLK0}}{2 \times k}$ [bps]

f_{XCLK0} : Frequency of base clock selected by the TPS01 and TPS00 bits of the BRGC0 register

k: Value set by the MDL04 to MDL00 bits of the BRGC0 register (k = 8, 9, 10, ..., 31)

(b) Error of baud rate

The baud rate error can be calculated by the following expression.

- Error (%) = $\left(\frac{\text{Actual baud rate (baud rate with error)}}{\text{Desired baud rate (correct baud rate)}} - 1 \right) \times 100$ [%]

Cautions 1. Keep the baud rate error during transmission to within the permissible error range at the reception destination.

2. Make sure that the baud rate error during reception satisfies the range shown in (4) Permissible baud rate range during reception.

Example: Frequency of base clock = 2.5 MHz = 2,500,000 Hz
Set value of MDL04 to MDL00 bits of BRGC0 register = 10000B (k = 16)
Target baud rate = 76,800 bps

$$\begin{aligned} \text{Baud rate} &= 2.5 \text{ M}/(2 \times 16) \\ &= 2,500,000/(2 \times 16) = 78,125 \text{ [bps]} \end{aligned}$$

$$\begin{aligned} \text{Error} &= (78,125/76,800 - 1) \times 100 \\ &= 1.725 \text{ [%]} \end{aligned}$$

(3) Example of setting baud rate

Table 14-4. Set Data of Baud Rate Generator

Baud Rate [bps]	fx = 10.0 MHz				fx = 8.38 MHz				fx = 4.19 MHz			
	TPS01, TPS00	k	Calculated Value	ERR[%]	TPS01, TPS00	k	Calculated Value	ERR[%]	TPS01, TPS00	k	Calculated Value	ERR[%]
2400	–	–	–	–	–	–	–	–	3	27	2425	1.03

31250	2	20	31250	0	2	17	30809	–1.41	–	–	–	–
38400	2	16	39063	1.73	2	14	37411	–2.58	1	27	38796	1.03
76800	2	8	78125	1.73	1	27	77593	1.03	1	14	74821	–2.58
115200	1	22	113636	–1.36	1	18	116389	1.03	1	9	116389	1.03
153600	1	16	156250	1.73	1	14	149643	–2.58	–	–	–	–
230400	1	11	227273	–1.36	1	9	232778	1.03	–	–	–	–

Remark TPS01, TPS00: Bits 7 and 6 of baud rate generator control register 0 (BRGC0) (setting of base clock (fxCLK0))

k: Value set by the MDL04 to MDL00 bits of BRGC0 (k = 8, 9, 10, ..., 31)

fx: High-speed system clock oscillation frequency

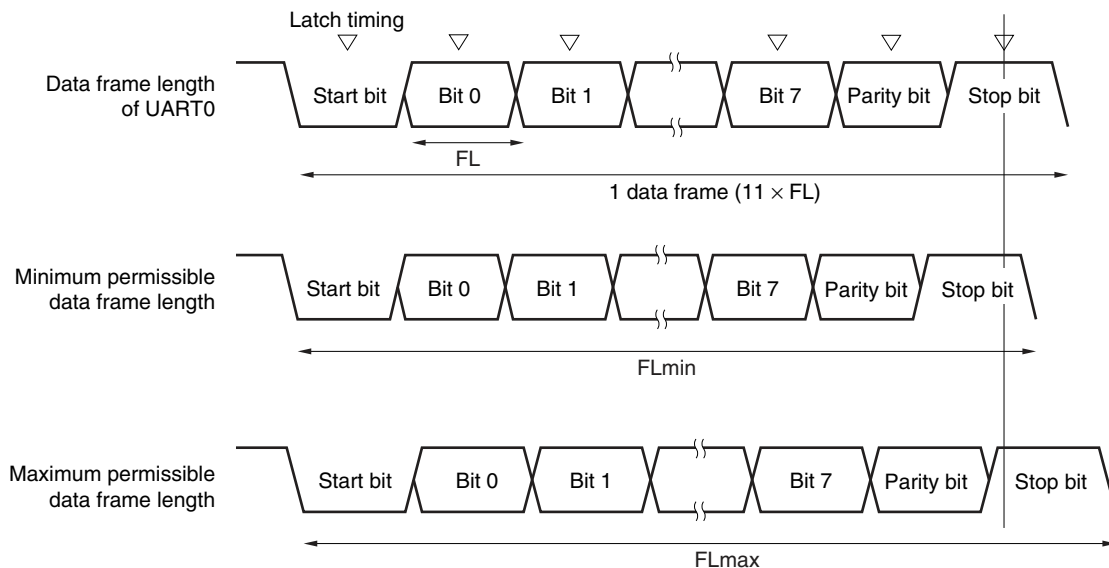

ERR: Baud rate error

(4) Permissible baud rate range during reception

The permissible error from the baud rate at the transmission destination during reception is shown below.

Caution Make sure that the baud rate error during reception is within the permissible error range, by using the calculation expression shown below.

Figure 14-12. Permissible Baud Rate Range During Reception

As shown in Figure 14-12, the latch timing of the receive data is determined by the counter set by baud rate generator control register 0 (BRGC0) after the start bit has been detected. If the last data (stop bit) meets this latch timing, the data can be correctly received.

Assuming that 11-bit data is received, the theoretical values can be calculated as follows.

$$FL = (\text{Brate})^{-1}$$

Brate: Baud rate of UART0

k: Set value of BRGC0

FL: 1-bit data length

Margin of latch timing: 2 clocks

$$\text{Minimum permissible data frame length: } FL_{\min} = 11 \times FL - \frac{k-2}{2k} \times FL = \frac{21k+2}{2k} FL$$

Therefore, the maximum receivable baud rate at the transmission destination is as follows.

$$BR_{\max} = (FL_{\min}/11)^{-1} = \frac{22k}{21k+2} \text{ Brate}$$

Similarly, the maximum permissible data frame length can be calculated as follows.

$$\frac{10}{11} \times FL_{\max} = 11 \times FL - \frac{k+2}{2 \times k} \times FL = \frac{21k-2}{2 \times k} FL$$

$$FL_{\max} = \frac{21k-2}{20k} FL \times 11$$

Therefore, the minimum receivable baud rate at the transmission destination is as follows.

$$BR_{\min} = (FL_{\max}/11)^{-1} = \frac{20k}{21k-2} \text{ Brate}$$

The permissible baud rate error between UART0 and the transmission destination can be calculated from the above minimum and maximum baud rate expressions, as follows.

Table 14-5. Maximum/Minimum Permissible Baud Rate Error

Division Ratio (k)	Maximum Permissible Baud Rate Error	Minimum Permissible Baud Rate Error
8	+3.53%	-3.61%
16	+4.14%	-4.19%
24	+4.34%	-4.38%
31	+4.44%	-4.47%

Remarks 1. The permissible error of reception depends on the number of bits in one frame, input clock frequency, and division ratio (k). The higher the input clock frequency and the higher the division ratio (k), the higher the permissible error.

2. k: Set value of BRGC0

CHAPTER 15 SERIAL INTERFACE UART6

15.1 Functions of Serial Interface UART6

Serial interface UART6 has the following two modes.

(1) Operation stop mode

This mode is used when serial communication is not executed and can enable a reduction in the power consumption.

For details, see **15.4.1 Operation stop mode**.

(2) Asynchronous serial interface (UART) mode

This mode supports the LIN (Local Interconnect Network)-bus. The functions of this mode are outlined below.

For details, see **15.4.2 Asynchronous serial interface (UART) mode** and **15.4.3 Dedicated baud rate generator**.

- Two-pin configuration TxD6: Transmit data output pin
RxD6: Receive data input pin
- Data length of communication data can be selected from 7 or 8 bits.
- Dedicated internal 8-bit baud rate generator allowing any baud rate to be set
- Transmission and reception can be performed independently.
- Twelve operating clock inputs selectable
- MSB- or LSB-first communication selectable
- Inverted transmission operation
- Synchronous break field transmission from 13 to 20 bits
- More than 11 bits can be identified for synchronous break field reception (SBF reception flag provided).

- Cautions**
1. **The TxD6 output inversion function inverts only the transmission side and not the reception side. To use this function, the reception side must be ready for reception of inverted data.**
 2. **If clock supply to serial interface UART6 is not stopped (e.g., in the HALT mode), normal operation continues. If clock supply to serial interface UART6 is stopped (e.g., in the STOP mode), each register stops operating, and holds the value immediately before clock supply was stopped. The TxD6 pin also holds the value immediately before clock supply was stopped and outputs it. However, the operation is not guaranteed after clock supply is resumed. Therefore, reset the circuit so that POWER6 = 0, RXE6 = 0, and TXE6 = 0.**
 3. **If data is continuously transmitted, the communication timing from the stop bit to the next start bit is extended two operating clocks of the macro. However, this does not affect the result of communication because the reception side initializes the timing when it has detected a start bit. Do not use the continuous transmission function if UART6 is used in the LIN communication operation.**

Remark LIN stands for Local Interconnect Network and is a low-speed (1 to 20 kbps) serial communication protocol intended to aid the cost reduction of an automotive network.

LIN communication is single-master communication, and up to 15 slaves can be connected to one master.

The LIN slaves are used to control the switches, actuators, and sensors, and these are connected to the LIN master via the LIN network.

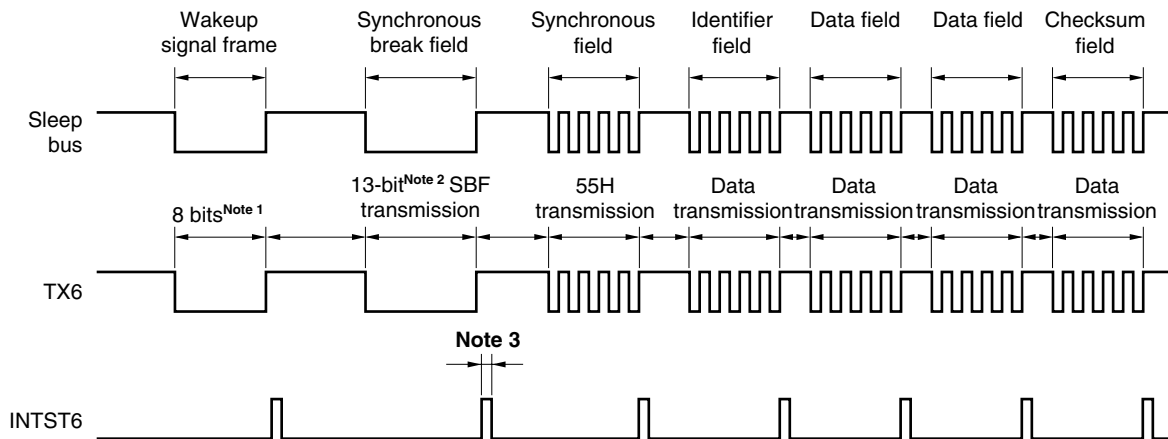

Normally, the LIN master is connected to a network such as CAN (Controller Area Network).

In addition, the LIN bus uses a single-wire method and is connected to the nodes via a transceiver that complies with ISO9141.

In the LIN protocol, the master transmits a frame with baud rate information and the slave receives it and corrects the baud rate error. Therefore, communication is possible when the baud rate error in the slave is $\pm 15\%$ or less.

Figures 15-1 and 15-2 outline the transmission and reception operations of LIN.

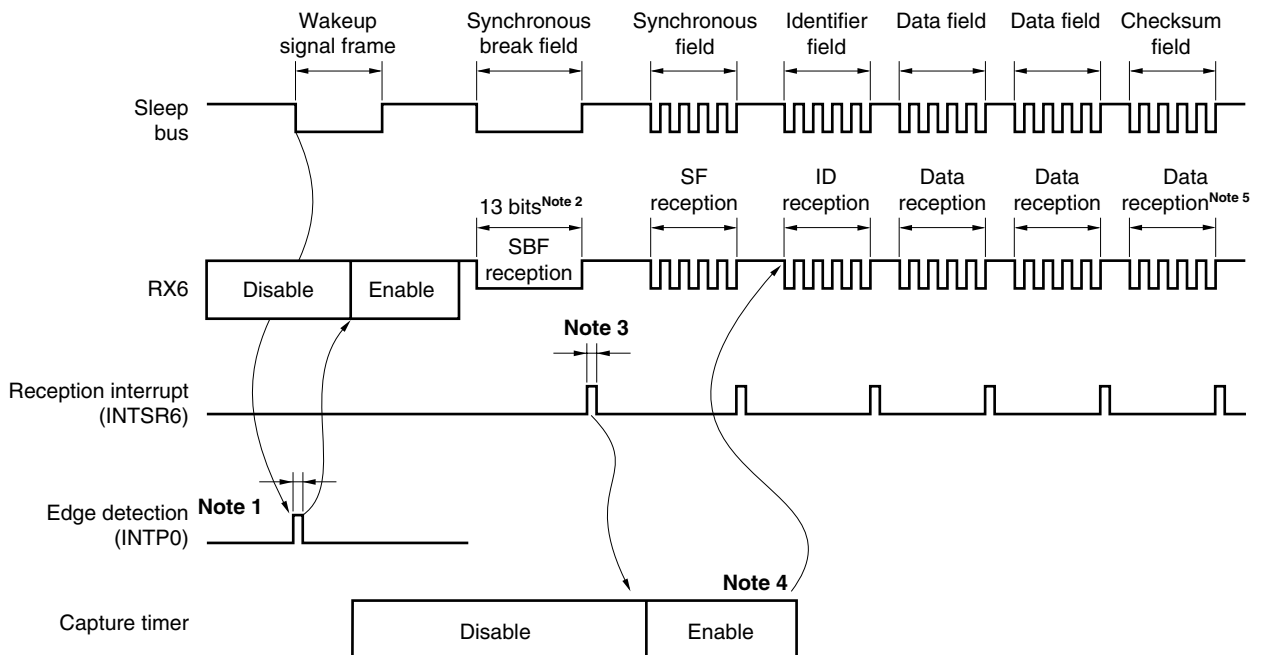

Figure 15-1. LIN Transmission Operation

- Notes**
1. The wakeup signal frame is substituted by 80H transmission in the 8-bit mode.
 2. The synchronous break field is output by hardware. The output width is the bit length set by bits 4 to 2 (SBL62 to SBL60) of asynchronous serial interface control register 6 (ASICL6) (see 15.4.2 (2) (h) SBF transmission).
 3. INTST6 is output on completion of each transmission. It is also output when SBF is transmitted.

Remark The interval between each field is controlled by software.

Figure 15-2. LIN Reception Operation

- Notes**
1. The wakeup signal is detected at the edge of the pin, and enables UART6 and sets the SBF reception mode.
 2. Reception continues until the STOP bit is detected. When an SBF with low-level data of 11 bits or more has been detected, it is assumed that SBF reception has been completed correctly, and an interrupt signal is output. If an SBF with low-level data of less than 11 bits has been detected, it is assumed that an SBF reception error has occurred. The interrupt signal is not output and the SBF reception mode is restored.
 3. If SBF reception has been completed correctly, an interrupt signal is output. This SBF reception completion interrupt enables the capture timer. Detection of errors OVE6, PE6, and FE6 is suppressed, and error detection processing of UART communication and data transfer of the shift register and RXB6 is not performed. The shift register holds the reset value FFH.
 4. Calculate the baud rate error from the bit length of the synchronous field, disable UART6 after SF reception, and then re-set baud rate generator control register 6 (BRGC6).
 5. Distinguish the checksum field by software. Also perform processing by software to initialize UART6 after reception of the checksum field and to set the SBF reception mode again.

To perform a LIN receive operation, use a configuration like the one shown in Figure 15-3.

The wakeup signal transmitted from the LIN master is received by detecting the edge of the external interrupt (INTP0). The length of the synchronous field transmitted from the LIN master can be measured using the external event capture operation of 16-bit timer/event counter 00, and the baud rate error can be calculated.

The input source of the reception port input (RxD6) can be input to the external interrupt (INTP0) and 16-bit timer/event counter 00 by port input switch control (ISC0/ISC1), without connecting RxD6 and INTP0/TI000 externally.

Figure 15-3. Port Configuration for LIN Reception Operation

Remark ISC0, ISC1: Bits 0 and 1 of the input switch control register (ISC) (see **Figure 15-11**)

The peripheral functions used in the LIN communication operation are shown below.

<Peripheral functions used>

- External interrupt (INTP0); wakeup signal detection
Use: Detects the wakeup signal edges and detects start of communication.
- 16-bit timer/event counter 00 (TI000); baud rate error detection
Use: Detects the baud rate error (measures the TI000 input edge interval in the capture mode) by detecting the sync field (SF) length and divides it by the number of bits.
- Serial interface UART6

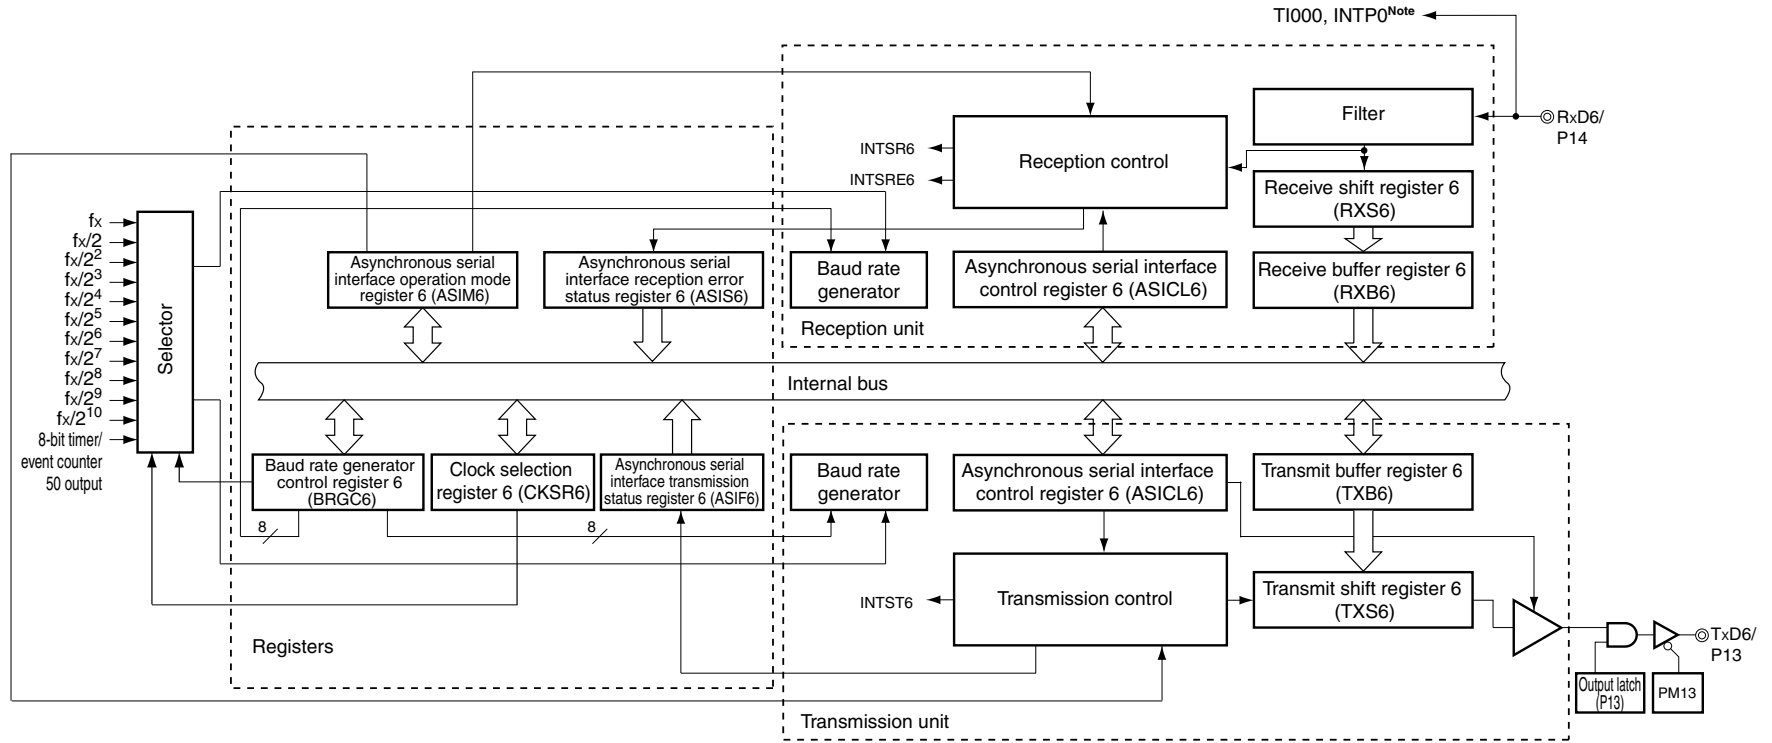

15.2 Configuration of Serial Interface UART6

Serial interface UART6 includes the following hardware.

Table 15-1. Configuration of Serial Interface UART6

Item	Configuration
Registers	Receive buffer register 6 (RXB6) Receive shift register 6 (RXS6) Transmit buffer register 6 (TXB6) Transmit shift register 6 (TXS6)
Control registers	Asynchronous serial interface operation mode register 6 (ASIM6) Asynchronous serial interface reception error status register 6 (ASIS6) Asynchronous serial interface transmission status register 6 (ASIF6) Clock selection register 6 (CKSR6) Baud rate generator control register 6 (BRGC6) Asynchronous serial interface control register 6 (ASICL6) Input switch control register (ISC) Port mode register 1 (PM1) Port register 1 (P1)

Figure 15-4. Block Diagram of Serial Interface UART6

Note Selectable with input switch control register (ISC).

(1) Receive buffer register 6 (RXB6)

This 8-bit register stores parallel data converted by receive shift register 6 (RXS6).

Each time 1 byte of data has been received, new receive data is transferred to this register from RXS6. If the data length is set to 7 bits, data is transferred as follows.

- In LSB-first reception, the receive data is transferred to bits 0 to 6 of RXB6 and the MSB of RXB6 is always 0.
- In MSB-first reception, the receive data is transferred to bits 1 to 7 of RXB6 and the LSB of RXB6 is always 0.

If an overrun error (OVE6) occurs, the receive data is not transferred to RXB6.

RXB6 can be read by an 8-bit memory manipulation instruction. No data can be written to this register.

$\overline{\text{RESET}}$ input sets this register to FFH.

(2) Receive shift register 6 (RXS6)

This register converts the serial data input to the RxD6 pin into parallel data.

RXS6 cannot be directly manipulated by a program.

(3) Transmit buffer register 6 (TXB6)

This buffer register is used to set transmit data. Transmission is started when data is written to TXB6.

This register can be read or written by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Cautions 1. Do not write data to TXB6 when bit 1 (TXBF6) of asynchronous serial interface transmission status register 6 (ASIF6) is 1.

2. Do not refresh (write the same value to) TXB6 by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of asynchronous serial interface operation mode register 6 (ASIM6) are 1 or when bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 are 1).

(4) Transmit shift register 6 (TXS6)

This register transmits the data transferred from TXB6 from the TxD6 pin as serial data. Data is transferred from TXB6 immediately after TXB6 is written for the first transmission, or immediately before INTST6 occurs after one frame was transmitted for continuous transmission. Data is transferred from TXB6 and transmitted from the TxD6 pin at the falling edge of the base clock.

TXS6 cannot be directly manipulated by a program.

15.3 Registers Controlling Serial Interface UART6

Serial interface UART6 is controlled by the following nine registers.

- Asynchronous serial interface operation mode register 6 (ASIM6)
- Asynchronous serial interface reception error status register 6 (ASIS6)
- Asynchronous serial interface transmission status register 6 (ASIF6)
- Clock selection register 6 (CKSR6)
- Baud rate generator control register 6 (BRGC6)
- Asynchronous serial interface control register 6 (ASICL6)
- Input switch control register (ISC)
- Port mode register 1 (PM1)
- Port register 1 (P1)

(1) Asynchronous serial interface operation mode register 6 (ASIM6)

This 8-bit register controls the serial communication operations of serial interface UART6.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to 01H.

Remark ASIM6 can be refreshed (the same value is written) by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1 or bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1).

Figure 15-5. Format of Asynchronous Serial Interface Operation Mode Register 6 (ASIM6) (1/2)

Address: FF50H After reset: 01H R/W

Symbol	<7>	<6>	<5>	4	3	2	1	0
ASIM6	POWER6	TXE6	RXE6	PS61	PS60	CL6	SL6	ISRM6

POWER6	Enables/disables operation of internal operation clock
0 ^{Note 1}	Disables operation of the internal operation clock (fixes the clock to low level) and asynchronously resets the internal circuit ^{Note 2} .
1 ^{Note 3}	Enables operation of the internal operation clock

TXE6	Enables/disables transmission
0	Disables transmission (synchronously resets the transmission circuit).
1	Enables transmission

- Notes**
1. The output of the TxD6 pin goes high and the input from the RxD6 pin is fixed to the high level when POWER6 = 0.
 2. Asynchronous serial interface reception error status register 6 (ASIS6), asynchronous serial interface transmission status register 6 (ASIF6), bit 7 (SBRF6) and bit 6 (SBRT6) of asynchronous serial interface control register 6 (ASICL6), and receive buffer register 6 (RXB6) are reset.
 3. Operation of the 8-bit counter output is enabled at the second base clock after 1 is written to the POWER6 bit.

Figure 15-5. Format of Asynchronous Serial Interface Operation Mode Register 6 (ASIM6) (2/2)

RXE6	Enables/disables reception
0	Disables reception (synchronously resets the reception circuit).
1	Enables reception

PS61	PS60	Transmission operation	Reception operation
0	0	Does not output parity bit.	Reception without parity
0	1	Outputs 0 parity.	Reception as 0 parity ^{note}
1	0	Outputs odd parity.	Judges as odd parity.
1	1	Outputs even parity.	Judges as even parity.

CL6	Specifies character length of transmit/receive data
0	Character length of data = 7 bits
1	Character length of data = 8 bits

SL6	Specifies number of stop bits of transmit data
0	Number of stop bits = 1
1	Number of stop bits = 2

ISRM6	Enables/disables occurrence of reception completion interrupt in case of error
0	“INTSRE6” occurs in case of error (at this time, INTSR6 does not occur).
1	“INTSR6” occurs in case of error (at this time, INTSRE6 does not occur).

Note If “reception as 0 parity” is selected, the parity is not judged. Therefore, bit 2 (PE6) of asynchronous serial interface reception error status register 6 (ASIS6) is not set and the error interrupt does not occur.

- Cautions**
1. At startup, set POWER6 to 1 and then set TXE6 to 1. To stop the operation, clear TXE6 to 0, and then clear POWER6 to 0.
 2. At startup, set POWER6 to 1 and then set RXE6 to 1. To stop the operation, clear RXE6 to 0, and then clear POWER6 to 0.
 3. Set POWER6 to 1 and then set RXE6 to 1 while a high level is input to the RxD6 pin. If POWER6 is set to 1 and RXE6 is set to 1 while a low level is input, reception is started.
 4. Clear the TXE6 and RXE6 bits to 0 before rewriting the PS61, PS60, and CL6 bits.
 5. Fix the PS61 and PS60 bits to 0 when UART6 is used in the LIN communication operation.
 6. Make sure that TXE6 = 0 when rewriting the SL6 bit. Reception is always performed with “the number of stop bits = 1”, and therefore, is not affected by the set value of the SL6 bit.
 7. Make sure that RXE6 = 0 when rewriting the ISRM6 bit.

(2) Asynchronous serial interface reception error status register 6 (ASIS6)

This register indicates an error status on completion of reception by serial interface UART6. It includes three error flag bits (PE6, FE6, OVE6).

This register is read-only by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input or clearing bit 7 (POWER6) or bit 5 (RXE6) of ASIM6 to 0 clears this register to 00H. 00H is read when this register is read.

Figure 15-6. Format of Asynchronous Serial Interface Reception Error Status Register 6 (ASIS6)

Address: FF53H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIS6	0	0	0	0	0	PE6	FE6	OVE6

PE6	Status flag indicating parity error
0	If POWER6 = 0 and RXE6 = 0, or if ASIS6 register is read
1	If the parity of transmit data does not match the parity bit on completion of reception

FE6	Status flag indicating framing error
0	If POWER6 = 0 and RXE6 = 0, or if ASIS6 register is read
1	If the stop bit is not detected on completion of reception

OVE6	Status flag indicating overrun error
0	If POWER6 = 0 and RXE6 = 0, or if ASIS6 register is read
1	If receive data is set to the RXB6 register and the next reception operation is completed before the data is read.

- Cautions**
1. The operation of the PE6 bit differs depending on the set values of the PS61 and PS60 bits of asynchronous serial interface operation mode register 6 (ASIM6).
 2. The first bit of the receive data is checked as the stop bit, regardless of the number of stop bits.
 3. If an overrun error occurs, the next receive data is not written to receive buffer register 6 (RXB6) but discarded.
 4. If data is read from ASIS6, a wait cycle is generated. Do not read data from ASIS6 when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.

(3) Asynchronous serial interface transmission status register 6 (ASIF6)

This register indicates the status of transmission by serial interface UART6. It includes two status flag bits (TXBF6 and TXSF6).

Transmission can be continued without disruption even during an interrupt period, by writing the next data to the TXB6 register after data has been transferred from the TXB6 register to the TXS6 register.

This register is read-only by an 8-bit memory manipulation instruction.

RESET input or clearing bit 7 (POWER6) or bit 6 (TXE6) of ASIM6 to 0 clears this register to 00H.

Figure 15-7. Format of Asynchronous Serial Interface Transmission Status Register 6 (ASIF6)

Address: FF55H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ASIF6	0	0	0	0	0	0	TXBF6	TXSF6

TXBF6	Transmit buffer data flag
0	If POWER6 = 0 or TXE6 = 0, or if data is transferred to transmit shift register 6 (TXS6)
1	If data is written to transmit buffer register 6 (TXB6) (if data exists in TXB6)

TXSF6	Transmit shift register data flag
0	If POWER6 = 0 or TXE6 = 0, or if the next data is not transferred from transmit buffer register 6 (TXB6) after completion of transfer
1	If data is transferred from transmit buffer register 6 (TXB6) (if data transmission is in progress)

- Cautions**
- 1. To transmit data continuously, write the first transmit data (first byte) to the TXB6 register. After that, be sure to check that the TXBF6 flag is “0”. If so, write the next transmit data (second byte) to the TXB6 register. If data is written to the TXB6 register while the TXBF6 flag is “1”, the transmit data cannot be guaranteed.**
 - 2. To initialize the transmission unit upon completion of continuous transmission, be sure to check that the TXSF6 flag is “0” after generation of the transmission completion interrupt, and then execute initialization. If initialization is executed while the TXSF6 flag is “1”, the transmit data cannot be guaranteed.**

(4) Clock selection register 6 (CKSR6)

This register selects the base clock of serial interface UART6.

CKSR6 can be set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Remark CKSR6 can be refreshed (the same value is written) by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1 or bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1).

Figure 15-8. Format of Clock Selection Register 6 (CKSR6)

Address: FF56H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
CKSR6	0	0	0	0	TPS63	TPS62	TPS61	TPS60

TPS63	TPS62	TPS61	TPS60	Base clock (f_{CLK6}) selection ^{Note 1}
0	0	0	0	f_x (10 MHz)
0	0	0	1	$f_x/2$ (5 MHz)
0	0	1	0	$f_x/2^2$ (2.5 MHz)
0	0	1	1	$f_x/2^3$ (1.25 MHz)
0	1	0	0	$f_x/2^4$ (625 kHz)
0	1	0	1	$f_x/2^5$ (312.5 kHz)
0	1	1	0	$f_x/2^6$ (156.25 kHz)
0	1	1	1	$f_x/2^7$ (78.13 kHz)
1	0	0	0	$f_x/2^8$ (39.06 kHz)
1	0	0	1	$f_x/2^9$ (19.53 kHz)
1	0	1	0	$f_x/2^{10}$ (9.77 kHz)
1	0	1	1	TM50 output ^{Note 2}
Other than above				Setting prohibited

Notes 1. Be sure to set the base clock so that the following condition is satisfied.

- $V_{\text{DD}} = 4.0$ to 5.5 V: Base clock ≤ 10 MHz
- $V_{\text{DD}} = 3.3$ to 4.0 V: Base clock ≤ 8.38 MHz
- $V_{\text{DD}} = 2.7$ to 3.3 V: Base clock ≤ 5 MHz
- $V_{\text{DD}} = 2.5$ to 2.7 V: Base clock ≤ 2.5 MHz (standard products, (A) grade products only)

2. Note the following points when selecting the TM50 output as the base clock.

- PWM mode (TMC506 = 1)
Start the operation of 8-bit timer/event counter 50 first and then set the count clock to make the duty = 50%.
- Mode in which the count clock is cleared and started upon a match of TM50 and CR50 (TMC506 = 0)
Start the operation of 8-bit timer/event counter 50 first and then enable the timer F/F inversion operation (TMC501 = 1).

It is not necessary to enable the TO50 pin as a timer output pin in any mode.

Cautions 1. When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the base clock is the internal oscillation clock, the operation of serial interface UART6 is not guaranteed.

2. Make sure POWER6 = 0 when rewriting TPS63 to TPS60.

<R>

- Remarks**
1. Figures in parentheses are for operation with $f_x = 10$ MHz
 2. f_x : High-speed system clock oscillation frequency
 3. TMC506: Bit 6 of 8-bit timer mode control register 50 (TMC50)
TMC501: Bit 1 of TMC50

(5) Baud rate generator control register 6 (BRGC6)

This register sets the division value of the 8-bit counter of serial interface UART6.

BRGC6 can be set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Remark BRGC6 can be refreshed (the same value is written) by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1 or bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1).

Figure 15-9. Format of Baud Rate Generator Control Register 6 (BRGC6)

Address: FF57H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
BRGC6	MDL67	MDL66	MDL65	MDL64	MDL63	MDL62	MDL61	MDL60

MDL67	MDL66	MDL65	MDL64	MDL63	MDL62	MDL61	MDL60	k	Output clock selection of 8-bit counter
0	0	0	0	0	×	×	×	×	Setting prohibited
0	0	0	0	1	0	0	0	8	$f_{\text{CLK6}}/8$
0	0	0	0	1	0	0	1	9	$f_{\text{CLK6}}/9$
0	0	0	0	1	0	1	0	10	$f_{\text{CLK6}}/10$
•	•	•	•	•	•	•	•	•	•
•	•	•	•	•	•	•	•	•	•
•	•	•	•	•	•	•	•	•	•
•	•	•	•	•	•	•	•	•	•
•	•	•	•	•	•	•	•	•	•
1	1	1	1	1	1	0	0	252	$f_{\text{CLK6}}/252$
1	1	1	1	1	1	0	1	253	$f_{\text{CLK6}}/253$
1	1	1	1	1	1	1	0	254	$f_{\text{CLK6}}/254$
1	1	1	1	1	1	1	1	255	$f_{\text{CLK6}}/255$

- Cautions**
1. Make sure that bit 6 (TXE6) and bit 5 (RXE6) of the ASIM6 register = 0 when rewriting the MDL67 to MDL60 bits.
 2. The baud rate is the output clock of the 8-bit counter divided by 2.

- Remarks**
1. f_{CLK6} : Frequency of base clock selected by the TPS63 to TPS60 bits of CKSR6 register
 2. k: Value set by MDL67 to MDL60 bits (k = 8, 9, 10, ..., 255)
 3. ×: Don't care

(6) Asynchronous serial interface control register 6 (ASICL6)

This register controls the serial communication operations of serial interface UART6.

ASICL6 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to 16H.

Caution ASICL6 can be refreshed (the same value is written) by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1 or bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1). Note, however, that communication is started by the refresh operation because bit 6 (SBRT6) of ASICL6 is cleared to 0 when communication is completed (when an interrupt signal is generated).

Figure 15-10. Format of Asynchronous Serial Interface Control Register 6 (ASICL6) (1/2)

Address: FF58H After reset: 16H R/W^{Note}

Symbol	<7>	<6>	5	4	3	2	1	0

SBRF6	SBF reception status flag
0	If POWER6 = 0 and RXE6 = 0 or if SBF reception has been completed correctly
1	SBF reception in progress

SBRT6	SBF reception trigger
0	–
1	SBF reception trigger

SBTT6	SBF transmission trigger
0	–
1	SBF transmission trigger

Note Bit 7 is read-only.

Figure 15-10. Format of Asynchronous Serial Interface Control Register 6 (ASICL6) (2/2)

SBL62	SBL61	SBL60	SBF transmission output width control
1	0	1	SBF is output with 13-bit length.
1	1	0	SBF is output with 14-bit length.
1	1	1	SBF is output with 15-bit length.
0	0	0	SBF is output with 16-bit length.
0	0	1	SBF is output with 17-bit length.
0	1	0	SBF is output with 18-bit length.
0	1	1	SBF is output with 19-bit length.
1	0	0	SBF is output with 20-bit length.

DIR6	First-bit specification
0	MSB
1	LSB

TXDLV6	Enables/disables inverting TxD6 output
0	Normal output of TxD6
1	Inverted output of TxD6

- Cautions**
1. In the case of an SBF reception error, return the mode to the SBF reception mode. The status of the SBRF6 flag is held (1).
 2. Before setting the SBRT6 bit, make sure that bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1.
 3. The read value of the SBRT6 bit is always 0. SBRT6 is automatically cleared to 0 after SBF reception has been correctly completed.
 4. Before setting the SBTT6 bit to 1, make sure that bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1.
 5. The read value of the SBTT6 bit is always 0. SBTT6 is automatically cleared to 0 at the end of SBF transmission.
 6. Before rewriting the DIR6 and TXDLV6 bits, clear the TXE6 and RXE6 bits to 0.
 7. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, set the SBTT6, SBL62, SBL61, and SBL60 bits to 0, 1, 0, 1, respectively.

(7) Input switch control register (ISC)

The input switch control register (ISC) is used to receive a status signal transmitted from the master during LIN (Local Interconnect Network) reception. The input source is switched by setting ISC.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 15-11. Format of Input Switch Control Register (ISC)

Address: FF4FH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0	
ISC	0	0	0	0	0	0	ISC1	ISC0	
ISC1	TI000 input source selection								
0	TI000 (P00)								
1	RxD6 (P14)								
ISC0	INTP0 input source selection								
0	INTP0 (P120)								
1	RxD6 (P14)								

(8) Port mode register 1 (PM1)

This register sets port 1 input/output in 1-bit units.

When using the P13/TxD6 pin for serial interface data output, clear PM13 to 0 and set the output latch of P13 to 1. When using the P14/RxD6 pin for serial interface data input, set PM14 to 1. The output latch of P14 at this time may be 0 or 1.

PM1 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Figure 15-12. Format of Port Mode Register 1 (PM1)

Address: FF21H After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0	
PM1	PM17	PM16	PM15	PM14	PM13	PM12	PM11	PM10	
PM1n	P1n pin I/O mode selection (n = 0 to 7)								
0	Output mode (output buffer on)								
1	Input mode (output buffer off)								

15.4 Operation of Serial Interface UART6

Serial interface UART6 has the following two modes.

- Operation stop mode
- Asynchronous serial interface (UART) mode

15.4.1 Operation stop mode

In this mode, serial communication cannot be executed; therefore, the power consumption can be reduced. In addition, the pins can be used as ordinary port pins in this mode. To set the operation stop mode, clear bits 7, 6, and 5 (POWER6, TXE6, and RXE6) of ASIM6 to 0.

(1) Register used

The operation stop mode is set by asynchronous serial interface operation mode register 6 (ASIM6).

ASIM6 can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input sets this register to 01H.

Address: FF50H After reset: 01H R/W

Symbol	<7>	<6>	<5>	4	3	2	1	0
ASIM6	POWER6	TXE6	RXE6	PS61	PS60	CL6	SL6	ISRM6
	POWER6	Enables/disables operation of internal operation clock						
	0 ^{Note 1}	Disables operation of the internal operation clock (fixes the clock to low level) and asynchronously resets the internal circuit ^{Note 2} .						
	TXE6	Enables/disables transmission						
	0	Disables transmission operation (synchronously resets the transmission circuit).						
	RXE6	Enables/disables reception						
	0	Disables reception (synchronously resets the reception circuit).						

- Notes**
1. The output of the TxD6 pin goes high and the input from the RxD6 pin is fixed to high level when POWER6 = 0.
 2. Asynchronous serial interface reception error status register 6 (ASIS6), asynchronous serial interface transmission status register 6 (ASIF6), bit 7 (SBRF6) and bit 6 (SBRT6) of asynchronous serial interface control register 6 (ASICL6), and receive buffer register 6 (RXB6) are reset.

Caution Clear POWER6 to 0 after clearing TXE6 and RXE6 to 0 to set the operation stop mode. To start the operation, set POWER6 to 1, and then set TXE6 and RXE6 to 1.

Remark To use the RxD6/P14 and TxD6/P13 pins as general-purpose port pins, see **CHAPTER 4 PORT FUNCTIONS**.

15.4.2 Asynchronous serial interface (UART) mode

In this mode, data of 1 byte is transmitted/received following a start bit, and a full-duplex operation can be performed.

A dedicated UART baud rate generator is incorporated, so that communication can be executed at a wide range of baud rates.

(1) Registers used

- Asynchronous serial interface operation mode register 6 (ASIM6)
- Asynchronous serial interface reception error status register 6 (ASIS6)
- Asynchronous serial interface transmission status register 6 (ASIF6)
- Clock selection register 6 (CKSR6)
- Baud rate generator control register 6 (BRGC6)
- Asynchronous serial interface control register 6 (ASICL6)
- Input switch control register (ISC)
- Port mode register 1 (PM1)
- Port register 1 (P1)

The basic procedure of setting an operation in the UART mode is as follows.

- <1> Set the CKSR6 register (see **Figure 15-8**).
- <2> Set the BRGC6 register (see **Figure 15-9**).
- <3> Set bits 0 to 4 (ISRM6, SL6, CL6, PS60, PS61) of the ASIM6 register (see **Figure 15-5**).
- <4> Set bits 0 and 1 (TXDLV6, DIR6) of the ASICL6 register (see **Figure 15-10**).
- <5> Set bit 7 (POWER6) of the ASIM6 register to 1.
- <6> Set bit 6 (TXE6) of the ASIM6 register to 1. → Transmission is enabled.
Set bit 5 (RXE6) of the ASIM6 register to 1. → Reception is enabled.
- <7> Write data to transmit buffer register 6 (TXB6). → Data transmission is started.

Caution Take relationship with the other party of communication when setting the port mode register and port register.

The relationship between the register settings and pins is shown below.

Table 15-2. Relationship Between Register Settings and Pins

POWER6	TXE6	RXE6	PM13	P13	PM14	P14	UART6 Operation	Pin Function	
								TxD6/P13	RxD6/P14
0	0	0	x ^{Note}	x ^{Note}	x ^{Note}	x ^{Note}	Stop	P13	P14
1	0	1	x ^{Note}	x ^{Note}	1	x	Reception	P13	RxD6
	1	0	0	1	x ^{Note}	x ^{Note}	Transmission	TxD6	P14
	1	1	0	1	1	x	Transmission/ reception	TxD6	RxD6

Note Can be set as port function.

Remark x: don't care

POWER6: Bit 7 of asynchronous serial interface operation mode register 6 (ASIM6)

TXE6: Bit 6 of ASIM6

RXE6: Bit 5 of ASIM6

PM1x: Port mode register

P1x: Port output latch

(2) Communication operation**(a) Format and waveform example of normal transmit/receive data**

Figures 15-13 and 15-14 show the format and waveform example of the normal transmit/receive data.

Figure 15-13. Format of Normal UART Transmit/Receive Data

1. LSB-first transmission/reception**2. MSB-first transmission/reception**

One data frame consists of the following bits.

- Start bit ... 1 bit
- Character bits ... 7 or 8 bits
- Parity bit ... Even parity, odd parity, 0 parity, or no parity
- Stop bit ... 1 or 2 bits

The character bit length, parity, and stop bit length in one data frame are specified by asynchronous serial interface operation mode register 6 (ASIM6).

Whether data is communicated with the LSB or MSB first is specified by bit 1 (DIR6) of asynchronous serial interface control register 6 (ASICL6).

Whether the Tx/D6 pin outputs normal or inverted data is specified by bit 0 (TXDLV6) of ASICL6.

Figure 15-14. Example of Normal UART Transmit/Receive Data Waveform

1. Data length: 8 bits, LSB first, Parity: Even parity, Stop bit: 1 bit, Communication data: 55H

2. Data length: 8 bits, MSB first, Parity: Even parity, Stop bit: 1 bit, Communication data: 55H

3. Data length: 8 bits, MSB first, Parity: Even parity, Stop bit: 1 bit, Communication data: 55H, Tx/D6 pin inverted output

4. Data length: 7 bits, LSB first, Parity: Odd parity, Stop bit: 2 bits, Communication data: 36H

5. Data length: 8 bits, LSB first, Parity: None, Stop bit: 1 bit, Communication data: 87H

(b) Parity types and operation

The parity bit is used to detect a bit error in communication data. Usually, the same type of parity bit is used on both the transmission and reception sides. With even parity and odd parity, a 1-bit (odd number) error can be detected. With zero parity and no parity, an error cannot be detected.

Caution Fix the PS61 and PS60 bits to 0 when the device is incorporated in LIN.

(i) Even parity

• Transmission

Transmit data, including the parity bit, is controlled so that the number of bits that are “1” is even. The value of the parity bit is as follows.

If transmit data has an odd number of bits that are “1”: 1

If transmit data has an even number of bits that are “1”: 0

• Reception

The number of bits that are “1” in the receive data, including the parity bit, is counted. If it is odd, a parity error occurs.

(ii) Odd parity

• Transmission

Unlike even parity, transmit data, including the parity bit, is controlled so that the number of bits that are “1” is odd.

If transmit data has an odd number of bits that are “1”: 0

If transmit data has an even number of bits that are “1”: 1

• Reception

The number of bits that are “1” in the receive data, including the parity bit, is counted. If it is even, a parity error occurs.

(iii) 0 parity

The parity bit is cleared to 0 when data is transmitted, regardless of the transmit data.

The parity bit is not detected when the data is received. Therefore, a parity error does not occur regardless of whether the parity bit is “0” or “1”.

(iv) No parity

No parity bit is appended to the transmit data.

Reception is performed assuming that there is no parity bit when data is received. Because there is no parity bit, a parity error does not occur.

(c) Normal transmission

The TxD6 pin outputs a high level when bit 7 (POWER6) of asynchronous serial interface operation mode register 6 (ASIM6) is set to 1. If bit 6 (TXE6) of ASIM6 is then set to 1, transmission is enabled. Transmission can be started by writing transmit data to transmit buffer register 6 (TXB6). The start bit, parity bit, and stop bit are automatically appended to the data.

When transmission is started, the data in TXB6 is transferred to transmit shift register 6 (TXS6). After that, the data is sequentially output from TXS6 to the TxD6 pin. When transmission is completed, the parity and stop bits set by ASIM6 are appended and a transmission completion interrupt request (INTST6) is generated. Transmission is stopped until the data to be transmitted next is written to TXB6.

Figure 15-15 shows the timing of the transmission completion interrupt request (INTST6). This interrupt occurs as soon as the last stop bit has been output.

Figure 15-15. Normal Transmission Completion Interrupt Request Timing

1. Stop bit length: 1

2. Stop bit length: 2

(d) Continuous transmission

The next transmit data can be written to transmit buffer register 6 (TXB6) as soon as transmit shift register 6 (TXS6) has started its shift operation. Consequently, even while the INTST6 interrupt is being serviced after transmission of one data frame, data can be continuously transmitted and an efficient communication rate can be realized. In addition, the TXB6 register can be efficiently written twice (2 bytes) without having to wait for the transmission time of one data frame, by reading bit 0 (TXSF6) of asynchronous serial interface transmission status register 6 (ASIF6) when the transmission completion interrupt has occurred.

To transmit data continuously, be sure to reference the ASIF6 register to check the transmission status and whether the TXB6 register can be written, and then write the data.

- Cautions**
1. The TXBF6 and TXSF6 flags of the ASIF6 register change from “10” to “11”, and to “01” during continuous transmission. To check the status, therefore, do not use a combination of the TXBF6 and TXSF6 flags for judgment. Read only the TXBF6 flag when executing continuous transmission.
 2. When the device is incorporated in a LIN, the continuous transmission function cannot be used. Make sure that asynchronous serial interface transmission status register 6 (ASIF6) is 00H before writing transmit data to transmit buffer register 6 (TXB6).

TXBF6	Writing to TXB6 Register
0	Writing enabled
1	Writing disabled

Caution To transmit data continuously, write the first transmit data (first byte) to the TXB6 register. After that, be sure to check that the TXBF6 flag is “0”. If so, write the next transmit data (second byte) to the TXB6 register. If data is written to the TXB6 register while the TXBF6 flag is “1”, the transmit data cannot be guaranteed.

The communication status can be checked using the TXSF6 flag.

TXSF6	Transmission Status
0	Transmission is completed.
1	Transmission is in progress.

- Cautions**
1. To initialize the transmission unit upon completion of continuous transmission, be sure to check that the TXSF6 flag is “0” after generation of the transmission completion interrupt, and then execute initialization. If initialization is executed while the TXSF6 flag is “1”, the transmit data cannot be guaranteed.
 2. During continuous transmission, an overrun error may occur, which means that the next transmission was completed before execution of INTST6 interrupt servicing after transmission of one data frame. An overrun error can be detected by developing a program that can count the number of transmit data and by referencing the TXSF6 flag.

Figure 15-16 shows an example of the continuous transmission processing flow.

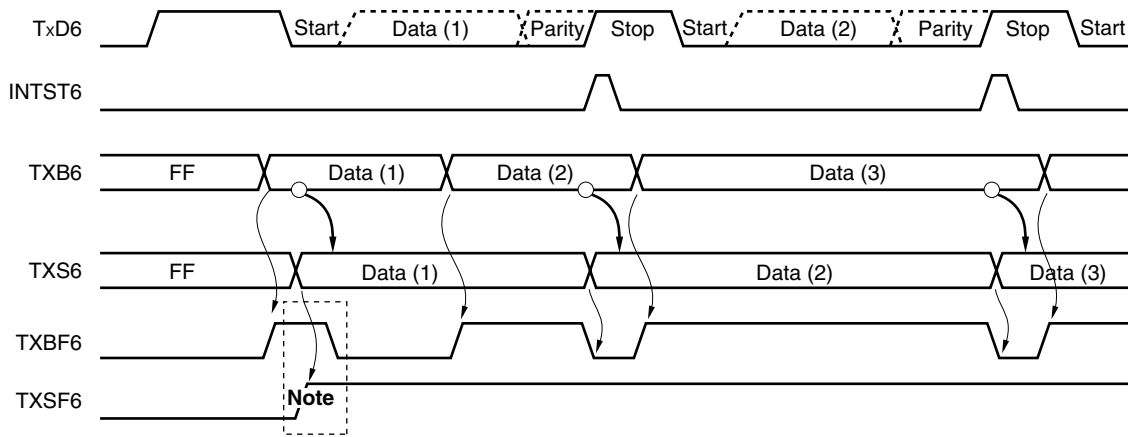

Figure 15-16. Example of Continuous Transmission Processing Flow

Remark TXB6: Transmit buffer register 6
 ASIF6: Asynchronous serial interface transmission status register 6
 TXBF6: Bit 1 of ASIF6 (transmit buffer data flag)
 TXSF6: Bit 0 of ASIF6 (transmit shift register data flag)

Figure 15-17 shows the timing of starting continuous transmission, and Figure 15-18 shows the timing of ending continuous transmission.

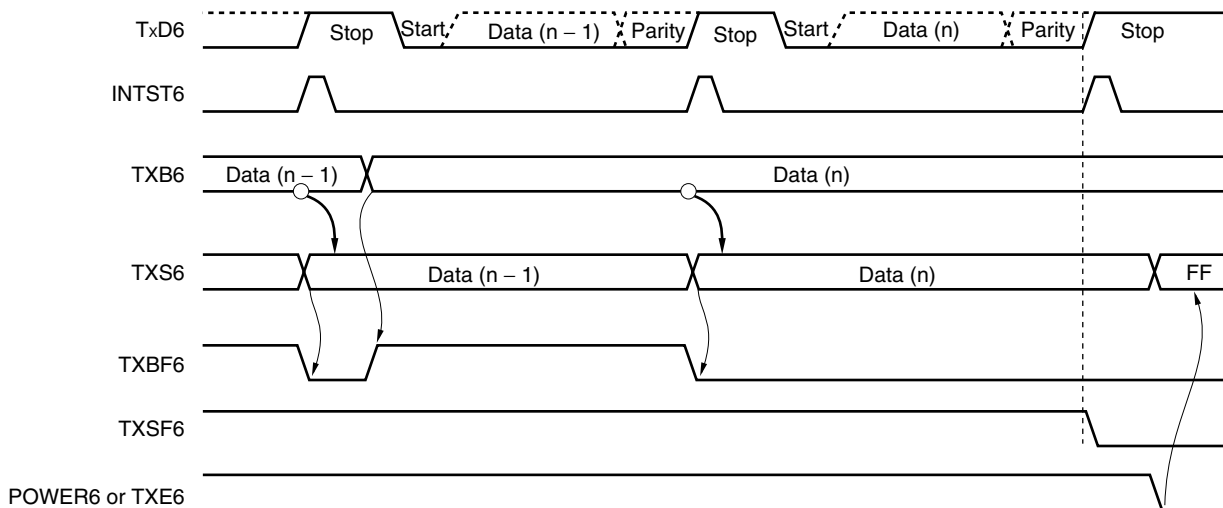

Figure 15-17. Timing of Starting Continuous Transmission

Note When ASIF6 is read, there is a period in which TXBF6 and TXSF6 = 1, 1. Therefore, judge whether writing is enabled using only the TXBF6 bit.

	TXBF6:	Bit 1 of ASIF6
	TXSF6:	Bit 0 of ASIF6
	POWER6:	Bit 7 of asynchronous serial interface operation mode register 6 (ASIM6)
	TXE6:	Bit 6 of asynchronous serial interface operation mode register 6 (ASIM6)

(e) Normal reception

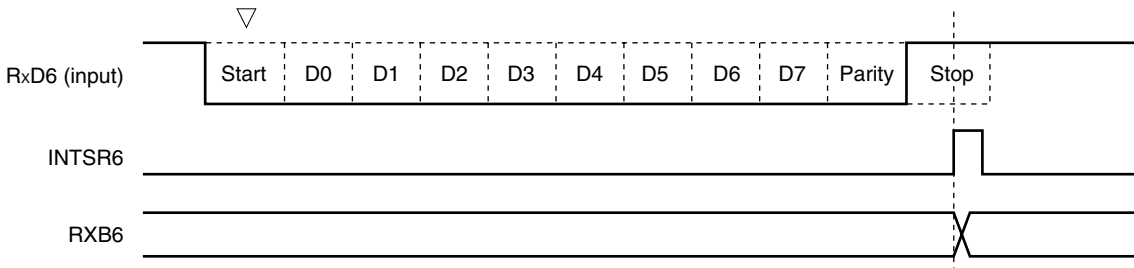

Reception is enabled and the RxD6 pin input is sampled when bit 7 (POWER6) of asynchronous serial interface operation mode register 6 (ASIM6) is set to 1 and then bit 5 (RXE6) of ASIM6 is set to 1.

The 8-bit counter of the baud rate generator starts counting when the falling edge of the RxD6 pin input is detected. When the set value of baud rate generator control register 6 (BRGC6) has been counted, the RxD6 pin input is sampled again (∇ in Figure 15-19). If the RxD6 pin is low level at this time, it is recognized as a start bit.

When the start bit is detected, reception is started, and serial data is sequentially stored in the receive shift register (RXS6) at the set baud rate. When the stop bit has been received, the reception completion interrupt (INTSR6) is generated and the data of RXS6 is written to receive buffer register 6 (RXB6). If an overrun error (OVE6) occurs, however, the receive data is not written to RXB6.

Even if a parity error (PE6) occurs while reception is in progress, reception continues to the reception position of the stop bit, and an error interrupt (INTSR6/INTSRE6) is generated on completion of reception.

Figure 15-19. Reception Completion Interrupt Request Timing

- Cautions**
1. Be sure to read receive buffer register 6 (RXB6) even if a reception error occurs. Otherwise, an overrun error will occur when the next data is received, and the reception error status will persist.
 2. Reception is always performed with the “number of stop bits = 1”. The second stop bit is ignored.
 3. Be sure to read asynchronous serial interface reception error status register 6 (ASIS6) before reading RXB6.

(f) Reception error

Three types of errors may occur during reception: a parity error, framing error, or overrun error. If the error flag of asynchronous serial interface reception error status register 6 (ASIS6) is set as a result of data reception, a reception error interrupt request (INTSR6/INTSRE6) is generated.

Which error has occurred during reception can be identified by reading the contents of ASIS6 in the reception error interrupt servicing (INTSR6/INTSRE6) (see **Figure 15-6**).

The contents of ASIS6 are reset to 0 when ASIS6 is read.

Table 15-3. Cause of Reception Error

Reception Error	Cause
Parity error	The parity specified for transmission does not match the parity of the receive data.
Framing error	Stop bit is not detected.
Overrun error	Reception of the next data is completed before data is read from receive buffer register 6 (RXB6).

The error interrupt can be separated into reception completion interrupt (INTSR6) and error interrupt (INTSRE6) by clearing bit 0 (ISRM6) of asynchronous serial interface operation mode register 6 (ASIM6) to 0.

Figure 15-20. Reception Error Interrupt

1. If ISRM6 is cleared to 0 (reception completion interrupt (INTSR6) and error interrupt (INTSRE6) are separated)

(a) No error during reception

(b) Error during reception

2. If ISRM6 is set to 1 (error interrupt is included in INTSR6)

(a) No error during reception

(b) Error during reception

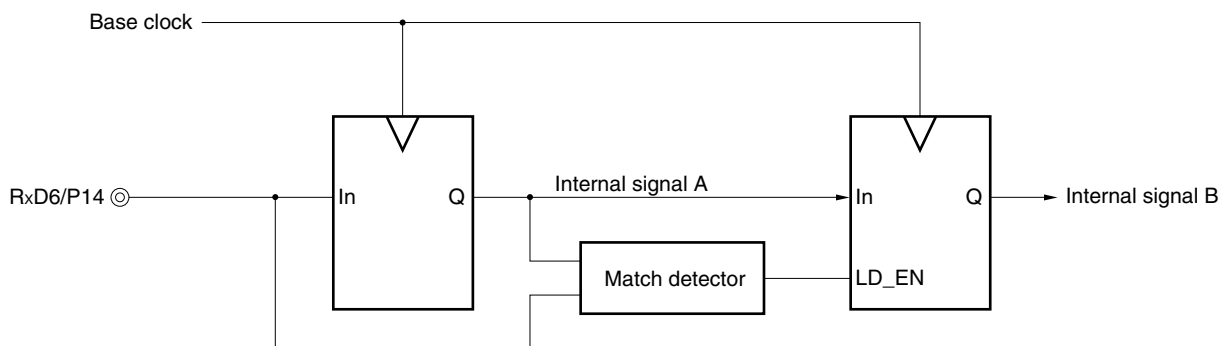

(g) Noise filter of receive data

The RxD6 signal is sampled with the base clock output by the prescaler block.

If two sampled values are the same, the output of the match detector changes, and the data is sampled as input data.

Because the circuit is configured as shown in Figure 15-21, the internal processing of the reception operation is delayed by two clocks from the external signal status.

Figure 15-21. Noise Filter Circuit

**(h) SBF transmission**

When the device is incorporated in LIN, the SBF (Synchronous Break Field) transmission control function is used for transmission. For the transmission operation of LIN, see **Figure 15-1 LIN Transmission Operation**.

The TxD6 pin outputs a high level when bit 7 (POWER6) of asynchronous serial interface mode register 6 (ASIM6) is set to 1. Transmission is enabled when bit 6 (TXE6) of ASIM6 is set to 1 next time, and SBF transmission operation is started when bit 5 (SBTT6) of asynchronous serial interface control register 6 (ASICL6) is set to 1.

After transmission has been started, the low levels of bits 13 to 20 (set by bits 4 to 2 (SBL62 to SBL60) of ASICL6) are output. When SBF transmission is complete, a transmission completion interrupt request (INTST6) is issued, and SBTT6 is automatically cleared. After SBF transmission is completed, the normal transmission mode is restored.

SBF transmission is stopped until the data to be transmitted next is written to transmit buffer register 6 (TXB6) or SBTT6 is set to 1.

Figure 15-22. SBF Transmission

Remark TxD6: TxD6 pin (output)

INTST6: Transmission completion interrupt request

SBTT6: Bit 5 of asynchronous serial interface control register 6 (ASICL6)

(i) SBF reception

When the device is incorporated in LIN, the SBF (Synchronous Break Field) reception control function is used for reception. For the reception operation of LIN, see **Figure 15-2 LIN Reception Operation**.

Reception is enabled when bit 7 (POWER6) of asynchronous serial interface operation mode register 6 (ASIM6) is set to 1 and then bit 5 (RXE6) of ASIM6 is set to 1. SBF reception is enabled when bit 6 (SBRT6) of asynchronous serial interface control register 6 (ASICL6) is set to 1. In the SBF reception enabled status, the RxD6 pin is sampled and the start bit is detected in the same manner as the normal reception enable status.

When the start bit has been detected, reception is started, and serial data is sequentially stored in the receive shift register 6 (RXS6) at the set baud rate. When the stop bit is received and if the width of SBF is 11 bits or more, a reception completion interrupt request (INTSR6) is generated as normal processing. At this time, the SBRF6 and SBRT6 bits are automatically cleared, and SBF reception ends. Detection of errors, such as OVE6, PE6, and FE6 (bits 0 to 2 of asynchronous serial interface reception error status register 6 (ASIS6)) is suppressed, and error detection processing of UART communication is not performed. In addition, data transfer between receive shift register 6 (RXS6) and receive buffer register 6 (RXB6) is not performed, and the reset value of FFH is retained. If the width of SBF is 10 bits or less, an interrupt does not occur as error processing after the stop bit has been received, and the SBF reception mode is restored. In this case, the SBRF6 and SBRT6 bits are not cleared.

Figure 15-23. SBF Reception

1. Normal SBF reception (stop bit is detected with a width of more than 10.5 bits)

2. SBF reception error (stop bit is detected with a width of 10.5 bits or less)

15.4.3 Dedicated baud rate generator

The dedicated baud rate generator consists of a source clock selector and an 8-bit programmable counter, and generates a serial clock for transmission/reception of UART6.

Separate 8-bit counters are provided for transmission and reception.

(1) Configuration of baud rate generator

- Base clock

The clock selected by bits 3 to 0 (TPS63 to TPS60) of clock selection register 6 (CKSR6) is supplied to each module when bit 7 (POWER6) of asynchronous serial interface operation mode register 6 (ASIM6) is 1. This clock is called the base clock and its frequency is called f_{CLK6} . The base clock is fixed to low level when POWER6 = 0.

- Transmission counter

This counter stops operation, cleared to 0, when bit 7 (POWER6) or bit 6 (TXE6) of asynchronous serial interface operation mode register 6 (ASIM6) is 0.

It starts counting when POWER6 = 1 and TXE6 = 1.

The counter is cleared to 0 when the first data transmitted is written to transmit buffer register 6 (TXB6).

If data are continuously transmitted, the counter is cleared to 0 again when one frame of data has been completely transmitted. If there is no data to be transmitted next, the counter is not cleared to 0 and continues counting until POWER6 or TXE6 is cleared to 0.

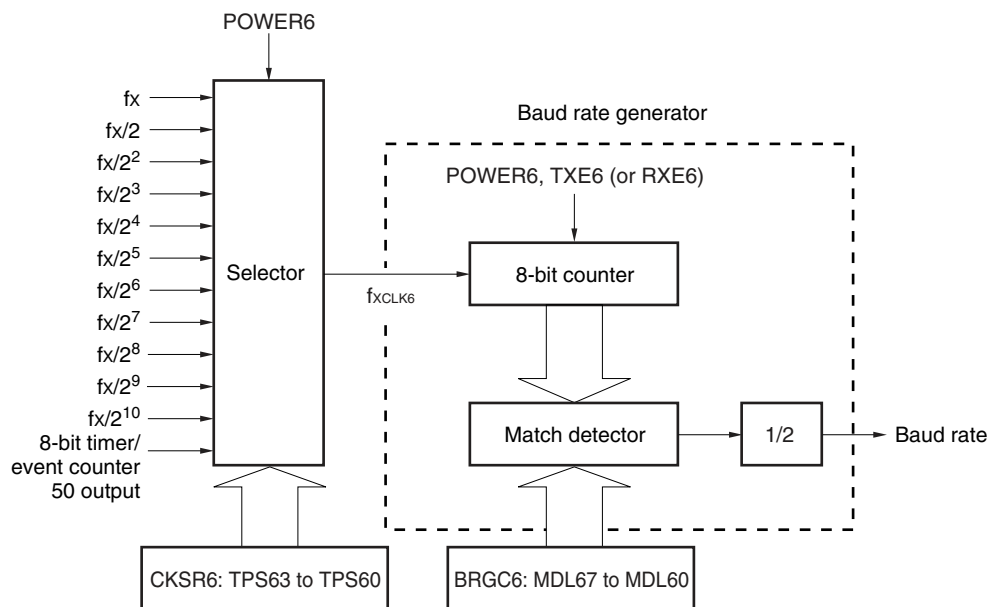

- Reception counter

This counter stops operation, cleared to 0, when bit 7 (POWER6) or bit 5 (RXE6) of asynchronous serial interface operation mode register 6 (ASIM6) is 0.

It starts counting when the start bit has been detected.

The counter stops operation after one frame has been received, until the next start bit is detected.

Figure 15-24. Configuration of Baud Rate Generator

Remark POWER6: Bit 7 of asynchronous serial interface operation mode register 6 (ASIM6)
 TXE6: Bit 6 of ASIM6
 RXE6: Bit 5 of ASIM6
 CKSR6: Clock selection register 6
 BRGC6: Baud rate generator control register 6

(2) Generation of serial clock

A serial clock can be generated by using clock selection register 6 (CKSR6) and baud rate generator control register 6 (BRGC6).

Select the clock to be input to the 8-bit counter by using bits 3 to 0 (TPS63 to TPS60) of CKSR6.

Bits 7 to 0 (MDL67 to MDL60) of BRGC6 can be used to select the division value of the 8-bit counter.

(a) Baud rate

The baud rate can be calculated by the following expression.

- Baud rate = $\frac{f_{\text{CLK6}}}{2 \times k}$ [bps]

f_{CLK6} : Frequency of base clock selected by TPS63 to TPS60 bits of CKSR6 register

k: Value set by MDL67 to MDL60 bits of BRGC6 register (k = 8, 9, 10, ..., 255)

(b) Error of baud rate

The baud rate error can be calculated by the following expression.

- Error (%) = $\left(\frac{\text{Actual baud rate (baud rate with error)}}{\text{Desired baud rate (correct baud rate)}} - 1 \right) \times 100$ [%]

Cautions 1. Keep the baud rate error during transmission to within the permissible error range at the reception destination.

2. Make sure that the baud rate error during reception satisfies the range shown in (4) Permissible baud rate range during reception.

Example: Frequency of base clock = 10 MHz = 10,000,000 Hz

Set value of MDL67 to MDL60 bits of BRGC6 register = 00100001B (k = 33)

Target baud rate = 153600 bps

$$\begin{aligned} \text{Baud rate} &= 10 \text{ M}/(2 \times 33) \\ &= 10000000/(2 \times 33) = 151,515 \text{ [bps]} \end{aligned}$$

$$\begin{aligned} \text{Error} &= (151515/153600 - 1) \times 100 \\ &= -1.357 \text{ [%]} \end{aligned}$$

(3) Example of setting baud rate

Table 15-4. Set Data of Baud Rate Generator

fx: High-speed system clock oscillation frequency
ERR: Baud rate error

(4) Permissible baud rate range during reception

The permissible error from the baud rate at the transmission destination during reception is shown below.

Caution Make sure that the baud rate error during reception is within the permissible error range, by using the calculation expression shown below.

Figure 15-25. Permissible Baud Rate Range During Reception

As shown in Figure 15-25, the latch timing of the receive data is determined by the counter set by baud rate generator control register 6 (BRGC6) after the start bit has been detected. If the last data (stop bit) meets this latch timing, the data can be correctly received.

Assuming that 11-bit data is received, the theoretical values can be calculated as follows.

$$FL = (\text{Brate})^{-1}$$

Brate: Baud rate of UART6

k: Set value of BRGC6

FL: 1-bit data length

Margin of latch timing: 2 clocks

$$\text{Minimum permissible data frame length: } FL_{\min} = 11 \times FL - \frac{k-2}{2k} \times FL = \frac{21k+2}{2k} FL$$

Therefore, the maximum receivable baud rate at the transmission destination is as follows.

$$BR_{\max} = (FL_{\min}/11)^{-1} = \frac{22k}{21k+2} \text{ Brate}$$

Similarly, the maximum permissible data frame length can be calculated as follows.

$$\frac{10}{11} \times FL_{\max} = 11 \times FL - \frac{k+2}{2 \times k} \times FL = \frac{21k-2}{2 \times k} FL$$

$$FL_{\max} = \frac{21k-2}{20k} FL \times 11$$

Therefore, the minimum receivable baud rate at the transmission destination is as follows.

$$BR_{\min} = (FL_{\max}/11)^{-1} = \frac{20k}{21k-2} \text{ Brate}$$

The permissible baud rate error between UART6 and the transmission destination can be calculated from the above minimum and maximum baud rate expressions, as follows.

Table 15-5. Maximum/Minimum Permissible Baud Rate Error

Division Ratio (k)	Maximum Permissible Baud Rate Error	Minimum Permissible Baud Rate Error
8	+3.52%	-3.61%
20	+4.26%	-4.30%
50	+4.56%	-4.58%
100	+4.66%	-4.67%
255	+4.72%	-4.72%

- Remarks**
1. The permissible error of reception depends on the number of bits in one frame, input clock frequency, and division ratio (k). The higher the input clock frequency and the higher the division ratio (k), the higher the permissible error.
 2. k: Set value of BRGC6

(5) Data frame length during continuous transmission

When data is continuously transmitted, the data frame length from a stop bit to the next start bit is extended by two clocks of base clock from the normal value. However, the result of communication is not affected because the timing is initialized on the reception side when the start bit is detected.

Figure 15-26. Data Frame Length During Continuous Transmission

Where the 1-bit data length is FL , the stop bit length is FL_{stp} , and base clock frequency is f_{CLK6} , the following expression is satisfied.

$$FL_{stp} = FL + 2/f_{CLK6}$$

Therefore, the data frame length during continuous transmission is:

$$\text{Data frame length} = 11 \times FL + 2/f_{CLK6}$$

16.1 Functions of Serial Interfaces CSI10 and CSI11

Serial interfaces CSI10 and CSI11 have the following two modes.

- Operation stop mode
- 3-wire serial I/O mode

(1) Operation stop mode

This mode is used when serial communication is not performed and can enable a reduction in the power consumption.

For details, see **16.4.1 Operation stop mode**.

(2) 3-wire serial I/O mode (MSB/LSB-first selectable)

This mode is used to communicate 8-bit data using three lines: a serial clock line ($\overline{\text{SCK1n}}$) and two serial data lines (SI1n and SO1n).

The processing time of data communication can be shortened in the 3-wire serial I/O mode because transmission and reception can be simultaneously executed.

In addition, whether 8-bit data is communicated with the MSB or LSB first can be specified, so this interface can be connected to any device.

The 3-wire serial I/O mode is used for connecting peripheral ICs and display controllers with a clocked serial interface.

For details, see **16.4.2 3-wire serial I/O mode**.

16.2 Configuration of Serial Interfaces CSI10 and CSI11

Serial interfaces CSI10 and CSI11 include the following hardware.

Table 16-1. Configuration of Serial Interfaces CSI10 and CSI11

Item	Configuration
Registers	Transmit buffer register 1n (SOTB1n) Serial I/O shift register 1n (SIO1n)
Control registers	Serial operation mode register 1n (CSIM1n) Serial clock selection register 1n (CSIC1n) Port mode register 0 (PM0) or port mode register 1 (PM1) Port register 0 (P0) or port register 1 (P1)

Remark n = 0, 1

Figure 16-1. Block Diagram of Serial Interface CSI10

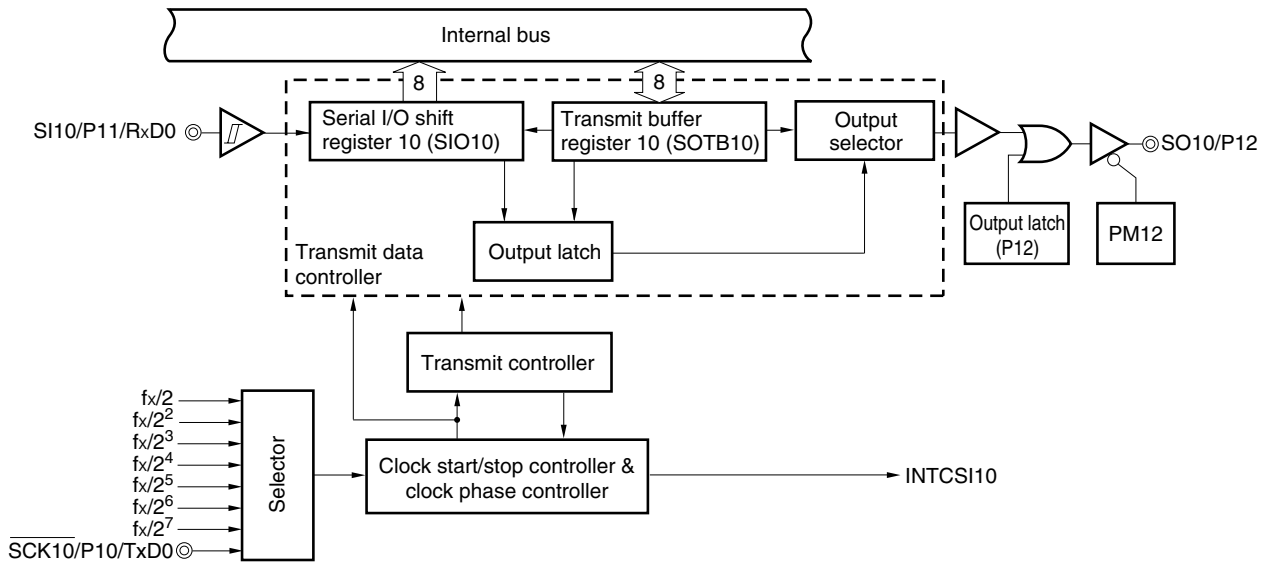

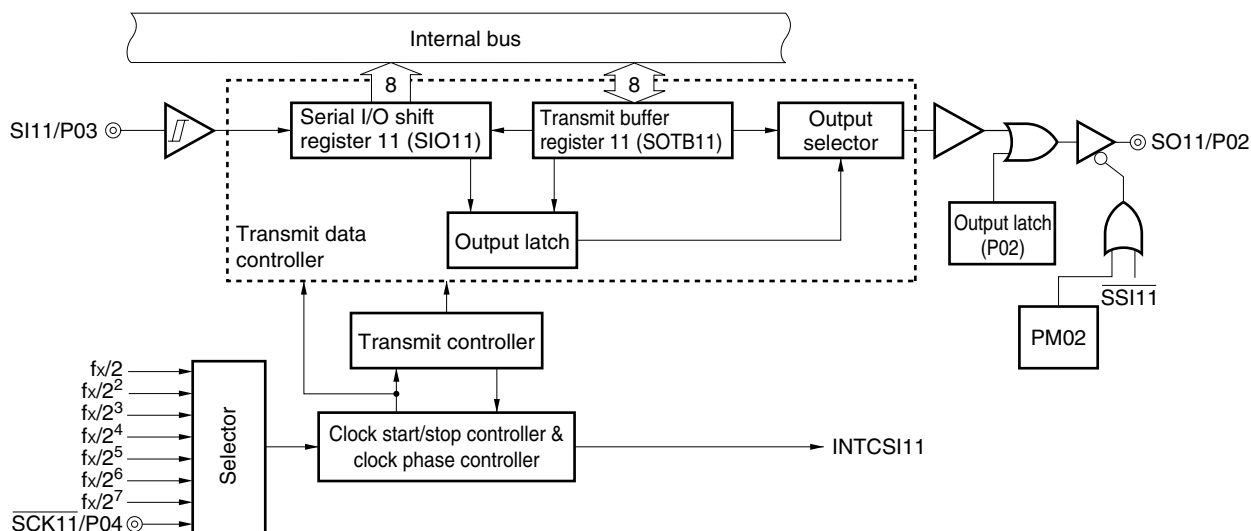

Figure 16-2. Block Diagram of Serial Interface CSI11

**(1) Transmit buffer register 1n (SOTB1n)**

This register sets the transmit data.

Transmission/reception is started by writing data to SOTB1n when bit 7 (CSIE1n) and bit 6 (TRMD1n) of serial operation mode register 1n (CSIM1n) is 1.

The data written to SOTB1n is converted from parallel data into serial data by serial I/O shift register 1n, and output to the serial output pin (SO1n).

SOTB1n can be written or read by an 8-bit memory manipulation instruction.

RESET input makes this register undefined.

Cautions 1. Do not access SOTB1n when CSOT1n = 1 (during serial communication).

2. The SS11 pin can be used in the slave mode. For details of the transmission/reception operation, see 16.4.2 (2) Communication operation.

(2) Serial I/O shift register 1n (SIO1n)

This is an 8-bit register that converts data from parallel data into serial data and vice versa.

This register can be read by an 8-bit memory manipulation instruction.

Reception is started by reading data from SIO1n if bit 6 (TRMD1n) of serial operation mode register 1n (CSIM1n) is 0.

During reception, the data is read from the serial input pin (SI1n) to SIO1n.

RESET input clears this register to 00H.

Cautions 1. Do not access SIO1n when CSOT1n = 1 (during serial communication).

2. The SS11 pin can be used in the slave mode. For details of the reception operation, see 16.4.2 (2) Communication operation.

Remark n = 0, 1

16.3 Registers Controlling Serial Interfaces CSI10 and CSI11

Serial interfaces CSI10 and CSI11 are controlled by the following four registers.

- Serial operation mode register 1n (CSIM1n)
- Serial clock selection register 1n (CSIC1n)
- Port mode register 0 (PM0) or port mode register 1 (PM1)
- Port register 0 (P0) or port register 1 (P1)

(1) Serial operation mode register 1n (CSIM1n)

CSIM1n is used to select the operation mode and enable or disable operation.

CSIM1n can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Remark n = 0, 1

0	Communication is stopped.
1	Communication is in progress.

Notes 1. Bit 0 is a read-only bit.

<R>

2. To use P10/SCK10/TxD0, P11/SI10/RxD0, and P12/SO10 as general-purpose ports, set CSIM10 in the default status (00H).
3. Bit 0 (CSOT10) of CSIM10 and serial I/O shift register 10 (SIO10) are reset.
4. Do not rewrite TRMD10 when CSOT10 = 1 (during serial communication).
5. The SO10 output is fixed to the low level when TRMD10 is 0. Reception is started when data is read from SIO10.
6. Do not rewrite DIR10 when CSOT10 = 1 (during serial communication).

Caution Be sure to clear bit 5 to 0.

Figure 16-4. Format of Serial Operation Mode Register 11 (CSIM11)

Notes 1. Bit 0 is a read-only bit.

<R>

- To use P02/SO11, P03/SI11, P04/ $\overline{\text{SCK11}}$, and P05/ $\overline{\text{SSI11}}$ /TI001 as general-purpose ports, set CSIM11 in the default status (00H).
- Bit 0 (CSOT11) of CSIM11 and serial I/O shift register 11 (SIO11) are reset.
- Do not rewrite TRMD11 when CSOT11 = 1 (during serial communication).
- The SO11 output is fixed to the low level when TRMD11 is 0. Reception is started when data is read from SIO11.
- Do not rewrite SSE11 when CSOT11 = 1 (during serial communication).
- Before setting this bit to 1, fix the $\overline{\text{SSI11}}$ pin input level to 0 or 1.
- Do not rewrite DIR11 when CSOT11 = 1 (during serial communication).

(2) Serial clock selection register 1n (CSIC1n)

This register specifies the timing of the data transmission/reception and sets the serial clock.

CSIC1n can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Remark n = 0, 1

Figure 16-5. Format of Serial Clock Selection Register 10 (CSIC10)

Address: FF81H After reset: 00H R/W

CSIC10	0	0	0	CKP10	DAP10	CKS102	CKS101	CKS100

CKP10	DAP10	Specification of data transmission/reception timing	Type
0	0	$\overline{\text{SCK10}}$	1
0	1	$\overline{\text{SCK10}}$	2
1	0	$\overline{\text{SCK10}}$	3
1	1	$\overline{\text{SCK10}}$	4

CKS102	CKS101	CKS100	CSI10 serial clock selection ^{Note}	Mode
0	0	0	$f_x/2$ (5 MHz)	Master mode
0	0	1	$f_x/2^2$ (2.5 MHz)	Master mode
0	1	0	$f_x/2^3$ (1.25 MHz)	Master mode
0	1	1	$f_x/2^4$ (625 kHz)	Master mode
1	0	0	$f_x/2^5$ (312.5 kHz)	Master mode
1	0	1	$f_x/2^6$ (156.25 kHz)	Master mode
1	1	0	$f_x/2^7$ (78.13 kHz)	Master mode
1	1	1	External clock input to $\overline{\text{SCK10}}$	Slave mode

Note Set the serial clock so that the following conditions are satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Serial clock ≤ 5 MHz
- $V_{DD} = 3.3$ to 4.0 V: Serial clock ≤ 4.19 MHz
- $V_{DD} = 2.7$ to 3.3 V: Serial clock ≤ 2.5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Serial clock ≤ 1.25 MHz (standard products, (A) grade products only)

<R>

- Cautions**
1. When the internal oscillation clock is selected as the clock supplied to the CPU, the clock of the internal oscillator is divided and supplied as the serial clock. At this time, the operation of serial interface CSI10 is not guaranteed.
 2. Do not write to CSIC10 while CSIE10 = 1 (operation enabled).
 3. To use P10/ $\overline{\text{SCK10}}$ /TxD0, P11/SI10/RxD0, and P12/SO10 as general-purpose ports, set CSIC10 in the default status (00H).
 4. The phase type of the data clock is type 1 after reset.

<R>

- Remarks**
1. Figures in parentheses are for operation with $f_x = 10$ MHz
 2. f_x : High-speed system clock oscillation frequency

Figure 16-6. Format of Serial Clock Selection Register 11 (CSIC11)

Address: FF89H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
CSIC11	0	0	0	CKP11	DAP11	CKS112	CKS111	CKS110

CKP11	DAP11	Specification of data transmission/reception timing	Type
0	0		1
0	1		2
1	0		3
1	1		4

CKS112	CKS111	CKS110	CSI11 serial clock selection ^{Note}	Mode
0	0	0	$f_x/2$ (5 MHz)	Master mode
0	0	1	$f_x/2^2$ (2.5 MHz)	Master mode
0	1	0	$f_x/2^3$ (1.25 MHz)	Master mode
0	1	1	$f_x/2^4$ (625 kHz)	Master mode
1	0	0	$f_x/2^5$ (312.5 kHz)	Master mode
1	0	1	$f_x/2^6$ (156.25 kHz)	Master mode
1	1	0	$f_x/2^7$ (78.13 kHz)	Master mode
1	1	1	External clock input to $\overline{\text{SCK11}}$	Slave mode

Note Set the serial clock so that the following conditions are satisfied.

- $V_{DD} = 4.0$ to 5.5 V: Serial clock ≤ 5 MHz
- $V_{DD} = 3.3$ to 4.0 V: Serial clock ≤ 4.19 MHz
- $V_{DD} = 2.7$ to 3.3 V: Serial clock ≤ 2.5 MHz
- $V_{DD} = 2.5$ to 2.7 V: Serial clock ≤ 1.25 MHz (standard products, (A) grade products only)

<R>

Cautions 1. When the internal oscillation clock is selected as the clock supplied to the CPU, the clock of the internal oscillator is divided and supplied as the serial clock. At this time, the operation of serial interface CSI11 is not guaranteed.

2. Do not write to CSIC11 while CSIE11 = 1 (operation enabled).

<R> 3. To use P02/SO11, P03/SI11, and P04/ $\overline{\text{SCK11}}$ as general-purpose ports, set CSIC11 in the default status (00H).

4. The phase type of the data clock is type 1 after reset.

Remarks 1. Figures in parentheses are for operation with $f_x = 10$ MHz

2. f_x : High-speed system clock oscillation frequency

(3) Port mode registers 0 and 1 (PM0, PM1)

These registers set port 0 and 1 input/output in 1-bit units.

When using P10/ $\overline{\text{SCK10}}$ and P04/ $\overline{\text{SCK11}}$ as the clock output pins of the serial interface, clear PM10 and PM04 to 0 and set the output latches of P10 and P04 to 1.

When using P12/SO10 and P02/SO11 as the data output pins of the serial interface, clear PM12 and PM02, and the output latches of P12 and P02 to 0.

When using P10/ $\overline{\text{SCK10}}$ and P04/ $\overline{\text{SCK11}}$ as the clock input pins of the serial interface, P11/SI10/RxD0 and P03/SI11 as the data input pins, and P05/ $\overline{\text{SS11}}$ /TI001 as the chip select input pin, set PM10, PM04, PM11, PM03, and PM05 to 1. At this time, the output latches of P10, P04, P11, P03, and P05 may be 0 or 1.

PM0 and PM1 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets these registers to FFH.

16.4 Operation of Serial Interfaces CSI10 and CSI11

Serial interfaces CSI10 and CSI11 can be used in the following two modes.

- Operation stop mode
- 3-wire serial I/O mode

16.4.1 Operation stop mode

Serial communication is not executed in this mode. Therefore, the power consumption can be reduced. In addition, the P10/ $\overline{\text{SCK10}}$ /TxD0, P11/SI10/RxD0, P12/SO10, P02/SO11, P03/SI11, and P04/ $\overline{\text{SCK11}}$ pins can be used as ordinary I/O port pins in this mode.

(1) Register used

The operation stop mode is set by serial operation mode register 1n (CSIM1n).

To set the operation stop mode, clear bit 7 (CSIE1n) of CSIM1n to 0.

(a) Serial operation mode register 1n (CSIM1n)

CSIM1n can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears CSIM1n to 00H.

Remark n = 0, 1

- Serial operation mode register 10 (CSIM10)

Address: FF80H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0

	CSIE10	Operation control in 3-wire serial I/O mode						
	0	Disables operation ^{Note 1} and asynchronously resets the internal circuit ^{Note 2} .						

- <R> **Notes 1.** To use P10/ $\overline{\text{SCK10}}$ /TxD0, P11/SI10/RxD0, and P12/SO10 as general-purpose ports, set CSIM10 in the default status (00H).
- 2.** Bit 0 (CSOT10) of CSIM10 and serial I/O shift register 10 (SIO10) are reset.

- Serial operation mode register 11 (CSIM11)

Address: FF88H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
CSIM11	CSIE11	TRMD11	SSE11	DIR11	0	0	0	CSOT11
	CSIE11	Operation control in 3-wire serial I/O mode						
	0	Disables operation ^{Note 1} and asynchronously resets the internal circuit ^{Note 2} .						

- <R> **Notes 1.** To use P02/SO11, P03/SI11, P04/ $\overline{\text{SCK11}}$, and P05/ $\overline{\text{SSI11}}$ /TI001 as general-purpose ports, set CSIM11 in the default status (00H).
- 2.** Bit 0 (CSOT11) of CSIM11 and serial I/O shift register 11 (SIO11) are reset.

16.4.2 3-wire serial I/O mode

The 3-wire serial I/O mode is used for connecting peripheral ICs and display controllers with a clocked serial interface.

In this mode, communication is executed by using three lines: the serial clock ($\overline{\text{SCK1n}}$), serial output (SO1n), and serial input (SI1n) lines.

(1) Registers used

- Serial operation mode register 1n (CSIM1n)
- Serial clock selection register 1n (CSIC1n)
- Port mode register 0 (PM0) or port mode register 1 (PM1)
- Port register 0 (P0) or port register 1 (P1)

The basic procedure of setting an operation in the 3-wire serial I/O mode is as follows.

- <1> Set the CSIC1n register (see **Figures 16-5** and **16-6**).
- <2> Set bits 4 to 6 (DIR1n, SSE11 (serial interface CSI11 only), and TRMD1n) of the CSIM1n register (see **Figures 16-3** and **16-4**).
- <3> Set bit 7 (CSIE1n) of the CSIM1n register to 1. → Transmission/reception is enabled.
- <4> Write data to transmit buffer register 1n (SOTB1n). → Data transmission/reception is started.
Read data from serial I/O shift register 1n (SIO1n). → Data reception is started.

Caution Take relationship with the other party of communication when setting the port mode register and port register.

Remark n = 0, 1

The relationship between the register settings and pins is shown below.

Table 16-2. Relationship Between Register Settings and Pins (1/2)

(a) Serial interface CSI10

CSIE10	TRMD10	PM11	P11	PM12	P12	PM10	P10	CSI10 Operation	Pin Function

P0x: Port output latch

(2) Communication operation

In the 3-wire serial I/O mode, data is transmitted or received in 8-bit units. Each bit of the data is transmitted or received in synchronization with the serial clock.

Data can be transmitted or received if bit 6 (TRMD1n) of serial operation mode register 1n (CSIM1n) is 1. Transmission/reception is started when a value is written to transmit buffer register 1n (SOTB1n). In addition, data can be received when bit 6 (TRMD1n) of serial operation mode register 1n (CSIM1n) is 0.

Reception is started when data is read from serial I/O shift register 1n (SIO1n).

However, communication is performed as follows if bit 5 (SSE11) of CSIM11 is 1 when serial interface CSI11 is in the slave mode.

- <1> Low level input to the $\overline{\text{SSI11}}$ pin
 - Transmission/reception is started when SOTB11 is written, or reception is started when SIO11 is read.
- <2> High level input to the $\overline{\text{SSI11}}$ pin
 - Transmission/reception or reception is held, therefore, even if SOTB11 is written or SIO11 is read, transmission/reception or reception will not be started.
- <3> Data is written to SOTB11 or data is read from SIO11 while a high level is input to the $\overline{\text{SSI11}}$ pin, then a low level is input to the $\overline{\text{SSI11}}$ pin
 - Transmission/reception or reception is started.
- <4> A high level is input to the $\overline{\text{SSI11}}$ pin during transmission/reception or reception
 - Transmission/reception or reception is suspended.

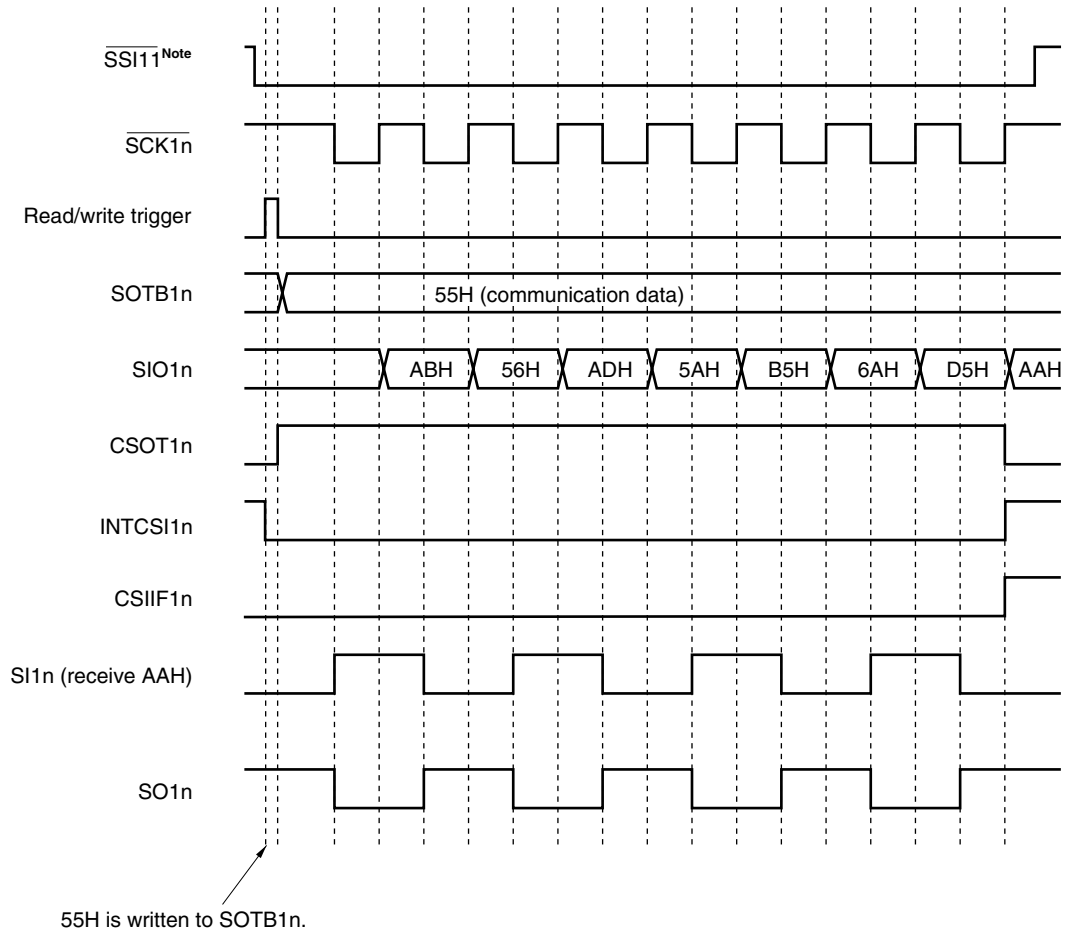

After communication has been started, bit 0 (CSOT1n) of CSIM1n is set to 1. When communication of 8-bit data has been completed, a communication completion interrupt request flag (CSIF1n) is set, and CSOT1n is cleared to 0. Then the next communication is enabled.

- Cautions**
1. Do not access the control register and data register when CSOT1n = 1 (during serial communication).
 2. When using serial interface CSI11, wait for the duration of at least one clock before the clock operation is started to change the level of the $\overline{\text{SSI11}}$ pin in the slave mode; otherwise, malfunctioning may occur.

Remark n = 0, 1

Figure 16-9. Timing in 3-Wire Serial I/O Mode (1/2)

(1) Transmission/reception timing (Type 1; TRMD1n = 1, DIR1n = 0, CKP1n = 0, DAP1n = 0, SSE11 = 1^{Note})

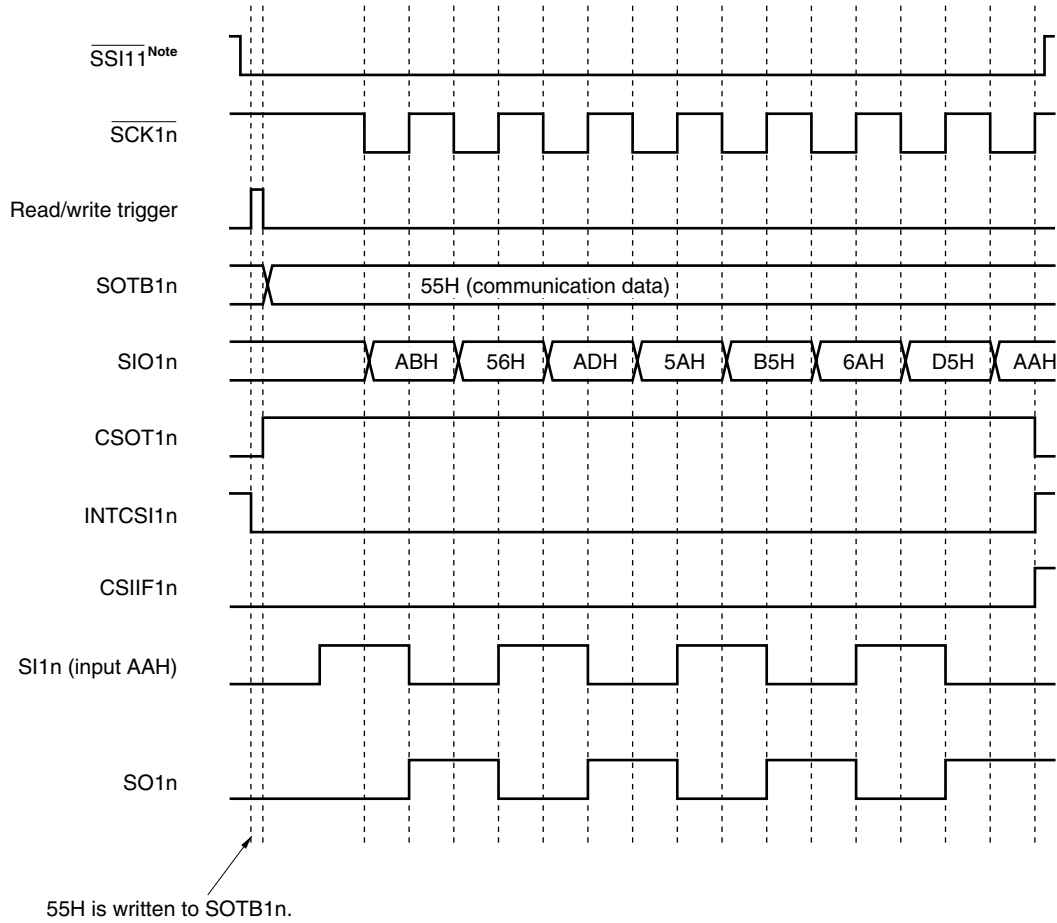

Note The SSE11 flag and $\overline{\text{SSI11}}$ pin are available only for serial interface CSI11, and are used in the slave mode.

Remark n = 0, 1

Figure 16-9. Timing in 3-Wire Serial I/O Mode (2/2)

(2) Transmission/reception timing (Type 2; TRMD1n = 1, DIR1n = 0, CKP1n = 0, DAP1n = 1, SSE11 = 1^{Note})

Note The SSE11 flag and $\overline{\text{SSI11}}$ pin are available only for serial interface CSI11, and are used in the slave mode.

Remark n = 0, 1

Figure 16-10. Timing of Clock/Data Phase

(a) Type 1; CKP1n = 0, DAP1n = 0

(b) Type 2; CKP1n = 0, DAP1n = 1

(c) Type 3; CKP1n = 1, DAP1n = 0

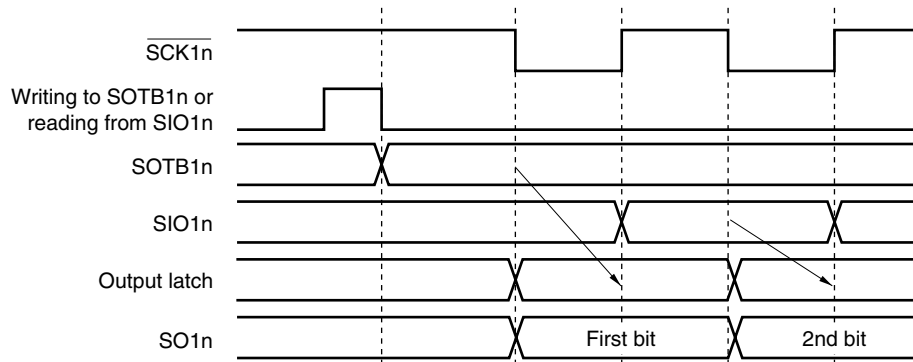

(d) Type 4; CKP1n = 1, DAP1n = 1

Remark n = 0, 1

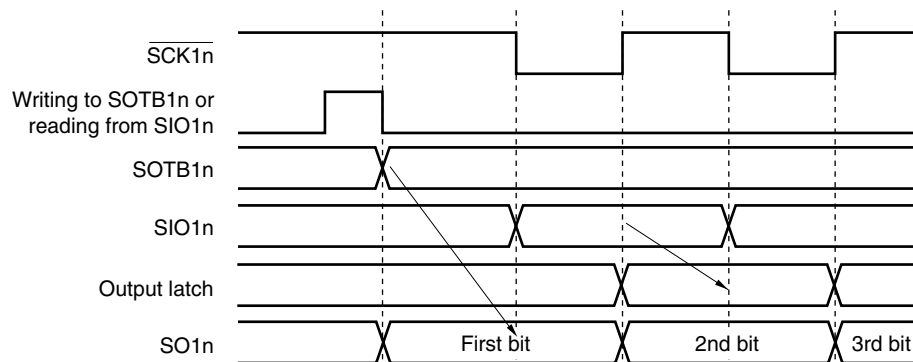

(3) Timing of output to SO1n pin (first bit)

When communication is started, the value of transmit buffer register 1n (SOTB1n) is output from the SO1n pin. The output operation of the first bit at this time is described below.

Figure 16-11. Output Operation of First Bit**(1) When CKP1n = 0, DAP1n = 0 (or CKP1n = 1, DAP1n = 0)**

The first bit is directly latched by the SOTB1n register to the output latch at the falling (or rising) edge of $\overline{SCK1n}$, and output from the SO1n pin via an output selector. Then, the value of the SOTB1n register is transferred to the SIO1n register at the next rising (or falling) edge of $\overline{SCK1n}$, and shifted one bit. At the same time, the first bit of the receive data is stored in the SIO1n register via the SI1n pin.

The second and subsequent bits are latched by the SIO1n register to the output latch at the next falling (or rising) edge of $\overline{SCK1n}$, and the data is output from the SO1n pin.

(2) When CKP1n = 0, DAP1n = 1 (or CKP1n = 1, DAP1n = 1)

The first bit is directly latched by the SOTB1n register at the falling edge of the write signal of the SOTB1n register or the read signal of the SIO1n register, and output from the SO1n pin via an output selector. Then, the value of the SOTB1n register is transferred to the SIO1n register at the next falling (or rising) edge of $\overline{SCK1n}$, and shifted one bit. At the same time, the first bit of the receive data is stored in the SIO1n register via the SI1n pin.

The second and subsequent bits are latched by the SIO1n register to the output latch at the next rising (or falling) edge of $\overline{SCK1n}$, and the data is output from the SO1n pin.

Remark n = 0, 1

(4) Output value of SO1n pin (last bit)

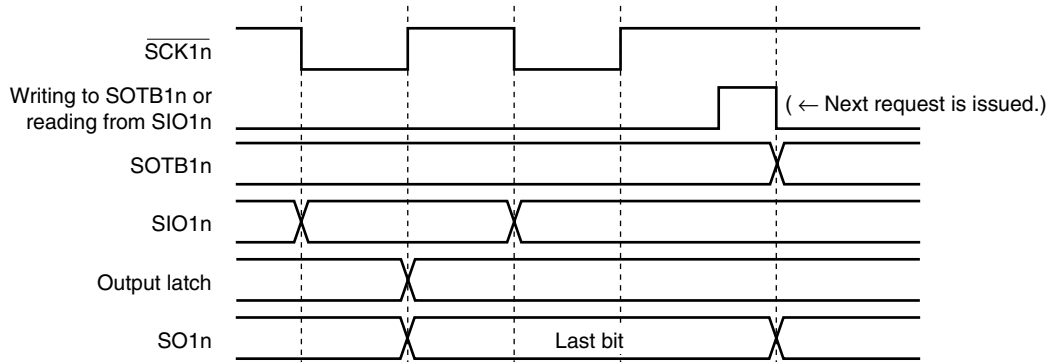

After communication has been completed, the SO1n pin holds the output value of the last bit.

Figure 16-12. Output Value of SO1n Pin (Last Bit)

(1) Type 1; when CKP1n = 0 and DAP1n = 0 (or CKP1n = 1, DAP1n = 0)

(2) Type 2; when CKP1n = 0 and DAP1n = 1 (or CKP1n = 1, DAP1n = 1)

Remark n = 0, 1

(5) SO1n output

The status of the SO1n output is as follows if bit 7 (CSIE1n) of serial operation mode register 1n (CSIM1n) is cleared to 0.

Table 16-3. SO1n Output Status

TRMD1n	DAP1n	DIR1n	SO1n Output ^{Note 1}
TRMD1n = 0 ^{Note}	–	–	Outputs low level ^{Note 2}
TRMD1n = 1	DAP1n = 0	–	Value of SO1n latch (low-level output)
	DAP1n = 1	DIR1n = 0	Value of bit 7 of SOTB1n
		DIR1n = 1	Value of bit 0 of SOTB1n

- Notes**
1. The actual output of the SO10/P12 or SO11/P02 pin is determined according to PM12 and P12 or PM02 and P02, as well as the SO1n output.
 2. Status after reset

Caution If a value is written to TRMD1n, DAP1n, and DIR1n, the output value of SO1n changes.

Remark n = 0, 1

17.1 Functions of Serial Interface CSIA0

Serial interface CSIA0 has the following three modes.

- Operation stop mode
- 3-wire serial I/O mode
- 3-wire serial I/O mode with automatic transmit/receive function

(1) Operation stop mode

This mode is used when serial communication is not performed and can enable a reduction in the power consumption.

For details, see **17.4.1 Operation stop mode**.

(2) 3-wire serial I/O mode (MSB/LSB-first selectable)

This mode is used to communicate 8-bit data using three lines: a serial clock line ($\overline{\text{SCKA0}}$) and two serial data lines (SIA0 and SOA0).

The processing time of data communication can be shortened in the 3-wire serial I/O mode because transmission and reception can be simultaneously executed.

In addition, whether 8-bit data is communicated MSB or LSB first can be specified, so this interface can be connected to any device.

For details, see **17.4.2 3-wire serial I/O mode**.

(3) 3-wire serial I/O mode with automatic transmit/receive function (MSB/LSB-first selectable)

This mode is used to communicate 8-bit data using three lines: a serial clock line ($\overline{\text{SCKA0}}$) and two serial data lines (SIA0 and SOA0).

The processing time of data communication can be shortened in the 3-wire serial I/O mode with automatic transmit/receive function because transmission and reception can be simultaneously executed.

In addition, whether 8-bit data is communicated MSB or LSB first can be specified, so this interface can be connected to any device.

Data can be communicated to/from a display driver etc. without using software since a 32-byte transfer buffer RAM is incorporated. Also, the incorporation of handshake pins (STB0, BUSY0) has made connection to peripheral LSIs easy.

For details, see **17.4.3 3-wire serial I/O mode with automatic transmit/receive function**.

- Master mode/slave mode selectable
- Communication data length: 8 bits
- MSB/LSB-first selectable for communication data
- Automatic transmit/receive function:
 - Number of transfer bytes can be specified between 1 and 32
 - Transfer interval can be specified (0 to 63 clocks)
 - Single communication/repeat communication selectable
- On-chip dedicated baud rate generator (6/8/16/32 divisions)
- 3-wire SOA0: Serial data output
 - SIA0: Serial data input
 - $\overline{\text{SCKA0}}$: Serial clock I/O
- Handshake function incorporated STB0: Strobe output
 - BUSY0: Busy input
- Transmission/reception completion interrupt: INTACSI
- Internal 32-byte buffer RAM

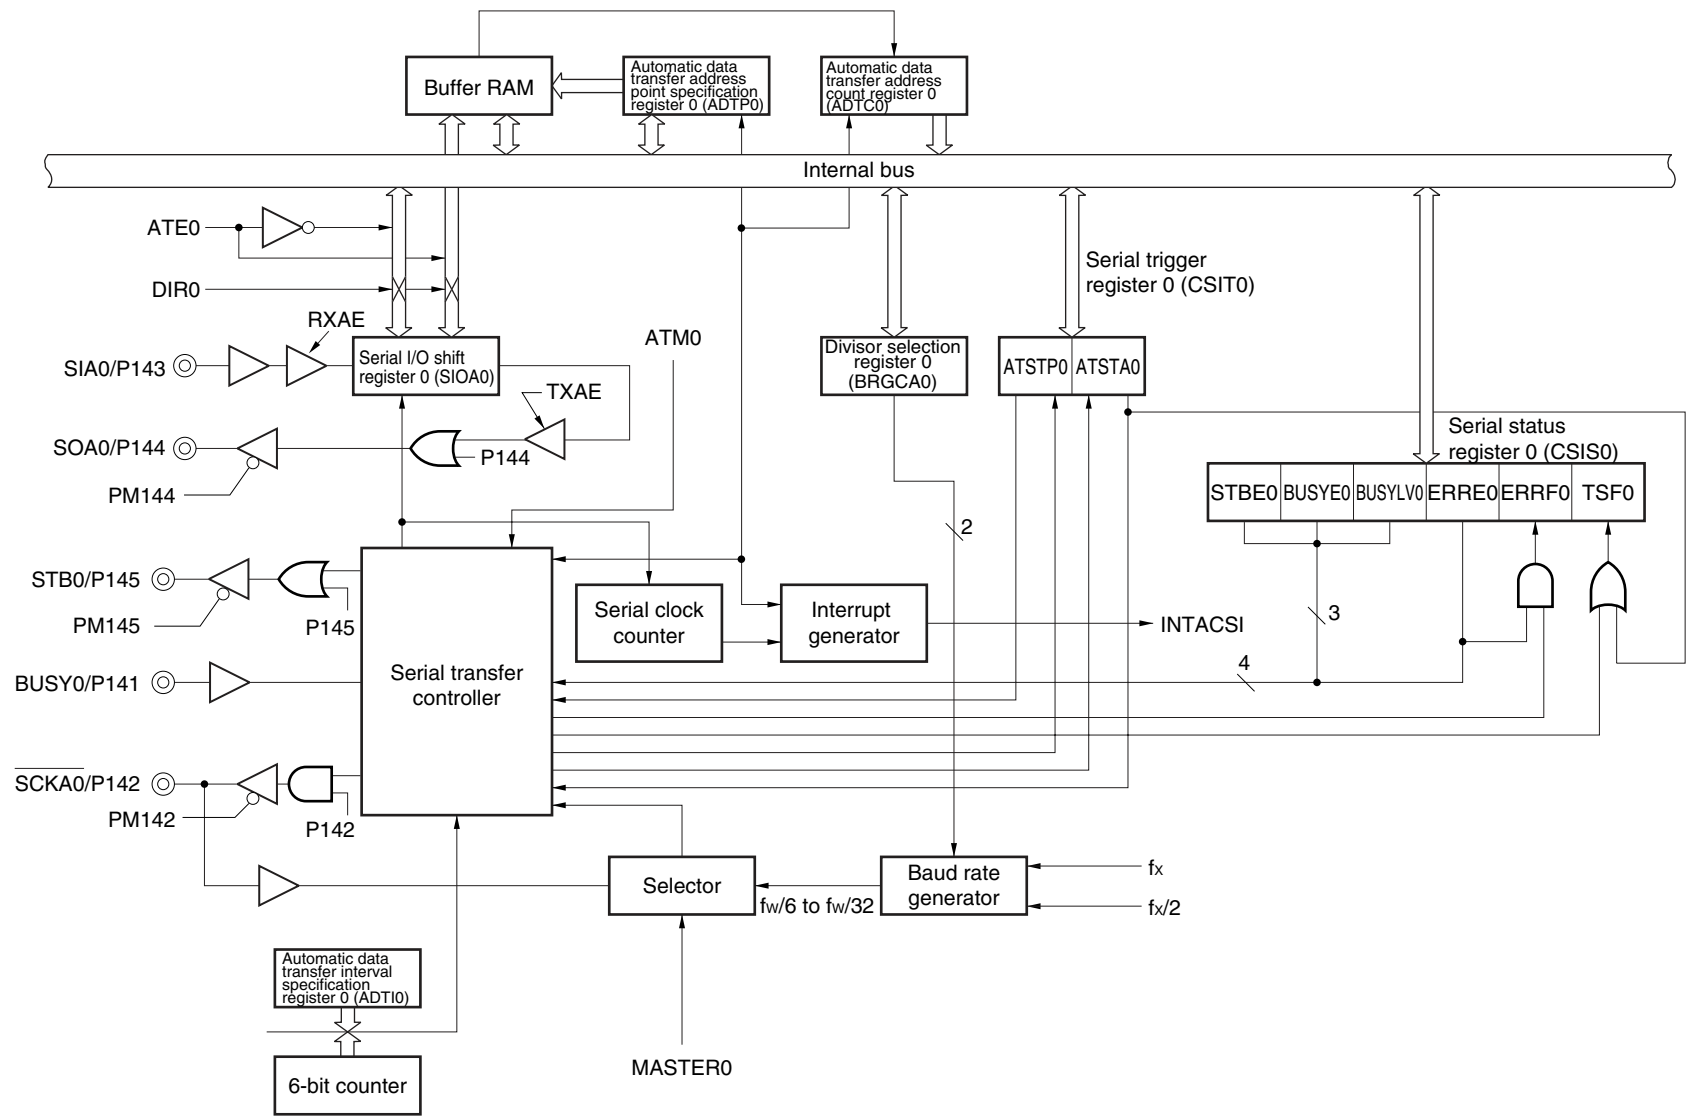

17.2 Configuration of Serial Interface CSIA0

Serial interface CSIA0 includes the following hardware.

Table 17-1. Configuration of Serial Interface CSIA0

Item	Configuration
Registers	Serial I/O shift register 0 (SIOA0) Automatic data transfer address count register 0 (ADTC0)
Control registers	Serial operation mode specification register 0 (CSIMA0) Serial status register 0 (CSIS0) Serial trigger register 0 (CSIT0) Divisor selection register 0 (BRGCA0) Automatic data transfer address point specification register 0 (ADTP0) Automatic data transfer interval specification register 0 (ADTI0) Port mode register 14 (PM14) Port register 14 (P14)

Figure 17-1. Block Diagram of Serial Interface CSIA0

(1) Serial I/O shift register 0 (SIOA0)

This is an 8-bit register used to store transmit/receive data in 1-byte transfer mode (bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) = 0). Writing transmit data to SIOA0 starts the communication. In addition, after a communication completion interrupt request (INTACSI) is output (bit 0 (TSF0) of serial status register 0 (CSIS0) = 0), data can be received by reading data from SIOA0.

This register can be written or read by an 8-bit memory manipulation instruction. However, writing to SIOA0 is prohibited when bit 0 (TSF0) of serial status register 0 (CSIS0) = 1.

$\overline{\text{RESET}}$ input clears this register to 00H.

Cautions 1. A communication operation is started by writing to SIOA0. Consequently, when transmission is disabled (bit 3 (TXEA0) of CSIMA0 = 0), write dummy data to the SIOA0 register to start the communication operation, and then perform a receive operation.

2. Do not write data to SIOA0 while the automatic transmit/receive function is operating.

(2) Automatic data transfer address count register 0 (ADTC0)

This is a register used to indicate buffer RAM addresses during automatic transfer. When automatic transfer is stopped, the data position when transfer stopped can be ascertained by reading ADTC0 register value.

This register can be read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H. However, reading from ADTC0 is prohibited when bit 0 (TSF0) of serial status register 0 (CSIS0) = 1.

Figure 17-2. Format of Automatic Data Transfer Address Count Register 0 (ADTC0)

Address: FF97H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
ADTC0	0	0	0	ADTC04	ADTC03	ADTC02	ADTC01	ADTP00

17.3 Registers Controlling Serial Interface CSIA0

Serial interface CSIA0 is controlled by the following eight registers.

- Serial operation mode specification register 0 (CSIMA0)
- Serial status register 0 (CSIS0)
- Serial trigger register 0 (CSIT0)
- Divisor selection register 0 (BRGCA0)
- Automatic data transfer address point specification register 0 (ADTP0)
- Automatic data transfer interval specification register 0 (ADTI0)
- Port mode register 14 (PM14)
- Port register 14 (P14)

(1) Serial operation mode specification register 0 (CSIMA0)

This is an 8-bit register used to control the serial communication operation.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Figure 17-3. Format of Serial Operation Mode Specification Register 0 (CSIMA0)

Address: FF90H After reset: 00H R/W

Symbol	<7>	6	5	4	<3>	<2>	1	0
CSIMA0	CSIAE0	ATE0	ATM0	MASTER0	TXEA0	RXEA0	DIR0	0
CSIAE0	Control of CSIA0 operation enable/disable							
0	CSIA0 operation disabled (SOA0: Low level, SCKA0: High level) and asynchronously resets the internal circuit ^{Note} .							
1	CSIA0 operation enabled							
ATE0	Control of automatic communication operation enable/disable							
0	1-byte communication mode							
1	Automatic communication mode							
ATM0	Automatic communication mode specification							
0	Single transfer mode (stops at the address specified by the ADTP0 register)							
1	Repeat transfer mode (after transfer is complete, clear the ADTC0 register to 00H to resume transfer)							
MASTER0	CSIA0 master/slave mode specification							
0	Slave mode (synchronous with SCKA0 input clock)							
1	Master mode (synchronous with internal clock)							
TXEA0	Control of transmit operation enable/disable							
0	Transmit operation disabled (SOA0: Low level)							
1	Transmit operation enabled							
RXEA0	Control of receive operation enable/disable							
0	Receive operation disabled							
1	Receive operation enabled							
DIR0	First bit specification							
0	MSB							
1	LSB							

Note Automatic data transfer address count register 0 (ADTC0), serial trigger register 0 (CSIT0), serial I/O shift register 0 (SIOA0), and bit 0 (TSF0) of serial status register 0 (CSIS0) are reset.

- Cautions**
1. When CSIAE0 = 0, the buffer RAM cannot be accessed.
 2. When CSIAE0 is changed from 1 to 0, the registers and bits mentioned in Note above are asynchronously initialized. To set CSIAE0 = 1 again, be sure to re-set the initialized registers.
 3. When CSIAE0 is re-set to 1 after CSIAE0 is changed from 1 to 0, it is not guaranteed that the value of the buffer RAM will be retained.

(2) Serial status register 0 (CSIS0)

This is an 8-bit register used to select the base clock, control the communication operation, and indicate the status of serial interface CSIA0.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H. However, rewriting CSIS0 is prohibited when bit 0 (TSF0) is 1.

Figure 17-4. Format of Serial Status Register 0 (CSIS0) (1/2)

Address: FF91H After reset: 00H R/W^{Note 1}

Symbol	7	6	5	4	3	2	1	0	
CSIS0	0	CKS00	STBE0	BUSYE0	BUSYLV0	ERRE0	ERRF0	TSF0	
CKS00	Base clock (fw) selection ^{Note 2}								
0	fx (10 MHz)								
1	fx/2 (5 MHz)								
STBE0 ^{Notes 3, 4}	Strobe output enable/disable								
0	Strobe output disabled								
1	Strobe output enabled								
BUSYE0	Busy signal detection enable/disable								
0	Busy signal detection disabled (input via BUSY0 pin is ignored)								
1	Busy signal detection enabled and communication wait by busy signal is executed								
BUSYLV0 ^{Note 5}	Busy signal active level setting								
0	Low level								
1	High level								

Notes 1. Bits 0 and 1 are read-only.

2. Set the base clock to satisfy the following conditions.

- V_{DD} = 4.0 to 5.5 V: Base clock ≤ 10 MHz
- V_{DD} = 3.3 to 4.0 V: Base clock ≤ 8.38 MHz
- V_{DD} = 2.7 to 3.3 V: Base clock ≤ 5 MHz
- V_{DD} = 2.5 to 2.7 V: Base clock ≤ 2.5 MHz (standard products, (A) grade products only)

<R>

3. STBE0 is valid only in master mode.

4. When STBE0 is set to 1, two transfer clocks are consumed between byte transfers regardless of the setting of automatic data transfer interval specification register 0 (ADTI0). That is, 10 transfer clocks are used for 1-byte transfer if ADTI0 = 00H is set.

5. In bit error detection by busy input, the active level specified by BUSYLV0 is detected.

Caution Be sure to clear bit 7 to 0.

Remarks 1. Figures in parentheses apply to operation with fx = 10 MHz.

2. fx: X1 input clock oscillation frequency

Figure 17-4. Format of Serial Status Register 0 (CSIS0) (2/2)

ERRE0 ^{Note}	Bit error detection enable/disable
0	Error detection disabled
1	Error detection enabled
ERRF0	Bit error detection flag
0	<ul style="list-style-type: none"> • Bit 7 (CSIAE0) of serial operation mode specification register 0 (CSIMA0) = 0 • At reset input • When communication is started by setting bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) to 1 or writing to SIOA0.
1	Bit error detected (when ERRE0 = 1, the level specified by BUSYLV0 during the data bit transfer period is detected via BUSY0 pin input).
TSF0	Transfer status detection flag
0	<ul style="list-style-type: none"> • Bit 7 (CSIAE0) of serial operation mode specification register 0 (CSIMA0) = 0 • At reset input • At the end of the specified transfer • When transfer is stopped by setting bit 1 (ATSTP0) of serial trigger register 0 (CSIT0) to 1
1	From the transfer start to the end of the specified transfer

Note The ERRE0 setting is valid even when BUSYE0 = 0.

Caution When TSF0 is 1, rewriting serial operation mode specification register 0 (CSIMA0), serial status register 0 (CSIS0), divisor selection register 0 (BRGCA0), automatic data transfer address point specification register 0 (ADTP0), automatic data transfer interval specification register 0 (ADTI0), and serial I/O shift register 0 (SIOA0) are prohibited. However, these registers can be read and re-written to the same value. In addition, the buffer RAM can be rewritten during transfer.

(3) Serial trigger register 0 (CSIT0)

This is an 8-bit register used to control execution/stop of automatic data transfer between buffer RAM and serial I/O shift register 0 (SIOA0).

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H. However, manipulate only when bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) is 1 (manipulation prohibited when ATE0 = 0).

Figure 17-5. Format of Serial Trigger Register 0 (CSIT0)

Address: FF92H After reset: 00H R/W

Symbol	7	6	5	4	3	2	<1>	<0>
CSIT0	0	0	0	0	0	0	ATSTP0	ATSTA0

ATSTP0	Automatic data transfer stop
0	–
1	Automatic data transfer stopped

ATSTA0	Automatic data transfer start
0	–
1	Automatic data transfer started

- Cautions**
1. Even if ATSTP0 or ATSTA0 is set to 1, automatic transfer cannot be started/stopped until 1-byte transfer is complete.
 2. ATSTP0 and ATSTA0 change to 0 automatically after the interrupt signal INTACSI is generated.
 3. After automatic data transfer is stopped, the data address when the transfer stopped is stored in automatic data transfer address count register 0 (ADTC0). However, since no function to restart automatic data transfer is incorporated, when transfer is stopped by setting ATSTP0 = 1, start automatic data transfer by ATSTA0 after re-setting the registers.

(4) Divisor selection register 0 (BRGCA0)

This is an 8-bit register used to select the base clock divisor of CSIA0.

This register can be set by an 8-bit memory manipulation instruction. However, when bit 0 (TSF0) of serial status register 0 (CSIS0) is 1, rewriting BRGCA0 is prohibited.

Figure 17-6. Format of Divisor Selection Register 0 (BRGCA0)

Address: FF93H After reset: 03H R/W

Symbol	7	6	5	4	3	2	1	0
BRGCA0	0	0	0	0	0	0	BRGCA01	BRGCA00

BRGCA01	BRGCA00	CSIA0 base clock (fw) divisor selection
0	0	fw/6 (1.67 MHz)
0	1	fw/2 ³ (1.25 MHz)
1	0	fw/2 ⁴ (625 kHz)
1	1	fw/2 ⁵ (312.5 kHz)

- Remarks**
1. Figures in parentheses apply to operation with fw = 10 MHz.
 2. fw: Base clock frequency selected by CKS00 bit of CSIS0 register

(5) Automatic data transfer address point specification register 0 (ADTP0)

This is an 8-bit register used to specify the buffer RAM address that ends transfer during automatic data transfer (bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) = 1).

This register can be set by an 8-bit memory manipulation instruction. However, when bit 0 (TSF0) of serial status register 0 (CSIS0) is 1, rewriting ADTP0 is prohibited.

In the 78K0/KF1+, 00H to 1FH can be specified because 32 bytes of buffer RAM are incorporated.

Example When ADTP0 is set to 07H
8 bytes of FA00H to FA07H are transferred.

In repeat transfer mode (bit 5 (ATM0) of CSIMA0 = 1), transfer is performed repeatedly up to the address specified with ADTP0.

Example When ADTP0 is set to 07H (repeat transfer mode)
Transfer is repeated as FA00H to FA07H, FA00H to FA07H,

Figure 17-7. Format of Automatic Data Transfer Address Point Specification Register 0 (ADTP0)

Address: FF94H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
ADTP0	0	0	0	ADTP04	ADTP03	ADTP02	ADTP01	ADTP00

Caution Be sure to clear bits 7 to 5 to 0.

The relationship between buffer RAM address values and ADTP0 setting values is shown below.

Table 17-2. Relationship Between Buffer RAM Address Values and ADTP0 Setting Values

Buffer RAM Address Value	ADTP0 Setting Value	Buffer RAM Address Value	ADTP0 Setting Value
FA00H	00H	FA10H	10H
FA01H	01H	FA11H	11H
FA02H	02H	FA12H	12H
FA03H	03H	FA13H	13H
FA04H	04H	FA14H	14H
FA05H	05H	FA15H	15H
FA06H	06H	FA16H	16H
FA07H	07H	FA17H	17H
FA08H	08H	FA18H	18H
FA09H	09H	FA19H	19H
FA0AH	0AH	FA1AH	1AH
FA0BH	0BH	FA1BH	1BH
FA0CH	0CH	FA1CH	1CH
FA0DH	0DH	FA1DH	1DH
FA0EH	0EH	FA1EH	1EH
FA0FH	0FH	FA1FH	1FH

(6) Automatic data transfer interval specification register 0 (ADTI0)

This is an 8-bit register used to specify the interval time between 1-byte communications during automatic data transfer (bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) = 1).

Set this register when in master mode (bit 4 (MASTER0) of CSIMA0 = 1) (setting is unnecessary in slave mode). Setting in 1-byte communication mode (bit 6 (ATE0) of CSIMA0 = 0) is also valid. When the interval time specified by ADTI0 after the end of 1-byte communication has elapsed, an interrupt request signal (INTACSI) is output. The number of clocks for the interval can be set to between 0 and 63 clocks.

This register can be set by an 8-bit memory manipulation instruction. However, when bit 0 (TSF0) of serial status register 0 (CSIS0) is 1, rewriting ADTI0 is prohibited.

Figure 17-8. Format of Automatic Data Transfer Interval Specification Register 0 (ADTI0)

Address: FF95H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
ADTI0	0	0	ADTI05	ADTI04	ADTI03	ADTI02	ADTI01	ADTI00

Caution Because the setting of bit 5 (STBE0) and bit 4 (BUSYE0) of serial status register 0 (CSIS0) takes priority over the ADTI0 setting, the interval time based on the setting of STBE0 and BUSYE0 is generated even when ADTI0 is cleared to 00H.

Example Interval time when busy signal is not generated

- <1> When STBE0 = 1, BUSYE0 = 0: Interval time of two serial clocks is generated
- <2> When STBE0 = 0, BUSYE0 = 1: Interval time of one serial clock is generated
- <3> When STBE0 = 1, BUSYE0 = 1: Interval time of two serial clocks is generated

Therefore, clearing STBE0 and BUSYE0 to 0 is required to perform no-wait transfer.

The specified interval time is the serial clock (specified by divisor selection register 0 (BRGCA0)) multiplied by an integer value.

Example When ADTI0 = 03H

(7) Port mode register 14 (PM14)

This register sets port 14 input/output in 1-bit units.

When using P142/ $\overline{\text{SCKA0}}$, P144/SOA0, and P145/STB0 pins as the clock output, data output, or strobe output of the serial interface, clear PM142, PM144, PM145, and the output latches of P142, P144, and P145 to 0.

When using P141/BUSY0, P142/ $\overline{\text{SCKA0}}$, and P143/SIA0 pins as the busy input, clock input, or data input of the serial interface, set PM141, PM142, and PM143 to 1. At this time, the output latches of P141, P142, and P143 may be 0 or 1.

PM14 can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to FFH.

Figure 17-9. Format of Port Mode Register 14 (PM14)

Address: FF2EH After reset: FFH R/W

Symbol	7	6	5	4	3	2	1	0
PM14	1	1	PM145	PM144	PM143	PM142	PM141	PM140

PM14n	P14n pin I/O mode selection (n = 0 to 5)
0	Output mode (output buffer on)
1	Input mode (output buffer off)

17.4 Operation of Serial Interface CSIA0

Serial interface CSIA0 has the following three modes.

- Operation stop mode
- 3-wire serial I/O mode
- 3-wire serial I/O mode with automatic transmit/receive function

17.4.1 Operation stop mode

Serial communication is not executed in this mode. Therefore, the power consumption can be reduced. In addition, the P142/SCKA0, P143/SIA0, and P144/SOA0 pins can be used as ordinary I/O port pins in this mode.

(1) Register used

The operation stop mode is set by serial operation mode specification register 0 (CSIMA0). To set the operation stop mode, clear bit 7 (CSIAE0) of CSIMA0 to 0.

(a) Serial operation mode specification register 0 (CSIMA0)

This is an 8-bit register used to control the serial communication operation.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

RESET input clears this register to 00H.

Address: FF90H After reset: 00H R/W

	<7>	6	5	4	<3>	<2>	1	0
CSIMA0	CSIAE0	ATE0	ATM0	MASTER0	TXEA0	RXEA0	DIR0	0
	CSIAE0	Control of CSIA0 operation enable/disable						
	0	CSIA0 operation disabled (SOA0: Low level, SCKA0: High level) and asynchronously resets the internal circuit						

17.4.2 3-wire serial I/O mode

The one-byte data transmission/reception is executed in the mode in which bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) is cleared to 0.

The 3-wire serial I/O mode is useful for connecting peripheral ICs and display controllers with a clocked serial interface.

In this mode, communication is executed by using three lines: serial clock ($\overline{\text{SCKA0}}$), serial output (SOA0), and serial input (SIA0) lines.

(1) Registers used

- Serial operation mode specification register 0 (CSIMA0)^{Note 1}
- Serial status register 0 (CSIS0)^{Note 2}
- Divisor selection register 0 (BRGCA0)
- Port mode register 14 (PM14)
- Port register 14 (P14)

Notes 1. Bits 7, 6, and 4 to 1 (CSIAE0, ATE0, MASTER0, TXEA0, RXEA0, and DIR0) are used. Setting of bit 5 (ATM0) is invalid.

2. Only bit 6 (CKS00) and bit 0 (TSF0) are used.

The basic procedure of setting an operation in the 3-wire serial I/O mode is as follows.

- <1> Set bit 6 (CKS00) of the CSIS0 register (see **Figure 17-4**).
- <2> Set the BRGCA0 register (see **Figure 17-6**)^{Note 1}.
- <3> Set bits 4 to 1 (MASTER0, TXEA0, RXEA0, and DIR0) of the CSIMA0 register (see **Figure 17-3**).
- <4> Set bit 7 (CSIAE0) of the CSIMA0 register to 1 and clear bit 6 (ATE0) to 0.
- <5> Write data to serial I/O shift register 0 (SIOA0). → Data transmission/reception is started^{Note 2}.

Notes 1. This register does not have to be set when the slave mode is specified (MASTER0 = 0).

2. Write dummy data to SIOA0 only for reception.

Caution Take relationship with the other party of communication when setting the port mode register and port register.

The relationship between the register settings and pins is shown below.

Table 17-3. Relationship Between Register Settings and Pins

CSIAE0	ATE0	MASTER0	PM143	P143	PM144	P144	PM142	P142	Serial I/O Shift Register 0 Operation	Serial Clock Counter Operation Control	Pin Function		
											SIA0/ P143	SOA0/ P144	SCKA0/ P142
0	x	x	x ^{Note 1}	x ^{Note 1}	x ^{Note 1}	x ^{Note 1}	x ^{Note 1}	x ^{Note 1}	Operation stopped	Clear	P143	P144	P142
1	0	0	1 ^{Note 2}	x ^{Note 2}	0 ^{Note 3}	0 ^{Note 3}	1	x	Operation enabled	Count operation	SIA0 ^{Note 2}	SOA0 ^{Note 3}	SCKA0 (input)
		1											0

- Notes**
1. Can be set as port function.
 2. Can be used as P143 when only transmission is performed. Clear bit 2 (RXEA0) of CSIMA0 to 0.
 3. Can be used as P144 when only reception is performed. Clear bit 3 (TXEA0) of CSIMA0 to 0.

Remark

- x: don't care
- CSIAE0: Bit 7 of serial operation mode specification register 0 (CSIMA0)
- ATE0: Bit 6 of CSIMA0
- MASTER0: Bit 4 of CSIMA0
- PM14x: Port mode register
- P14x: Port output latch

(2) 1-byte transmission/reception communication operation**(a) 1-byte transmission/reception**

When bit 7 (CSIAE0) and bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) = 1, 0, respectively, if communication data is written to serial I/O shift register 0 (SIOA0), the data is output via the SOA0 pin in synchronization with the $\overline{\text{SCKA0}}$ falling edge, and then input via the SIA0 pin in synchronization with $\overline{\text{SCKA0}}$ falling edge, and stored in the SIOA0 register in synchronization with the rising edge 1 clock later.

Data transmission and data reception can be performed simultaneously.

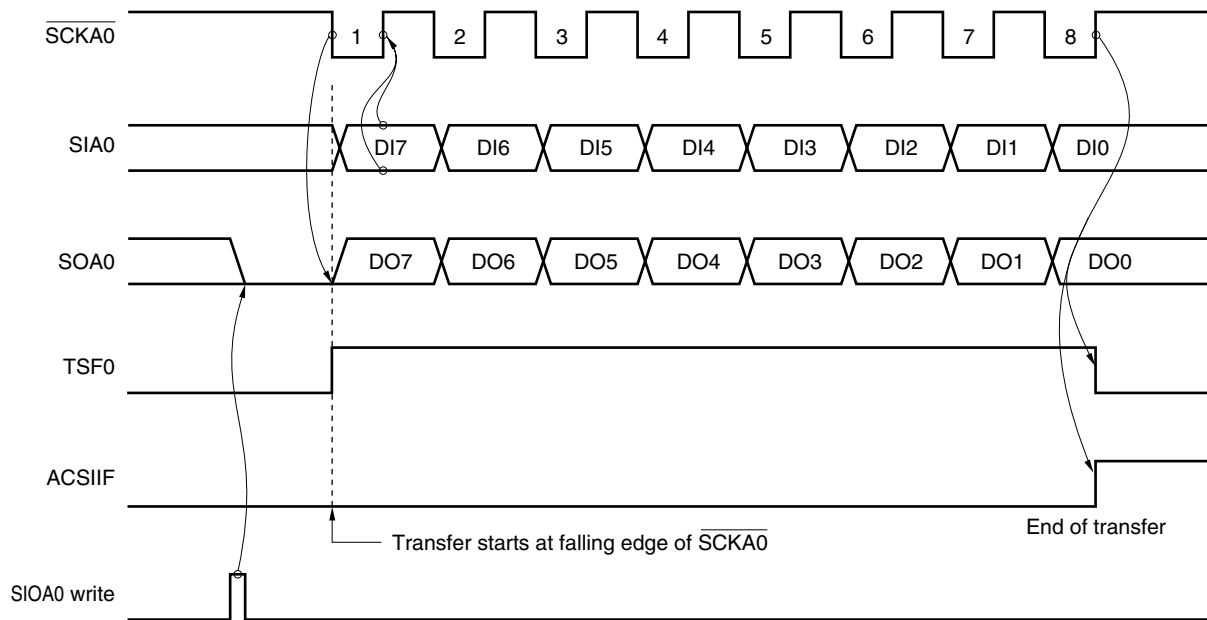

If only reception is to be performed, communication can only be started by writing a dummy value to the SIOA0 register.

When communication of 1 byte is complete, an interrupt request signal (INTACSI) is generated.

In 1-byte transmission/reception, the setting of bit 5 (ATM0) of CSIMA0 is invalid.

Be sure to read data after confirming that bit 0 (TSF0) of serial status register 0 (CSIS0) = 0.

Figure 17-10. 3-Wire Serial I/O Mode Timing

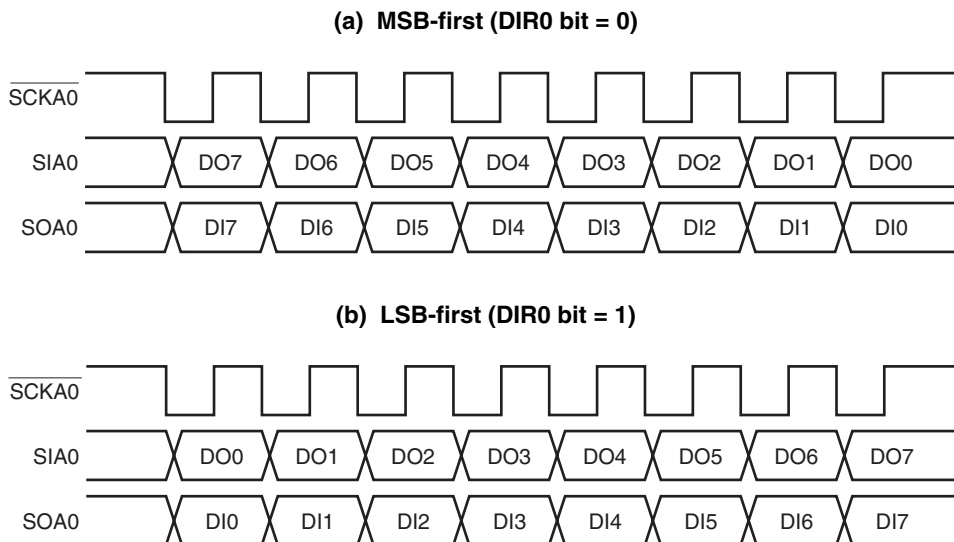

Caution The SOA0 pin becomes low level by an SIOA0 write.

(b) Data format

In the data format, data is changed in synchronization with the $\overline{\text{SCKA0}}$ falling edge as shown below.

The data length is fixed to 8 bits and the data communication direction can be switched by the specification of bit 1 (DIR0) of serial operation mode specification register 0 (CSIMA0).

Figure 17-11. Format of Transmit/Receive Data

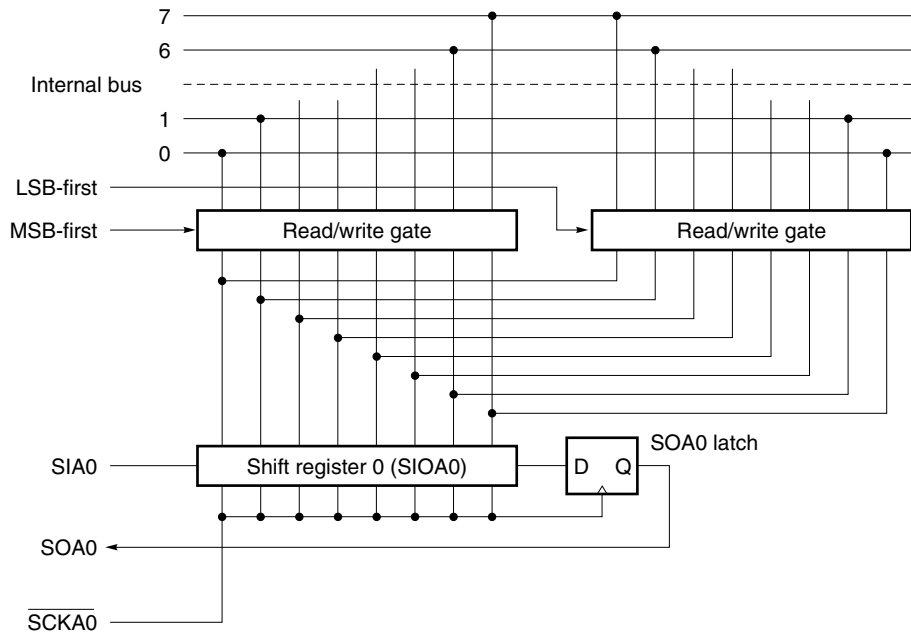

(c) Switching MSB/LSB as start bit

Figure 17-12 shows the configuration of serial I/O shift register 0 (SIOA0) and the internal bus. As shown in the figure, MSB/LSB can be read/written in reverse form.

Switching MSB/LSB as the start bit can be specified using bit 1 (DIR0) of serial operation mode specification register 0 (CSIMA0).

Figure 17-12. Transfer Bit Order Switching Circuit

Start bit switching is realized by switching the bit order for data written to SIOA0. The SIOA0 shift order remains unchanged.

Thus, switching between MSB-first and LSB-first must be performed before writing data to the shift register.

(d) Communication start

Serial communication is started by setting communication data to serial I/O shift register 0 (SIOA0) when the following two conditions are satisfied.

- Serial interface CSIA0 operation control bit (CSIAE0) = 1
- Serial communication is not in progress

Caution If CSIAE0 is set to 1 after data is written to SIOA0, communication does not start.

Upon termination of 8-bit communication, serial communication automatically stops and the interrupt request flag (ACSIIF) is set.

17.4.3 3-wire serial I/O mode with automatic transmit/receive function

Up to 32 bytes of data can be transmitted/received without using software in the mode in which bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) is set to 1. After communication is started, only data of the set number of bytes stored in RAM in advance can be transmitted, and only data of the set number of bytes can be received and stored in RAM.

In addition, to transmit/receive data continuously, handshake signals (STB0 and BUSY0) generated by hardware are supported. Therefore, connection to peripheral LSIs such as OSD (On Screen Display) LSIs and LCD controller/drivers can be easily realized.

(1) Registers used

- Serial operation mode specification register 0 (CSIMA0)
- Serial status register 0 (CSIS0)
- Serial trigger register 0 (CSIT0)
- Divisor selection register 0 (BRGCA0)
- Automatic data transfer address point specification register 0 (ADTP0)
- Automatic data transfer interval specification register 0 (ADTI0)
- Port mode register 14 (PM14)
- Port register 14 (P14)

The relationship between the register settings and pins is shown below.

Caution A wait state may be generated when data is written to the buffer RAM. For details, see **CHAPTER 34 CAUTIONS FOR WAIT.**

Table 17-4. Relationship Between Register Settings and Pins

CSIAE0	ATE0	MASTER0	STBE0	BUSYE0	ERRE0	PM143	P143	PM144	P144	PM142	P142	PM145	P145	PM141	P141	Serial I/O Shift Register 0 Operation	Serial Clock Counter Operation Control	Pin Function

- Notes**
1. Can be set as port function.
 2. Can be used as P143 when only transmission is performed. Clear bit 2 (RXEA0) of CSIMA0 to 0.

Remark

- ×: don't care
- CSIAE0: Bit 7 of serial operation mode specification register 0 (CSIMA0)
- ATE0: Bit 6 of CSIMA0
- MASTER0: Bit 4 of CSIMA0
- STBE0: Bit 5 of serial status register 0 (CSIS0)
- BUSYE0: Bit 4 of CSIS0
- ERRE0: Bit 2 of CSIS0
- PM14×: Port mode register
- P14×: Port output latch

(2) Automatic transmit/receive data setting**(a) Transmit data setting**

- <1> Write transmit data from the least significant address FA00H of buffer RAM (up to FA1FH at maximum). The transmit data should be in the order from lower address to higher address.
- <2> Set the automatic data transfer address point specification register 0 (ADTP0) to the value obtained by subtracting 1 from the number of transmit data bytes.

(b) Setting example of automatic transmission/reception mode

- <1> Set bit 7 (CSIAE0) and bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) to 1.
- <2> Set bit 2 (RXEA0) and bit 3 (TXEA0) of CSIMA0 to 1.
- <3> Set a data transfer interval in automatic data transfer interval specification register 0 (ADTI0).
- <4> Set bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) to 1.

Caution Take relationship with the other party of communication when setting the port mode register and port register.

The following operations are automatically carried out when (a) and (b) are carried out.

- After the buffer RAM data indicated by automatic data transfer address count register 0 (ADTC0) is transferred to SIOA0, transmission is carried out (start of automatic transmission/reception).
- The received data is written to the buffer RAM address indicated by ADTC0.
- ADTC0 is incremented and the next data transmission/reception is carried out. Data transmission/reception continues until the ADTC0 incremental output matches the set value of automatic data transfer address point specification register 0 (ADTP0) (end of automatic transmission/reception). However, if bit 5 (ATM0) of CSIMA0 is set to 1 (repeat mode), ADTC0 is cleared after a match between ADTP0 and ADTC0, and then repeated transmission/reception is started.
- When automatic transmission/reception is terminated, TSF0 is cleared to 0.

(3) Automatic transmission/reception communication operation**(a) Automatic transmission/reception mode**

Automatic transmission/reception can be performed using buffer RAM.

The data stored in the buffer RAM is output from the SOA0 pin via the SIOA0 register in synchronization with the $\overline{SCKA0}$ falling edge by performing (a) and (b) in **(2) Automatic transmit/receive data setting**.

The data is then input from the SIA0 pin via the SIOA0 register in synchronization with the $\overline{SCKA0}$ falling edge and the receive data is stored in the buffer RAM in synchronization with the rising edge 1 clock later.

Data transfer ends if bit 0 (TSF0) of serial status register 0 (CSIS0) is set to 1 when any of the following conditions is met.

- Reset by clearing bit 7 (CSIAE0) of the CSIMA0 register to 0
- Transfer of 1 byte is complete by setting bit 1 (ATSTP0) of the CSIT0 register to 1
- Transfer of 1 byte is complete when bit 1 (ERRF0) of the CSIS0 register becomes 1 while bit 2 (ERRE0) = 1
- Transfer of the range specified by the ADTP0 register is complete

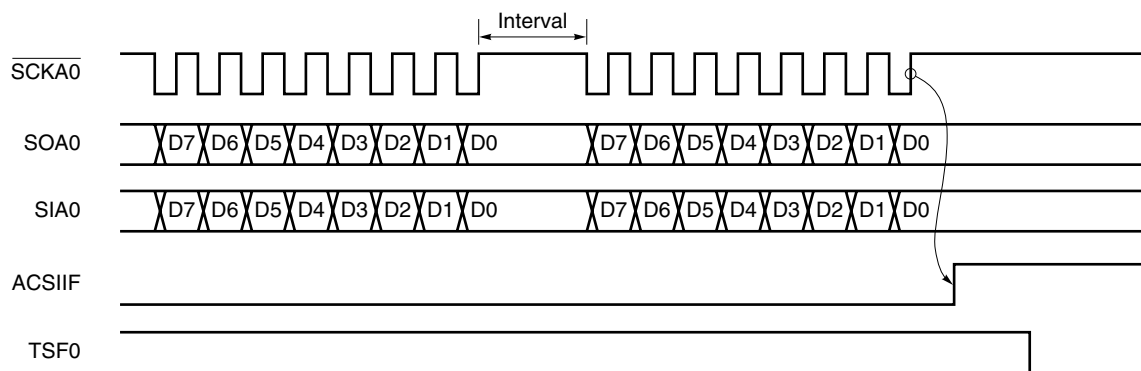

At this time, an interrupt request signal (INTACSI) is generated except when the CSIAE0 bit = 0.

If a transfer is terminated in the middle, transfer starting from the remaining data is not possible. Read automatic data transfer address count register 0 (ADTC0) to confirm how much of the data has already been transferred and re-execute transfer by performing (a) and (b) in **(2) Automatic transmit/receive data setting**.

In addition, when busy control and strobe control are not performed, the BUSY0/BUZ/INTP7/P141 and STB0/P145 pins can be used as ordinary I/O port pins.

Figure 17-13 shows the operation timing in automatic transmission/reception mode and Figure 17-14 shows the operation flowchart. Figure 17-15 shows the operation of internal buffer RAM when 6 bytes of data are transmitted/received.

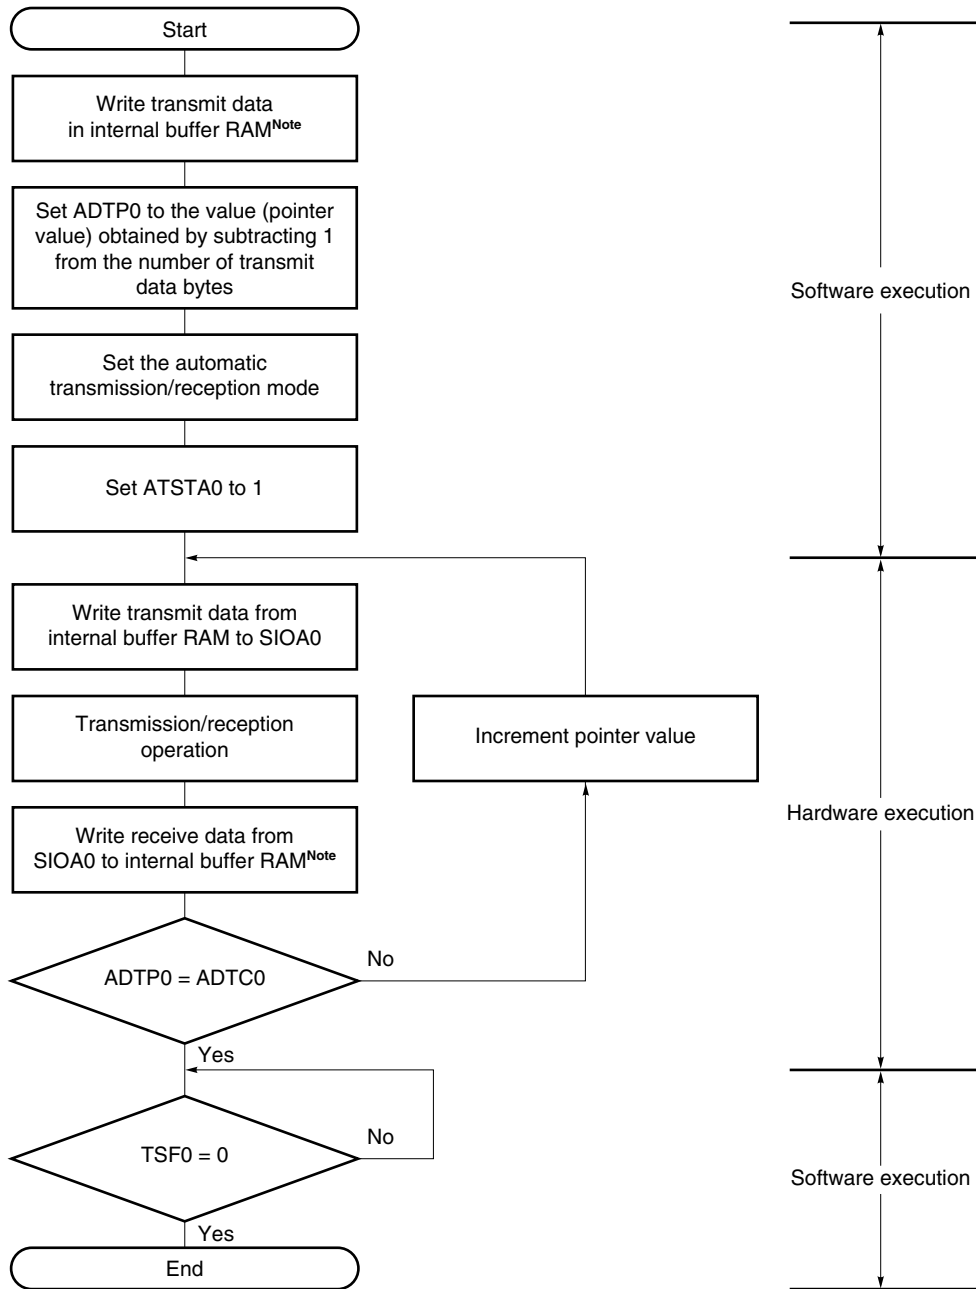

Figure 17-13. Automatic Transmission/Reception Mode Operation Timings

- Cautions**
1. Because, in the automatic transmission/reception mode, the automatic transmit/receive function writes/reads data to/from the internal buffer RAM after 1-byte transmission/reception, an interval is inserted until the next transmission/reception. As the buffer RAM write/read is performed at the same time as CPU processing, the interval is dependent upon the value of automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see **(5) Automatic transmit/receive interval time**).
 2. If an access to the buffer RAM by the CPU conflicts with an access to the buffer RAM by serial interface CSIA0 during the interval period, the interval time specified by automatic data transfer interval specification register 0 (ADTI0) may be extended.

Remark ACSIF: Interrupt request flag

- TSF0: Bit 0 of serial status register 0 (CSIS0)

Note A wait state may be generated when data is written to the buffer RAM. For details, see **CHAPTER 34 CAUTIONS FOR WAIT**.

In 6-byte transmission/reception (ATM0 = 0, RXEA0 = 1, TXEA0 = 1) in automatic transmission/reception mode, internal buffer RAM operates as follows.

(i) Starting transmission/reception (see Figure 17-15 (a).)

When bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) is set to 1, transmit data 1 (T1) is transferred from the internal buffer RAM to SIOA0. When transmission of the first byte is completed, receive data 1 (R1) is transferred from SIOA0 to the buffer RAM, and automatic data transfer address count register 0 (ADTC0) is incremented. Then transmit data 2 (T2) is transferred from the internal buffer RAM to SIOA0.

(ii) 4th byte transmission/reception point (see Figure 17-15 (b).)

Transmission/reception of the third byte is completed, and transmit data 4 (T4) is transferred from the internal buffer RAM to SIOA0. When transmission of the fourth byte is completed, the receive data 4 (R4) is transferred from SIOA0 to the internal buffer RAM, and ADTC0 is incremented.

(iii) Completion of transmission/reception (see Figure 17-15 (c).)

When transmission of the sixth byte is completed, receive data 6 (R6) is transferred from SIOA0 to the internal buffer RAM, and the interrupt request flag (ACSIIF) is set (INTACSI generation). Bit 0 (TSF0) of serial status register 0 (CSIS0) is cleared.

Figure 17-15. Internal Buffer RAM Operation in 6-Byte Transmission/Reception (in Automatic Transmission/Reception Mode) (1/2)

(a) Starting transmission/reception

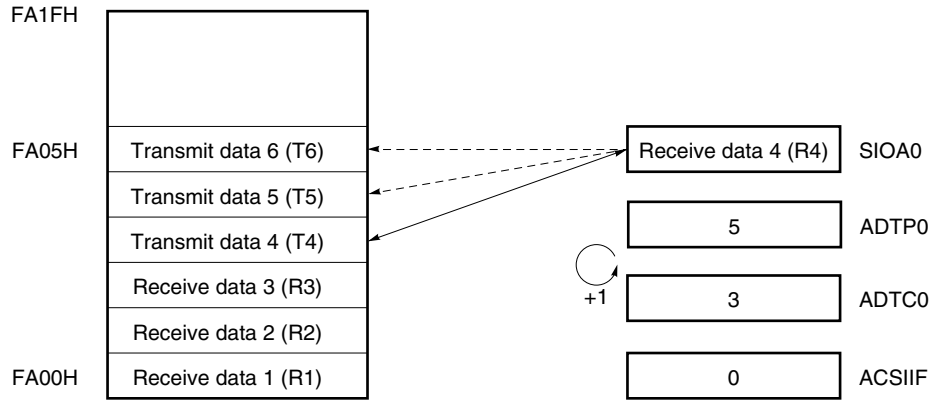

Figure 17-15. Internal Buffer RAM Operation in 6-Byte Transmission/Reception (in Automatic Transmission/Reception Mode) (2/2)

(b) 4th byte transmission/reception

(c) Completion of transmission/reception

(b) Automatic transmission mode

In this mode, the specified number of 8-bit unit data is transmitted.

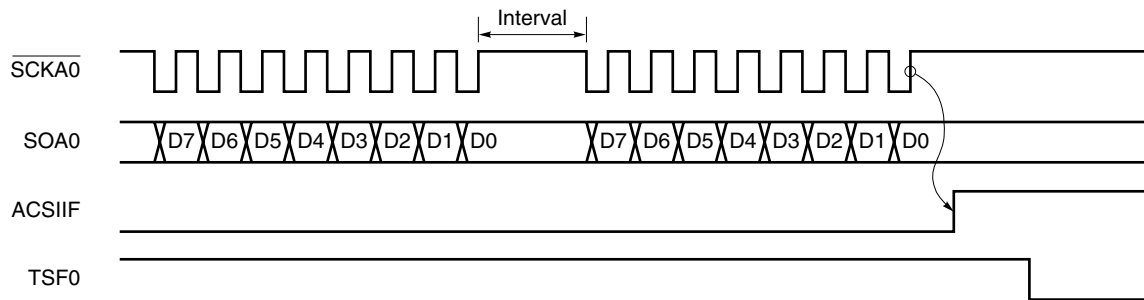

Serial communication is started when bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) is set to 1 while bit 7 (CSIAE0), bit 6 (ATE0), and bit 3 (TXEA0) of serial operation mode specification register 0 (CSIMA0) are set to 1.

When the final byte has been transmitted, an interrupt request flag (ACSIIF) is set. The termination of automatic transmission and reception can also be judged by bit 0 (TSF0) of serial status register 0 (CSIS0).

If a receive operation, busy control and strobe control are not executed, the SIA0/P143, BUSY0/BUZ/INTP7/P141, and STB0/P145 pins can be used as normal I/O port pins.

Figure 17-16 shows the automatic transmission mode operation timing, and Figure 17-17 shows the operation flowchart. Figure 17-18 shows the operation of the internal buffer RAM when 6 bytes of data are transmitted.

Figure 17-16. Automatic Transmission Mode Operation Timing

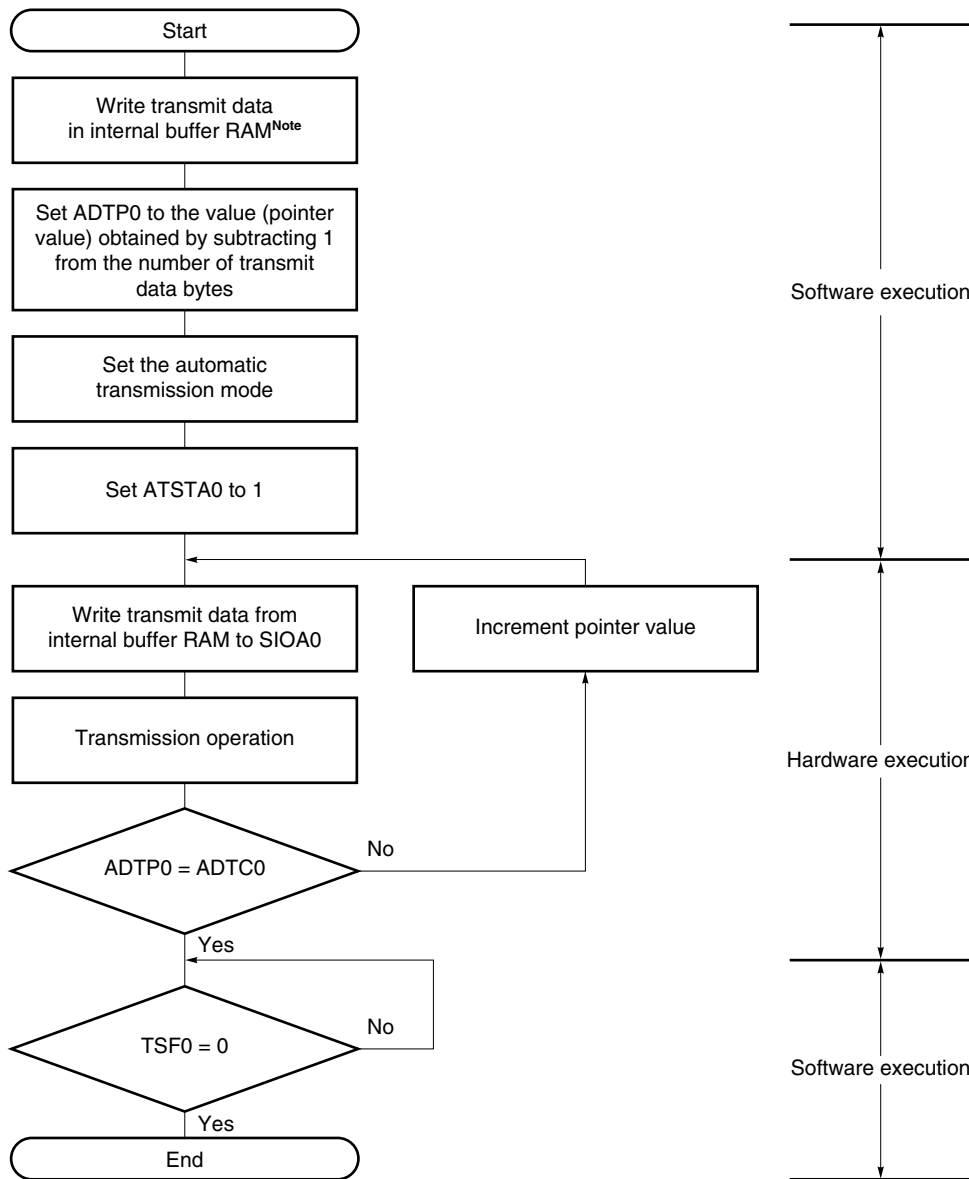

Cautions 1. Because, in the automatic transmission mode, the automatic transmit/receive function reads data from the internal buffer RAM after 1-byte transmission, an interval is inserted until the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon the value of automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see (5) Automatic transmit/receive interval time).

2. If an access to the buffer RAM by the CPU conflicts with an access to the buffer RAM by serial interface CSIA0 during the interval period, the interval time specified by automatic data transfer interval specification register 0 (ADTI0) may be extended.

Remark ACSIIF: Interrupt request flag

TSF0: Bit 0 of serial status register 0 (CSIS0)

Figure 17-17. Automatic Transmission Mode Flowchart

- ADTP0: Automatic data transfer address point specification register 0
- ADTI0: Automatic data transfer interval specification register 0

- TSF0: Bit 0 of serial status register 0 (CSIS0)

Note A wait state may be generated when data is written to the buffer RAM. For details, see **CHAPTER 34 CAUTIONS FOR WAIT.**

In 6-byte transmission (ATM0 = 0, RXEA0 = 0, TXEA0 = 1, ATE0 = 1) in automatic transmission mode, internal buffer RAM operates as follows.

(i) Starting transmission (see Figure 17-18 (a).)

When bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) is set to 1, transmit data 1 (T1) is transferred from the internal buffer RAM to SIOA0. When transmission of the first byte is completed, automatic data transfer address count register 0 (ADTC0) is incremented. Then transmit data 2 (T2) is transferred from the internal buffer RAM to SIOA0.

(ii) 4th byte transmission point (see Figure 17-18 (b).)

Transmission of the third byte is completed, and transmit data 4 (T4) is transferred from the internal buffer RAM to SIOA0. When transmission of the fourth byte is completed, ADTC0 is incremented.

(iii) Completion of transmission (see Figure 17-18 (c).)

When transmission of the sixth byte is completed, the interrupt request flag (ACSIIF) is set (INTACSI generation). Bit 0 (TSF0) of serial status register 0 (CSIS0) is cleared.

Figure 17-18. Internal Buffer RAM Operation in 6-Byte Transmission (in Automatic Transmission Mode) (1/2)

(a) Starting transmission

Figure 17-18. Internal Buffer RAM Operation in 6-Byte Transmission (in Automatic Transmission Mode) (2/2)

(b) 4th byte transmission point

(c) Completion of transmission

(c) Repeat transmission mode

In this mode, data stored in the internal buffer RAM is transmitted repeatedly.

Serial communication is started when bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) is set to 1 while bit 7 (CSIAE0), bit 6 (ATE0), bit 5 (ATM0), and bit 3 (TXEA0) of serial operation mode specification register 0 (CSIMA0) are set to 1.

Unlike the basic transmission mode, after the number of setting bytes has been transmitted, the interrupt request flag (ACSIIF) is not set, automatic data transfer address count register 0 (ADTC0) is reset to 0, and the internal buffer RAM contents are transmitted again.

When a reception operation, busy control and strobe control are not performed, the SIA0/P143, BUSY0/BUZ/INTP7/P141, and STB0/P145 pins can be used as ordinary I/O port pins.

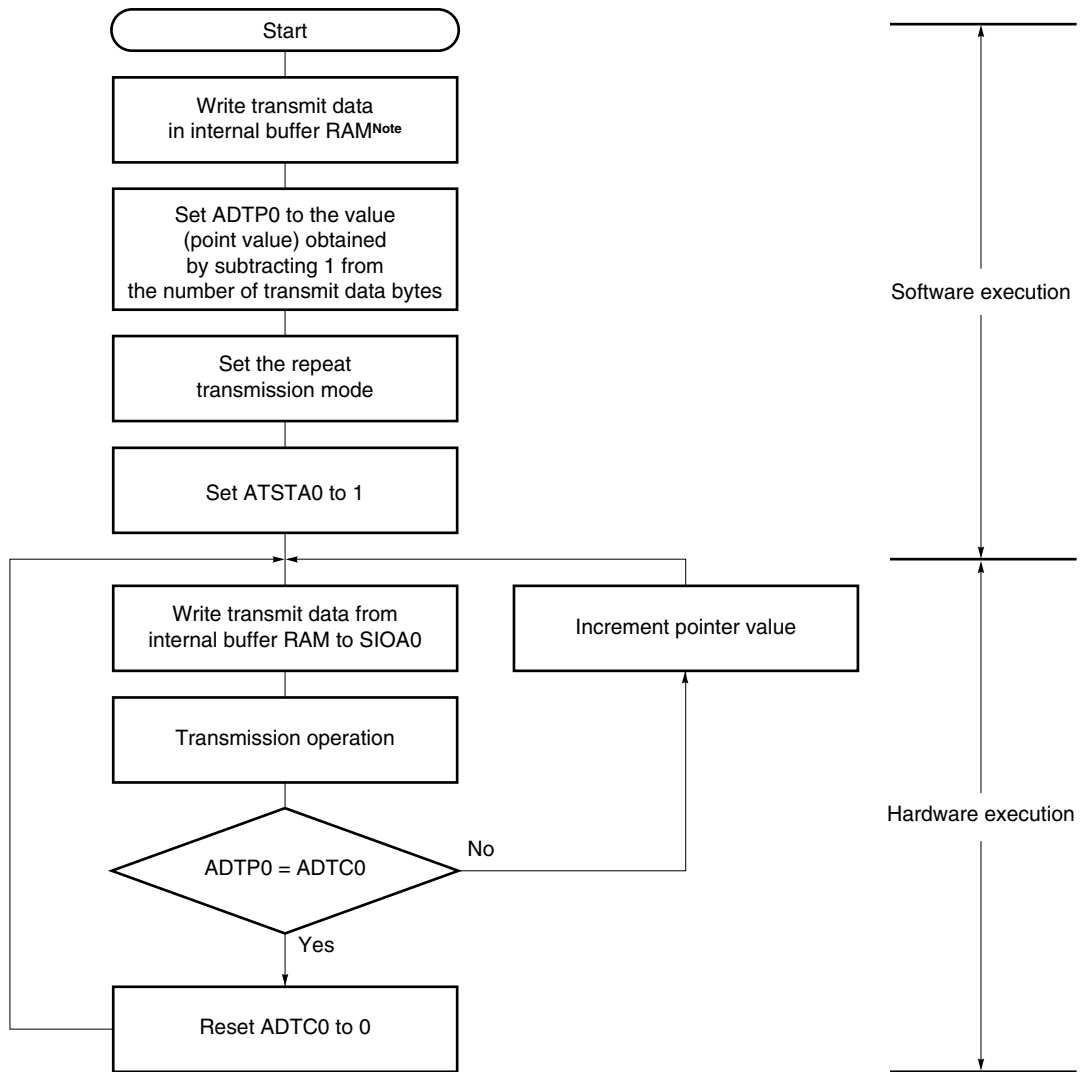

The repeat transmission mode operation timing is shown in Figure 17-19, and the operation flowchart in Figure 17-20. Figure 17-21 shows the operation of the internal buffer RAM when 6 bytes of data are transmitted in the repeat transmission mode.

Figure 17-19. Repeat Transmission Mode Operation Timing

- Cautions**
1. Because, in the repeat transmission mode, a read is performed on the buffer RAM after the transmission of one byte, the interval is included in the period up to the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see (5) Automatic transmit/receive interval time).
 2. If an access to the buffer RAM by the CPU conflicts with an access to the buffer RAM by serial interface CSIA0 during the interval period, the interval time specified by automatic data transfer interval specification register 0 (ADTI0) may be extended.

Figure 17-20. Repeat Transmission Mode Flowchart

- ADTP0: Automatic data transfer address point specification register 0
- ADTI0: Automatic data transfer interval specification register 0
- ATSTA0: Bit 0 of serial trigger register 0 (CSIT0)
- SIOA0: Serial I/O shift register 0
- ADTC0: Automatic data transfer address count register 0

Note A wait state may be generated when data is written to the buffer RAM. For details, see **CHAPTER 34 CAUTIONS FOR WAIT**.

In 6-byte transmission (ATM0 = 1, RXEA0 = 0, TXEA0 = 1, ATE0 = 1) in repeat transmission mode, internal buffer RAM operates as follows.

(i) Starting transmission (see Figure 17-21 (a).)

When bit 0 (ATSTA0) of serial trigger register 0 (CSIT0) is set to 1, transmit data 1 (T1) is transferred from the internal buffer RAM to SIOA0. When transmission of the first byte is completed, automatic data transfer address count register 0 (ADTC0) is incremented. Then transmit data 2 (T2) is transferred from the internal buffer RAM to SIOA0.

(ii) Upon completion of transmission of 6 bytes (see Figure 17-21 (b).)

When transmission of the sixth byte is completed, the interrupt request flag (ACSIIF) is not set. ADTC0 is reset to 0.

(iii) 7th byte transmission point (see Figure 17-21 (c).)

Transmit data 1 (T1) is transferred from the internal buffer RAM to SIOA0 again. When transmission of the first byte is completed, ADTC0 is incremented. Then transmit data 2 (T2) is transferred from the internal buffer RAM to SIOA0.

Figure 17-21. Internal Buffer RAM Operation in 6-Byte Transmission (in Repeat Transmission Mode) (1/2)

(a) Starting transmission

**Figure 17-21. Internal Buffer RAM Operation in 6-Byte Transmission
(in Repeat Transmission Mode) (2/2)**

(b) Upon completion of transmission of 6 bytes

(c) 7th byte transmission point

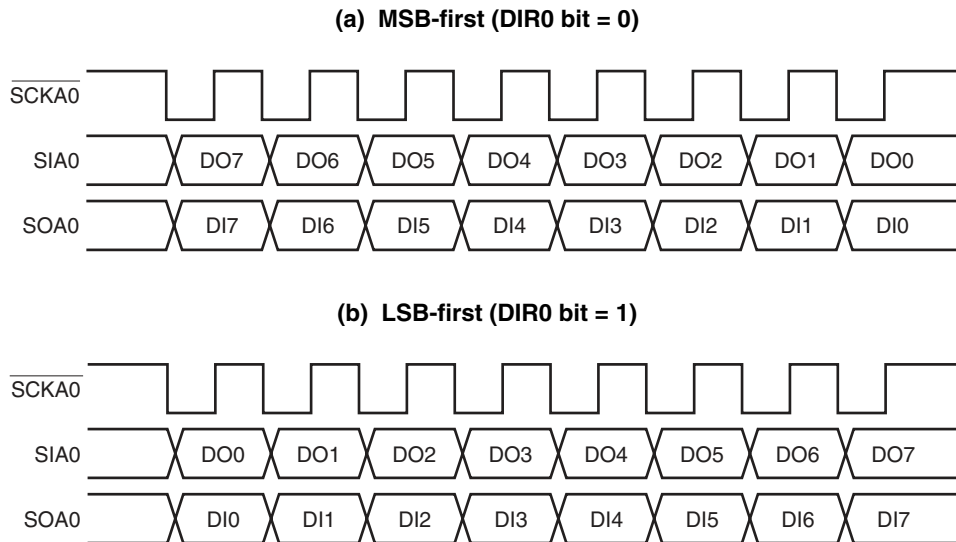

(d) Data format

In the data format, data is changed in synchronization with the $\overline{\text{SCKA0}}$ falling edge as shown below.

The data length is fixed to 8 bits and the data transfer direction can be switched by the specification of bit 1 (DIR0) of serial operation mode specification register 0 (CSIMA0).

Figure 17-22. Format of CSIA0 Transmit/Receive Data

(e) Automatic transmission/reception suspension and restart

Automatic transmission/reception can be temporarily suspended by setting bit 1 (ATSTP0) of serial trigger register 0 (CSIT0) to 1.

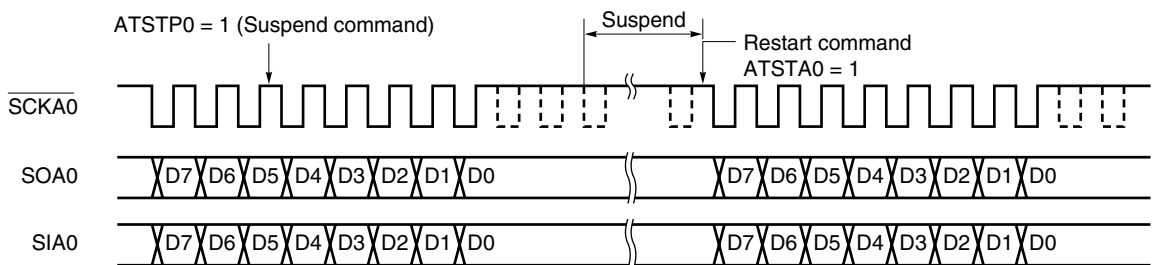

During 8-bit data communication, the transmission/reception is not suspended. It is suspended upon completion of 8-bit data communication.

When suspended, bit 0 (TSF0) of serial status register 0 (CSIS0) is cleared to 0 after transfer of the 8th bit.

Cautions 1. If the HALT instruction is executed during automatic transmission/reception, communication is suspended and the HALT mode is set if during 8-bit data communication. When the HALT mode is cleared, automatic transmission/reception is restarted from the suspended point.

2. When suspending automatic transmission/reception, do not change the operating mode to 3-wire serial I/O mode while TSF0 = 1.

Figure 17-23. Automatic Transmission/Reception Suspension and Restart

ATSTP0: Bit 1 of serial trigger register 0 (CSIT0)

ATSTA0: Bit 0 of CSIT0

(4) Synchronization control

Busy control and strobe control are functions used to synchronize transmission/reception between the master device and a slave device.

By using these functions, a shift in bits being transmitted or received can be detected.

(a) Busy control option

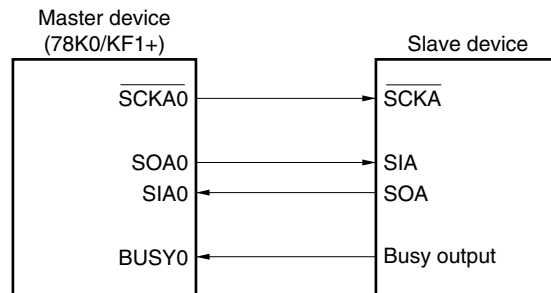

Busy control is a function to keep the serial transmission/reception by the master device waiting while the busy signal output by a slave device to the master is active.

When using this busy control option, the following conditions must be satisfied.

- Bit 6 (ATE0) of serial operation mode specification register 0 (CSIMA0) is set to 1.
- Bit 4 (BUSYE0) of serial status register 0 (CSIS0) is set to 1.

Figure 17-24 shows the system configuration of the master device and slave device when the busy control option is used.

Figure 17-24. System Configuration When Busy Control Option Is Used

The master device inputs the busy signal output by the slave device to the BUSY0/BUZ/INTP7/P141 pin. The master device samples the input busy signal in synchronization with the falling of the serial clock. Even if the busy signal becomes active while 8-bit data is being transmitted or received, transmission/reception by the master is not kept waiting. If the busy signal is active at the rising edge of the serial clock one clock after completion of transmission/reception of the 8-bit data, the busy input becomes valid. After that, the master transmission/reception is kept waiting while the busy signal is active.

The active level of the busy signal is set by bit 3 (BUSYLV0) of CSIS0.

BUSYLV0 = 1: Active-high

BUSYLV0 = 0: Active-low

When using the busy control option, select the internal clock as the serial clock. Control with the busy signal cannot be implemented with the external clock.

Figure 17-25 shows the operation timing when the busy control option is used.

Caution Busy control cannot be used simultaneously with the interval time control function of automatic data transfer interval specification register 0 (ADTI0).

Figure 17-25. Operation Timing When Busy Control Option Is Used (When BUSYLV0 = 1)

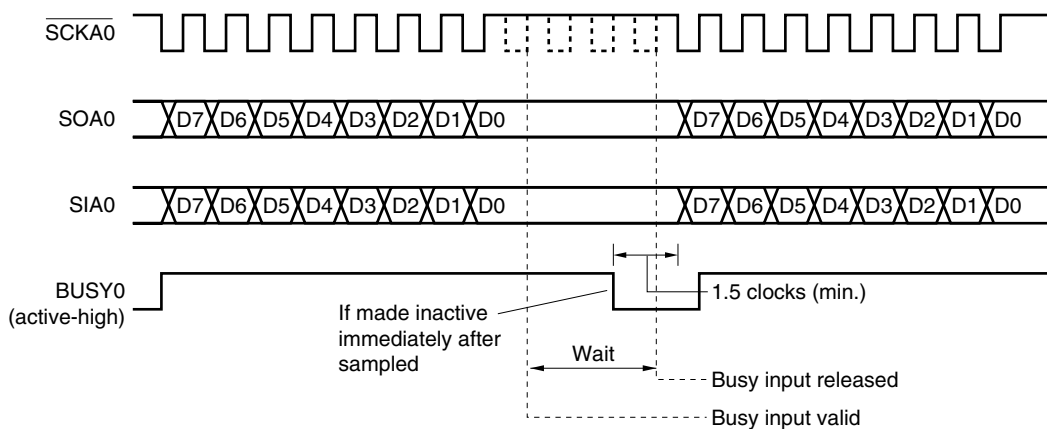

Remark ACSIF: Interrupt request flag
 TSF0: Bit 0 of serial status register 0 (CSIS0)

When the busy signal becomes inactive, waiting is released. If the sampled busy signal is inactive, transmission/reception of the next 8-bit data is started at the falling edge of the next serial clock. Because the busy signal is asynchronous with the serial clock, it takes up to 1 clock until the busy signal is sampled, even if made inactive by the slave. It takes 0.5 clock until data transfer is started after the busy signal was sampled.

To accurately release waiting, the slave must keep the busy signal inactive for at least for the duration of 1.5 clock.

Figure 17-26 shows the timing of the busy signal and releasing the waiting. This figure shows an example in which the busy signal is active as soon as transmission/reception has been started.

Figure 17-26. Busy Signal and Wait Release (When BUSYLV0 = 1)

(b) Busy & strobe control option

Strobe control is a function used to synchronize data transmission/reception between the master and slave devices. The master device outputs the strobe signal from the STB0/P145 pin when 8-bit transmission/reception has been completed. By this signal, the slave device can determine the timing of the end of data transmission. Therefore, synchronization is established even if a bit shift occurs because noise is superimposed on the serial clock, and transmission of the next byte is not affected by the bit shift.

To use the strobe control option, the following conditions must be satisfied:

- Bit 6 (ATE0) of the serial operation mode specification register 0 (CSIMA0) is set to 1.
- Bit 5 (STBE0) of serial status register 0 (CSIS0) is set to 1.

Usually, the busy control and strobe control options are simultaneously used as handshake signals. In this case, the strobe signal is output from the STB0/P145 pin, the BUSY0/BUZ/INTP7/P141 pin can be sampled to keep transmission/reception waiting while the busy signal is input.

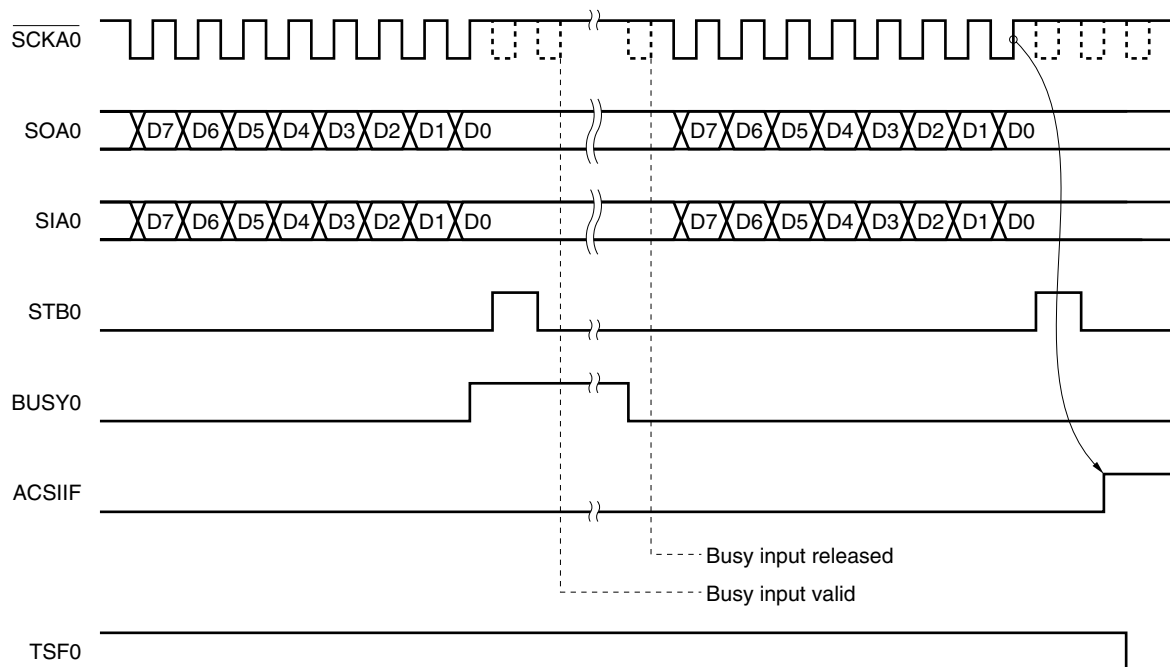

A high level lasting for one transfer clock is output from the STB0/P145 pin in synchronization with the falling edge of the ninth serial clock as the strobe signal. The busy signal is detected at the rising edge of the serial clock two clocks after 8-bit data transmission/reception completion.

When the strobe control option is not used, the P145/STB0 pin can be used as a normal I/O port pin.

Figure 17-27 shows the operation timing when the busy & strobe control options are used.

When the strobe control option is used, the interrupt request flag (ACSIIF) that is set on completion of transmission/reception is set after the strobe signal is output.

Figure 17-27. Operation Timing When Busy & Strobe Control Options Are Used (When BUSYLV0 = 1)

Caution When TSF0 is cleared, the SOA0 pin goes low.

Remark ACSIIF: Interrupt request flag
TSF0: Bit 0 of serial status register 0 (CSIS0)

(c) Bit shift detection by busy signal

During automatic transmission/reception, a bit shift of the serial clock of the slave device may occur because noise is superimposed on the serial clock signal output by the master device. Unless the strobe control option is used at this time, the bit shift affects transmission of the next byte. In this case, the master can detect the bit shift by checking the busy signal during transmission by using the busy control option.

A bit shift is detected by using the busy signal as follows:

The slave outputs the busy signal after the rising of the eighth serial clock during data transmission/reception (to not keep transmission/reception waiting by the busy signal at this time, make the busy signal inactive within 2 clocks).

The master samples the busy signal in synchronization with the falling edge of the serial clock if bit 2 (ERRE0) of serial status register 0 (CSIS0) is set to 1. If a bit shift does not occur, all the eight serial clocks that have been sampled are inactive. If the sampled serial clocks are active, it is assumed that a bit shift has occurred, error processing is executed (by setting bit 1 (ERRF0) of serial status register 0 (CSIS0) to 1, and communication is suspended and an interrupt request signal (INTACSI) is output).

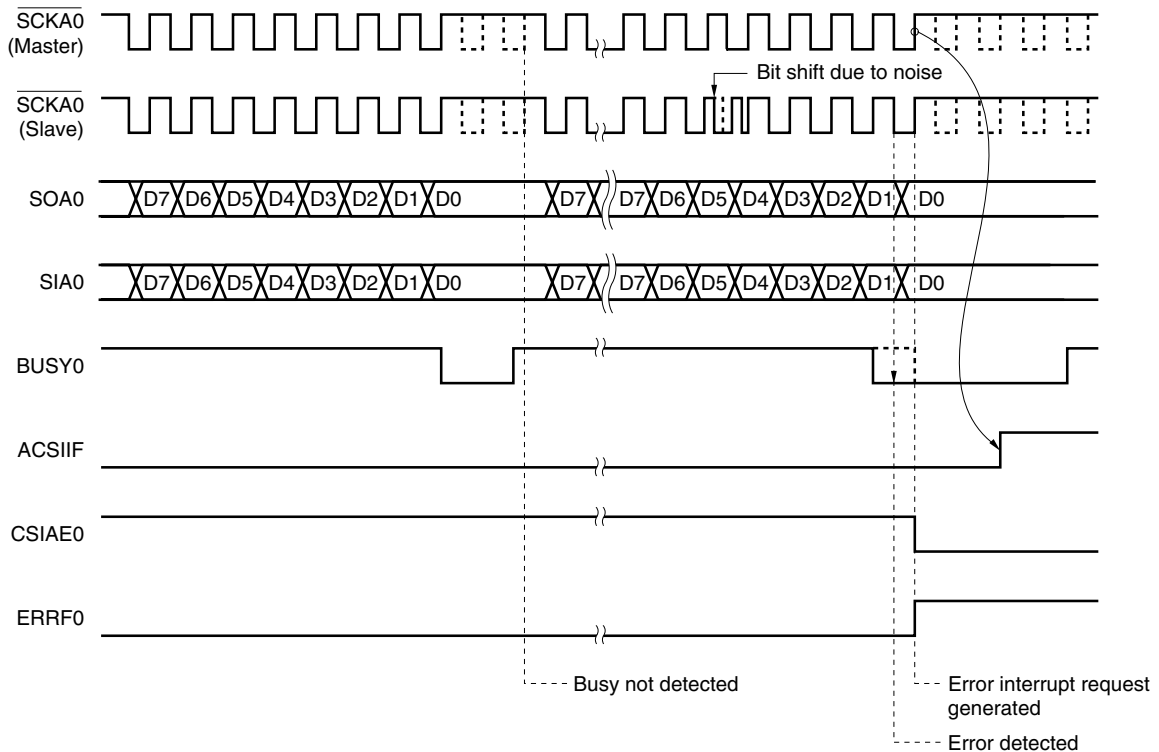

Although communication is suspended after completion of 1-byte data communication, slave signal output, wait due to the busy signal, and wait due to the interval time specified by ADTI0 are not executed.

If ERRE0 = 0, ERRF0 cannot become 1 even if a bit shift occurs.

Figure 17-28 shows the operation timing of the bit shift detection function by the busy signal.

Remark The bit error function is valid both in the master mode and slave mode. The setting of ERRE0 is valid even when BUSYE0 = 0.

Figure 17-28. Operation Timing of Bit Shift Detection Function by Busy Signal (When BUSYLV0 = 0)

ACSIF: Interrupt request flag

CSIAE0: Bit 7 of serial operation mode specification register 0 (CSIMA0)

ERRF0: Bit 1 of serial status register 0 (CSIS0)

(5) Automatic transmit/receive interval time

When using the automatic transmit/receive function, the read/write operations from/to the internal buffer RAM are performed after transmitting/receiving one byte. Therefore, an interval is inserted before the next transmit/receive operation.

Since the read/write operations from/to the buffer RAM are performed in parallel with the CPU processing when using the automatic transmit/receive function by the internal clock, the interval depends on the value which is set in automatic data transfer interval specification register 0 (ADTI0) and bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0). When ADTI0 is cleared to 00H, an interval time based on the STBE0 and BUSYE0 settings is generated.

For example, when ADTI0 = 00H and STBE0 = BUSYE0 = 1, an interval time of two clocks is generated. If an interval time of two clocks or more is set by ADTI0, the interval time set by ADTI0 is generated regardless of the STBE0 and BUSYE0 settings.

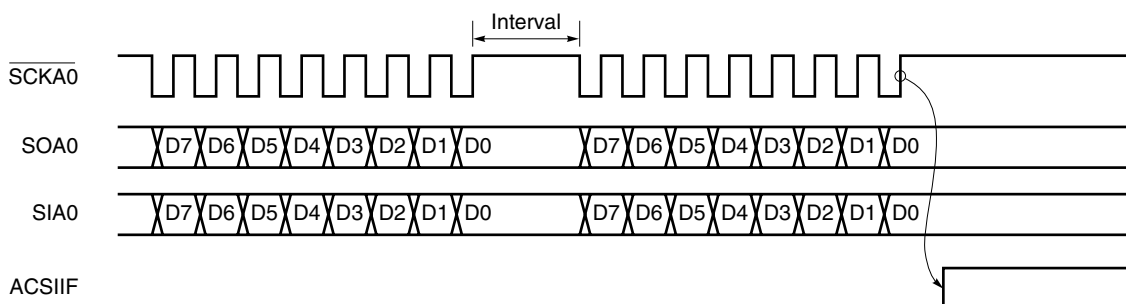

Example Interval time when busy signal is not generated

<1> When STBE0 = 1, BUSYE0 = 0: Interval time of two serial clocks is generated

<2> When STBE0 = 0, BUSYE0 = 1: Interval time of one serial clock is generated

<3> When STBE0 = 1, BUSYE0 = 1: Interval time of two serial clocks is generated

Figure 17-29. Automatic Transmit/Receive Interval Time

ACSIF: Interrupt request flag

CHAPTER 18 MULTIPLIER/DIVIDER

18.1 Functions of Multiplier/Divider

The multiplier/divider has the following functions.

- $16 \text{ bits} \times 16 \text{ bits} = 32 \text{ bits}$ (multiplication)
- $32 \text{ bits} \div 16 \text{ bits} = 32 \text{ bits}, 16\text{-bit remainder}$ (division)

18.2 Configuration of Multiplier/Divider

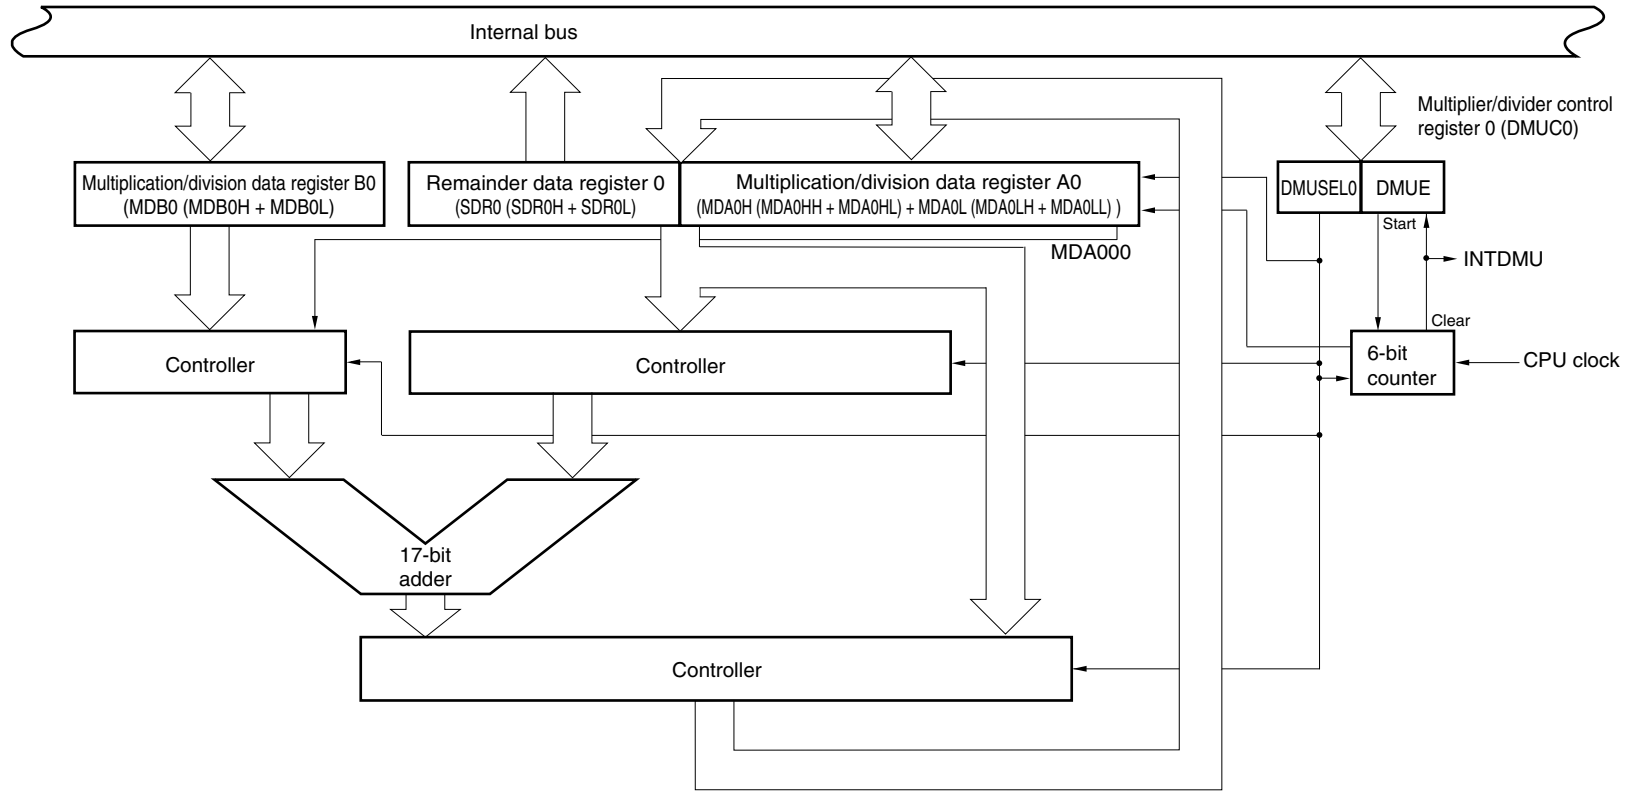

The multiplier/divider includes the following hardware.

Table 18-1. Configuration of Multiplier/Divider

Item	Configuration
Registers	Remainder data register 0 (SDR0) Multiplication/division data registers A0 (MDA0H, MDA0L) Multiplication/division data registers B0 (MDB0)
Control register	Multiplier/divider control register 0 (DMUC0)

Figure 18-1 shows the block diagram of the multiplier/divider.

Figure 18-1. Block Diagram of Multiplier/Divider

(1) Remainder data register 0 (SDR0)

SDR0 is a 16-bit register that stores a remainder. This register stores 0 in the multiplication mode and the remainder of an operation result in the division mode.

This register can be read by an 8-bit or 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 0000H.

Figure 18-2. Format of Remainder Data Register 0 (SDR0)

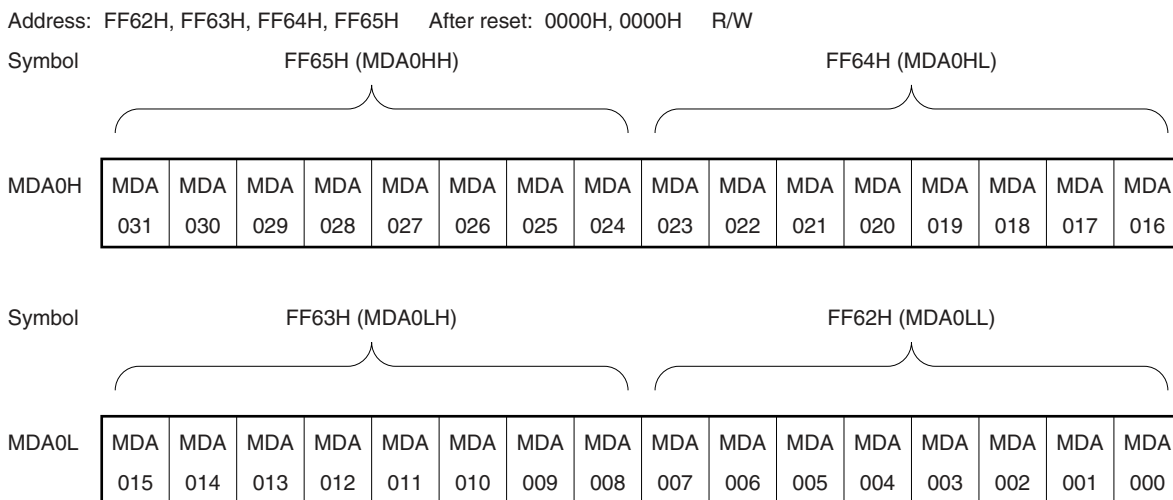

- Cautions 1. The value read from SDR0 during operation processing (while bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is 1) is not guaranteed.**
- 2. SDR0 is reset when the operation is started (when DMUE is set to 1).**

(2) Multiplication/division data register A0 (MDA0H, MDA0L)

MDA0 is a 32-bit register that sets a 16-bit multiplier A in the multiplication mode and a 32-bit dividend in the division mode, and stores the 32-bit result of the operation (higher 16 bits: MDA0H, lower 16 bits: MDA0L).

Figure 18-3. Format of Multiplication/Division Data Register A0 (MDA0H, MDA0L)

- Cautions 1. MDA0H is cleared to 0 when an operation is started in the multiplication mode (when multiplier/divider control register 0 (DMUC0) is set to 81H).**
- 2. Do not change the value of MDA0 during operation processing (while bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is 1). Even in this case, the operation is executed, but the result is undefined.**
- 3. The value read from MDA0 during operation processing (while DMUE is 1) is not guaranteed.**

The functions of MDA0 when an operation is executed are shown in the table below.

Table 18-2. Functions of MDA0 During Operation Execution

DMUSEL0	Operation Mode	Setting	Operation Result
0	Division mode	Dividend	Division result (quotient)
1	Multiplication mode	Higher 16 bits: 0, Lower 16 bits: Multiplier A	Multiplication result (product)

The register configuration differs between when multiplication is executed and when division is executed, as follows.

- Register configuration during multiplication

<Multiplier A> <Multiplier B> <Product>

$$\text{MDA0 (bits 15 to 0)} \times \text{MDB0 (bits 15 to 0)} = \text{MDA0 (bits 31 to 0)}$$

- Register configuration during division

<Dividend> <Divisor> <Quotient> <Remainder>

$$\text{MDA0 (bits 31 to 0)} \div \text{MDB0 (bits 15 to 0)} = \text{MDA0 (bits 31 to 0)} \dots \text{SDR0 (bits 15 to 0)}$$

MDA0 fetches the calculation result as soon as the clock is input, when bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is set to 1.

MDA0H and MDA0L can be set by an 8-bit or 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 0000H.

(3) Multiplication/division data register B0 (MDB0)

MDB0 is a register that stores a 16-bit multiplier B in the multiplication mode and a 16-bit divisor in the division mode.

This register can be set by an 8-bit or 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 0000H.

Figure 18-4. Format of Multiplication/Division Data Register B0 (MDB0)

Cautions 1. Do not change the value of MDB0 during operation processing (while bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is 1). Even in this case, the operation is executed, but the result is undefined.

2. Do not clear MDB0 to 0000H in the division mode. If set, undefined operation results are stored in MDA0 and SDR0.

18.3 Register Controlling Multiplier/Divider

The multiplier/divider is controlled by multiplier/divider control register 0 (DMUC0).

(1) Multiplier/divider control register 0 (DMUC0)

DMUC0 is an 8-bit register that controls the operation of the multiplier/divider.

This register can be read by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 18-5. Format of Multiplier/Divider Control Register 0 (DMUC0)

Address: FF68H After reset: 00H R/W

Symbol	<7>	6	5	4	3	2	1	0
DMUC0	DMUE	0	0	0	0	0	0	DMUSEL0
DMUE ^{Note}	Operation start/stop							
0	Stops operation							
1	Starts operation							
DMUSEL0	Operation mode (multiplication/division) selection							
0	Division mode							
1	Multiplication mode							

Note When DMUE is set to 1, the operation is started. DMUE is automatically cleared to 0 after the operation is complete.

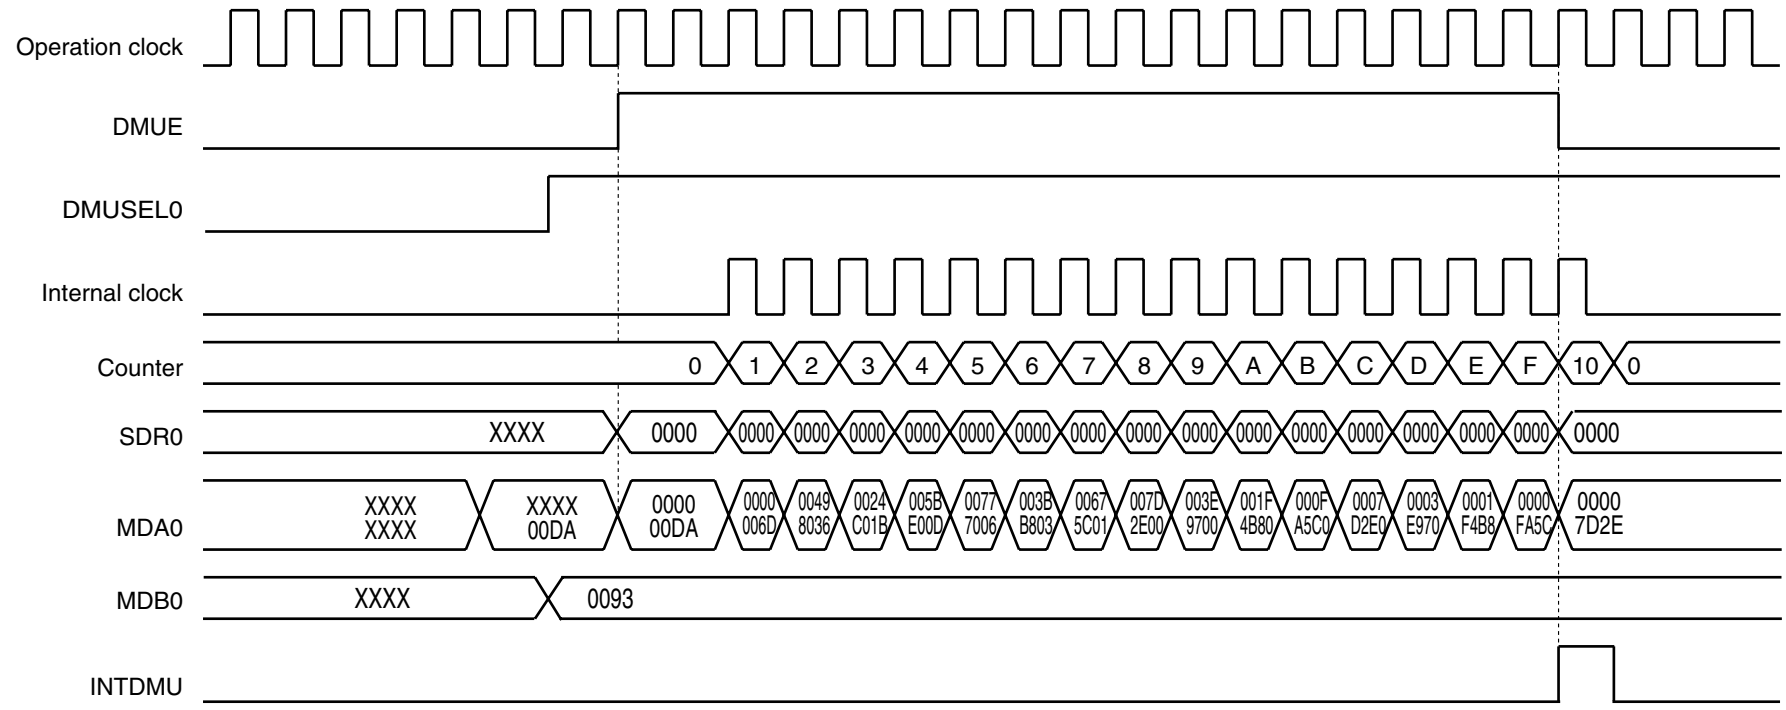

- Cautions**
1. If DMUE is cleared to 0 during operation processing (when DMUE is 1), the operation result is not guaranteed. If the operation is completed while the clearing instruction is being executed, the operation result is guaranteed, provided that the interrupt flag is set.
 2. Do not change the value of DMUSEL0 during operation processing (while DMUE is 1). If it is changed, undefined operation results are stored in multiplication/division data register A0 (MDA0) and remainder data register 0 (SDR0).
 3. If DMUE is cleared to 0 during operation processing (while DMUE is 1), the operation processing is stopped. To execute the operation again, set multiplication/division data register A0 (MDA0), multiplication/division data register B0 (MDB0), and multiplier/divider control register 0 (DMUC0), and start the operation (by clearing DMUE to 1).

18.4 Operations of Multiplier/Divider

18.4.1 Multiplication operation

- Initial setting
 1. Set operation data to multiplication/division data register A0L (MDA0L) and multiplication/division data register B0 (MDB0).
 2. Set bits 0 (DMUSEL0) and 7 (DMUE) of multiplier/divider control register 0 (DMUC0) to 1. Operation will start.
- During operation
 3. The operation will be completed when 16 internal clocks have been issued after the start of the operation (intermediate data is stored in the MDA0L and MDA0H registers during operation, and therefore the read values of these registers are not guaranteed).
- End of operation
 4. The operation result data is stored in the MDA0L and MDA0H registers.
 5. DMUE is cleared to 0 (end of operation).
 6. After the operation, an interrupt request signal (INTDMU) is generated.
- Next operation
 7. To execute multiplication next, start from the initial setting in **18.4.1 Multiplication operation**.
 8. To execute division next, start from the initial setting in **18.4.2 Division operation**.

Figure 18-6. Timing Chart of Multiplication Operation (00DAH × 0093H)

18.4.2 Division operation

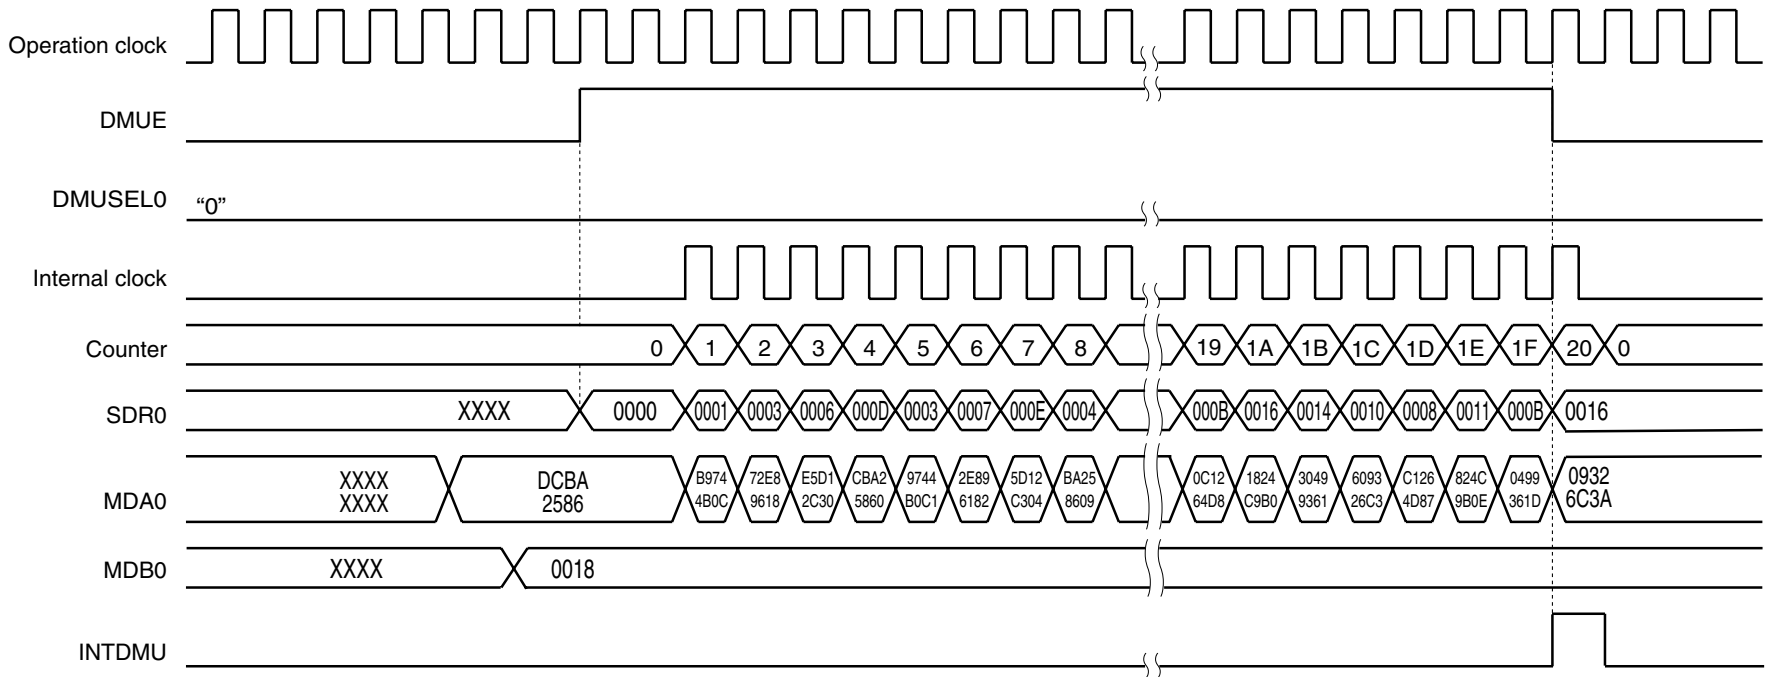

- Initial setting
 1. Set operation data to multiplication/division data register A0 (MDA0L and MDA0H) and multiplication/division data register B0 (MDB0).
 2. Set bits 0 (DMUSEL0) and 7 (DMUE) of multiplier/divider control register 0 (DMUC0) to 0 and 1, respectively. Operation will start.

- During operation
 3. The operation will be completed when 32 internal clocks have been issued after the start of the operation (intermediate data is stored in the MDA0L and MDA0H registers and remainder data register 0 (SDR0) during operation, and therefore the read values of these registers are not guaranteed).

- End of operation
 4. The result data is stored in the MDA0L, MDA0H, and SDR0 registers.
 5. DMUE is cleared to 0 (end of operation).
 6. After the operation, an interrupt request signal (INTDMU) is generated.

- Next operation
 7. To execute multiplication next, start from the initial setting in **18.4.1 Multiplication operation**.
 8. To execute division next, start from the initial setting in **18.4.2 Division operation**.

Figure 18-7. Timing Chart of Division Operation (DCBA2586H + 0018H)

CHAPTER 19 INTERRUPT FUNCTIONS

19.1 Interrupt Function Types

The following two types of interrupt functions are used.

(1) Maskable interrupts

These interrupts undergo mask control. Maskable interrupts can be divided into a high interrupt priority group and a low interrupt priority group by setting the priority specification flag registers (PR0L, PR0H, PR1L, PR1H). Multiple interrupt servicing can be applied to low-priority interrupts when high-priority interrupts are generated. If two or more interrupts with the same priority are generated simultaneously, each interrupt is serviced according to its predetermined priority (see **Table 19-1**).

A standby release signal is generated and STOP and HALT modes are released.

Nine external interrupt requests and 20 interrupt requests are provided as maskable interrupts.

(2) Software interrupt

This is a vectored interrupt generated by executing the BRK instruction. It is acknowledged even when interrupts are disabled. The software interrupt does not undergo interrupt priority control.

19.2 Interrupt Sources and Configuration

A total of 30 sources exist for maskable and software interrupts (see **Table 19-1**).

Table 19-1. Interrupt Source List (1/2)

Interrupt Type	Default Priority ^{Note 1}	Interrupt Source		Internal/ External	Vector Table Address	Basic Configuration Type ^{Note 2}
		Name	Trigger			
Maskable	0	INTLVI	Low-voltage detection ^{Note 3}	Internal	0004H	(A)
	1	INTP0	Pin input edge detection	External	0006H	(B)
	2	INTP1			0008H	
	3	INTP2			000AH	
	4	INTP3			000CH	
	5	INTP4			000EH	
	6	INTP5			0010H	
	7	INTSRE6	UART6 reception error generation	Internal	0012H	(A)
	8	INTSR6	End of UART6 reception		0014H	
	9	INTST6	End of UART6 transmission		0016H	
	10	INTCSI10/ INTST0	End of CSI10 communication/end of UART0 transmission		0018H	
	11	INTTMH1	Match between TMH1 and CMP01 (when compare register is specified)		001AH	
	12	INTTMH0	Match between TMH0 and CMP00 (when compare register is specified)		001CH	
	13	INTTM50	Match between TM50 and CR50 (when compare register is specified)		001EH	
	14	INTTM000	Match between TM00 and CR000 (when compare register is specified), TI010 pin valid edge detection (when capture register is specified)		0020H	
	15	INTTM010	Match between TM00 and CR010 (when compare register is specified), TI000 pin valid edge detection (when capture register is specified)		0022H	
	16	INTAD	End of A/D conversion		0024H	
	17	INTSR0	End of UART0 reception or reception error generation		0026H	
	18	INTWTI	Watch timer reference time interval signal		0028H	
	19	INTTM51	Match between TM51 and CR51 (when compare register is specified)		002AH	
	20	INTKR	Key interrupt detection	External	002CH	(C)
	21	INTWT	Watch timer overflow	Internal	002EH	(A)
	22	INTP6	Pin input edge detection	External	0030H	(B)
23	INTP7	0032H				

- Notes**
1. The default priority is the priority applicable when two or more maskable interrupt are generated simultaneously. 0 is the highest priority, and 28 is the lowest.
 2. Basic configuration types (A) to (D) correspond to (A) to (D) in Figure 19-1.
 3. When bit 1 (LVIMD) of the low-voltage detection register (LVIM) is set to 0.

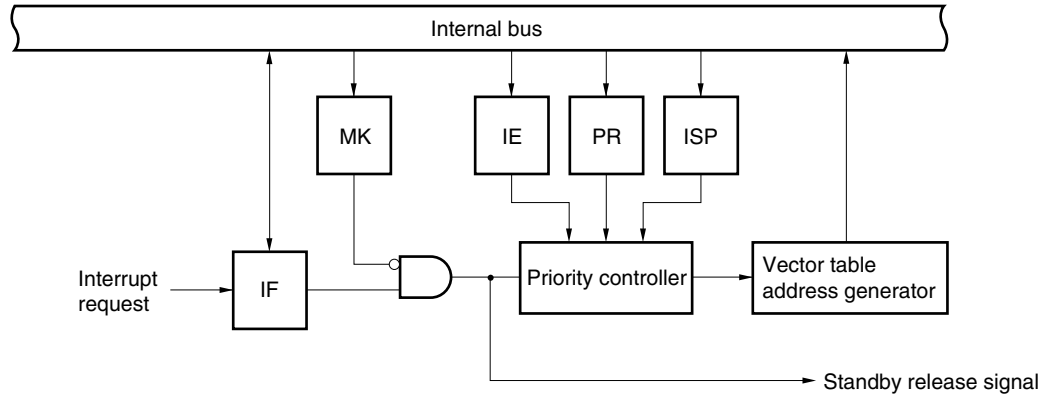

Table 19-1. Interrupt Source List (2/2)

Interrupt Type	Default Priority ^{Note 1}	Interrupt Source		Internal/External	Vector Table Address	Basic Configuration Type ^{Note 2}
		Name	Trigger			
Maskable	24	INTDMU	End of multiply/divide operation	Internal	0034H	(A)
	25	INTCSI11	End of CSI11 communication		0036H	
	26	INTTM001	Match between TM01 and CR001 (when compare register is specified), TI011 pin valid edge detection (when capture register is specified)		0038H	
	27	INTTM011	Match between TM01 and CR011 (when compare register is specified), TI001 pin valid edge detection (when capture register is specified)		003AH	
	28	INTACSI	End of CSIA0 communication		003CH	
Software	–	BRK	BRK instruction execution	–	003EH	(D)
Reset	–	RESET	Reset input	–	0000H	–
		POC	Power-on clear			
		LVI	Low-voltage detection ^{Note 3}			
		Clock monitor	High-speed system clock oscillation stop detection			
		WDT	WDT overflow			

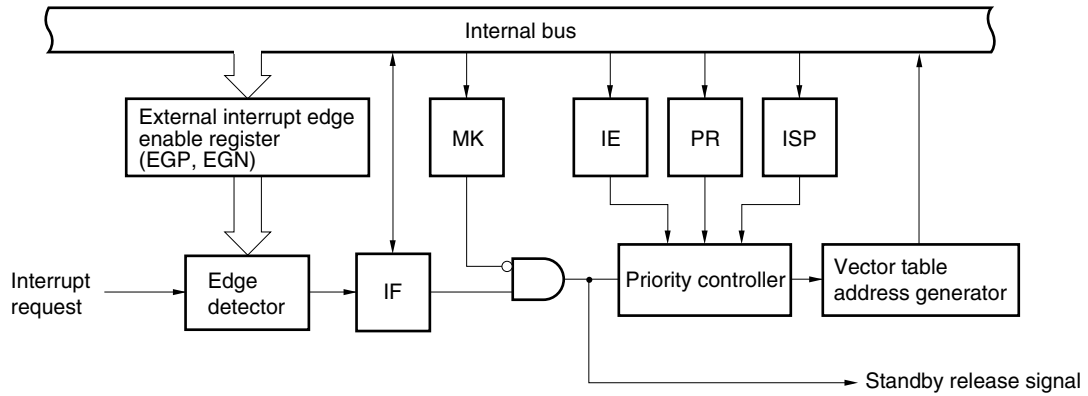

- Notes**
1. The default priority is the priority applicable when two or more maskable interrupt are generated simultaneously. 0 is the highest priority, and 28 is the lowest.
 2. Basic configuration types (A) to (D) correspond to (A) to (D) in Figure 19-1.
 3. When bit 1 (LVIMD) of the low-voltage detection register (LVIM) is set to 1.

19.3 Registers Controlling Interrupt Functions

The following 6 types of registers are used to control the interrupt functions.

- Interrupt request flag register (IF0L, IF0H, IF1L, IF1H)
- Interrupt mask flag register (MK0L, MK0H, MK1L, MK1H)
- Priority specification flag register (PR0L, PR0H, PR1L, PR1H)
- External interrupt rising edge enable register (EGP)
- External interrupt falling edge enable register (EGN)
- Program status word (PSW)

Table 19-2 shows a list of interrupt request flags, interrupt mask flags, and priority specification flags corresponding to interrupt request sources.

Table 19-2. Flags Corresponding to Interrupt Request Sources

Interrupt Request	Interrupt Request Flag		Interrupt Mask Flag		Priority Specification Flag	
		Register		Register		Register
INTLVI	LVIIIF	IF0L	LVIMK	MK0L	LVIPR	PR0L

INTACSI	ACSIIF		ACSIMK	ACSIPR		

- Notes**
1. If either of the two types of interrupt sources is generated, these flags are set (1).
 2. Both types of interrupt sources are supported.

(1) Interrupt request flag registers (IF0L, IF0H, IF1L, IF1H)

The interrupt request flags are set to 1 when the corresponding interrupt request is generated or an instruction is executed. They are cleared to 0 when an instruction is executed upon acknowledgment of an interrupt request or upon $\overline{\text{RESET}}$ input.

When an interrupt is acknowledged, the interrupt request flag is automatically cleared and then the interrupt routine is entered.

IF0L, IF0H, IF1L, and IF1H are set by a 1-bit or 8-bit memory manipulation instruction. When IF0L and IF0H, and IF1L and IF1H are combined to form 16-bit registers IF0 and IF1, they are read with a 16-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears these registers to 00H.

Figure 19-2. Format of Interrupt Request Flag Registers (IF0L, IF0H, IF1L, IF1H)

Address: FFE0H After reset: 00H R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>

Address: FFE2H After reset: 00H R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
IF1L	PIF7	PIF6	WTIF	KRIF	TMIF51	WTIF	SRIF0	ADIF

Address: FFE3H After reset: 00H R/W

Symbol	7	6	5	<4>	<3>	<2>	<1>	<0>
IF1H	0	0	0	ACSIIF	TMIF011	TMIF001	CSIIF11	DMUIF

XXIFX	Interrupt request flag
0	No interrupt request signal is generated
1	Interrupt request is generated, interrupt request status

- Cautions**
1. Be sure to clear bits 5 to 7 of IF1H to 0.
 2. When operating a timer, serial interface, or A/D converter after standby release, operate it once after clearing the interrupt request flag. An interrupt request flag may be set by noise.

- Caution 3.** Use the 1-bit memory manipulation instruction (CLR1) for manipulating the flag of the interrupt request flag register. A 1-bit manipulation instruction such as “IF0L.0 = 0;” and “_asm(“clr1 IF0L, 0”);” should be used when describing in C language, because assembly instructions after compilation must be 1-bit memory manipulation instructions (CLR1). If an 8-bit memory manipulation instruction “IF0L & = 0xfe;” is described in C language, for example, it is converted to the following three assembly instructions after compilation:

```
mov a, IF0L
and a, #0FEH
mov IF0L, a
```

In this case, at the timing between “mov a, IF0L” and “mov IF0L, a”, if the request flag of another bit of the identical interrupt request flag register (IF0L) is set to 1, it is cleared to 0 by “mov IF0L, a”. Therefore, care must be exercised when using an 8-bit memory manipulation instruction in C language.

(2) Interrupt mask flag registers (MK0L, MK0H, MK1L, MK1H)

The interrupt mask flags are used to enable/disable the corresponding maskable interrupt servicing.

MK0L, MK0H, MK1L, and MK1H are set by a 1-bit or 8-bit memory manipulation instruction. When MK0L and MK0H, and MK1L and MK1H are combined to form 16-bit registers MK0 and MK1, they are set with a 16-bit memory manipulation instruction.

RESET input sets MK0L, MK0H, and MK1L to FFH and sets MK1H to DFH.

Figure 19-3. Format of Interrupt Mask Flag Registers (MK0L, MK0H, MK1L, MK1H)

Address: FFE4H After reset: FFH R/W

Symbol	<7>	<6>	<5>	<4>	<3>	<2>	<1>	<0>
MK0L	SREMK6	PMK5	PMK4	PMK3	PMK2	PMK1	PMK0	LVIMK

XXMKX	Interrupt servicing control
0	Interrupt servicing enabled
1	Interrupt servicing disabled

Caution Be sure to set bits 6 and 7 of MK1H to 1. Be sure to clear bit 5 of MK1H to 0.

(3) Priority specification flag registers (PR0L, PR0H, PR1L, PR1H)

The priority specification flag registers are used to set the corresponding maskable interrupt priority order. PR0L, PR0H, PR1L, and PR1H are set by a 1-bit or 8-bit memory manipulation instruction. If PR0L and PR0H, and PR1L and PR1H are combined to form 16-bit registers PR0 and PR1, they are set with a 16-bit memory manipulation instruction.

RESET input sets these registers to FFH.

Figure 19-4. Format of Priority Specification Flag Registers (PR0L, PR0H, PR1L, PR1H)

XXPRX	Priority level selection
0	High priority level
1	Low priority level

Caution Be sure to set bits 5 to 7 of PR1H to 1.

(4) External interrupt rising edge enable register (EGP), external interrupt falling edge enable register (EGN)

These registers specify the valid edge for INTP0 to INTP7.

EGP and EGN are set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears these registers to 00H.

Figure 19-5. Format of External Interrupt Rising Edge Enable Register (EGP) and External Interrupt Falling Edge Enable Register (EGN)

Address: FF48H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0

EGPn	EGNn	INTPn pin valid edge selection (n = 0 to 7)
0	0	Edge detection disabled
0	1	Falling edge
1	0	Rising edge
1	1	Both rising and falling edges

Table 19-3 shows the ports corresponding to EGPn and EGNn.

Table 19-3. Ports Corresponding to EGPn and EGNn

Detection Enable Register		Edge Detection Port	External Request Signal
EGP0	EGN0	P120	INTP0
EGP1	EGN1	P30	INTP1
EGP2	EGN2	P31	INTP2
EGP3	EGN3	P32	INTP3
EGP4	EGN4	P33	INTP4
EGP5	EGN5	P16	INTP5
EGP6	EGN6	P140	INTP6
EGP7	EGN7	P141	INTP7

Caution Select the port mode by clearing EGPn and EGNn to 0 because an edge may be detected when the external interrupt function is switched to the port function.

Remark n = 0 to 7

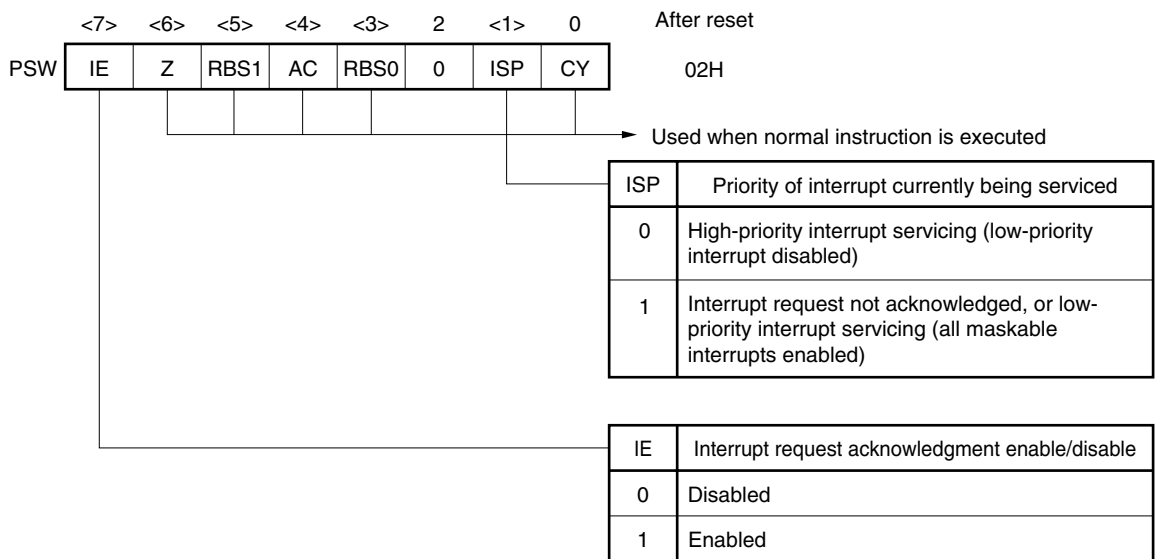

(5) Program status word (PSW)

The program status word is a register used to hold the instruction execution result and the current status for an interrupt request. The IE flag that sets maskable interrupt enable/disable and the ISP flag that controls multiple interrupt servicing are mapped to the PSW.

Besides 8-bit read/write, this register can carry out operations using bit manipulation instructions and dedicated instructions (EI and DI). When a vectored interrupt request is acknowledged, if the BRK instruction is executed, the contents of the PSW are automatically saved into a stack and the IE flag is reset to 0. If a maskable interrupt request is acknowledged, the contents of the priority specification flag of the acknowledged interrupt are transferred to the ISP flag. The PSW contents are also saved into the stack with the PUSH PSW instruction. They are restored from the stack with the RETI, RETB, and POP PSW instructions.

$\overline{\text{RESET}}$ input sets PSW to 02H.

Figure 19-6. Format of Program Status Word

19.4 Interrupt Servicing Operations

19.4.1 Maskable interrupt acknowledgment

A maskable interrupt becomes acknowledgeable when the interrupt request flag is set to 1 and the mask (MK) flag corresponding to that interrupt request is cleared to 0. A vectored interrupt request is acknowledged if interrupts are in the interrupt enabled state (when the IE flag is set to 1). However, a low-priority interrupt request is not acknowledged during servicing of a higher priority interrupt request (when the ISP flag is reset to 0). The times from generation of a maskable interrupt request until interrupt servicing is performed are listed in Table 19-4 below.

For the interrupt request acknowledgment timing, see **Figures 19-8 and 19-9**.

Table 19-4. Time from Generation of Maskable Interrupt Until Servicing

	Minimum Time	Maximum Time ^{Note}
When $\times\times PR = 0$	7 clocks	32 clocks
When $\times\times PR = 1$	8 clocks	33 clocks

Note If an interrupt request is generated just before a divide instruction, the wait time becomes longer.

Remark 1 clock: $1/f_{CPU}$ (f_{CPU} : CPU clock)

If two or more maskable interrupt requests are generated simultaneously, the request with a higher priority level specified in the priority specification flag is acknowledged first. If two or more interrupts requests have the same priority level, the request with the highest default priority is acknowledged first.

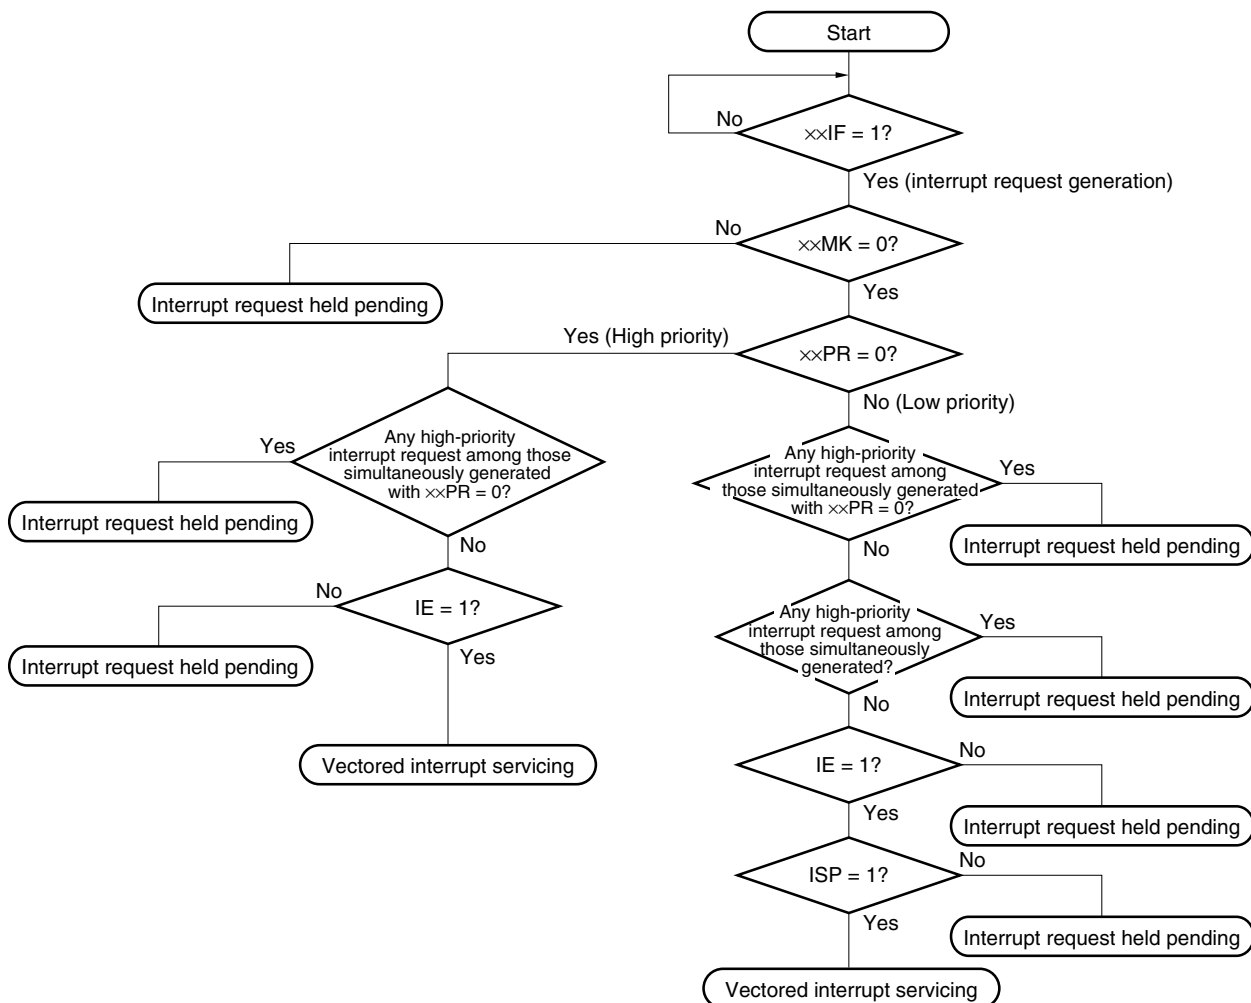

An interrupt request that is held pending is acknowledged when it becomes acknowledgeable.

Figure 19-7 shows the interrupt request acknowledgment algorithm.

If a maskable interrupt request is acknowledged, the contents are saved into the stacks in the order of PSW, then PC, the IE flag is reset (0), and the contents of the priority specification flag corresponding to the acknowledged interrupt are transferred to the ISP flag. The vector table data determined for each interrupt request is the loaded into the PC and branched.

Restoring from an interrupt is possible by using the RETI instruction.

Figure 19-7. Interrupt Request Acknowledgment Processing Algorithm

××IF: Interrupt request flag

××MK: Interrupt mask flag

××PR: Priority specification flag

IE: Flag that controls acknowledgment of maskable interrupt request (1 = Enable, 0 = Disable)

ISP: Flag that indicates the priority level of the interrupt currently being serviced (0 = high-priority interrupt servicing, 1 = No interrupt request acknowledged, or low-priority interrupt servicing)

Figure 19-8. Interrupt Request Acknowledgment Timing (Minimum Time)

Remark 1 clock: $1/f_{CPU}$ (f_{CPU} : CPU clock)

Figure 19-9. Interrupt Request Acknowledgment Timing (Maximum Time)

Remark 1 clock: $1/f_{CPU}$ (f_{CPU} : CPU clock)

19.4.2 Software interrupt request acknowledgment

A software interrupt acknowledge is acknowledged by BRK instruction execution. Software interrupts cannot be disabled.

If a software interrupt request is acknowledged, the contents are saved into the stacks in the order of the program status word (PSW), then program counter (PC), the IE flag is reset (0), and the contents of the vector table (003EH, 003FH) are loaded into the PC and branched.

Restoring from a software interrupt is possible by using the RETB instruction.

Caution Do not use the RETI instruction for restoring from the software interrupt.

19.4.3 Multiple interrupt servicing

Multiple interrupt servicing occurs when another interrupt request is acknowledged during execution of an interrupt.

Multiple interrupt servicing does not occur unless the interrupt request acknowledgment enabled state is selected (IE = 1). When an interrupt request is acknowledged, interrupt request acknowledgment becomes disabled (IE = 0). Therefore, to enable multiple interrupt servicing, it is necessary to set (1) the IE flag with the EI instruction during interrupt servicing to enable interrupt acknowledgment.

Moreover, even if interrupts are enabled, multiple interrupt servicing may not be enabled, this being subject to interrupt priority control. Two types of priority control are available: default priority control and programmable priority control. Programmable priority control is used for multiple interrupt servicing.

In the interrupt enabled state, if an interrupt request with a priority equal to or higher than that of the interrupt currently being serviced is generated, it is acknowledged for multiple interrupt servicing. If an interrupt with a priority lower than that of the interrupt currently being serviced is generated during interrupt servicing, it is not acknowledged for multiple interrupt servicing. Interrupt requests that are not enabled because interrupts are in the interrupt disabled state or because they have a lower priority are held pending. When servicing of the current interrupt ends, the pending interrupt request is acknowledged following execution of at least one main processing instruction execution.

Table 19-5 shows relationship between interrupt requests enabled for multiple interrupt servicing and Figure 19-10 shows multiple interrupt servicing examples.

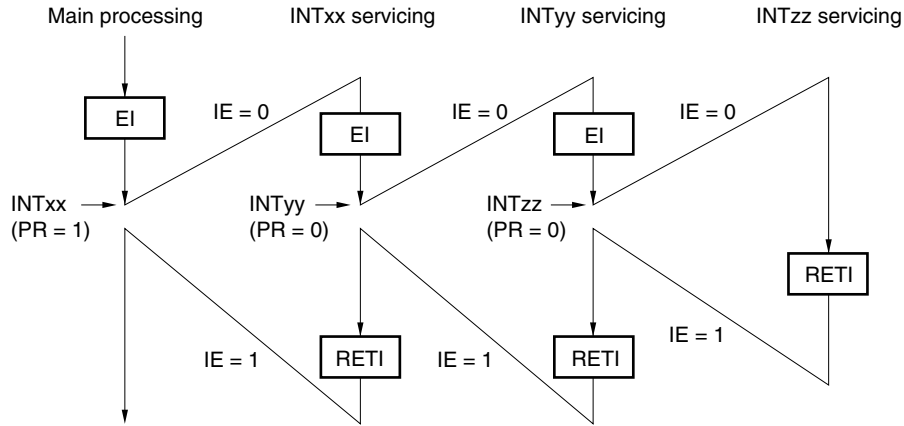

Table 19-5. Relationship Between Interrupt Requests Enabled for Multiple Interrupt Servicing During Interrupt Servicing

Multiple Interrupt Request Interrupt Being Serviced		Maskable Interrupt Request				Software Interrupt Request
		PR = 0		PR = 1		
		IE = 1	IE = 0	IE = 1	IE = 0	
Maskable interrupt	ISP = 0	√	×	×	×	√
	ISP = 1	√	×	√	×	√
Software interrupt		√	×	√	×	√

- Remarks**
1. √: Multiple interrupt servicing enabled
 2. ×: Multiple interrupt servicing disabled
 3. ISP and IE are flags contained in the PSW.
 ISP = 0: An interrupt with higher priority is being serviced.
 ISP = 1: No interrupt request has been acknowledged, or an interrupt with a lower priority is being serviced.
 IE = 0: Interrupt request acknowledgment is disabled.
 IE = 1: Interrupt request acknowledgment is enabled.
 4. PR is a flag contained in PR0L, PR0H, PR1L, and PR1H.
 PR = 0: Higher priority level
 PR = 1: Lower priority level

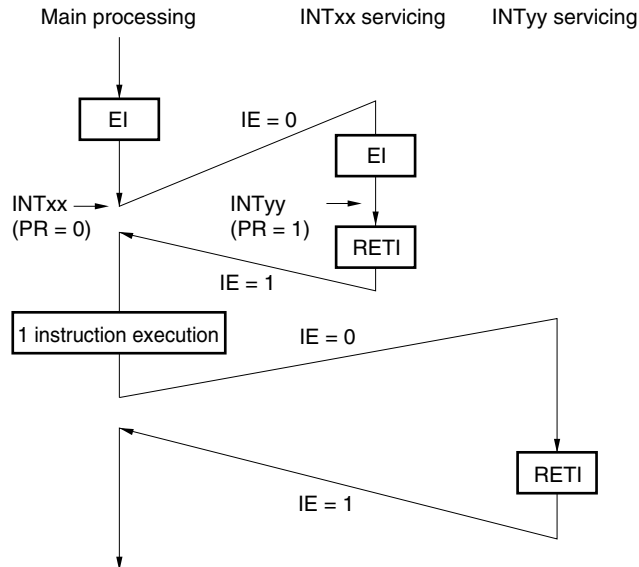

Figure 19-10. Examples of Multiple Interrupt Servicing (1/2)

Example 1. Multiple interrupt servicing occurs twice

During servicing of interrupt INTxx, two interrupt requests, INTyy and INTzz, are acknowledged, and multiple interrupt servicing takes place. Before each interrupt request is acknowledged, the EI instruction must always be issued to enable interrupt request acknowledgment.

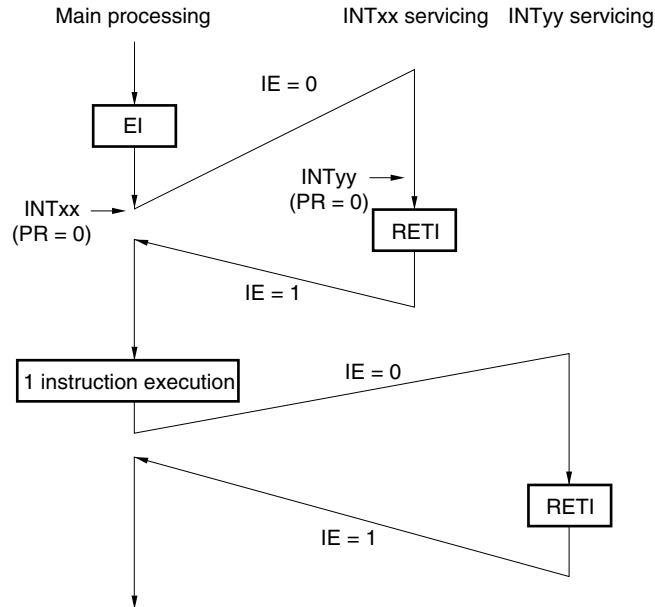

Example 2. Multiple interrupt servicing does not occur due to priority control

Interrupt request INTyy issued during servicing of interrupt INTxx is not acknowledged because its priority is lower than that of INTxx, and multiple interrupt servicing does not take place. The INTyy interrupt request is held pending, and is acknowledged following execution of one main processing instruction.

- PR = 0: Higher priority level
- PR = 1: Lower priority level
- IE = 0: Interrupt request acknowledgment disabled

Figure 19-10. Examples of Multiple Interrupt Servicing (2/2)

Example 3. Multiple interrupt servicing does not occur because interrupts are not enabled

Interrupts are not enabled during servicing of interrupt INTxx (EI instruction is not issued), therefore, interrupt request INTyy is not acknowledged and multiple interrupt servicing does not take place. The INTyy interrupt request is held pending, and is acknowledged following execution of one main processing instruction.

PR = 0: Higher priority level

IE = 0: Interrupt request acknowledgment disabled

19.4.4 Interrupt request hold

There are instructions where, even if an interrupt request is issued for them while another instruction is being executed, request acknowledgment is held pending until the end of execution of the next instruction. These instructions (interrupt request hold instructions) are listed below.

- MOV PSW, #byte
- MOV A, PSW
- MOV PSW, A
- MOV1 PSW. bit, CY
- MOV1 CY, PSW. bit
- AND1 CY, PSW. bit
- OR1 CY, PSW. bit
- XOR1 CY, PSW. bit
- SET1 PSW. bit
- CLR1 PSW. bit
- RETB
- RETI
- PUSH PSW
- POP PSW
- BT PSW. bit, \$addr16
- BF PSW. bit, \$addr16
- BTCLR PSW. bit, \$addr16
- EI
- DI
- Manipulation instructions for the IF0L, IF0H, IF1L, IF1H, MK0L, MK0H, MK1L, MK1H, PR0L, PR0H, PR1L, and PR1H registers.

Caution The BRK instruction is not one of the above-listed interrupt request hold instructions. However, the software interrupt activated by executing the BRK instruction causes the IE flag to be cleared. Therefore, even if a maskable interrupt request is generated during execution of the BRK instruction, the interrupt request is not acknowledged.

Figure 19-11 shows the timing at which interrupt requests are held pending.

Figure 19-11. Interrupt Request Hold

- Remarks**
1. Instruction N: Interrupt request hold instruction
 2. Instruction M: Instruction other than interrupt request hold instruction
 3. The $\times\times PR$ (priority level) values do not affect the operation of $\times\times IF$ (instruction request).

CHAPTER 20 KEY INTERRUPT FUNCTION

20.1 Functions of Key Interrupt

A key interrupt (INTKR) can be generated by setting the key return mode register (KRM) and inputting a rising edge to the key interrupt input pins (KR0 to KR7).

Table 20-1. Assignment of Key Interrupt Detection Pins

Flag	Description
KRM0	Controls KR0 signal in 1-bit units.
KRM1	Controls KR1 signal in 1-bit units.
KRM2	Controls KR2 signal in 1-bit units.
KRM3	Controls KR3 signal in 1-bit units.
KRM4	Controls KR4 signal in 1-bit units.
KRM5	Controls KR5 signal in 1-bit units.
KRM6	Controls KR6 signal in 1-bit units.
KRM7	Controls KR7 signal in 1-bit units.

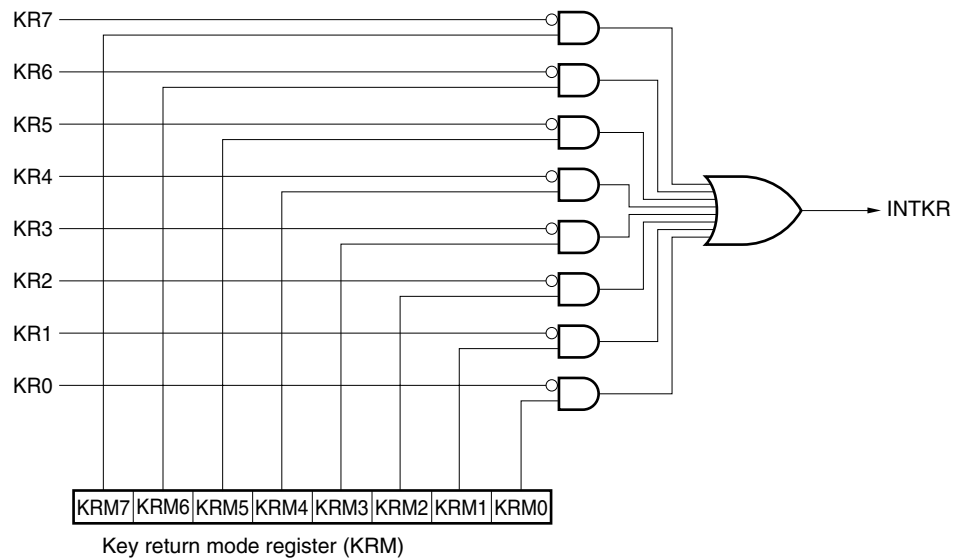

20.2 Configuration of Key Interrupt

The key interrupt includes the following hardware.

Table 20-2. Configuration of Key Interrupt

Item	Configuration
Control register	Key return mode register (KRM)

Figure 20-1. Block Diagram of Key Interrupt

20.3 Register Controlling Key Interrupt

(1) Key return mode register (KRM)

This register controls the KRM0 to KRM7 bits using the KR0 to KR7 signals, respectively.

This register is set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 20-2. Format of Key Return Mode Register (KRM)

Address: FF6EH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
KRM	KRM7	KRM6	KRM5	KRM4	KRM3	KRM2	KRM1	KRM0

KRMn	Key interrupt mode control
0	Does not detect key interrupt signal
1	Detects key interrupt signal

- Cautions**
1. If any of the KRM0 to KRM7 bits used is set to 1, set bits 0 to 7 (PU70 to PU77) of the corresponding pull-up resistor register 7 (PU7) to 1.
 2. If KRM is changed, the interrupt request flag may be set. Therefore, disable interrupts and then change the KRM register. After that, clear the interrupt request flag and then enable interrupts.
 3. The bits not used in the key interrupt mode can be used as normal ports.

CHAPTER 21 STANDBY FUNCTION

21.1 Standby Function and Configuration

21.1.1 Standby function

Table 21-1. Relationship Between Operation Clocks in Each Operation Status

Operation Mode	High-Speed System Clock Oscillator		Internal Oscillator			Subsystem Clock Oscillator	CPU Clock After Release	Prescaler Clock Supplied to Peripherals	
	MSTOP = 0 MCC = 0	MSTOP = 1 MCC = 1	Note 1	Note 2				MCM0 = 0	MCM0 = 1
				RSTOP = 0	RSTOP = 1				
Reset	Stopped		Stopped			Oscillating	Internal oscillation	Stopped	
STOP			Oscillating	Oscillating	Stopped		Note 3	Stopped	
HALT	Oscillating	Stopped					Note 4	Internal oscillation	High-speed system clock

- Notes**
1. When “Cannot be stopped” is selected for the internal oscillator by the option byte.
 2. When “Can be stopped by software” is selected for the internal oscillator by the option byte.
 3. Operates using the CPU clock at STOP instruction execution.
 4. Operates using the CPU clock at HALT instruction execution.

Caution The RSTOP setting is valid only when “Can be stopped by software” is set for the internal oscillator by the option byte.

Remark

- MSTOP: Bit 7 of the main OSC control register (MOC)
- MCC: Bit 7 of the processor clock control register (PCC)
- RSTOP: Bit 0 of the internal oscillation mode register (RCM)
- MCM0: Bit 0 of the main clock mode register (MCM)

The standby function is designed to reduce the operating current of the system. The following two modes are available.

(1) HALT mode

HALT instruction execution sets the HALT mode. In the HALT mode, the CPU operation clock is stopped. If the high-speed system clock oscillator, internal oscillator, or subsystem clock oscillator is operating before the HALT mode is set, oscillation of each clock continues. In this mode, the operating current is not decreased as much as in the STOP mode, but the HALT mode is effective for restarting operation immediately upon interrupt request generation and carrying out intermittent operations.

(2) STOP mode

STOP instruction execution sets the STOP mode. In the STOP mode, the high-speed system clock oscillator stops, stopping the whole system, thereby considerably reducing the CPU operating current.

Because this mode can be cleared by an interrupt request, it enables intermittent operations to be carried out. However, because a wait time is required to secure the oscillation stabilization time after the STOP mode is released, select the HALT mode if it is necessary to start processing immediately upon interrupt request generation.

In either of these two modes, all the contents of registers, flags and data memory just before the standby mode is set are held. The I/O port output latches and output buffer statuses are also held.

- Cautions**
- 1. STOP mode can be used only when the CPU is operating on the high-speed system clock or internal oscillation clock. HALT mode can be used when the CPU is operating on the high-speed system clock, internal oscillation clock, or subsystem clock. However, when the STOP instruction is executed during internal oscillation clock operation, the high-speed system clock oscillator stops, but the internal oscillator does not stop.**
 - 2. When shifting to the STOP mode, be sure to stop the peripheral hardware operation before executing STOP instruction.**
 - 3. The following sequence is recommended for operating current reduction of the A/D converter when the standby function is used: First clear bit 7 (ADCS) of the A/D converter mode register (ADM) to 0 to stop the A/D conversion operation, and then execute the HALT or STOP instruction.**
 - 4. If the internal oscillator is operating before the STOP mode is set, oscillation of the internal oscillation clock cannot be stopped in the STOP mode. However, when the internal oscillation clock is used as the CPU clock, the CPU operation is stopped for $17/f_R$ (s) after STOP mode is released.**

21.1.2 Registers controlling standby function

The standby function is controlled by the following two registers.

- Oscillation stabilization time counter status register (OSTC)
- Oscillation stabilization time select register (OSTS)

Remark For the registers that start, stop, or select the clock, see **CHAPTER 6 CLOCK GENERATOR**.

(1) Oscillation stabilization time counter status register (OSTC)

This is the status register of the high-speed system clock oscillation stabilization time counter. If the internal oscillation clock is used as the CPU clock, the high-speed system clock oscillation stabilization time can be checked.

OSTC can be read by a 1-bit or 8-bit memory manipulation instruction.

Reset release (reset by $\overline{\text{RESET}}$ input, POC, LVI, clock monitor, and WDT), the STOP instruction, MSTOP (bit 7 of MOC register) = 1, or MCC (bit 7 of PCC register) = 1 clear OSTC to 00H.

Figure 21-1. Format of Oscillation Stabilization Time Counter Status Register (OSTC)

Address: FFA3H After reset: 00H R

Symbol	7	6	5	4	3	2	1	0
OSTC	0	0	0	MOST11	MOST13	MOST14	MOST15	MOST16

MOST11	MOST13	MOST14	MOST15	MOST16	Oscillation stabilization time status	
					$f_{XP} = 10 \text{ MHz}$	$f_{XP} = 16 \text{ MHz}$
1	0	0	0	0	$2^{11}/f_{XP} \text{ min.}$	204.8 μs min., 128 μs min.
1	1	0	0	0	$2^{13}/f_{XP} \text{ min.}$	819.2 μs min., 512 μs min.
1	1	1	0	0	$2^{14}/f_{XP} \text{ min.}$	1.64 ms min., 1.02 ms min.
1	1	1	1	0	$2^{15}/f_{XP} \text{ min.}$	3.27 ms min., 2.04 ms min.
1	1	1	1	1	$2^{16}/f_{XP} \text{ min.}$	6.55 ms min., 4.09 ms min.

Cautions 1. After the above time has elapsed, the bits are set to 1 in order from MOST11 and remain 1.

2. If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows.

- Desired OSTC oscillation stabilization time \leq Oscillation stabilization time set by OSTS

The oscillation stabilization time counter counts only during the oscillation stabilization time set by OSTS. Therefore, note that only the statuses during the oscillation stabilization time set by OSTS are set to OSTC after STOP mode has been released.

3. The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by $\overline{\text{RESET}}$ input or interrupt generation.

Remark f_{XP} : High-speed system clock oscillation frequency

(2) Oscillation stabilization time select register (OSTS)

This register is used to select the high-speed system clock oscillation stabilization wait time when STOP mode is released. The wait time set by OSTS is valid only after STOP mode is released when the high-speed system clock is selected as the CPU clock. After STOP mode is released when the internal oscillation clock is selected, check the oscillation stabilization time using OSTC.

OSTS can be set by an 8-bit memory manipulation instruction.

RESET input sets OSTS to 05H.

Figure 21-2. Format of Oscillation Stabilization Time Select Register (OSTS)

Address: FFA4H After reset: 05H R/W

Symbol	7	6	5	4	3	2	1	0
OSTS	0	0	0	0	0	OSTS2	OSTS1	OSTS0

OSTS2	OSTS1	OSTS0	Oscillation stabilization time selection	Oscillation stabilization time selection	
				f _{XP} = 10 MHz	f _{XP} = 16 MHz
0	0	1	2 ¹¹ /f _{XP}	204.8 μs	128 μs
0	1	0	2 ¹³ /f _{XP}	819.2 μs	512 μs
0	1	1	2 ¹⁴ /f _{XP}	1.64 ms	1.02 ms
1	0	0	2 ¹⁵ /f _{XP}	3.27 ms	2.04 ms
1	0	1	2 ¹⁶ /f _{XP}	6.55 ms	4.09 ms
Other than above			Setting prohibited		

- Cautions**
1. To set the STOP mode when the high-speed system clock is used as the CPU clock, set OSTS before executing a STOP instruction.
 2. Before setting OSTS, confirm with OSTC that the desired oscillation stabilization time has elapsed.
 3. If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows.

- Desired OSTC oscillation stabilization time ≤ Oscillation stabilization time set by OSTS

The oscillation stabilization time counter counts only during the oscillation stabilization time set by OSTS. Therefore, note that only the statuses during the oscillation stabilization time set by OSTS are set to OSTC after STOP mode has been released.

4. The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by RESET input or interrupt generation.

Remark f_{XP}: High-speed system clock oscillation frequency

21.2 Standby Function Operation

21.2.1 HALT mode

(1) HALT mode

The HALT mode is set by executing the HALT instruction. HALT mode can be set regardless of whether the CPU clock before the setting was the high-speed system clock, Internal oscillation clock, or subsystem clock.

The operating statuses in the HALT mode are shown below.

Table 21-2. Operating Statuses in HALT Mode (1/2)

HALT Mode Setting Item		When HALT Instruction Is Executed While CPU Is Operating on High-Speed System Clock				When HALT Instruction Is Executed While CPU Is Operating on Internal Oscillation Clock			
		When Internal Oscillation Clock Continues		When Internal Oscillation Clock Stopped ^{Note 1}		When High-Speed System Clock Oscillation Continues		When High-Speed System Clock Oscillation Stopped	
		When Subsystem Clock Used	When Subsystem Clock Not Used	When Subsystem Clock Used	When Subsystem Clock Not Used	When Subsystem Clock Used	When Subsystem Clock Not Used	When Subsystem Clock Used	When Subsystem Clock Not Used
System clock		Clock supply to the CPU is stopped							
CPU		Operation stopped							
Port (output latch)		Status before HALT mode was set is retained							
16-bit timer/event counter 00		Operable				Operation not guaranteed			
16-bit timer/event counter 01		Operable				Operation not guaranteed			
8-bit timer/event counter 50		Operable				Operation not guaranteed when count clock other than T150 is selected			
8-bit timer/event counter 51		Operable				Operation not guaranteed when count clock other than T151 is selected			
8-bit timer H0		Operable				Operation not guaranteed when count clock other than TM50 output is selected during 8-bit timer/event counter 50 operation			
8-bit timer H1		Operable				Operation not guaranteed when count clock other than $f_n/2^7$ is selected

	CSI11	Operable		Operable only when external $\overline{\text{SCKT1}}$ is selected as the serial clock	
	CSIA0	Operable		Operation stopped	
Clock monitor		Operable	Operation stopped		
Multiplier/divider		Operable		Operation stopped	
Power-on-clear function		Operable			
Low-voltage detection function		Operable			
External interrupt		Operable			

- Notes**
1. When “Stopped by software” is selected for the internal oscillator by the option byte and the internal oscillator is stopped by software (for option bytes, see **CHAPTER 26 OPTION BYTE**).
 2. “Internal oscillator cannot be stopped” or “Internal oscillator can be stopped by software” can be selected by the option byte.

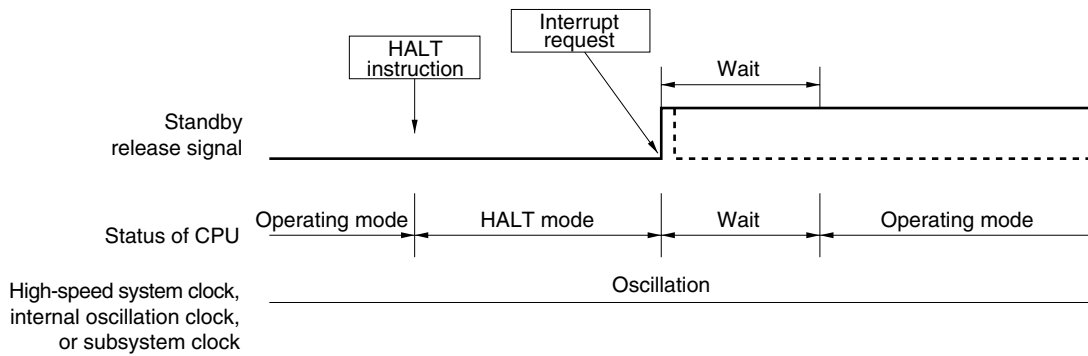

(2) HALT mode release

The HALT mode can be released by the following two sources.

(a) Release by unmasked interrupt request

When an unmasked interrupt request is generated, the HALT mode is released. If interrupt acknowledgment is enabled, vectored interrupt servicing is carried out. If interrupt acknowledgment is disabled, the next address instruction is executed.

Figure 21-3. HALT Mode Release by Interrupt Request Generation

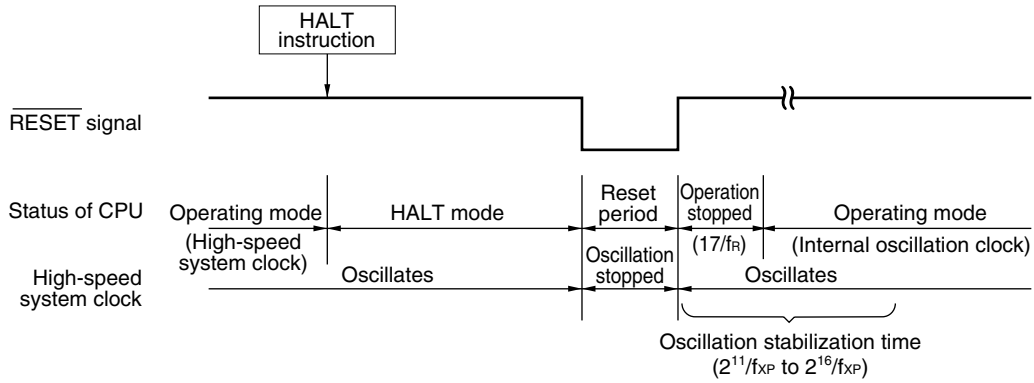

- Remarks**
- The broken lines indicate the case when the interrupt request which has released the standby mode is acknowledged.
 - The wait time is as follows:
 - When vectored interrupt servicing is carried out: 8 or 9 clocks
 - When vectored interrupt servicing is not carried out: 2 or 3 clocks

(b) Release by $\overline{\text{RESET}}$ input

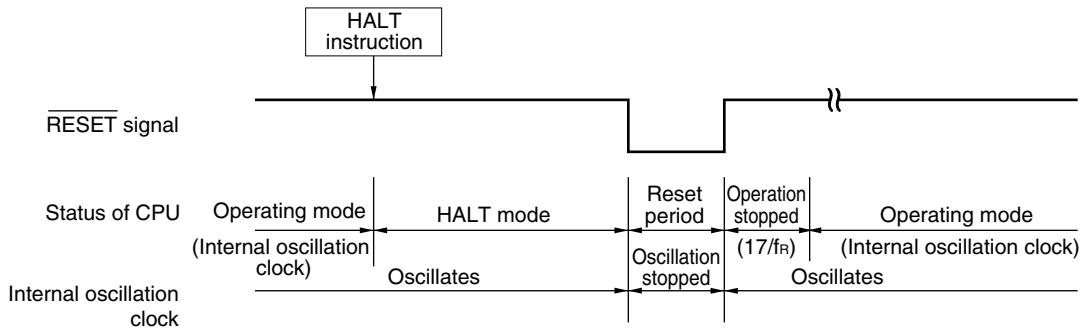

When the $\overline{\text{RESET}}$ signal is input, HALT mode is released, and then, as in the case with a normal reset operation, the program is executed after branching to the reset vector address.

Figure 21-4. HALT Mode Release by $\overline{\text{RESET}}$ Input (1/2)

(1) When high-speed system clock is used as CPU clock

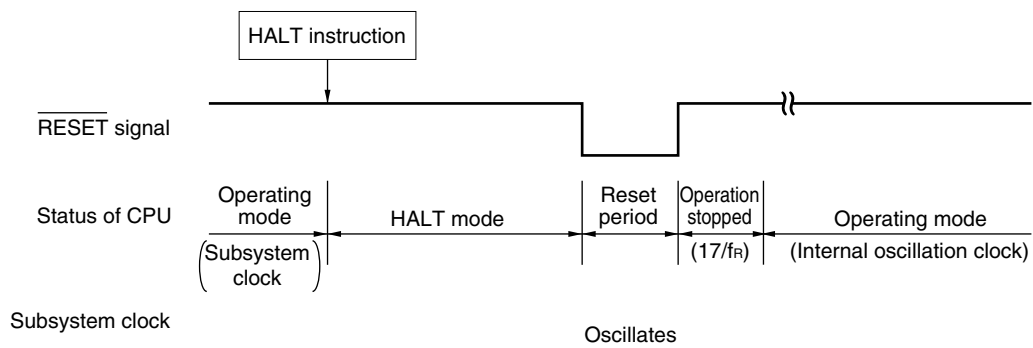

(2) When internal oscillation clock is used as CPU clock

- Remarks**
1. f_{XP} : High-speed system clock oscillation frequency
 2. f_R : Internal oscillation clock frequency

Figure 21-4. HALT Mode Release by $\overline{\text{RESET}}$ Input (2/2)

(3) When subsystem clock is used as CPU clock

Remark f_R: Internal oscillation clock frequency

Table 21-3. Operation in Response to Interrupt Request in HALT Mode

Release Source	MK _{xx}	PR _{xx}	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt servicing execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	
	0	1	1	1	Interrupt servicing execution
	1	×	×	×	HALT mode held
$\overline{\text{RESET}}$ input	–	–	×	×	Reset processing

×: don't care

21.2.2 STOP mode

(1) STOP mode setting and operating statuses

The STOP mode is set by executing the STOP instruction, and it can be set when the CPU clock before the setting was the high-speed system clock or internal oscillation clock.

Caution Because the interrupt request signal is used to release the standby mode, if there is an interrupt source with the interrupt request flag set and the interrupt mask flag reset, the standby mode is immediately released if set. Thus, the STOP mode is reset to the HALT mode immediately after execution of the STOP instruction and the system returns to the operating mode as soon as the wait time set using the oscillation stabilization time select register (OSTS) has elapsed.

The operating statuses in the STOP mode are shown below.

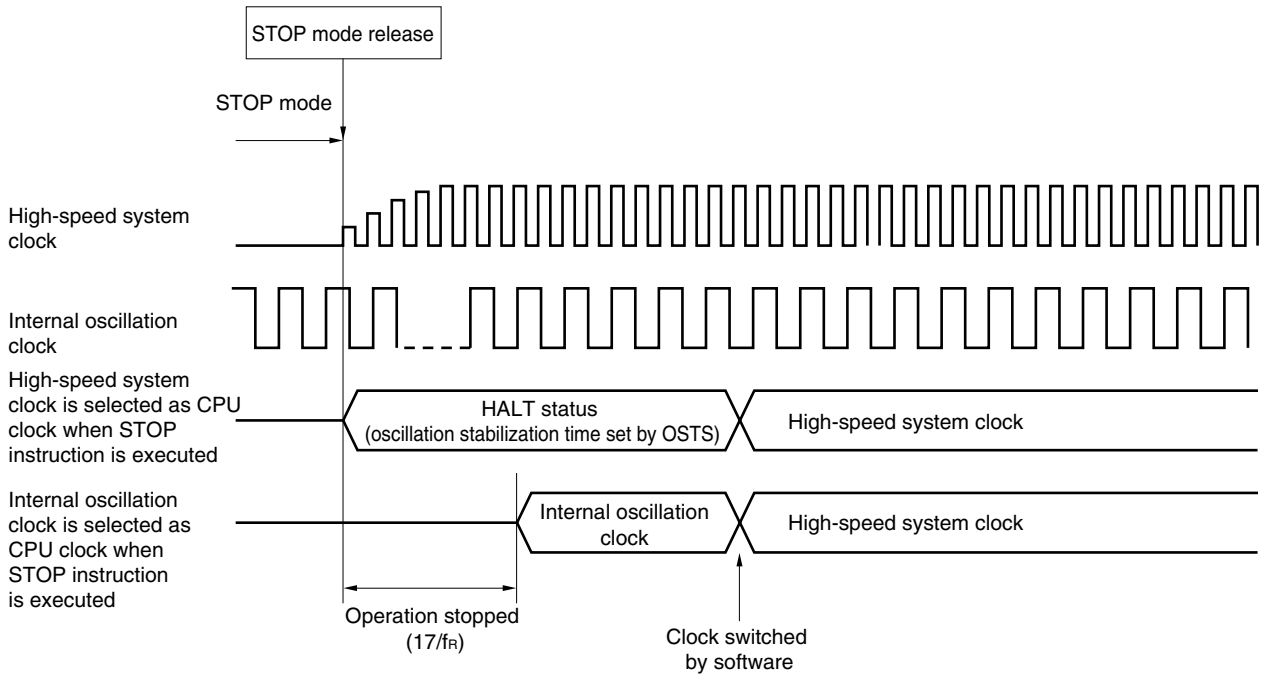

Table 21-4. Operating Statuses in STOP Mode

STOP Mode Setting		When STOP Instruction Is Executed While CPU Is Operating on High-Speed System Clock				When STOP Instruction Is Executed While CPU Is Operating on Internal Oscillation Clock	
		When Internal Oscillation Clock Continues		When Internal Oscillation Clock Stopped ^{Note 1}			
		When Subsystem Clock Used	When Subsystem Clock Not Used	When Subsystem Clock Used	When Subsystem Clock Not Used	When Subsystem Clock Used	When Subsystem Clock Not Used
Item							
System clock		Only high-speed system clock oscillator oscillation is stopped. Clock supply to the CPU is stopped.					
CPU		Operation stopped					
Port (output latch)		Status before STOP mode was set is retained					
16-bit timer/event counter 00		Operation stopped					
16-bit timer/event counter 01		Operation stopped					
8-bit timer/event counter 50		Operable only when TI50 is selected as the count clock					
8-bit timer/event counter 51		Operable only when TI51 is selected as the count clock					
8-bit timer H0		Operable only when TM50 output is selected as the count clock during 8-bit timer/event counter 50 operation					
8-bit timer H1		Operable ^{Note 2}		Operation stopped		Operable ^{Note 2}	
Watch timer		Operable ^{Note 3}		Operation stopped		Operable ^{Note 3}	
Watchdog timer	Internal oscillator cannot be stopped ^{Note 4}	Operable		-		Operable	
	Internal oscillator can be stopped ^{Note 4}	Operation stopped

Serial interface	UART0	Operable only when TM50 output is selected as the serial clock during TM50 operation					
	UART6						
	CSI10	Operable only when external $\overline{\text{SCK10}}$ is selected as the serial clock					
	CSI11	Operable only when external $\overline{\text{SCK11}}$ is selected as the serial clock					
	CSIA0	Operation stopped					
Clock monitor		Operation stopped					
Multiplier/divider		Operation stopped					
Power-on-clear function		Operable					
Low-voltage detection function		Operable					
External interrupt		Operable					

- Notes 1.** When “Stopped by software” is selected for the internal oscillator by the option byte and the internal oscillator is stopped by software (for option bytes, see **CHAPTER 26 OPTION BYTE**).
- 2.** Operable only when $f_R/2^7$ is selected as the count clock.
- 3.** Operable when the subsystem clock is selected.
- 4.** “Internal oscillator cannot be stopped” or “Internal oscillator can be stopped by software” can be selected by the option byte.

(2) STOP mode release

Figure 21-5. Operation Timing When STOP Mode Is Released

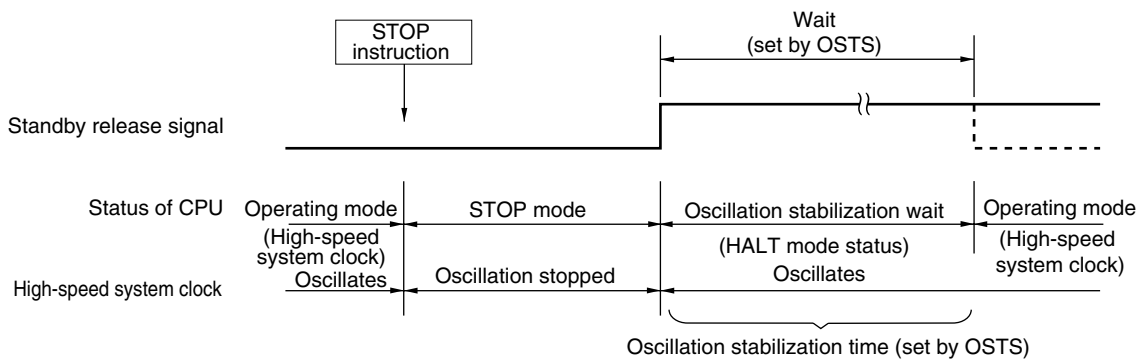

The STOP mode can be released by the following two sources.

(a) Release by unmasked interrupt request

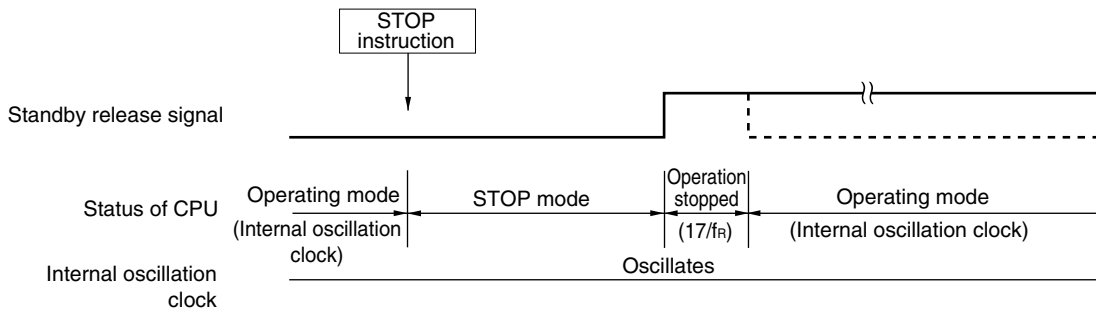

When an unmasked interrupt request is generated, the STOP mode is released. After the oscillation stabilization time has elapsed, if interrupt acknowledgment is enabled, vectored interrupt servicing is carried out. If interrupt acknowledgment is disabled, the next address instruction is executed.

Figure 21-6. STOP Mode Release by Interrupt Request Generation

(1) When high-speed system clock is used as CPU clock

(2) When internal oscillation clock is used as CPU clock

Remarks 1. The broken lines indicate the case when the interrupt request that has released the standby mode is acknowledged.

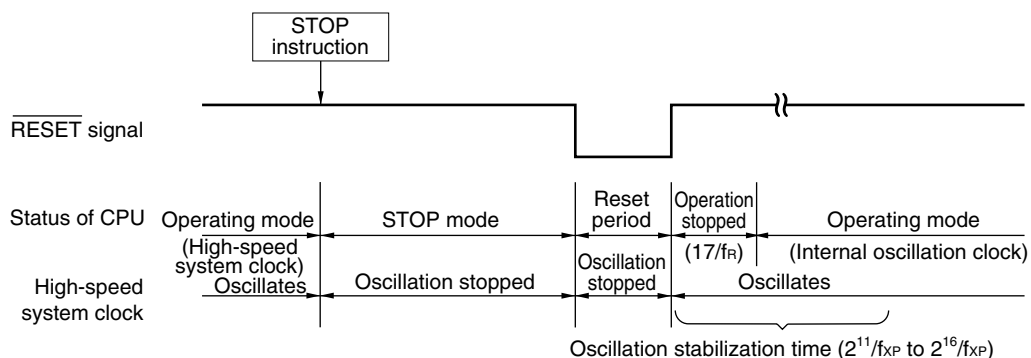

2. f_R : Internal oscillation clock frequency

(b) Release by $\overline{\text{RESET}}$ input

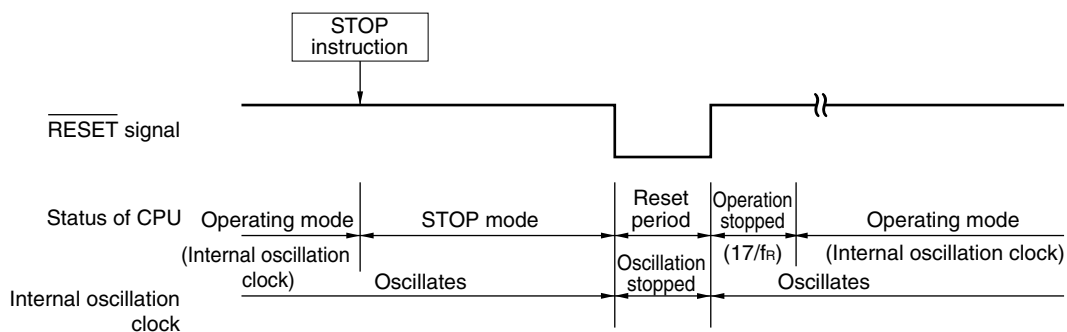

When the $\overline{\text{RESET}}$ signal is input, STOP mode is released and a reset operation is performed after the oscillation stabilization time has elapsed.

Figure 21-7. STOP Mode Release by $\overline{\text{RESET}}$ Input

(1) When high-speed system clock is used as CPU clock

(2) When internal oscillation clock is used as CPU clock

- Remarks 1. f_{XP} : High-speed system clock oscillation frequency
- 2. f_R : Internal oscillation clock frequency

Table 21-5. Operation in Response to Interrupt Request in STOP Mode

Release Source	MK $\times\times$	PR $\times\times$	IE	ISP	Operation
Maskable interrupt request	0	0	0	×	Next address instruction execution
	0	0	1	×	Interrupt servicing execution
	0	1	0	1	Next address instruction execution
	0	1	×	0	
	0	1	1	1	Interrupt servicing execution
1	×	×	×	STOP mode held	
$\overline{\text{RESET}}$ input	–	–	×	×	Reset processing

×: don't care

CHAPTER 22 RESET FUNCTION

The following five operations are available to generate a reset signal.

- (1) External reset input via $\overline{\text{RESET}}$ pin
- (2) Internal reset by watchdog timer program loop detection
- (3) Internal reset by clock monitor high-speed system clock oscillation stop detection
- (4) Internal reset by comparison of supply voltage and detection voltage of power-on-clear (POC) circuit
- (5) Internal reset by comparison of supply voltage and detection voltage of low-power-supply detector (LVI)

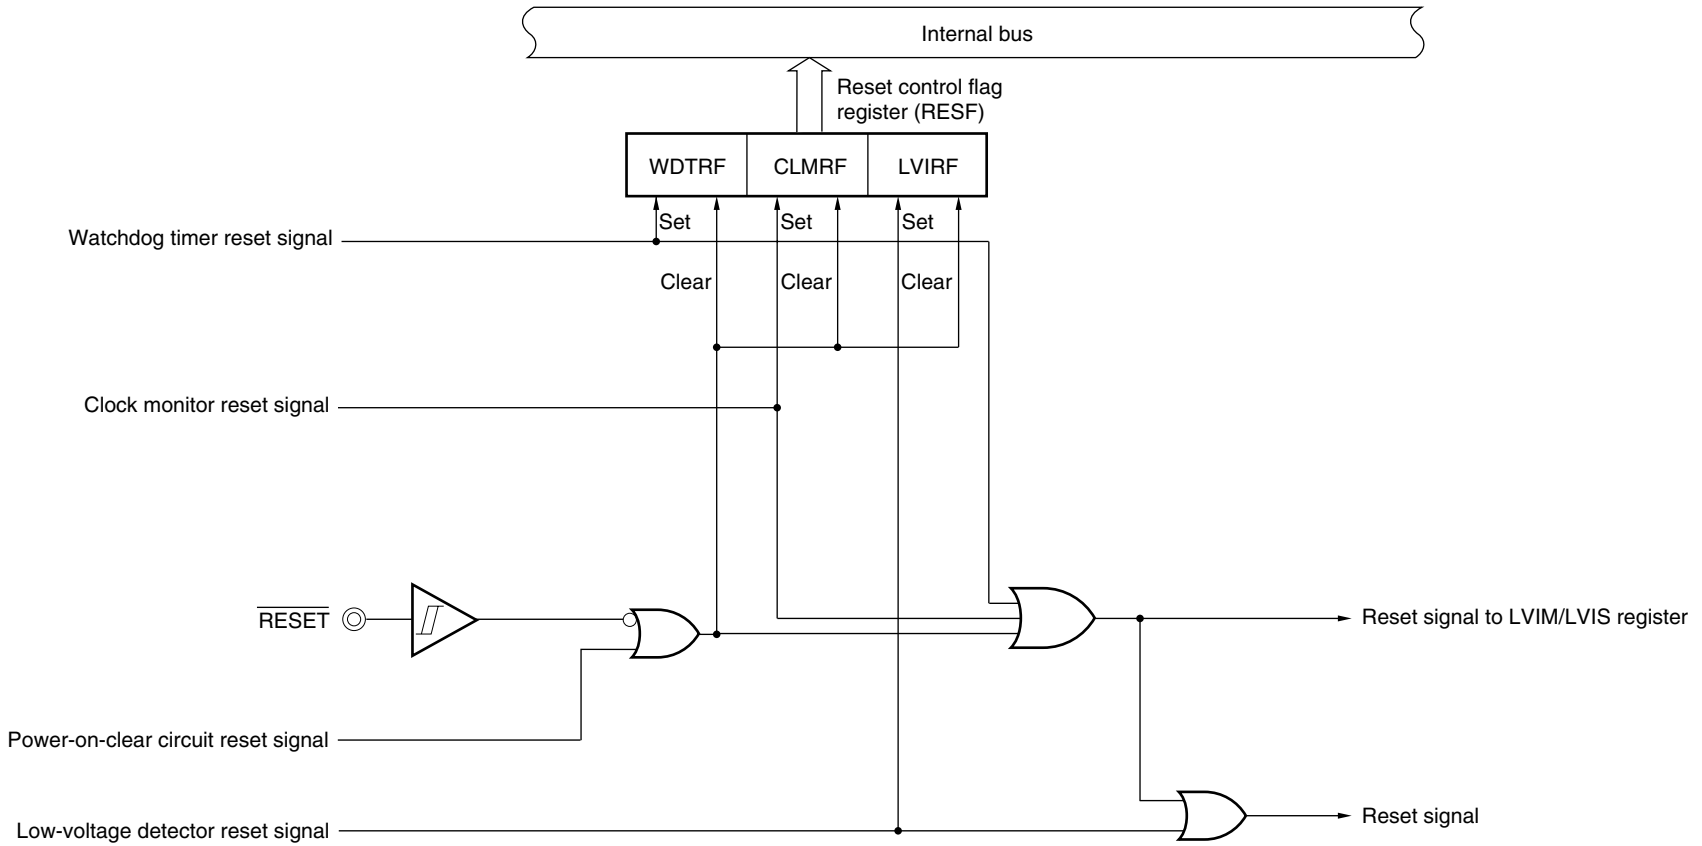

External and internal resets have no functional differences. In both cases, program execution starts at the address at 0000H and 0001H when the reset signal is input.

A reset is applied when a low level is input to the $\overline{\text{RESET}}$ pin, the watchdog timer overflows, high-speed system clock oscillation stop is detected by the clock monitor, or by POC and LVI circuit voltage detection, and each item of hardware is set to the status shown in Table 22-1. Each pin is high impedance during reset input or during the oscillation stabilization time just after reset release, except for P130, which is low-level output.

When a high level is input to the $\overline{\text{RESET}}$ pin, the reset is released and program execution starts using the internal oscillation clock after the CPU clock operation has stopped for $17/f_R$ (s). A reset generated by the watchdog timer and clock monitor sources is automatically released after the reset, and program execution starts using the internal oscillation clock after the CPU clock operation has stopped for $17/f_R$ (s) (see **Figures 22-2 to 22-4**). Reset by POC and LVI circuit power supply detection is automatically released when $V_{DD} > V_{POC}$ or $V_{DD} > V_{LVI}$ after the reset, and program execution starts using the internal oscillation clock after the CPU clock operation has stopped for $17/f_R$ (s) (see **CHAPTER 24 POWER-ON-CLEAR CIRCUIT** and **CHAPTER 25 LOW-VOLTAGE DETECTOR**).

- Cautions**
1. For an external reset, input a low level for 10 μs or more to the $\overline{\text{RESET}}$ pin.
 2. During reset input, the high-speed system clock and the internal oscillation clock stop oscillating.
 3. When the STOP mode is released by a reset, the STOP mode contents are held during reset input. However, the port pins become high-impedance, except for P130, which is set to low-level output.

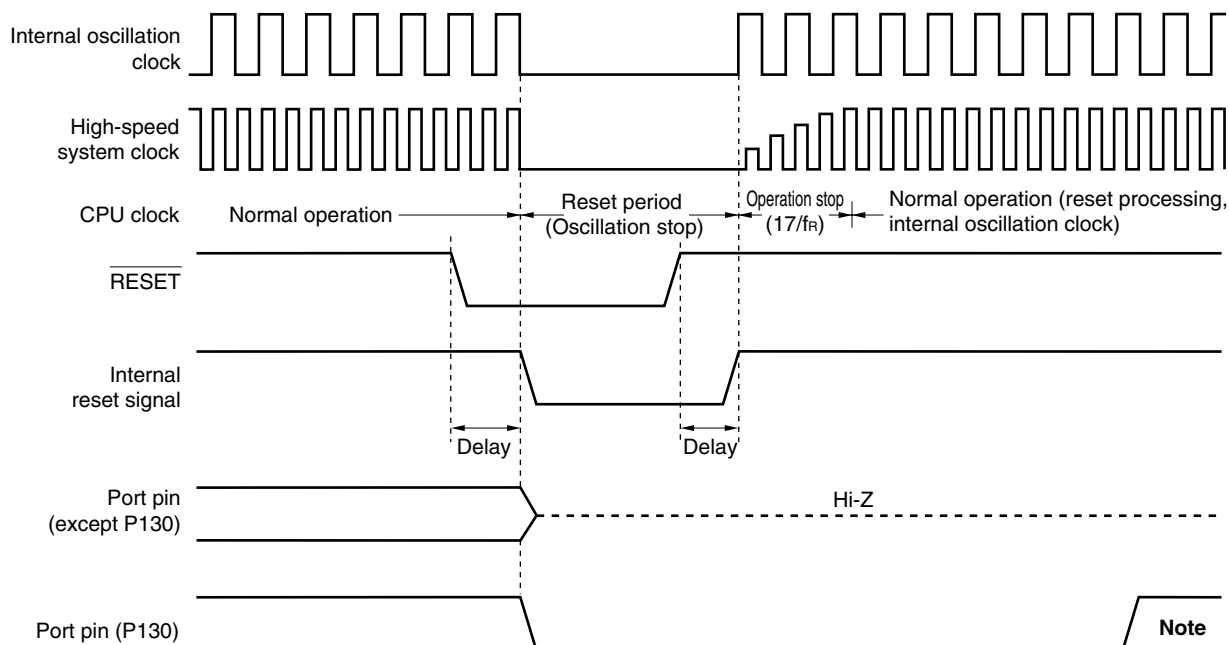

Figure 22-1. Block Diagram of Reset Function

Caution An LVI circuit internal reset does not reset the LVI circuit.

- Remarks**
1. LVIM: Low-voltage detection register
 2. LVIS: Low-voltage detection level selection register

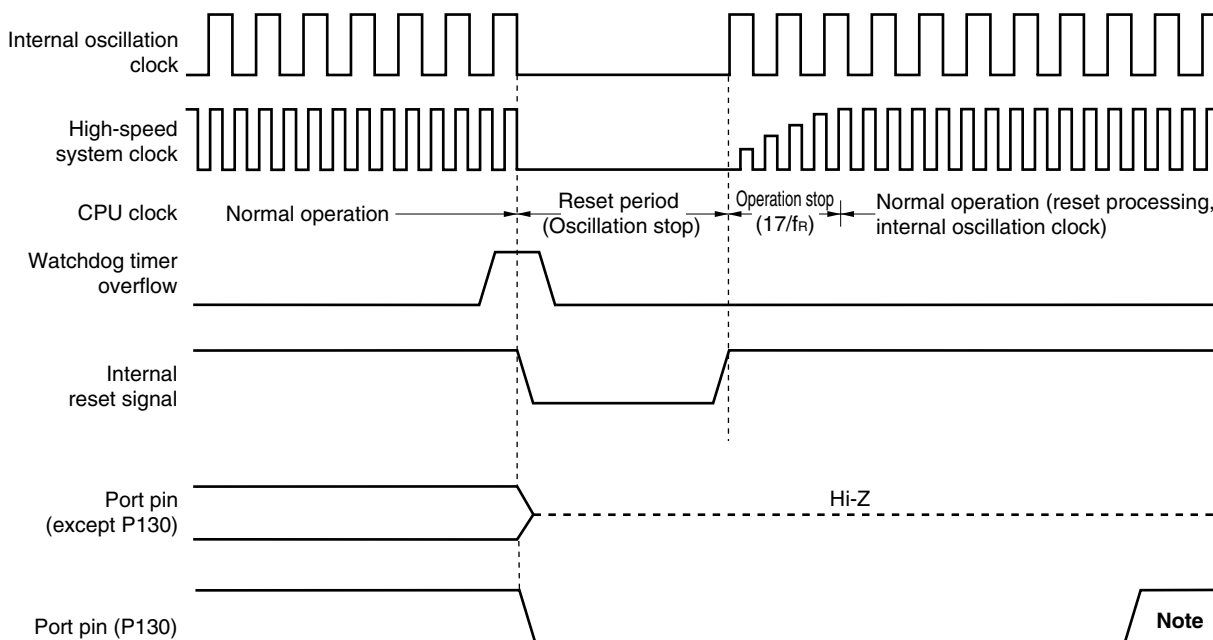

Figure 22-2. Timing of Reset by RESET Input

Note Set P130 to high-level output by software.

Remark When reset is effected, P130 outputs a low level. If P130 is set to output a high level before reset is effected, the output signal of P130 can be dummy-output as the CPU reset signal.

Figure 22-3. Timing of Reset Due to Watchdog Timer Overflow

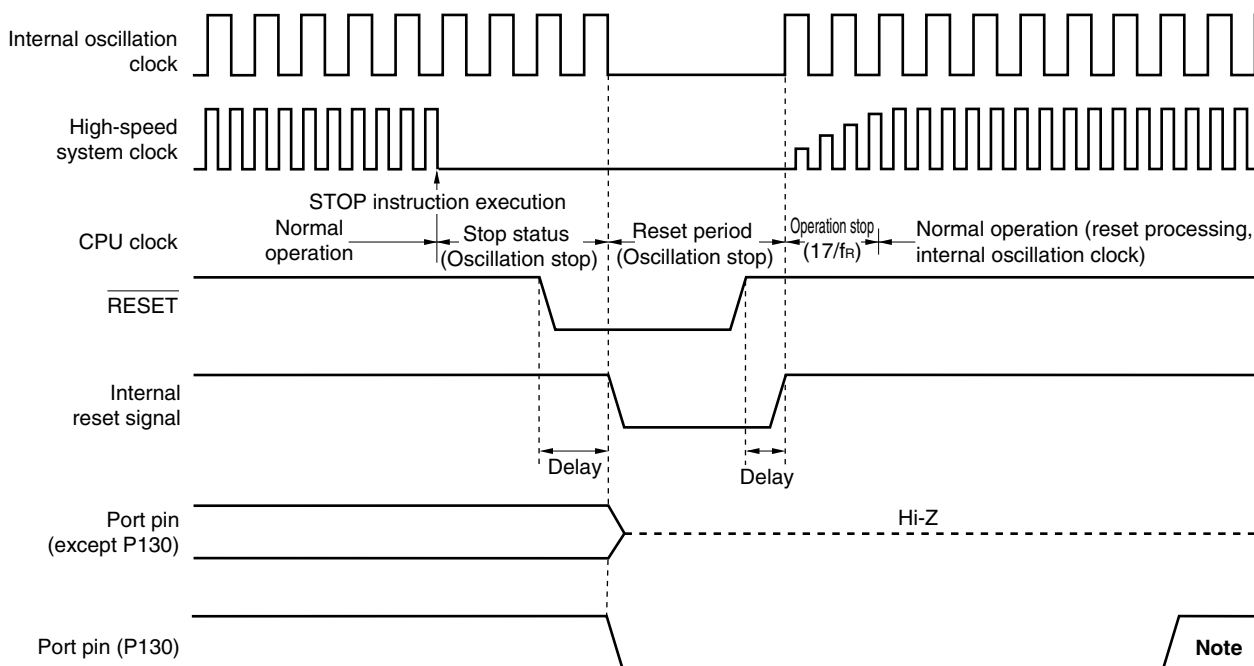

Note Set P130 to high-level output by software.

Caution A watchdog timer internal reset resets the watchdog timer.

Remark When reset is effected, P130 outputs a low level. If P130 is set to output a high level before reset is effected, the output signal of P130 can be dummy-output as the CPU reset signal.

Figure 22-4. Timing of Reset in STOP Mode by $\overline{\text{RESET}}$ Input

Note Set P130 to high-level output by software.

- Remarks 1.** When reset is effected, P130 outputs a low level. If P130 is set to output a high level before reset is effected, the output signal of P130 can be dummy-output as the CPU reset signal.
- 2.** For the reset timing of the power-on-clear circuit and low-voltage detector, see **CHAPTER 24 POWER-ON-CLEAR CIRCUIT** and **CHAPTER 25 LOW-VOLTAGE DETECTOR**.

Table 22-1. Hardware Statuses After Reset Acknowledgment (1/3)

Hardware		Status After Reset Acknowledgment ^{Note 1}
Program counter (PC)		The contents of the reset vector table (0000H, 0001H) are set.
Stack pointer (SP)		Undefined
Program status word (PSW)		02H
RAM	Data memory	Undefined ^{Note 2}
	General-purpose registers	Undefined ^{Note 2}
Port registers (P0 to P7, P12 to P14) (output latches)		00H (undefined only for P2)
Port mode registers (PM0, PM1, PM3 to PM7, PM12, PM14)		FFH
Pull-up resistor option registers (PU0, PU1, PU3 to PU7, PU12, PU14)		00H
Input switch control register (ISC)		00H
Internal memory size switching register (IMS)		CFH
Internal expansion RAM size switching register (IXS)		0CH
Memory expansion mode register (MEM)		00H
Memory expansion wait setting register (MM)		10H
Processor clock control register (PCC)		00H
Internal oscillation mode register (RCM)		00H
Main clock mode register (MCM)		00H
Main OSC control register (MOC)		00H
Oscillation stabilization time select register (OSTS)		05H
Oscillation stabilization time counter status register (OSTC)		00H
16-bit timer/event counters 00, 01	Timer counters 00, 01 (TM00, TM01)	0000H
	Capture/compare registers 000, 010, 001, 011 (CR000, CR010, CR001, CR011)	0000H
	Mode control registers 00, 01 (TMC00, TMC01)	00H
	Prescaler mode registers 00, 01 (PRM00, PRM01)	00H
	Capture/compare control registers 00, 01 (CRC00, CRC01)	00H
	Timer output control registers 00, 01 (TOC00, TOC01)	00H
8-bit timer/event counters 50, 51	Timer counters 50, 51 (TM50, TM51)	00H
	Compare registers 50, 51 (CR50, CR51)	00H
	Timer clock selection registers 50, 51 (TCL50, TCL51)	00H
	Mode control registers 50, 51 (TMC50, TMC51)	00H
8-bit timers H0, H1	Compare registers 00, 10, 01, 11 (CMP00, CMP10, CMP01, CMP11)	00H
	Mode registers (TMHMD0, TMHMD1)	00H
	Carrier control register 1 (TMCYC1) ^{Note 3}	00H
Watch timer	Operation mode register (WTM)	00H

- Notes**
1. During reset input or oscillation stabilization time wait, only the PC contents among the hardware statuses become undefined. All other hardware statuses remain unchanged after reset.
 2. When a reset is executed in the standby mode, the pre-reset status is held even after reset.
 3. 8-bit timer H1 only.

Table 22-1. Hardware Statuses After Reset Acknowledgment (2/3)

Hardware		Status After Reset Acknowledgment
Clock output/buzzer output controller	Clock output selection register (CKS)	00H
Watchdog timer	Mode register (WDTM)	67H
	Enable register (WDTE)	9AH
A/D converter	Conversion result register (ADCR)	Undefined

	External interrupt falling edge enable register (EGN)	00H
Flash memory	Flash protect command register (PFCMD)	Undefined
	Flash status register (PFS)	00H
	Flash programming mode control register (FLPMC)	0XH ^{Note 2}

Notes 1. These values vary depending on the reset source.

Reset Source Register	RESET Input	Reset by POC	Reset by WDT	Reset by CLM	Reset by LVI
RESF	See Table 22-2 .				
LVIM	Cleared (00H)	Cleared (00H)	Cleared (00H)	Cleared (00H)	Held
LVIS					

2. Varies depending on the operation mode.

- User mode: 08H
- On-board mode: 0CH

22.1 Register for Confirming Reset Source

Many internal reset generation sources exist in the 78K0/KF1+. The reset control flag register (RESF) is used to store which source has generated the reset request.

RESF can be read by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input, reset input by power-on-clear (POC) circuit, and reading RESF clear RESF to 00H.

Figure 22-5. Format of Reset Control Flag Register (RESF)

Address: FFACH After reset: 00H^{Note} R

Symbol	7	6	5	4	3	2	1	0
RESF	0	0	0	WDTRF	0	0	CLMRF	LVIRF

WDTRF	Internal reset request by watchdog timer (WDT)
0	Internal reset request is not generated, or RESF is cleared.
1	Internal reset request is generated.

CLMRF	Internal reset request by clock monitor (CLM)
0	Internal reset request is not generated, or RESF is cleared.
1	Internal reset request is generated.

LVIRF	Internal reset request by low-voltage detector (LVI)
0	Internal reset request is not generated, or RESF is cleared.
1	Internal reset request is generated.

Note The value after reset varies depending on the reset source.

Caution Do not read data by a 1-bit memory manipulation instruction.

The status of RESF when a reset request is generated is shown in Table 22-2.

Table 22-2. RESF Status When Reset Request Is Generated

Reset Source / Flag	$\overline{\text{RESET}}$ Input	Reset by POC	Reset by WDT	Reset by CLM	Reset by LVI
WDTRF	Cleared (0)	Cleared (0)	Set (1)	Held	Held
CLMRF			Held	Set (1)	Held
LVIRF			Held	Held	Set (1)

CHAPTER 23 CLOCK MONITOR

23.1 Functions of Clock Monitor

The clock monitor samples the high-speed system clock using the internal oscillator, and generates an internal reset signal when the high-speed system clock is stopped.

When a reset signal is generated by the clock monitor, bit 1 (CLMRF) of the reset control flag register (RESF) is set to 1. For details of RESF, see **CHAPTER 22 RESET FUNCTION**.

The clock monitor automatically stops under the following conditions.

- Reset is released and during the oscillation stabilization time
- In STOP mode and during the oscillation stabilization time
- When the high-speed system clock is stopped by software (MSTOP = 1 or MCC = 1) and during the oscillation stabilization time
- When the internal oscillation clock is stopped

Remark MSTOP: Bit 7 of the main OSC control register (MOC)
MCC: Bit 7 of the processor clock control register (PCC)

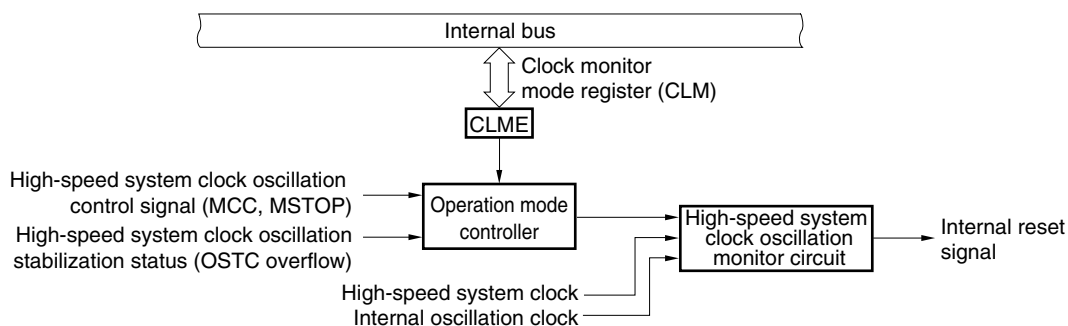

23.2 Configuration of Clock Monitor

The clock monitor includes the following hardware.

Table 23-1. Configuration of Clock Monitor

Item	Configuration
Control register	Clock monitor mode register (CLM)

Figure 23-1. Block Diagram of Clock Monitor

Remark MCC: Bit 7 of the processor clock control register (PCC)
MSTOP: Bit 7 of the main OSC control register (MOC)
OSTC: Oscillation stabilization time counter status register (OSTC)

23.3 Registers Controlling Clock Monitor

The clock monitor is controlled by the clock monitor mode register (CLM).

(1) Clock monitor mode register (CLM)

This register sets the operation mode of the clock monitor.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 23-2. Format of Clock Monitor Mode Register (CLM)

Address: FFA9H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	<0>
CLM	0	0	0	0	0	0	0	CLME

CLME	Enables/disables clock monitor operation
0	Disables clock monitor operation
1	Enables clock monitor operation

- Cautions**
1. Once bit 0 (CLME) is set to 1, it cannot be cleared to 0 except by $\overline{\text{RESET}}$ input or the internal reset signal.
 2. If the reset signal is generated by the clock monitor, CLME is cleared to 0 and bit 1 (CLMRF) of the reset control flag register (RESF) is set to 1.

23.4 Operation of Clock Monitor

This section explains the functions of the clock monitor. The monitor start and stop conditions are as follows.

<Monitor start condition>

When bit 0 (CLME) of the clock monitor mode register (CLM) is set to operation enabled (1).

<Monitor stop condition>

- Reset is released and during the oscillation stabilization time
- In STOP mode and during the oscillation stabilization time
- When the high-speed system clock is stopped by software (MSTOP = 1 or MCC = 1) and during the oscillation stabilization time
- When the internal oscillation clock is stopped

Remark MSTOP: Bit 7 of the main OSC control register (MOC)

MCC: Bit 7 of the processor clock control register (PCC)

Table 23-2. Operation Status of Clock Monitor (When CLME = 1)

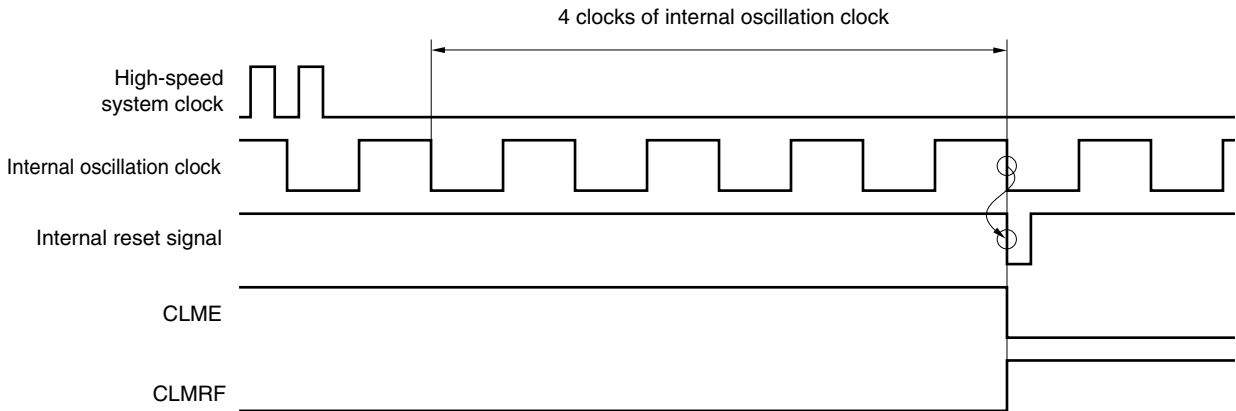

CPU Operation Clock	Operation Mode	High-Speed System Clock Status	Internal Oscillation Clock Status	Clock Monitor Status
High-speed system clock	STOP mode	Stopped	Oscillating	Stopped
			Stopped ^{Note}	
	RESET input		Oscillating	
			Stopped ^{Note}	
Normal operation mode HALT mode	Oscillating	Oscillating	Operating	
		Stopped ^{Note}	Stopped	
Internal oscillation clock	STOP mode	Stopped	Oscillating	Stopped
	RESET input			
	Normal operation mode HALT mode	Oscillating		Operating
		Stopped		Stopped

Note The internal oscillation clock is stopped only when the “Internal oscillator can be stopped by software” is selected by the option byte. If “Internal oscillator cannot be stopped” is selected, the internal oscillation clock cannot be stopped.

The clock monitor timing is as shown in Figure 23-3.

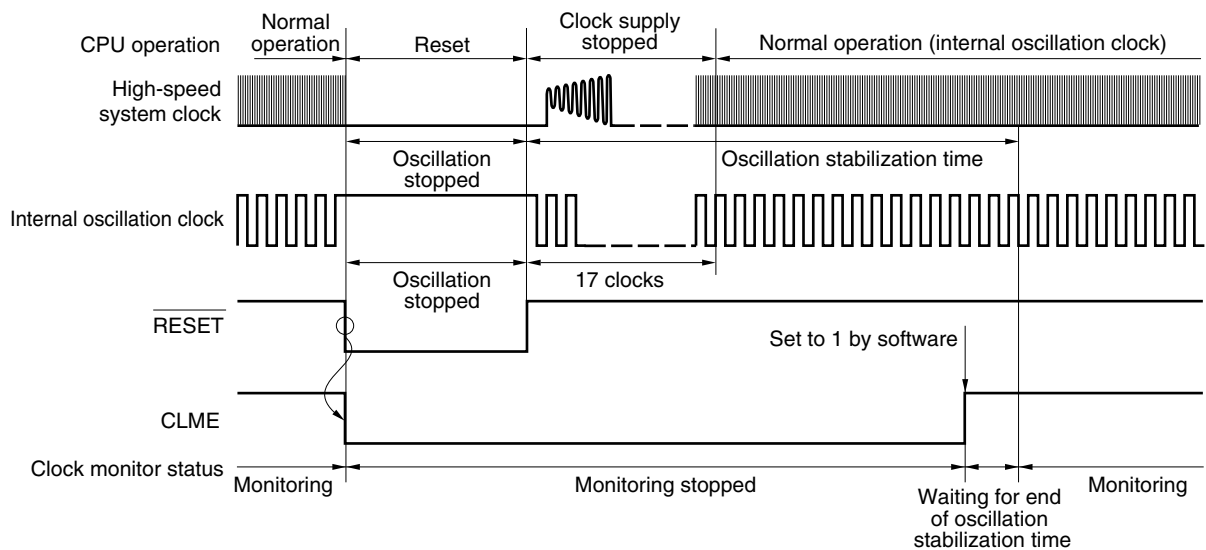

Figure 23-3. Timing of Clock Monitor (1/4)

(1) When internal reset is executed by oscillation stop of high-speed system clock

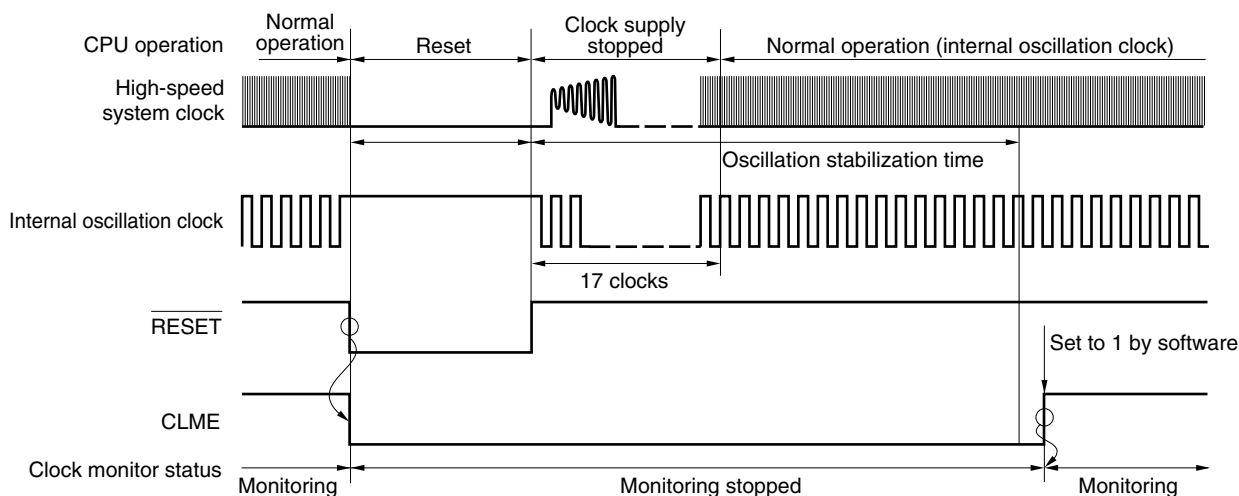

(2) Clock monitor status after $\overline{\text{RESET}}$ input

(CLME = 1 is set after $\overline{\text{RESET}}$ input and during high-speed system clock oscillation stabilization time)

$\overline{\text{RESET}}$ input clears bit 0 (CLME) of the clock monitor mode register (CLM) to 0 and stops the clock monitor operation. Even if CLME is set to 1 by software during the oscillation stabilization time (reset value of OSTS register is 05H ($2^{16}/f_{XP}$)) of the high-speed system clock, monitoring is not performed until the oscillation stabilization time of the high-speed system clock ends. Monitoring is automatically started at the end of the oscillation stabilization time.

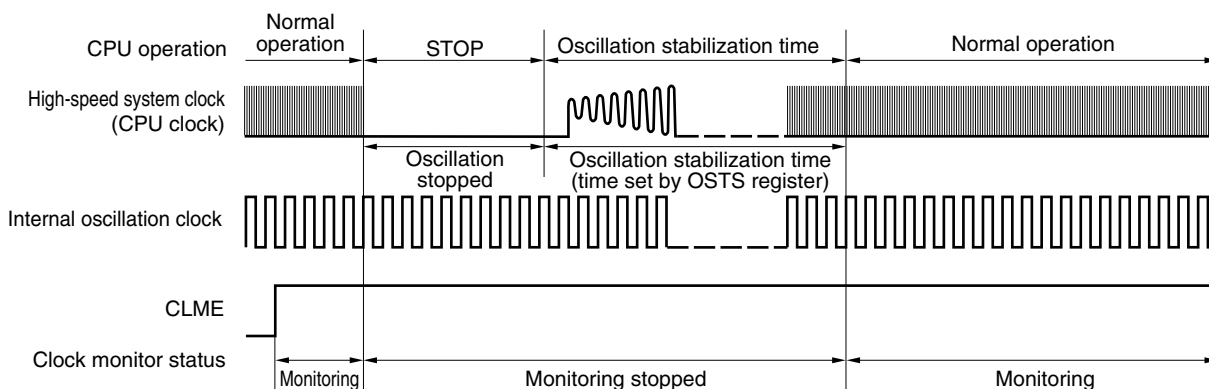

Figure 23-3. Timing of Clock Monitor (2/4)

(3) Clock monitor status after $\overline{\text{RESET}}$ input(CLME = 1 is set after $\overline{\text{RESET}}$ input and at the end of high-speed system clock oscillation stabilization time)

$\overline{\text{RESET}}$ input clears bit 0 (CLME) of the clock monitor mode register (CLM) to 0 and stops the clock monitor operation. When CLME is set to 1 by software at the end of the oscillation stabilization time (reset value of OSTC register is 05H ($2^{16}/f_{XP}$)) of the high-speed system clock, monitoring is started.

(4) Clock monitor status after STOP mode is released

(CLME = 1 is set when CPU clock operates on high-speed system clock and before entering STOP mode)

When bit 0 (CLME) of the clock monitor mode register (CLM) is set to 1 before entering STOP mode, monitoring automatically starts at the end of the high-speed system clock oscillation stabilization time. Monitoring is stopped in STOP mode and during the oscillation stabilization time.

Figure 23-3. Timing of Clock Monitor (3/4)

(5) Clock monitor status after STOP mode is released
(CLME = 1 is set when CPU clock operates on internal oscillation clock and before entering STOP mode)

When bit 0 (CLME) of the clock monitor mode register (CLM) is set to 1 before entering STOP mode, monitoring automatically starts at the end of the high-speed system clock oscillation stabilization time. Monitoring is stopped in STOP mode and during the oscillation stabilization time.

(6) Clock monitor status after high-speed system clock oscillation is stopped by software

When bit 0 (CLME) of the clock monitor mode register (CLM) is set to 1 before or while oscillation of the high-speed system clock is stopped, monitoring automatically starts at the end of the high-speed system clock oscillation stabilization time. Monitoring is stopped when oscillation of the high-speed system clock is stopped and during the oscillation stabilization time.

Note The register that controls oscillation of the high-speed system clock differs depending on the type of the clock supplied to the CPU.

- When CPU operates on internal oscillation clock:
Controlled by bit 7 (MSTOP) of the main OSC control register (MOC)
- When CPU operates on subsystem clock:
Controlled by bit 7 (MCC) of the processor clock control register (PCC)

Figure 23-3. Timing of Clock Monitor (4/4)

When bit 0 (CLME) of the clock monitor mode register (CLM) is set to 1 before or while oscillation of the internal oscillation clock is stopped, monitoring automatically starts after the internal oscillation clock is stopped. Monitoring is stopped when oscillation of the Internal oscillation clock is stopped.

Note If it is specified by the option byte that the internal oscillator cannot be stopped, the setting of bit 0 (RSTOP) of the internal oscillation mode register (RCM) is invalid. To set RSTOP, be sure to confirm that bit 1 (MCS) of the main clock mode register (MCM) is 1.

CHAPTER 24 POWER-ON-CLEAR CIRCUIT

24.1 Functions of Power-on-Clear Circuit

The power-on-clear circuit (POC) has the following functions.

- Generates internal reset signal at power on.
- Compares supply voltage (V_{DD}) and detection voltage ($V_{POC} = 2.1\text{ V} \pm 0.1\text{ V}$), and generates internal reset signal when $V_{DD} < V_{POC}$.

Cautions

1. If an internal reset signal is generated in the POC circuit, the reset control flag register (RESF) is cleared to 00H.
2. The supply voltage is $V_{DD} = 2.0$ to 5.5 V when the internal oscillation clock or subsystem clock is used, but be sure to use the product in a voltage range of 2.2 to 5.5 V because the detection voltage (V_{POC}) of the POC circuit is $2.1\text{ V} \pm 0.1\text{ V}$.

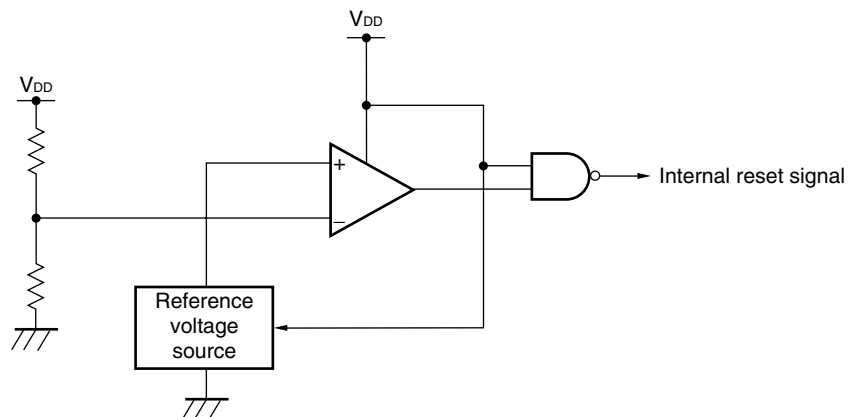

Remark This product incorporates multiple hardware functions that generate an internal reset signal. A flag that indicates the reset cause is located in the reset control flag register (RESF) for when an internal reset signal is generated by the watchdog timer (WDT), low-voltage-detection (LVI) circuit, or clock monitor. RESF is not cleared to 00H and the flag is set to 1 when an internal reset signal is generated by WDT, LVI, or the clock monitor.

For details of the RESF, refer to **CHAPTER 22 RESET FUNCTION**.

24.2 Configuration of Power-on-Clear Circuit

The block diagram of the power-on-clear circuit is shown in Figure 24-1.

Figure 24-1. Block Diagram of Power-on-Clear Circuit

24.3 Operation of Power-on-Clear Circuit

In the power-on-clear circuit, the supply voltage (V_{DD}) and detection voltage (V_{POC}) are compared, and when $V_{DD} < V_{POC}$, an internal reset signal is generated.

Figure 24-2. Timing of Internal Reset Signal Generation in Power-on-Clear Circuit

24.4 Cautions for Power-on-Clear Circuit

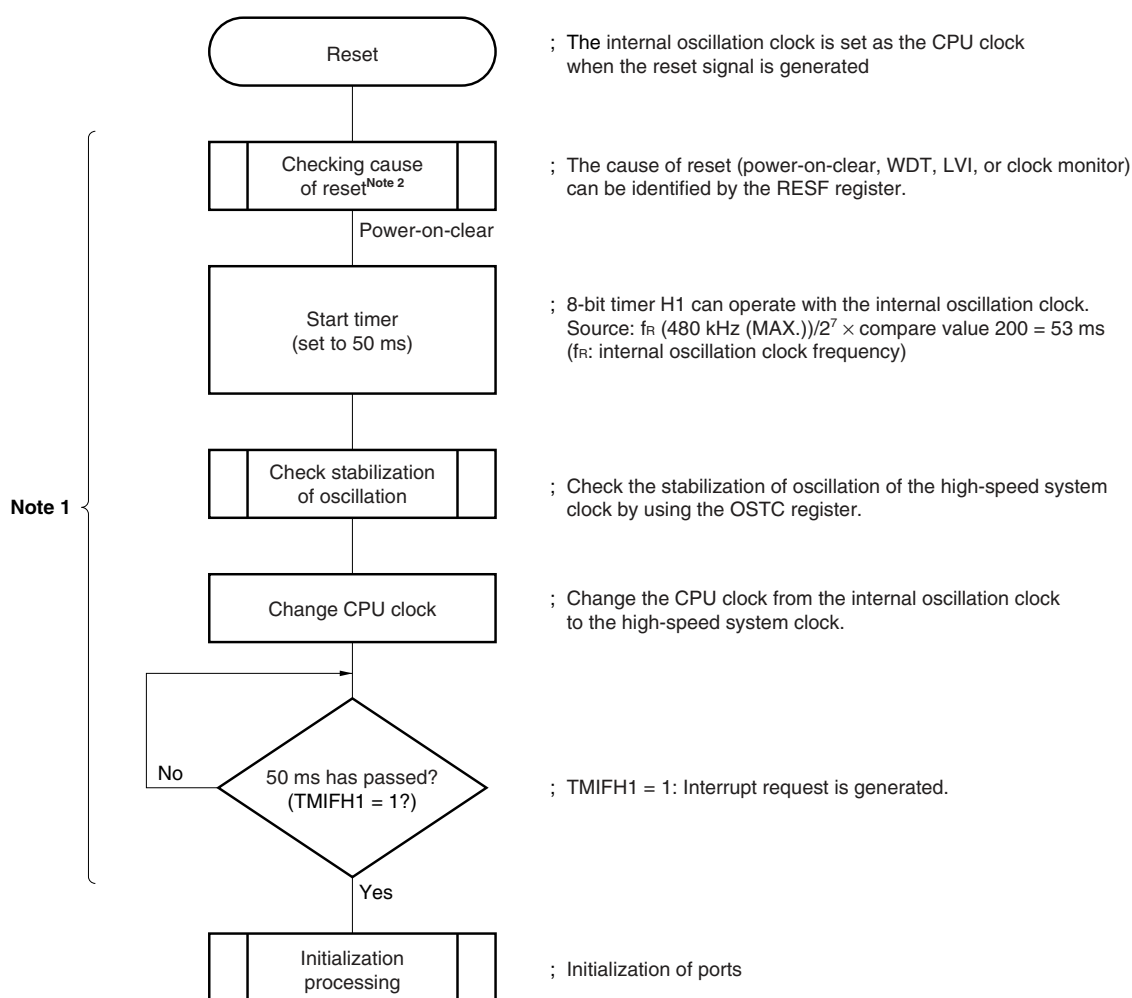

In a system where the supply voltage (V_{DD}) fluctuates for a certain period in the vicinity of the POC detection voltage (V_{POC}), the system may be repeatedly reset and released from the reset status. In this case, the time from release of reset to the start of the operation of the microcontroller can be arbitrarily set by taking the following action.

<Action>

After releasing the reset signal, wait for the supply voltage fluctuation period of each system by means of a software counter that uses a timer, and then initialize the ports.

Figure 24-3. Example of Software Processing After Release of Reset (1/2)

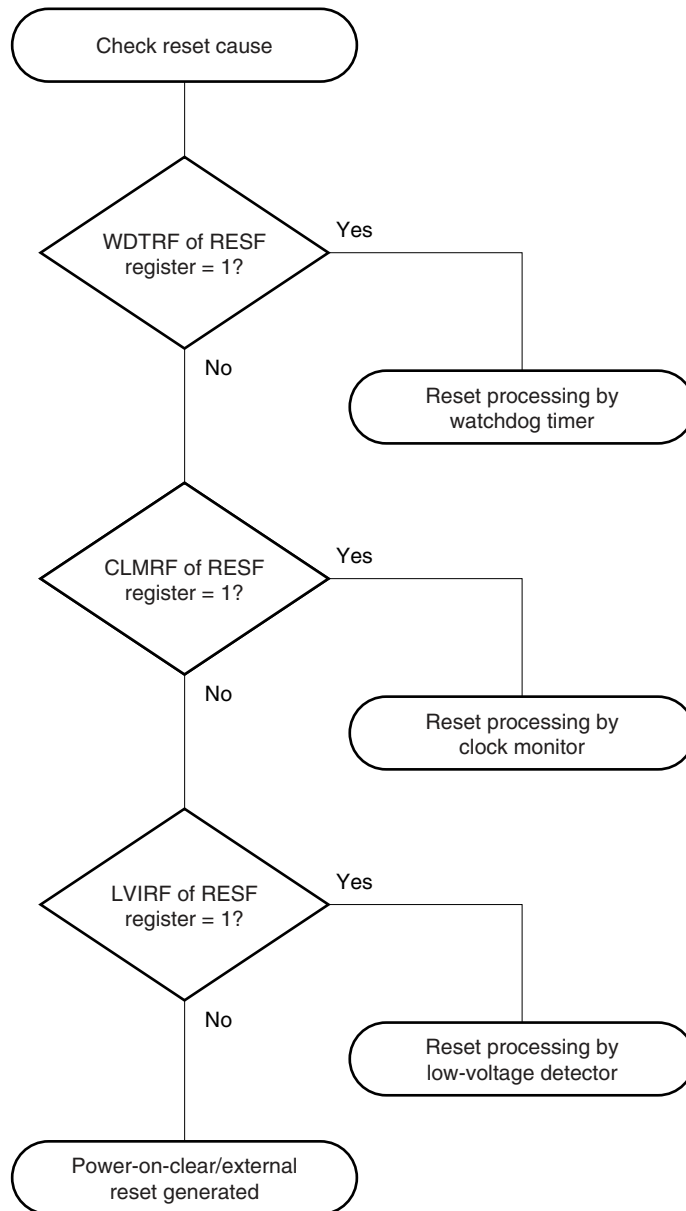

- If supply voltage fluctuation is 50 ms or less in vicinity of POC detection voltage

- Notes**
1. If reset is generated again during this period, initialization processing is not started.
 2. A flowchart is shown on the next page.

Figure 24-3. Example of Software Processing After Release of Reset (2/2)

- Checking reset cause

CHAPTER 25 LOW-VOLTAGE DETECTOR

25.1 Functions of Low-Voltage Detector

The low-voltage detector (LVI) has following functions.

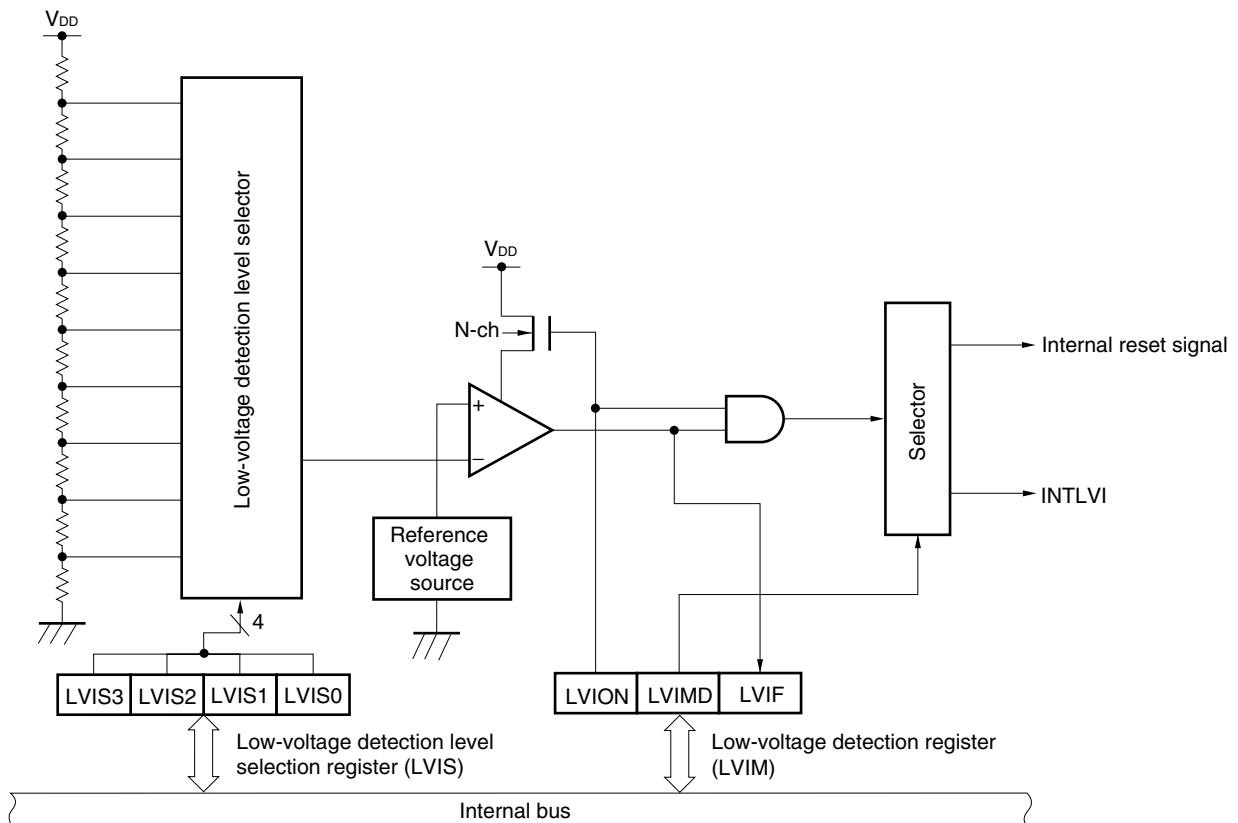

- Compares supply voltage (V_{DD}) and detection voltage (V_{LVI}), and generates an internal interrupt signal or internal reset signal when $V_{DD} < V_{LVI}$.
- Detection levels (nine levels) of supply voltage can be changed by software.
- Interrupt or reset function can be selected by software.
- Operable in STOP mode.

When the low-voltage detector is used to reset, bit 0 (LVIRF) of the reset control flag register (RESF) is set to 1 if reset occurs. For details of RESF, refer to **CHAPTER 22 RESET FUNCTION**.

25.2 Configuration of Low-Voltage Detector

The block diagram of the low-voltage detector is shown below.

Figure 25-1. Block Diagram of Low-Voltage Detector

25.3 Registers Controlling Low-Voltage Detector

The low-voltage detector is controlled by the following registers.

- Low-voltage detection register (LVIM)
- Low-voltage detection level selection register (LVIS)

(1) Low-voltage detection register (LVIM)

This register sets low-voltage detection and the operation mode.

This register can be set by a 1-bit or 8-bit memory manipulation instruction.

A reset other than LVI clears LVIM to 00H.

Figure 25-2. Format of Low-Voltage Detection Register (LVIM)

Address: FFBEH After reset: 00H R/W^{Note 1}

Symbol	<7>	6	5	4	3	2	<1>	<0>
LVIM	LVION	0	0	0 ^{Note 2}	0	0	LVIMD	LVIF

LVION ^{Notes 3, 4}	Enables low-voltage detection operation
0	Disables operation
1	Enables operation

LVIMD ^{Note 3}	Low-voltage detection operation mode selection
0	Generates interrupt signal when supply voltage (V_{DD}) < detection voltage (V_{LVI})
1	Generates internal reset signal when supply voltage (V_{DD}) < detection voltage (V_{LVI})

LVIF ^{Note 5}	Low-voltage detection flag
0	Supply voltage (V_{DD}) \geq detection voltage (V_{LVI}), or when operation is disabled
1	Supply voltage (V_{DD}) < detection voltage (V_{LVI})

- Notes**
1. Bit 0 is read-only.
 2. Bit 4 may be 0 or 1. This bit corresponds to the LVIE bit in the 78K0/KF1.
 3. LVION and LVIMD are cleared to 0 in the case of a reset other than an LVI reset. These are not cleared to 0 in the case of an LVI reset.
 4. When LVION is set to 1, operation of the comparator in the LVI circuit is started. Use software to instigate a wait of at least 0.2 ms from when LVION is set to 1 until the voltage is confirmed at LVIF.
 5. The value of LVIF is output as the interrupt request signal INTLVI when LVION = 1 and LVIMD = 0.

Caution To stop LVI, follow either of the procedures below.

- When using 8-bit manipulation instruction: Write 00H to LVIM.
- When using 1-bit memory manipulation instruction: Clear LVION to 0.

(2) Low-voltage detection level selection register (LVIS)

This register selects the low-voltage detection level.

This register can be set by an 8-bit memory manipulation instruction.

A reset other than LVI clears LVIS to 00H.

Figure 25-3. Format of Low-Voltage Detection Level Selection Register (LVIS)

Address: FFBFH After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
LVIS	0	0	0	0	LVIS3	LVIS2	LVIS1	LVIS0

LVIS3	LVIS2	LVIS1	LVIS0	Detection level
0	0	0	0	V_{LV10} (4.3 V \pm 0.2 V)
0	0	0	1	V_{LV11} (4.1 V \pm 0.2 V)
0	0	1	0	V_{LV12} (3.9 V \pm 0.2 V)
0	0	1	1	V_{LV13} (3.7 V \pm 0.2 V)
0	1	0	0	V_{LV14} (3.5 V \pm 0.2 V)
0	1	0	1	V_{LV15} (3.3 V \pm 0.15 V)
0	1	1	0	V_{LV16} (3.1 V \pm 0.15 V)
0	1	1	1	V_{LV17} (2.85 V \pm 0.15 V)
1	0	0	0	V_{LV18} (2.6 V \pm 0.1 V) ^{Note}
1	0	0	1	V_{LV19} (2.35 V \pm 0.1 V) ^{Note}
Other than above				Setting prohibited

<R>

Note Do not set V_{LV18} or V_{LV19} when using the standard products and (A) grade products to evaluate the program of a mask ROM version of the 78K0/KF1 or when using the (A1) grade products.

Cautions 1. Be sure to clear bits 4 to 7 to 0.

<R>

2. Clear all port pins after the supply voltage (V_{DD}) exceeds the preset detection voltage (V_{LVI}) after POC release in the (A1) grade products.

25.4 Operation of Low-Voltage Detector

The low-voltage detector can be used in the following two modes.

- Used as reset
Compares the supply voltage (V_{DD}) and detection voltage (V_{LVI}), and generates an internal reset signal when $V_{DD} < V_{LVI}$.
- Used as interrupt
Compares the supply voltage (V_{DD}) and detection voltage (V_{LVI}), and generates an interrupt signal (INTLVI) when $V_{DD} < V_{LVI}$.

The operation is set as follows.

(1) When used as reset

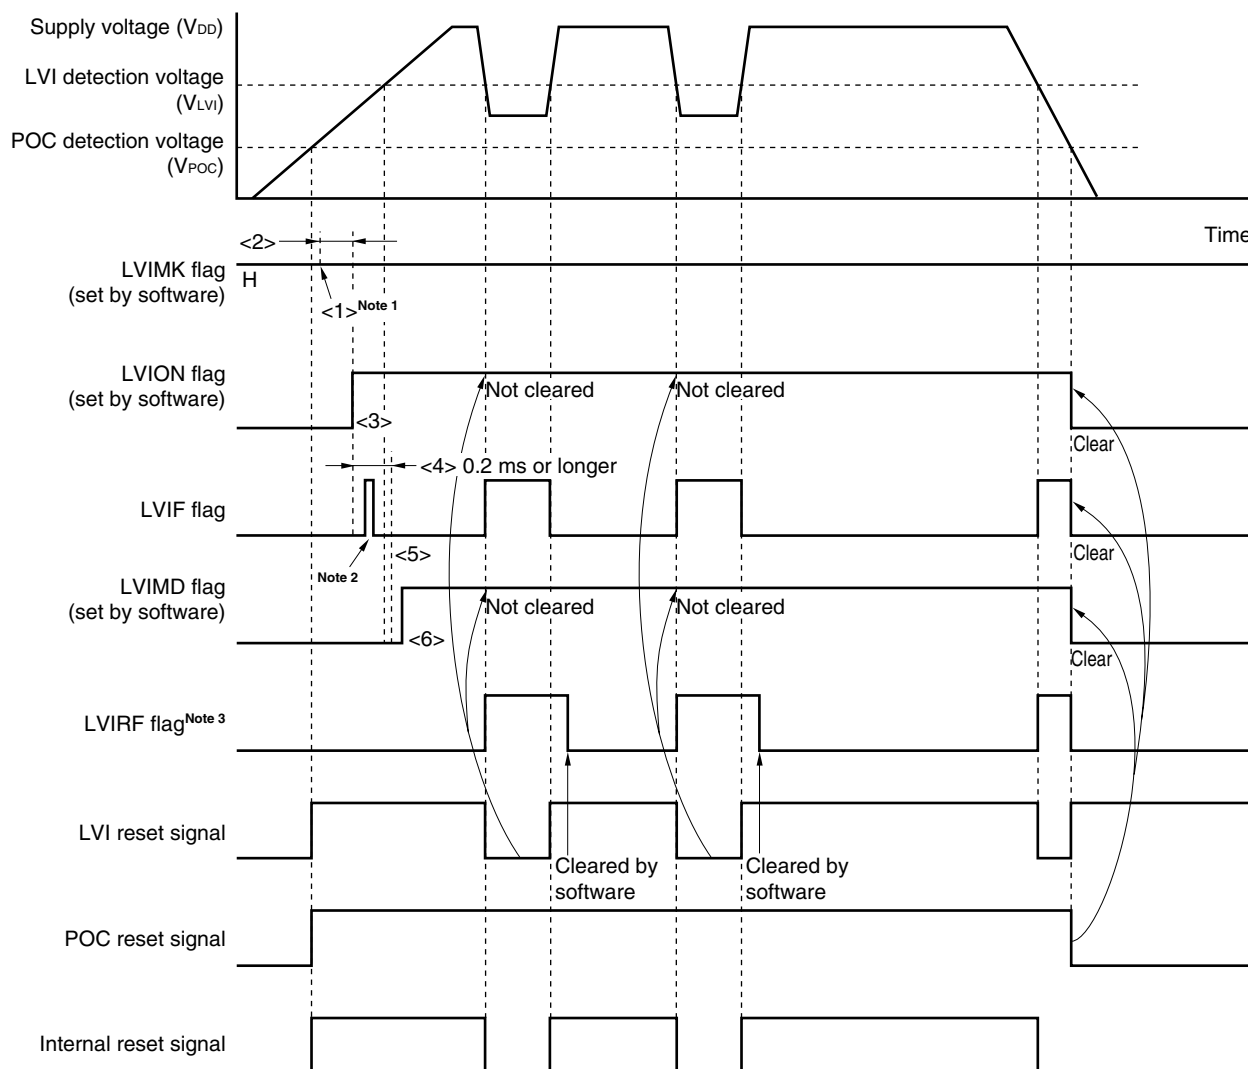

- When starting operation
 - <1> Mask the LVI interrupt ($LVIMK = 1$).
 - <2> Set the detection voltage using bits 3 to 0 ($LVIS3$ to $LVIS0$) of the low-voltage detection level selection register ($LVIS$).
 - <3> Set bit 7 ($LVION$) of $LVIM$ to 1 (enables LVI operation).
 - <4> Use software to instigate a wait of at least 0.2 ms.
 - <5> Confirm that “supply voltage (V_{DD}) \geq detection voltage (V_{LVI})” with bit 0 ($LVIF$) of $LVIM$.
 - <6> Set bit 1 ($LVIMD$) of $LVIM$ to 1 (generates internal reset signal when supply voltage (V_{DD}) < detection voltage (V_{LVI})).

Figure 25-4 shows the timing of the internal reset signal generated by the low-voltage detector. The numbers in this timing chart correspond to <1> to <6> above.

- Cautions**
1. <1> must always be executed. When $LVIMK = 0$, an interrupt may occur immediately after the processing in <3>.
 2. If supply voltage (V_{DD}) \geq detection voltage (V_{LVI}) when $LVIMD$ is set to 1, an internal reset signal is not generated.

- When stopping operation
Either of the following procedures must be executed.
 - When using 8-bit memory manipulation instruction:
Write 00H to $LVIM$.
 - When using 1-bit memory manipulation instruction:
Clear $LVIMD$ to 0 and then $LVION$ to 0.

Figure 25-4. Timing of Low-Voltage Detector Internal Reset Signal Generation

- Notes**
1. The LVIMK flag is set to "1" by \overline{RESET} input.
 2. The LVIF flag may be set (1).
 3. LVIRF is bit 0 of the reset control flag register (RESF). For details of RESF, see CHAPTER 22 RESET FUNCTION.

Remark <1> to <6> in Figure 25-4 above correspond to <1> to <6> in the description of "when starting operation" in 25.4 (1) When used as reset.

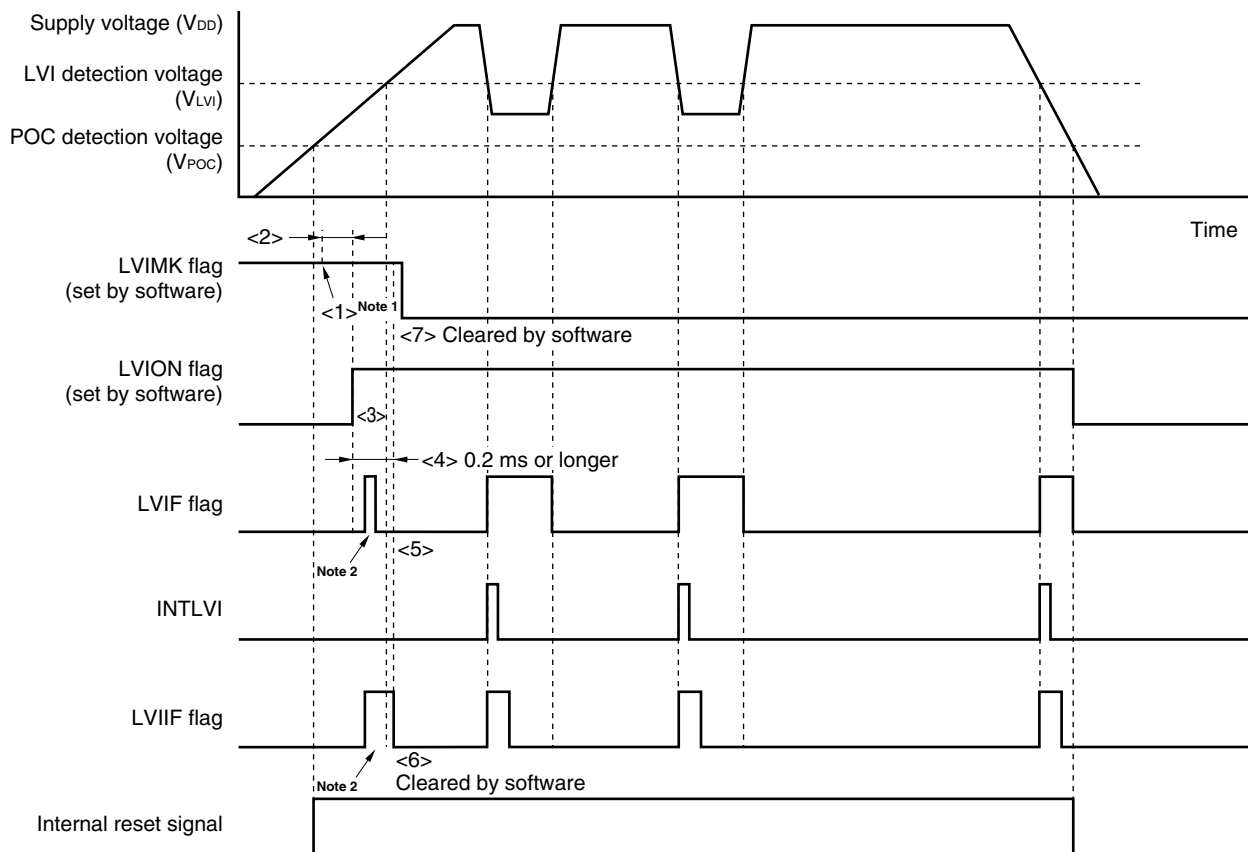

(2) When used as interrupt

- When starting operation
 - <1> Mask the LVI interrupt (LVIMK = 1).
 - <2> Set the detection voltage using bits 3 to 0 (LVIS3 to LVIS0) of the low-voltage detection level selection register (LVIS).
 - <3> Set bit 7 (LVION) of LVIM to 1 (enables LVI operation).
 - <4> Use software to instigate a wait of at least 0.2 ms.
 - <5> Confirm that “supply voltage (V_{DD}) \geq detection voltage (V_{LVI})” with bit 0 (LVIF) of LVIM.
 - <6> Clear the interrupt request flag of LVI (LVIF) to 0.
 - <7> Release the interrupt mask flag of LVI (LVIMK).
 - <8> Execute the EI instruction (when vector interrupts are used).

Figure 25-5 shows the timing of the internal reset signal generated by the low-voltage detector. The numbers in this timing chart correspond to <1> to <7> above.

- When stopping operation
 - Either of the following procedures must be executed.
 - When using 8-bit memory manipulation instruction:
 - Write 00H to LVIM.
 - When using 1-bit memory manipulation instruction:
 - Clear LVION to 0.

Figure 25-5. Timing of Low-Voltage Detector Interrupt Signal Generation

Notes 1. The LVIMK flag is set to “1” by $\overline{\text{RESET}}$ input.

2. The LVIF and LVIIF flags may be set (1).

Remark <1> to <7> in Figure 25-5 above correspond to <1> to <7> in the description of “when starting operation” in 25.4 (2) **When used as interrupt**.

25.5 Cautions for Low-Voltage Detector

In a system where the supply voltage (V_{DD}) fluctuates for a certain period in the vicinity of the LVI detection voltage (V_{LVI}), the operation is as follows depending on how the low-voltage detector is used.

(1) When used as reset

The system may be repeatedly reset and released from the reset status.

In this case, the time from release of reset to the start of the operation of the microcontroller can be arbitrarily set by taking action (a) below.

(2) When used as interrupt

Interrupt requests may be frequently generated. Take action (b) below.

In this system, take the following actions.

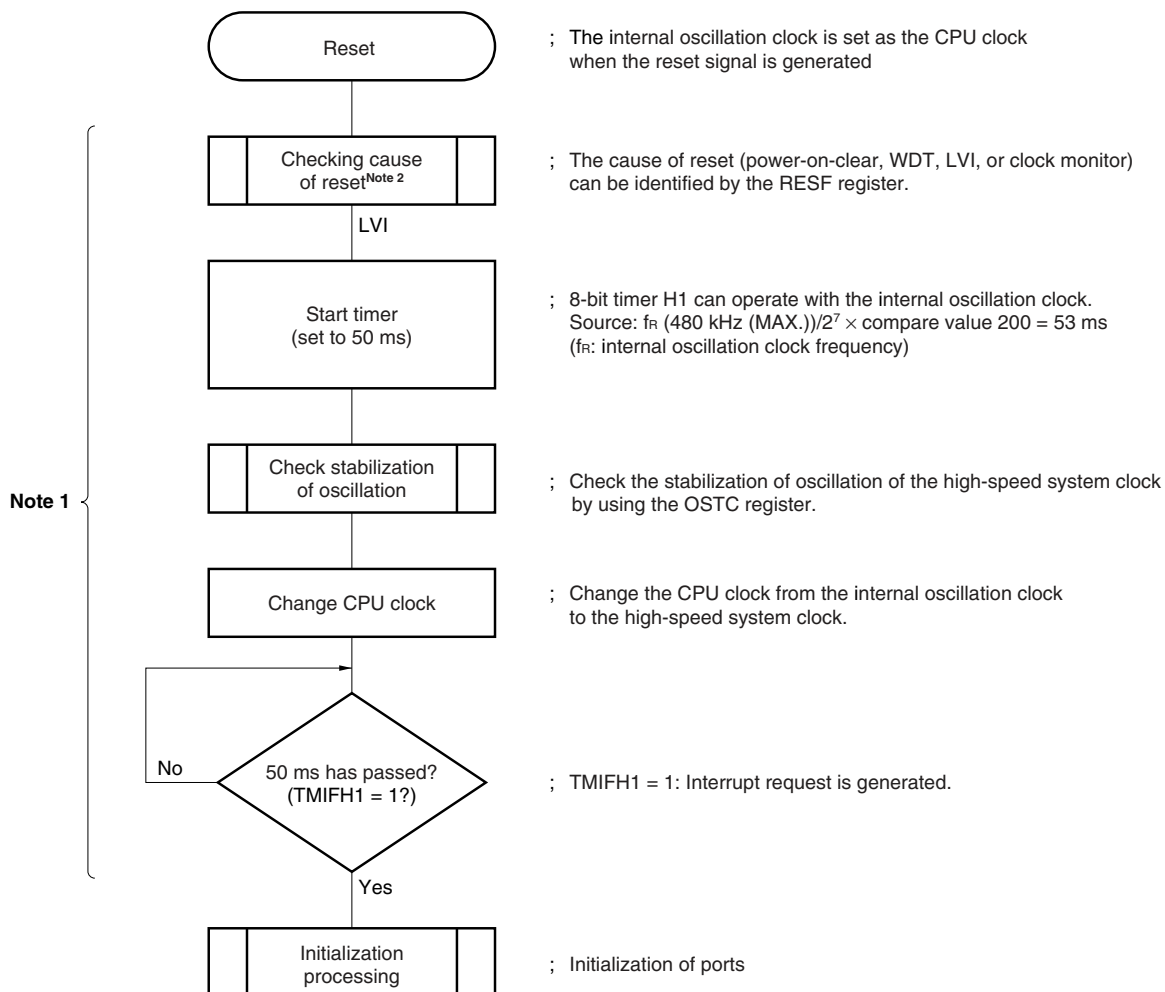

<Action>

(a) When used as reset

After releasing the reset signal, wait for the supply voltage fluctuation period of each system by means of a software counter that uses a timer, and then initialize the ports.

Figure 25-6. Example of Software Processing After Release of Reset (1/2)

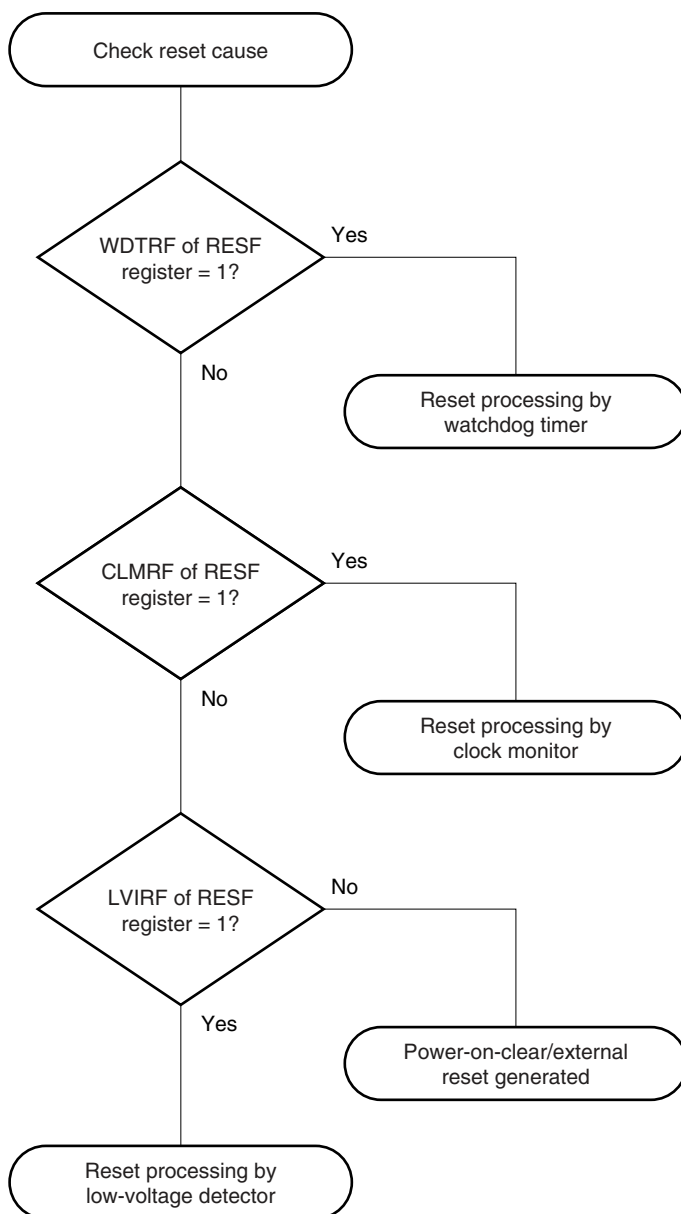

- If supply voltage fluctuation is 50 ms or less in vicinity of LVI detection voltage

- Notes**
1. If reset is generated again during this period, initialization processing is not started.
 2. A flowchart is shown on the next page.

Figure 25-6. Example of Software Processing After Release of Reset (2/2)

- Checking reset cause

(b) When used as interrupt

Check that “supply voltage (V_{DD}) \geq detection voltage (V_{LVI})” in the servicing routine of the LVI interrupt by using bit 0 (LVIF) of the low-voltage detection register (LVIM). Clear bit 0 (LVIIF) of interrupt request flag register 0L (IF0L) to 0 and enable interrupts (EI).

In a system where the supply voltage fluctuation period is long in the vicinity of the LVI detection voltage, wait for the supply voltage fluctuation period, check that “supply voltage (V_{DD}) \geq detection voltage (V_{LVI})” using the LVIF flag, and then enable interrupts (EI).

26.1 Functions of Option Bytes

The flash memory at 0080H to 0084H of the 78K0/KF1+ is an option byte area. When power is turned on or when the device is restarted from the reset status, the device automatically references the option bytes and sets specified functions. When using the product, be sure to set the following functions by using the option bytes.

When the boot swap operation is used during self-programming, 0080H to 0084H are switched to 1080H to 1084H. Therefore, set values that are the same as those of 0080H to 0084H to 1080H to 1084H in advance.

(1) 0080H/1080H

- Internal oscillator operation
 - Can be stopped by software
 - Cannot be stopped

(2) 0084H/1084H

- On-chip debug operation control
 - Disabling on-chip debug operation
 - Enabling on-chip debug operation and erasing data of the flash memory in case authentication of the on-chip debug security ID fails
 - Enabling on-chip debug operation and not erasing data of the flash memory even in case authentication of the on-chip debug security ID fails

Cautions 1. Be sure to set 00H (disabling on-chip debug operation) to 0084H for products not equipped with the on-chip debug function (μ PD78F0148H). Also set 00H to 1084H because 0084H and 1084H are switched at boot swapping.

2. To use the on-chip debug function with a product equipped with the on-chip debug function (μ PD78F0148HD), set 02H or 03H to 0084H. Set a value that is the same as that of 0084H to 1084H because 0084H and 1084H are switched at boot swapping.

Caution Be sure to set 00H to 0081H, 0082H, and 0083H (0081H/1081H, 0082H/1082H, and 0083H/1083H when the boot swap function is used).

26.2 Format of Option Byte

The format of the option byte is shown below.

Figure 26-1. Format of Option Byte (1/2)

Address: 0080H/1080H^{Note}

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	LSROSC

LSROSC	Internal oscillator operation
0	Can be stopped by software (stopped when 1 is written to bit 0 (RSTOP) of RCM register)
1	Cannot be stopped (not stopped even if 1 is written to RSTOP bit)

Note Set a value that is the same as that of 0080H to 1080H because 0080H and 1080H are switched during the boot swap operation.

Cautions 1. If LSROSC = 0 (oscillation can be stopped by software), the count clock is not supplied to the watchdog timer in the HALT and STOP modes, regardless of the setting of bit 0 (RSTOP) of the internal oscillation mode register (RCM).

When 8-bit timer H1 operates with the internal oscillation clock, the count clock is supplied to 8-bit timer H1 even in the HALT/STOP mode.

2. Be sure to clear bit 1 to 7 to 0.

Address: 0081H/1081H, 0082H/1082H, 0083H/1083H^{Note}

7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0

Note Be sure to set 00H to 0081H, 0082H, and 0083H, as these addresses are reserved areas. Also set 00H to 1081H, 1082H, and 1083H because 0081H, 0082H, and 0083H are switched with 1081H, 1082H, and 1083H when the boot swap operation is used.

Address: 0084H/1084H^{Notes1, 2}

7	6	5	4	3	2	1	0
0	0	0	0	0	0	OCDEN1	OCDEN0

OCDEN1	OCDEN0	On-chip debug operation control
0	0	Operation disabled
0	1	Setting prohibited
1	0	Operation enabled. Does not erase data of the flash memory in case authentication of the on-chip debug security ID fails.
1	1	Operation enabled. Erases data of the flash memory in case authentication of the on-chip debug security ID fails.

Notes 1. Be sure to set 00H (on-chip debug operation disabled) to 0084H for products not equipped with the on-chip debug function (μ PD78F0148H). Also set 00H to 1084H because 0084H and 1084H are switched at boot swapping.

2. To use the on-chip debug function with a product equipped with the on-chip debug function (μ PD78F0148HD), set 02H or 03H to 0084H. Set a value that is the same as that of 0084H to 1084H because 0084H and 1084H are switched at boot swapping.

Remark For the on-chip debug security ID, see **CHAPTER 28 ON-CHIP DEBUG FUNCTION (μ PD78F0148HD ONLY)**.

Here is an example of description of the software for setting the option bytes.

```
OPT    CSEG  AT 0080H
OPTION: DB    00H    ; Internal oscillator can be stopped by software.
        DB    00H    ; Reserved area
        DB    00H    ; Reserved area
        DB    00H    ; Reserved area
        DB    00H    ; On-chip debug operation disabled
```

Remark Referencing of the option byte is performed during reset processing. For the reset processing timing, see **CHAPTER 22 RESET FUNCTION**.

CHAPTER 27 FLASH MEMORY

The μ PD78F0148H/HD replace the internal mask ROM of the μ PD780148 of the 78K0/KF1 respectively with flash memory to which a program can be written, erased, and overwritten while mounted on the board. Table 27-1 lists the differences between the 78K0/KF1+ and the 78K0/KF1.

Table 27-1. Differences Between 78K0/KF1+ and 78K0/KF1

Item	78K0/KF1+		78K0/KF1	
	μ PD78F0148H, 78F0148HD		μ PD78F0148	Mask ROM Versions
Internal ROM configuration	Flash memory (single power supply)		Flash memory (two power supplies)	Mask ROM
Internal ROM capacity	60 KB ^{Note 1}		μ PD780143: 24 KB μ PD780144: 32 KB μ PD780146: 48 KB μ PD780148: 60 KB	
Internal expansion RAM capacity	1024 bytes ^{Note 1}		μ PD780143: None μ PD780144: None μ PD780146: 1024 bytes μ PD780148: 1024 bytes	
Pin 8	FLMD0 pin		V_{PP} pin	IC pin
Pin 25	P17/TI50/TO50/FLMD1 pin		P17/TI50/TO50 pin	
Power-on clear (POC) function	Detection voltage is fixed ($V_{POC} = 2.1 \text{ V} \pm 0.1 \text{ V}$)		Enabling use of POC and detection voltage selectable by product	Enabling use of POC and detection voltage selectable by mask option
Regulator	None		Available ^{Note 2}	
Self-programming function	Available		None	–
On-chip debug function	Available only in μ PD78F0148HD		None	–
Electrical specifications	Refer to the electrical specifications chapter in the user's manual of each product.			

- Notes**
1. The same capacity as the mask ROM versions can be specified by means of the internal memory size switching register (IMS) and the internal expansion RAM size switching register (IXS).
 2. The regulator cannot be used in (A1) grade products and (A2) grade products.

Caution There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM versions.

27.1 Internal Memory Size Switching Register

The internal memory capacity can be selected using the internal memory size switching register (IMS).

IMS is set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets IMS to CFH.

Caution The initial value of IMS is CFH. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, be sure to set the values shown in Table 27-2.

Figure 27-1. Format of Internal Memory Size Switching Register (IMS)

Address: FFF0H After reset: CFH R/W

Symbol	7	6	5	4	3	2	1	0
IMS	RAM2	RAM1	RAM0	0	ROM3	ROM2	ROM1	ROM0

RAM2	RAM1	RAM0	Internal high-speed RAM capacity selection
1	1	0	1024 bytes
Other than above			Setting prohibited

ROM3	ROM2	ROM1	ROM0	Internal ROM capacity selection
0	1	1	0	24 KB
1	0	0	0	32 KB
1	1	0	0	48 KB
1	1	1	1	60 KB
Other than above				Setting prohibited

The IMS settings required to obtain the same memory map as mask ROM versions of the 78K0/KF1 are shown in Table 27-2.

Table 27-2. Internal Memory Size Switching Register Settings

Flash Memory Versions (78K0/KF1+)	Target Mask ROM Versions (78K0/KF1)	IMS Setting
–	μ PD780143	C6H
–	μ PD780144	C8H
–	μ PD780146	CCH
μ PD78F0148H, 78F0148HD	μ PD780148	CFH

27.2 Internal Expansion RAM Size Switching Register

The internal expansion RAM capacity can be selected using the internal expansion RAM size switching register (IXS).

This register is set by an 8-bit memory manipulation instruction.

RESET input sets IXS to 0CH.

Caution Since the initial value of IXS is 0CH, be sure to set IXS to 0AH. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, be sure to set the values shown in Table 27-3.

Figure 27-2. Format of Internal Expansion RAM Size Switching Register (IXS)

Address: FFF4H After reset: 0CH R/W

Symbol	7	6	5	4	3	2	1	0
IXS	0	0	0	IXRAM4	IXRAM3	IXRAM2	IXRAM1	IXRAM0

IXRAM4	IXRAM3	IXRAM2	IXRAM1	IXRAM0	Internal expansion RAM capacity selection
0	1	1	0	0	0 bytes
0	1	0	1	0	1024 bytes
Other than above					Setting prohibited

The IXS settings required to obtain the same memory map as mask ROM versions of the 78K0/KF1 are shown in Table 27-3.

Table 27-3. Internal Expansion RAM Size Switching Register Settings

Flash Memory Versions (78K0/KF1+)	Target Mask ROM Versions (78K0/KF1)	IXS Setting
–	μPD780143	0CH
–	μPD780144	0CH
–	μPD780146	0AH
μPD78F0148H, 78F0148HD	μPD780148	0AH

27.3 Writing with Flash Programmer

Data can be written to the flash memory on-board or off-board, by using a dedicated flash programmer.

(1) On-board programming

The contents of the flash memory can be rewritten after the 78K0/KF1+ has been mounted on the target system. The connectors that connect the dedicated flash programmer must be mounted on the target system.

(2) Off-board programming

Data can be written to the flash memory with a dedicated program adapter (FA series) before the 78K0/KF1+ is mounted on the target system.

Remark The FA series is a product of Naito Densai Machida Mfg. Co., Ltd.

Table 27-4. Wiring Between 78K0/KF1+ and Dedicated Flash Programmer

Pin Configuration of Dedicated Flash Programmer			With CSI10		With CSI10 + HS		With UART6	
Signal Name	I/O	Pin Function	Pin Name	Pin No.	Pin Name	Pin No.	Pin Name	Pin No.
SI/RxD	Input	Receive signal	SO10/P12	20	SO10/P12	20	TxD6/P13	21
SO/TxD	Output	Transmit signal	SI10/RxD0/P11	19	SI10/RxD0/P11	19	RxD6/P14	22
SCK	Output	Transfer clock	SCK10/TxD0/P10	18	SCK10/TxD0/P10	18	Not needed	Not needed
CLK	Output	Clock to 78K0/KF1+	X1	12	X1	12	X1	12
			X2 ^{Note}	13	X2 ^{Note}	13	X2 ^{Note}	13
/RESET	Output	Reset signal	RESET	14	RESET	14	RESET	14
FLMD0	Output	Mode signal	FLMD0	8	FLMD0	8	FLMD0	8
FLMD1	Output	Mode signal	FLMD1/TI50/ TO50/P17	25	FLMD1/TI50/ TO50/P17	25	FLMD1/TI50/ TO50/P17	25
H/S	Input	Handshake signal	Not needed	Not needed	HS/P15/TOH0	23	Not needed	Not needed
V _{DD}	I/O	V _{DD} voltage generation/voltage monitoring	V _{DD}	9	V _{DD}	9	V _{DD}	9
			EV _{DD}	31	EV _{DD}	31	EV _{DD}	31
			AV _{REF}	1	AV _{REF}	1	AV _{REF}	1
GND	-	Ground	V _{SS}	11	V _{SS}	11	V _{SS}	11
			EV _{SS}	30	EV _{SS}	30	EV _{SS}	30
			AV _{SS}	2	AV _{SS}	2	AV _{SS}	2

Note When using the clock out of the flash programmer, connect CLK of the programmer to X1, and connect its inverse signal to X2.

Examples of the recommended connection when using the adapter for flash memory writing are shown below.

Figure 27-3. Example of Wiring Adapter for Flash Memory Writing in 3-Wire Serial I/O (CSI10) Mode

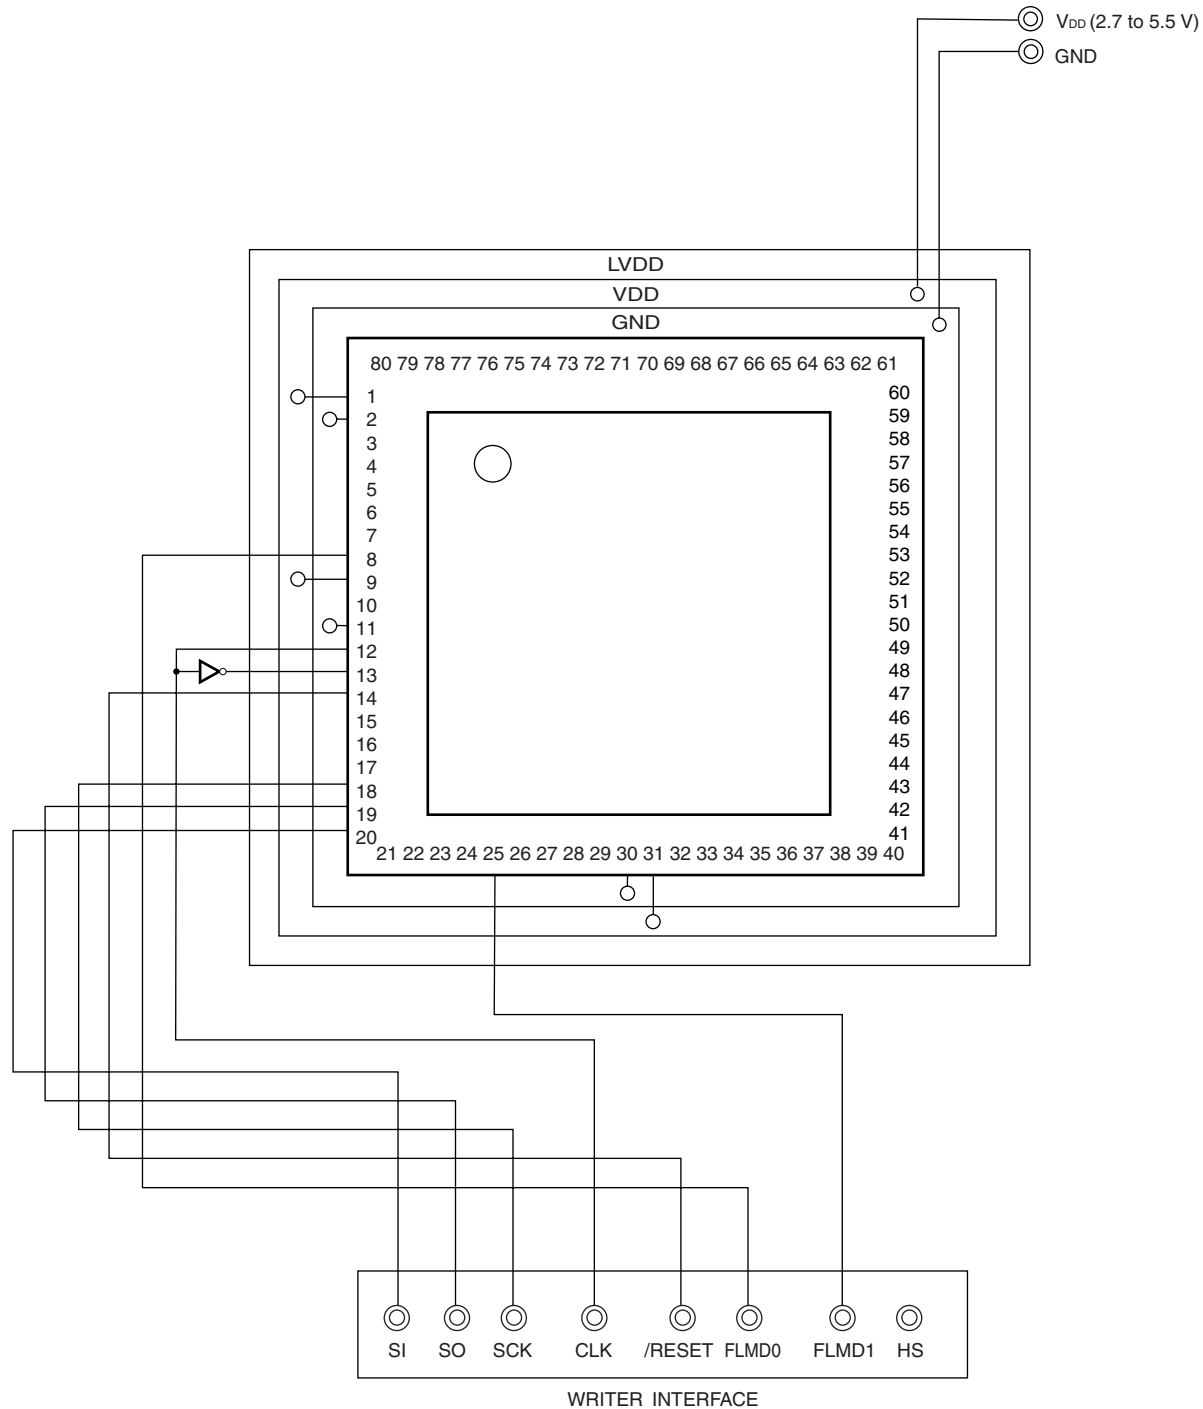

Figure 27-4. Example of Wiring Adapter for Flash Memory Writing in 3-Wire Serial I/O (CSI10 + HS) Mode

Figure 27-5. Example of Wiring Adapter for Flash Memory Writing in UART (UART6) Mode

27.4 Programming Environment

The environment required for writing a program to the flash memory of the 78K0/KF1+ is illustrated below.

Figure 27-6. Environment for Writing Program to Flash Memory

A host machine that controls the dedicated flash programmer is necessary.

To interface between the dedicated flash programmer and the 78K0/KF1+, CSI10 or UART6 is used for manipulation such as writing and erasing. To write the flash memory off-board, a dedicated program adapter (FA series) is necessary.

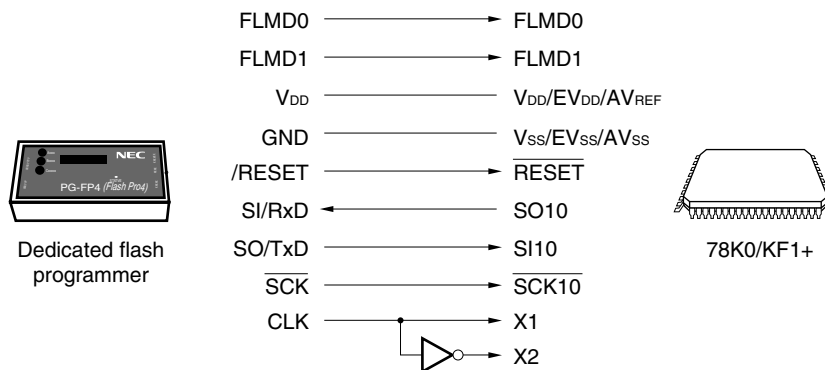

27.5 Communication Mode

Communication between the dedicated flash programmer and the 78K0/KF1+ is established by serial communication via CSI10 or UART6 of the 78K0/KF1+.

(1) CSI10

Transfer rate: 200 kHz to 2 MHz

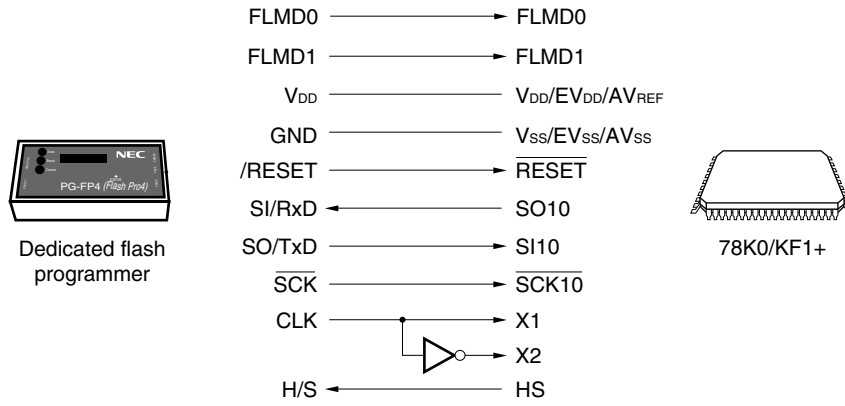

Figure 27-7. Communication with Dedicated Flash Programmer (CSI10)

(2) CSI communication mode supporting handshake

Transfer rate: 200 kHz to 2 MHz

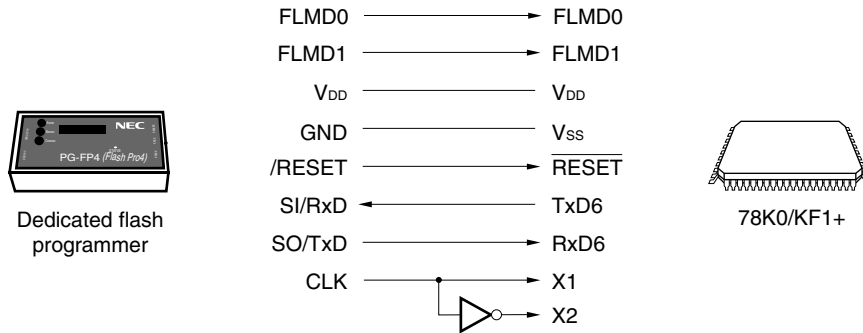

Figure 27-8. Communication with Dedicated Flash Programmer (CSI10 + HS)

(3) UART6

Transfer rate: 4800 to 76800 bps

Figure 27-9. Communication with Dedicated Flash Programmer (UART6)

If Flashpro IV is used as the dedicated flash programmer, Flashpro IV generates the following signal for the 78K0/KF1+. For details, refer to the Flashpro IV manual.

Table 27-5. Pin Connection

Flashpro IV			78K0/KF1+	Connection	
Signal Name	I/O	Pin Function	Pin Name	CSI10	UART6
FLMD0	Output	Mode signal	FLMD0	◎	◎
FLMD1	Output	Mode signal	FLMD1	○	○
V _{DD}	I/O	V _{DD} voltage generation/voltage monitoring	V _{DD} , EV _{DD} , AV _{REF}	◎	◎
GND	–	Ground	V _{SS} , EV _{SS} , AV _{SS}	◎	◎
CLK	Output	Clock output to 78K0/KF1+	X1, X2 ^{Note}	○	○
/RESET	Output	Reset signal	$\overline{\text{RESET}}$	◎	◎
SI/RxD	Input	Receive signal	SO10/TxD6	◎	◎
SO/TxD	Output	Transmit signal	SI10/RxD6	◎	◎
SCK	Output	Transfer clock	$\overline{\text{SCK10}}$	◎	×
H/S	Input	Handshake signal	HS	△	×

Note When using the clock out of the flash programmer, connect CLK of the programmer to X1, and connect its inverse signal to X2.

Remark ◎: Be sure to connect the pin.

○: The pin does not have to be connected if the signal is generated on the target board.

×: The pin does not have to be connected.

△: In handshake mode

27.6 Connection of Pins on Board

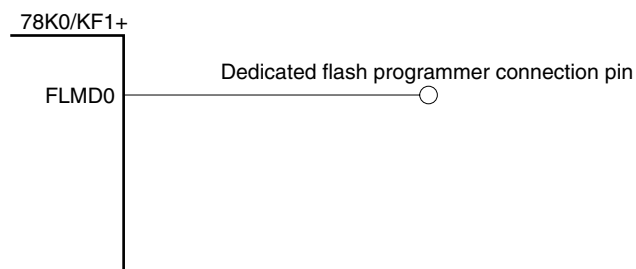

To write the flash memory on-board, connectors that connect the dedicated flash programmer must be provided on the target system. First provide a function that selects the normal operation mode or flash memory programming mode on the board.

When the flash memory programming mode is set, all the pins not used for programming the flash memory are in the same status as immediately after reset. Therefore, if the external device does not recognize the state immediately after reset, the pins must be connected as described below.

27.6.1 FLMD0 pin

In the normal operation mode, 0 V is input to the FLMD0 pin. In the flash memory programming mode, the V_{DD} write voltage is supplied to the FLMD0 pin. An FLMD0 pin connection example is shown below.

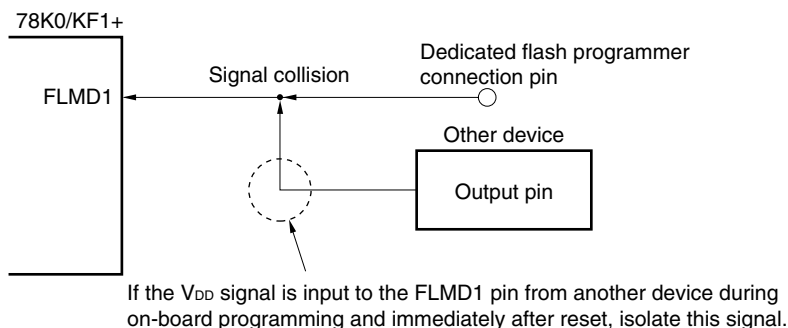

Figure 27-10. FLMD0 Pin Connection Example

27.6.2 FLMD1 pin

When 0 V is input to the FLMD0 pin, the FLMD1 pin does not function. When V_{DD} is supplied to the FLMD0 pin, the flash memory programming mode is entered, so the same voltage as V_{SS} must be supplied to the FLMD1 pin. An FLMD1 pin connection example is shown below.

Figure 27-11. FLMD1 Pin Connection Example

27.6.3 Serial interface pins

The pins used by each serial interface are listed below.

Table 27-6. Pins Used by Each Serial Interface

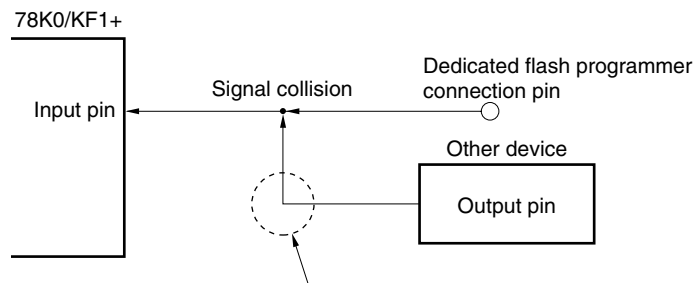

Serial Interface	Pins Used
CSI10	SO10, SI10, $\overline{\text{SCK10}}$
CSI10 + HS	SO10, SI10, $\overline{\text{SCK10}}$, HS/P15
UART6	TxD6, RxD6

To connect the dedicated flash programmer to the pins of a serial interface that is connected to another device on the board, care must be exercised so that signals do not collide or that the other device does not malfunction.

(1) Signal collision

If the dedicated flash programmer (output) is connected to a pin (input) of a serial interface connected to another device (output), signal collision takes place. To avoid this collision, either isolate the connection with the other device, or make the other device go into an output high-impedance state.

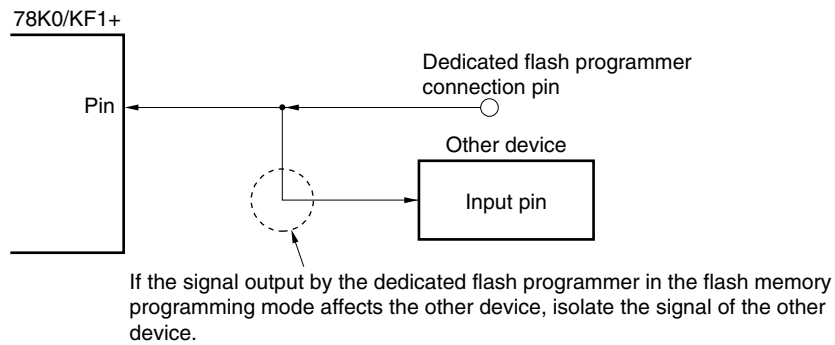

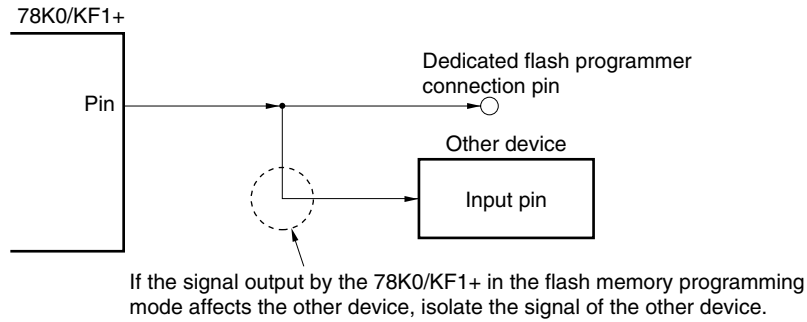

Figure 27-12. Signal Collision (Input Pin of Serial Interface)

In the flash memory programming mode, the signal output by the device collides with the signal sent from the dedicated flash programmer. Therefore, isolate the signal of the other device.

(2) Malfunction of other device

If the dedicated flash programmer (output or input) is connected to a pin (input or output) of a serial interface connected to another device (input), a signal may be output to the other device, causing the device to malfunction. To avoid this malfunction, isolate the connection with the other device.

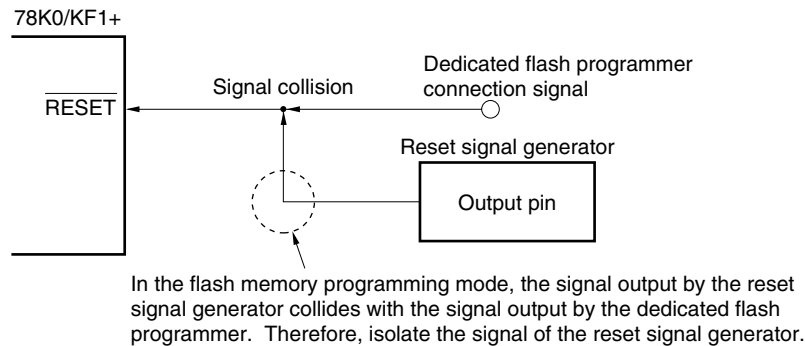

Figure 27-13. Malfunction of Other Device

27.6.4 $\overline{\text{RESET}}$ pin

If the reset signal of the dedicated flash programmer is connected to the $\overline{\text{RESET}}$ pin that is connected to the reset signal generator on the board, signal collision takes place. To prevent this collision, isolate the connection with the reset signal generator.

If the reset signal is input from the user system while the flash memory programming mode is set, the flash memory will not be correctly programmed. Do not input any signal other than the reset signal of the dedicated flash programmer.

Figure 27-14. Signal Collision ($\overline{\text{RESET}}$ Pin)

27.6.5 Port pins

When the flash memory programming mode is set, all the pins not used for flash memory programming enter the same status as that immediately after reset. If external devices connected to the ports do not recognize the port status immediately after reset, the port pin must be connected to V_{DD} or V_{SS} via a resistor.

27.6.6 Other signal pins

Connect X1 and X2 in the same status as in the normal operation mode when using the on-board clock.

To input the operating clock from the programmer, however, connect the clock out of the programmer to X1, and its inverse signal to X2.

27.6.7 Power supply

To use the supply voltage output of the flash programmer, connect the V_{DD} pin to V_{DD} of the flash programmer, and the V_{SS} pin to V_{SS} of the flash programmer.

To use the on-board supply voltage, connect in compliance with the normal operation mode.

However, be sure to connect the V_{DD} and V_{SS} pins to V_{DD} and GND of the flash programmer, respectively, because the voltage is monitored by the flash programmer.

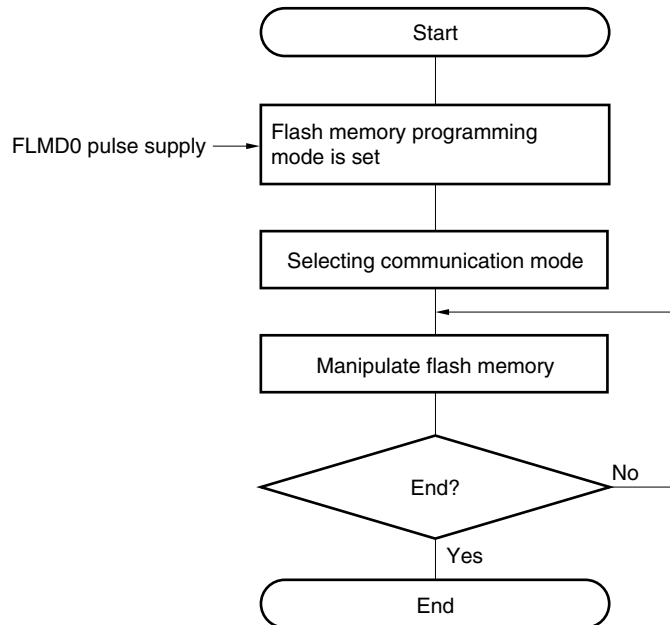

Supply the same other power supplies (EV_{DD} , EV_{SS} , AV_{REF} , and AV_{SS}) as those in the normal operation mode.

27.7 Programming Method

27.7.1 Controlling flash memory

The following figure illustrates the procedure to manipulate the flash memory.

Figure 27-15. Flash Memory Manipulation Procedure

27.7.2 Flash memory programming mode

To rewrite the contents of the flash memory by using the dedicated flash programmer, set the 78K0/KF1+ in the flash memory programming mode. To set the mode, set the FLMD0 pin to V_{DD} and clear the reset signal.

Change the mode by using a jumper when writing the flash memory on-board.

Figure 27-16. Flash Memory Programming Mode

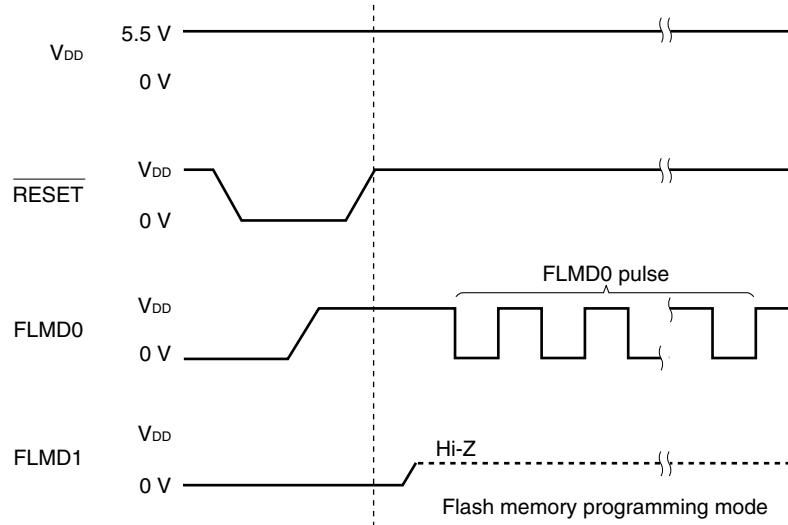

Table 27-7. Relationship Between FLMD0, FLMD1 Pins and Operation Mode After Reset Release

FLMD0	FLMD1	Operation Mode
0	Any	Normal operation mode
V_{DD}	0	Flash memory programming mode
V_{DD}	V_{DD}	Setting prohibited

27.7.3 Selecting communication mode

In the 78K0/KF1+, a communication mode is selected by inputting pulses (up to 11 pulses) to the FLMD0 pin after the dedicated flash memory programming mode is entered. These FLMD0 pulses are generated by the flash programmer.

The following table shows the relationship between the number of pulses and communication modes.

<R>

Table 27-8. Communication Modes

Communication Mode	Standard Setting ^{Note 1}					Pins Used	Number of FLMD0 Pulses
	Port	Speed	On Target	Frequency	Multiply Rate		
UART (UART6)	UART-ch0	9600, 19200, 31250, 38400, 76800, 153600 ^{Note 3} bps ^{Note 4}	Optional	2 MHz to 16 MHz ^{Note 2}	1.0	TxD6, RxD6	0
3-wire serial I/O (CSI10)	SIO-ch0	2.4 kHz to 2.5 MHz				SO10, SI10, SCK10	8
3-wire serial I/O with handshake supported (CSI10 + HS)	SIO-H/S	2.4 kHz to 2.5 MHz				SO10, SI10, SCK10, HS/P15	11

- Notes**
1. Selection items for Standard settings on Flashpro IV.
 2. The possible setting range differs depending on the voltage. For details, refer to the chapters of electrical specifications.
 3. When peripheral hardware clock frequency is 2.5 MHz or less, this cannot be selected.
 4. Because factors other than the baud rate error, such as the signal waveform slew, also affect UART communication, thoroughly evaluate the slew as well as the baud rate error.

Caution When UART6 is selected, the receive clock is calculated based on the reset command sent from the dedicated flash programmer after the FLMD0 pulse has been received.

27.7.4 Communication commands

The 78K0/KF1+ communicates with the dedicated flash programmer by using commands. The signals sent from the flash programmer to the 78K0/KF1+ are called commands, and the commands sent from the 78K0/KF1+ to the dedicated flash programmer are called response commands.

Figure 27-17. Communication Commands

The flash memory control commands of the 78K0/KF1+ are listed in the table below. All these commands are issued from the programmer and the 78K0/KF1+ perform processing corresponding to the respective commands.

Table 27-9. Flash Memory Control Commands

Classification	Command Name	Function
Verify	Batch verify command	Compares the contents of the entire memory with the input data.
Erase	Batch erase command	Erases the contents of the entire memory.
Blank check	Batch blank check command	Checks the erasure status of the entire memory.
Data write	High-speed write command	Writes data by specifying the write address and number of bytes to be written, and executes a verify check.
	Successive write command	Writes data from the address following that of the high-speed write command executed immediately before, and executes a verify check.
System setting, control	Status read command	Obtains the operation status
	Oscillation frequency setting command	Sets the oscillation frequency
	Erase time setting command	Sets the erase time for batch erase
	Write time setting command	Sets the write time for writing data
	Baud rate setting command	Sets the baud rate when UART is used
	Silicon signature command	Reads the silicon signature information
	Reset command	Escapes from each status

The 78K0/KF1+ return a response command for the command issued by the dedicated flash programmer. The response commands sent from the 78K0/KF1+ are listed below.

Table 27-10. Response Commands

Command Name	Function
ACK	Acknowledges command/data.
NAK	Acknowledges illegal command/data.

27.8 Flash Memory Programming by Self-Writing

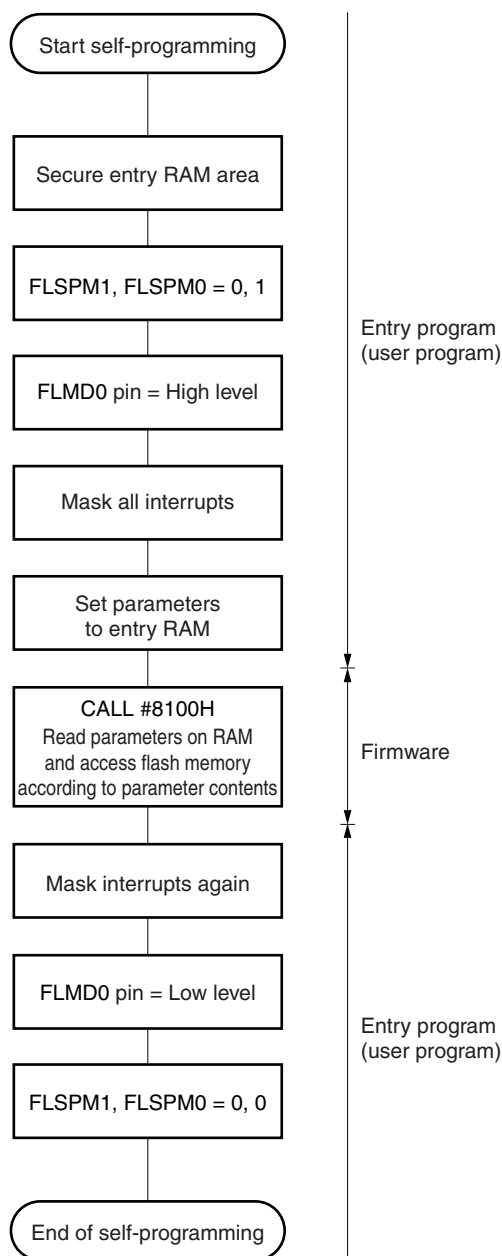

The 78K0/KF1+ supports a self-programming function that can be used to rewrite the flash memory via a user program, so that the program can be upgraded in the field.

The programming mode is selected by bits 0 and 1 (FLSPM0 and FLSPM1) of the flash programming mode control register (FLPMC).

The procedure of self-programming is illustrated below.

Remark For details of the self programming function, refer to the **78K0/Kx1+ Flash Memory Self Programming User's Manual (U16701E)**.

Figure 27-18. Self-Programming Procedure

27.8.1 Registers used for self-programming function

The following three registers are used for the self-programming function.

- Flash programming mode control register (FLPMC)
- Flash protect command register (PFCMD)
- Flash status register (PFS)

(1) Flash programming mode control register (FLPMC)

This register is used to enable or disable writing or erasing of the flash memory and to set the operation mode during self-programming.

FLPMC can be written only in a specific sequence (see **27.8.1 (2) Flash protect command register (PFCMD)**) so that the application system does not stop inadvertently due to malfunction caused by noise or program hang-up.

FLPMC can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input sets this register to 0xH^{Note}.

Note Differs depending on the operation mode.

- User mode: 08H
- On-board mode: 0CH

Figure 27-19. Format of Flash Programming Mode Control Register (FLPMC)

Address: FFC4H After reset: 0xH^{Note 1} R/W^{Note 2}

Symbol	7	6	5	4	3	2	1	0
FLPMC	0	0	0	0	FWEDIS	FWEPR	FLSPM1	FLSPM0

0	Low level
1	High level ^{Note 3}

FLSPM1 ^{Note 4}	FLSPM0 ^{Note 4}	Selection of operation mode during self-programming
0	0	Normal mode Instructions of flash memory can be fetched from all addresses.
0	1	Self-programming mode A1 Firmware can be called (CALL #8100H).
1	1	Self-programming mode A2 Instructions are fetched from firmware ROM. This mode is set in firmware and cannot be set by the user.
1	0	Setting prohibited

- Notes**
- Differs depending on the operation mode.
 - User mode: 08H
 - On-board mode: 0CH
 - Bit 2 (FWEPR) is read-only.
 - For actual writing/erasing, the FLMD0 pin must be high (FWEPR = 1), as well as FWEDIS = 0.

FWEDIS	FWEPR	Enable or disable of flash memory writing/erasing
0	1	Writing/erasing enabled
Other than above		Writing/erasing disabled

- The user ROM (flash memory) or firmware ROM can be selected by FLSPM1 and FLSPM0, and the operation mode set on the application system by the mode pin or the self-programming mode can be selected.

- Cautions**
- Be sure to keep FWEDIS at 0 until writing or erasing of the flash memory is completed.
 - Make sure that FWEDIS = 1 in the normal mode.
 - Manipulate FLSPM1 and FLSPM0 after execution branches to the internal RAM. The address of the flash memory is specified by an address signal from the CPU when FLSPM1 = 0 or the set value of the firmware written when FLSPM1 = 1. In the on-board mode, the specifications of FLSPM1 and FLSPM0 are ignored.

(2) Flash protect command register (PFCMD)

If the application system stops inadvertently due to malfunction caused by noise or program hang-up, an operation to write the flash programming mode control register (FLPMC) may have a serious effect on the system. PFCMD is used to protect FLPMC from being written, so that the application system does not stop inadvertently. Writing FLPMC is enabled only when a write operation is performed in the following specific sequence.

- <1> Write a specific value to PFCMD (PFCMD = A5H)
- <2> Write the value to be set to FLPMC (writing in this step is invalid)
- <3> Write the inverted value of the value to be set to FLPMC (writing in this step is invalid)
- <4> Write the value to be set to FLPMC (writing in this step is valid)

This rewrites the value of the register, so that the register cannot be written illegally.

Occurrence of an illegal store operation can be checked by bit 0 (FPRERR) of the flash status register (PFS).

A5H must be written to PFCMD each time the value of FLPMC is changed.

PFCMD can be set by an 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input makes this register undefined.

Figure 27-20. Format of Flash Protect Command Register (PFCMD)

Address: FFC0H After reset: Undefined W

Symbol	7	6	5	4	3	2	1	0
PFCMD	REG7	REG6	REG5	REG4	REG3	REG2	REG1	REG0

(3) Flash status register (PFS)

If data is not written to the flash programming mode control register (FLPMC), which is protected, in the correct sequence (writing the flash protect command register (PFCMD)), FLPMC is not written and a protection error occurs. If this happens, bit 0 of PFS (FPRERR) is set to 1.

This bit is a cumulative flag. After checking FPRERR, clear it by writing 0 to it.

PFS can be set by a 1-bit or 8-bit memory manipulation instruction.

$\overline{\text{RESET}}$ input clears this register to 00H.

Figure 27-21. Format of Flash Status Register (PFS)

Address: FFC2H After reset: 00H R/W

Symbol	7	6	5	4	3	2	1	0
PFS	0	0	0	0	0	0	0	FPRERR

The operating conditions of the FPRERR flag are as follows.

<Setting conditions>

- If PFCMD is written when the store instruction operation recently performed on a peripheral register is not to write a specific value (A5H) to PFCMD
- If the first store instruction operation after <1> is on a peripheral register other than FLPMC
- If the first store instruction operation after <2> is on a peripheral register other than FLPMC
- If a value other than the inverted value of the value to be set to FLPMC is written by the first store instruction after <2>
- If the first store instruction operation after <3> is on a peripheral register other than FLPMC
- If a value other than the value to be set to FLPMC (value written in <2>) is written by the first store instruction after <3>

Remark The numbers in angle brackets above correspond to the those in **(2) Flash protect command register (PFCMD)**.

<Reset conditions>

- If 0 is written to the FPRERR flag
- If RESET is input

<Example of description in specific sequence>

To write 05H to FLPMC

```
MOV   PFCMD, #0A5H    ; Writes A5H to PFCMD.
MOV   FLPMC, #05H     ; Writes 05H to FLPMC.
MOV   FLPMC, #0FAH    ; Writes 0FAH (inverted value of 05H) to FLPMC.
MOV   FLPMC, #05H     ; Writes 05H to FLPMC.
```

27.9 Boot Swap Function

The 78K0/KF1+ has a boot swap function.

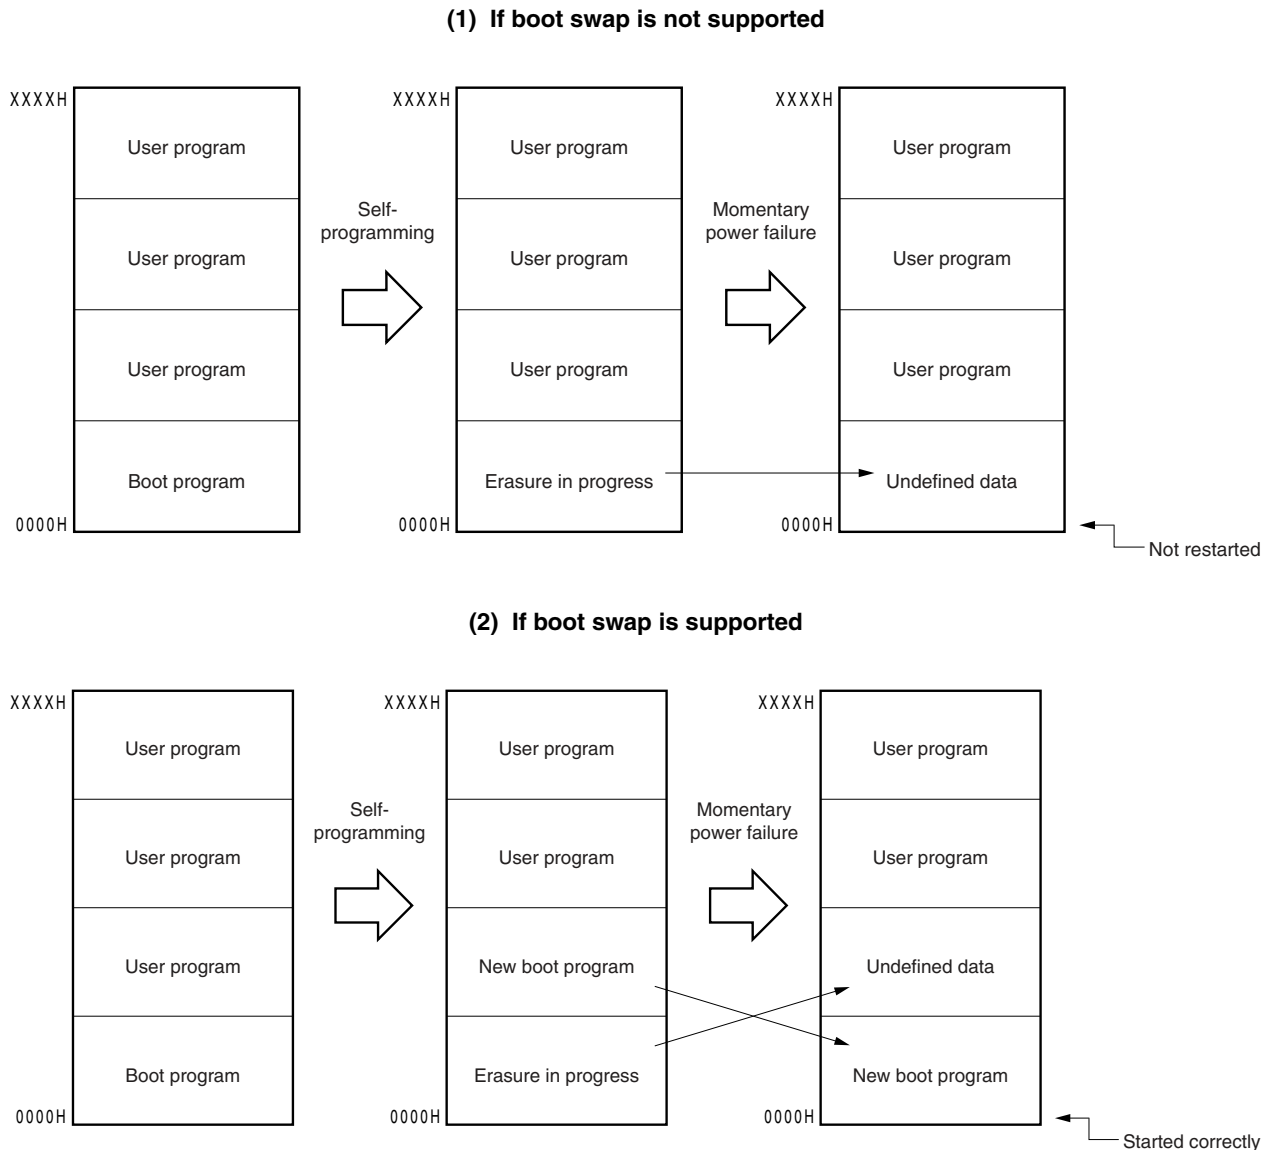

Even if a momentary power failure occurs for some reason while the boot area is being rewritten by self-programming and the program in the boot area is lost, the boot swap function can execute the program correctly after re-application of power, reset, and start.

27.9.1 Outline of boot swap function

Before erasing the boot program area by self-programming, write a new boot program to the block to be swapped, and also set the boot flag^{Note}. Even if a momentary power failure occurs, the address is swapped when the system is reset and started next time. Consequently, the above area to be swapped is used as a boot area, and the program is executed correctly. Figure 27-22 shows an image of the boot swap function.

Note The boot flag is controlled by the flash memory control firmware of the 78K0/KF1+.

Figure 27-22. Image of Boot Swap Function

27.9.2 Memory map and boot area

Figure 27-23 shows the memory map and boot area. The boot program area of the 78K0/KF1+ is in 4 KB units. When boot swap is executed, boot cluster 0 and boot cluster 1 in the figure are exchanged.

Figure 27-23. Memory Map and Boot Area (1/2)

(1) μ PD78F0148H

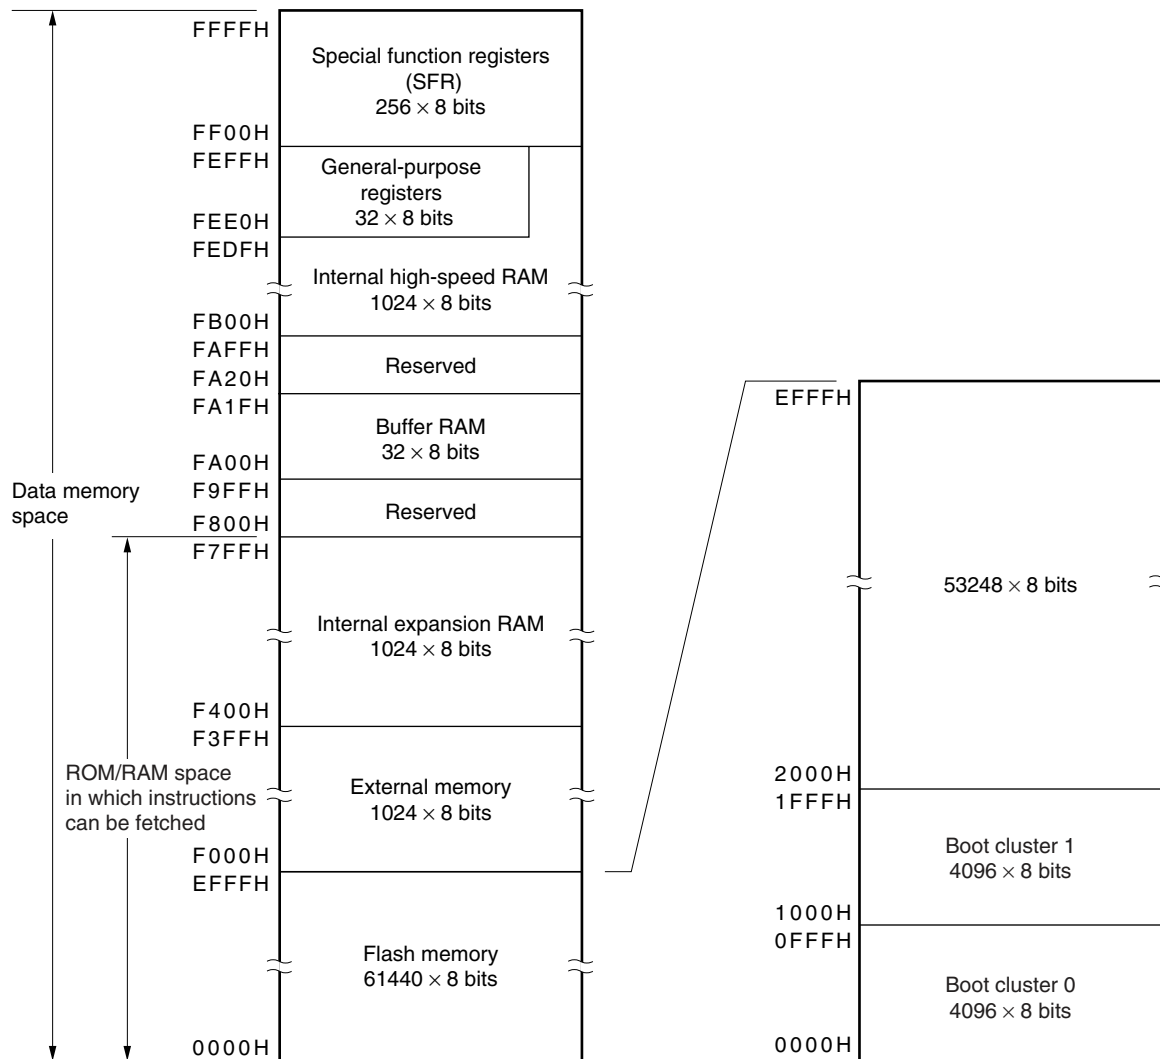

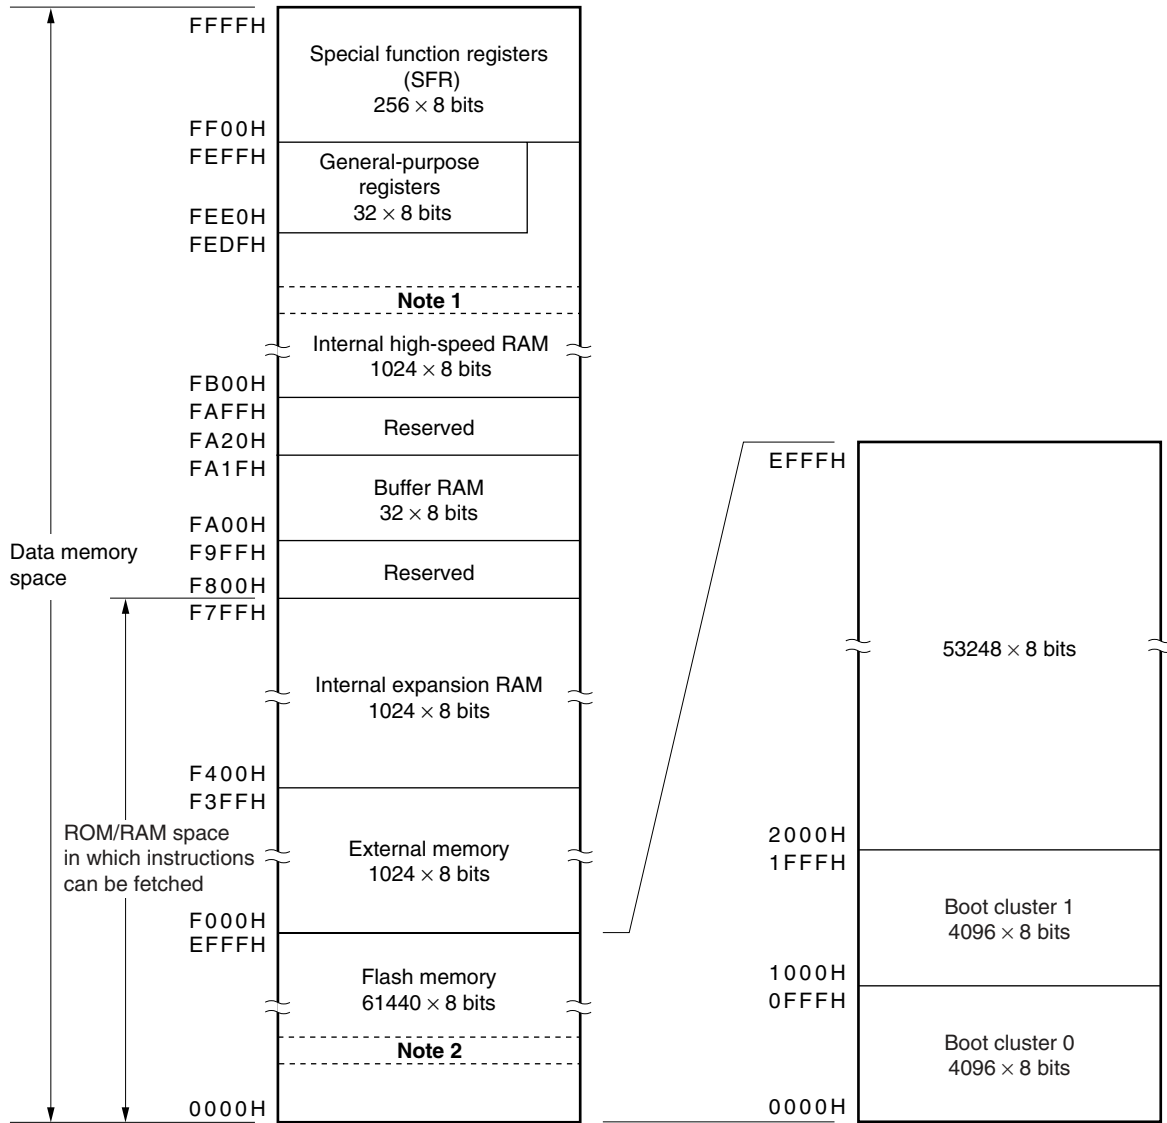

Figure 27-23. Memory Map and Boot Area (2/2)

(2) μ PD78F0148HD

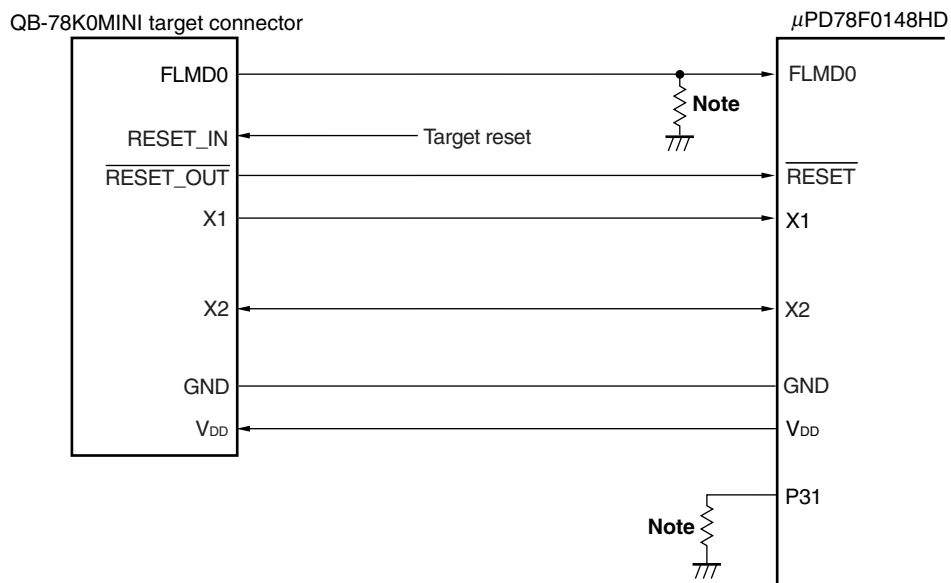

- <R> **Notes** 1. During on-chip debugging, about 7 to 16 bytes of this area are used as the user data backup area for communication.
- <R> 2. During on-chip debugging, use of this area is disabled because it is used as the communication command area (008FH to 018FH: debugger's default setting).

CHAPTER 28 ON-CHIP DEBUG FUNCTION (μ PD78F0148HD ONLY)

The μ PD78F0148HD uses the V_{DD} , FLMD0, $\overline{\text{RESET}}$, X1 (or P31), X2 (or P32), and V_{SS} pins to communicate with the host machine via an on-chip debug emulator (QB-78K0MINI). Whether X1 and P31, or X2 and P32 are used can be selected.

Caution The μ PD78F0148HD has an on-chip debug function. Do not use this product for mass production because its reliability cannot be guaranteed after the on-chip debug function has been used, given the issue of the number of times the flash memory can be rewritten. NEC Electronics does not accept complaints concerning this product.

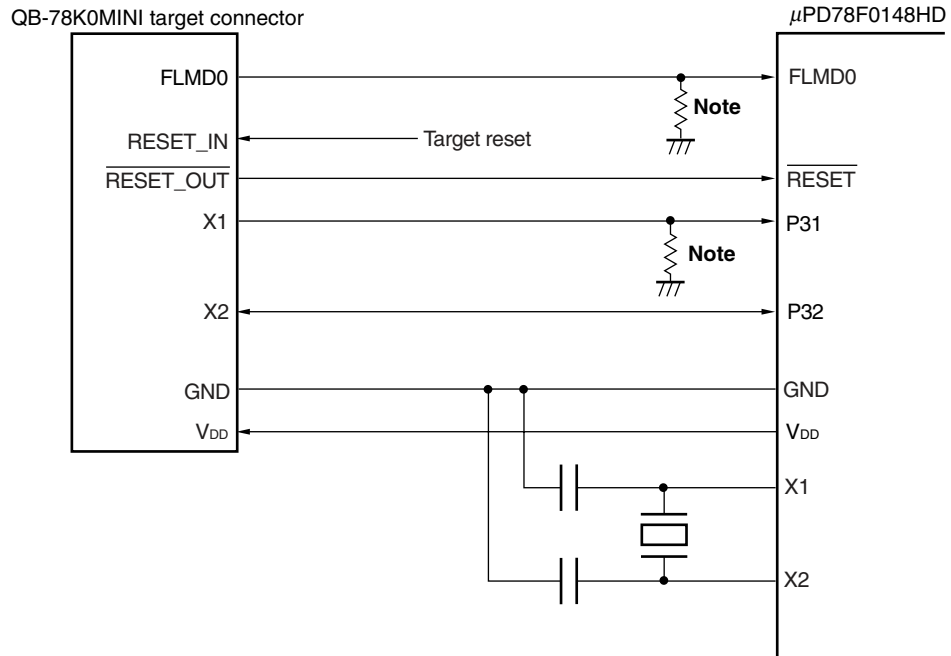

Figure 28-1. Connection Example of QB-78K0MINI and μ PD78F0148HD (When X1 and X2 Are Used)

Note Make pull-down resistor 470 Ω or more.

- Cautions**
1. Input the clock from the X1 pin during on-chip debugging.
 2. Control the X1 and X2 pins by externally pulling down the P31 pin.

Figure 28-2. Connection Example of QB-78K0MINI and μ PD78F0148HD (When P31 and P32 Are Used)

Note Make pull-down resistor 470 Ω or more.

28.1 On-Chip Debug Security ID

The μ PD78F0148HD has an on-chip debug operation control flag in the flash memory at 0084H (see **CHAPTER 26 OPTION BYTE**) and an on-chip debug security ID setting area at 0085H to 008EH.

When the boot swap function is used, also set a value that is the same as that of 1084H and 1085H to 108EH in advance, because 0084H, 0085H to 008EH and 1084H, and 1085H to 108EH are switched.

For details on the on-chip debug security ID, refer to the QB-78K0MINI User's Manual (U17029E).

Table 28-1. On-Chip Debug Security ID

Address	On-Chip Debug Security ID
0085H to 008EH	Any ID code of 10 bytes
1085H to 108EH	

CHAPTER 29 INSTRUCTION SET

This chapter lists each instruction set of the 78K0/KF1+ in table form. For details of each operation and operation code, refer to the separate document **78K/0 Series Instructions User's Manual (U12326E)**.

29.1 Conventions Used in Operation List

29.1.1 Operand identifiers and specification methods

Operands are written in the "Operand" column of each instruction in accordance with the specification method of the instruction operand identifier (refer to the assembler specifications for details). When there are two or more methods, select one of them. Upper case letters and the symbols #, !, \$ and [] are keywords and must be written as they are. Each symbol has the following meaning.

- #: Immediate data specification
- !: Absolute address specification
- \$: Relative address specification
- []: Indirect address specification

In the case of immediate data, describe an appropriate numeric value or a label. When using a label, be sure to write the #, !, \$, and [] symbols.

For operand register identifiers r and rp, either function names (X, A, C, etc.) or absolute names (names in parentheses in the table below, R0, R1, R2, etc.) can be used for specification.

Table 29-1. Operand Identifiers and Specification Methods

Identifier	Specification Method
r	X (R0), A (R1), C (R2), B (R3), E (R4), D (R5), L (R6), H (R7),
rp	AX (RP0), BC (RP1), DE (RP2), HL (RP3)
sfr	Special function register symbol ^{Note}
sfrp	Special function register symbol (16-bit manipulatable register even addresses only) ^{Note}
saddr	FE20H to FF1FH Immediate data or labels
saddrp	FE20H to FF1FH Immediate data or labels (even address only)
addr16	0000H to FFFFH Immediate data or labels (Only even addresses for 16-bit data transfer instructions)
addr11	0800H to 0FFFH Immediate data or labels
addr5	0040H to 007FH Immediate data or labels (even address only)
word	16-bit immediate data or label
byte	8-bit immediate data or label
bit	3-bit immediate data or label
RBn	RB0 to RB3

Note Addresses from FFD0H to FFDFH cannot be accessed with these operands.

Remark For special function register symbols, refer to **Table 3-4 Special Function Register List**.

29.1.2 Description of operation column

A:	A register; 8-bit accumulator
X:	X register
B:	B register
C:	C register
D:	D register
E:	E register
H:	H register
L:	L register
AX:	AX register pair; 16-bit accumulator
BC:	BC register pair
DE:	DE register pair
HL:	HL register pair
PC:	Program counter
SP:	Stack pointer
PSW:	Program status word
CY:	Carry flag
AC:	Auxiliary carry flag
Z:	Zero flag
RBS:	Register bank select flag
IE:	Interrupt request enable flag
():	Memory contents indicated by address or register contents in parentheses
X _H , X _L :	Higher 8 bits and lower 8 bits of 16-bit register
∧:	Logical product (AND)
∨:	Logical sum (OR)
⊕:	Exclusive logical sum (exclusive OR)
—:	Inverted data
addr16:	16-bit immediate data or label
jdisp8:	Signed 8-bit data (displacement value)

29.1.3 Description of flag operation column

(Blank):	Not affected
0:	Cleared to 0
1:	Set to 1
×	Set/cleared according to the result
R:	Previously saved value is restored

29.2 Operation List

Instruction Group	Mnemonic	Operands	Bytes	Clocks		Operation	Flag			
				Note 1	Note 2		Z	AC	CY	
8-bit data transfer	MOV	r, #byte	2	4	–	r ← byte				
		saddr, #byte	3	6	7	(saddr) ← byte

		A, [HL + B]		2	8	10 + n + m	A ↔ (HL + B)			
A, [HL + C]		2	8	10 + n + m	A ↔ (HL + C)					

- Notes**
1. When the internal high-speed RAM area is accessed or for an instruction with no data access
 2. When an area except the internal high-speed RAM area is accessed
 3. Except “r = A”

- Remarks**
1. One instruction clock cycle is one cycle of the CPU clock (f_{CPU}) selected by the processor clock control register (PCC).
 2. This clock cycle applies to the internal ROM program.
 3. n is the number of waits when the external memory expansion area is read.
 4. m is the number of waits when the external memory expansion area is written.

Instruction Group	Mnemonic	Operands	Bytes	Clocks		Operation	Flag		
				Note 1	Note 2		Z	AC	CY
16-bit data transfer	MOVW	rp, #word	3	6	–	rp ← word

- Notes**
1. When the internal high-speed RAM area is accessed or for an instruction with no data access
 2. When an area except the internal high-speed RAM area is accessed

- Remarks**
1. One instruction clock cycle is one cycle of the CPU clock (f_{CPU}) selected by the processor clock control register (PCC).
 2. This clock cycle applies to the internal ROM program.
 3. n is the number of waits when the external memory expansion area is read.
 4. m is the number of waits when the external memory expansion area is written.

 3. n is the number of waits when the external memory expansion area is read.
 4. m is the number of waits when the external memory expansion area is written.

29.3 Instructions Listed by Addressing Type

(1) 8-bit instructions

MOV, XCH, ADD, ADDC, SUB, SUBC, AND, OR, XOR, CMP, MULU, DIVUW, INC, DEC, ROR, ROL, RORC, ROLC, ROR4, ROL4, PUSH, POP, DBNZ

Second Operand First Operand	#byte	A	r ^{Note}	sfr	saddr	laddr16	PSW	[DE]	[HL]	[HL + byte] [HL + B] [HL + C]	\$addr16	1	None
A	ADD ADDC SUB SUBC AND OR XOR CMP		MOV XCH ADD ADDC SUB SUBC AND OR XOR CMP	MOV XCH	MOV XCH ADD ADDC SUB SUBC AND OR XOR CMP	MOV XCH ADD ADDC SUB SUBC AND OR XOR CMP	MOV	MOV XCH	MOV XCH ADD ADDC SUB SUBC AND OR XOR CMP	MOV XCH ADD ADDC SUB SUBC AND OR XOR CMP		ROR ROL RORC ROLC	
r	MOV	MOV ADD ADDC SUB SUBC AND OR XOR CMP											INC DEC
B, C											DBNZ		
sfr	MOV	MOV											
saddr	MOV ADD ADDC SUB SUBC AND OR XOR CMP	MOV									DBNZ		INC DEC
laddr16		MOV											
PSW	MOV	MOV											PUSH POP
[DE]		MOV											
[HL]		MOV											ROR4 ROL4
[HL + byte] [HL + B] [HL + C]		MOV											
X													MULU
C													DIVUW

Note Except “r = A”

(2) 16-bit instructions

MOVW, XCHW, ADDW, SUBW, CMPW, PUSH, POP, INCW, DECW

Second Operand First Operand	#word	AX	rp ^{Note}	sfrp	saddrp	laddr16	SP	None
AX	ADDW SUBW CMPW		MOVW XCHW	MOVW	MOVW	MOVW	MOVW	
rp	MOVW	MOVW ^{Note}						INCW DECW PUSH POP
sfrp	MOVW	MOVW						
saddrp	MOVW	MOVW						
laddr16		MOVW						
SP	MOVW	MOVW						

Note Only when rp = BC, DE, HL

(3) Bit manipulation instructions

MOV1, AND1, OR1, XOR1, SET1, CLR1, NOT1, BT, BF, BTCLR

Second Operand First Operand	A.bit	sfr.bit	saddr.bit	PSW.bit	[HL].bit	CY	\$addr16	None
A.bit						MOV1	BT BF BTCLR	SET1 CLR1
sfr.bit						MOV1	BT BF BTCLR	SET1 CLR1
saddr.bit						MOV1	BT BF BTCLR	SET1 CLR1
PSW.bit						MOV1	BT BF BTCLR	SET1 CLR1
[HL].bit						MOV1	BT BF BTCLR	SET1 CLR1
CY	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1	MOV1 AND1 OR1 XOR1			SET1 CLR1 NOT1

(4) Call instructions/branch instructions

CALL, CALLF, CALLT, BR, BC, BNC, BZ, BNZ, BT, BF, BTCLR, DBNZ

Second Operand First Operand	AX	!addr16	!addr11	[addr5]	\$addr16
Basic instruction	BR	CALL BR	CALLF	CALLT	BR BC BNC BZ BNZ
Compound instruction					BT BF BTCLR DBNZ

(5) Other instructions

ADJBA, ADJBS, BRK, RET, RETI, RETB, SEL, NOP, EI, DI, HALT, STOP

CHAPTER 30 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS, (A) GRADE PRODUCTS)

Target products: μ PD78F0148H, 78F0148H(A), 78F0148HD

Caution The μ PD78F0148HD has an on-chip debug function. Do not use this product for mass production because its reliability cannot be guaranteed after the on-chip debug function has been used, given the issue of the number of times the flash memory can be rewritten. NEC Electronics does not accept complaints concerning this product.

Absolute Maximum Ratings (T_A = 25°C) (1/2)

Parameter	Symbol	Conditions		Ratings	Unit
Supply voltage	V _{DD}			-0.3 to +6.5	V
	EV _{DD}			-0.3 to +6.5	V
	V _{SS}			-0.3 to +0.3	V
	EV _{SS}			-0.3 to +0.3	V
	AV _{REF}			-0.3 to V _{DD} + 0.3 ^{Note}	V
	AV _{SS}			-0.3 to +0.3	V
Input voltage	V _{I1}	P00 to P06, P10 to P17, P20 to P27, P30 to P33, P40 to P47, P50 to P57, P60, P61, P64 to p67, P70 to P77, P120, P140 to P145, X1, X2, XT1, XT2, RESET \bar		-0.3 to V _{DD} + 0.3 ^{Note}	V
	V _{I2}	P62, P63	N-ch open drain	-0.3 to +13	V
Output voltage	V _O			-0.3 to V _{DD} + 0.3 ^{Note}	V
Analog input voltage	V _{AN}			AV _{SS} - 0.3 to AV _{REF} + 0.3 ^{Note} and -0.3 to V _{DD} + 0.3 ^{Note}	V
Output current, high	I _{OH}	Per pin		-10	mA
		Total of all pins -60 mA	P00 to P06, P40 to P47, P50 to P57, P64 to P67, P70 to P77, P142 to P145	-30	mA
			P10 to P17, P30 to P33, P120, P130, P140, P141	-30	mA

Note Must be 6.5 V or lower.

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

Absolute Maximum Ratings (T_A = 25°C) (2/2)

Parameter	Symbol	Conditions		Ratings	Unit
Output current, low	I _{OL}	Per pin	P00 to P06, P10 to P17, P30 to P33, P40 to P47, P50 to P57, P64 to P67, P70 to P77, P120, P130, P140 to P145	20	mA
			P60 to P63	30	
		Total of all pins 70 mA	P00 to P06, P40 to P47, P50 to P57, P60, P61, P64 to P67, P70 to P77, P142 to P145	35	mA
			P10 to P17, P30 to P33, P62, P63, P120, P130, P140, P141	35	
Operating ambient temperature	T _A	In normal operation mode	-40 to +85	°C	
		In flash memory programming mode	-10 to +65		
Storage temperature	T _{stg}	In flash memory blank state	-65 to +150	°C	
		In flash memory programmed state	-40 to +125		

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

High-Speed System Clock (Crystal/Ceramic) Oscillator Characteristics

(TA = -40 to +85°C, 2.5 V ≤ VDD = EVDD ≤ 5.5 V, 2.5 V ≤ AVREF ≤ VDD, VSS = EVSS = AVSS = 0 V)

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Ceramic resonator		Oscillation frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.5 V ≤ V _{DD} < 3.0 V	2.0		5.0	
Crystal resonator		Oscillation frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.5 V ≤ V _{DD} < 3.0 V	2.0		5.0	
External clock ^{Note 2}		X1 input frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.5 V ≤ V _{DD} < 3.0 V	2.0		5.0	
		X1 input high-/low-level width (t _{xPH} , t _{xPL})	4.0 V ≤ V _{DD} ≤ 5.5 V	30		250	ns
			3.5 V ≤ V _{DD} < 4.0 V	46		250	
			3.0 V ≤ V _{DD} < 3.5 V	56		250	
			2.5 V ≤ V _{DD} < 3.0 V	96		250	

Notes 1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

2. Input a clock signal to the X1 pin and input the inverse clock signal to the X2 pin.

Cautions 1. When using the high-speed system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
- 2.** Since the CPU is started by the internal oscillation clock after reset, check the oscillation stabilization time of the high-speed system clock using the oscillation stabilization time counter status register (OSTC). Determine the oscillation stabilization time of the OSTC register and oscillation stabilization time select register (OSTS) after sufficiently evaluating the oscillation stabilization time with the resonator to be used.

Recommended Oscillator Constants

Ceramic Resonator ($T_A = -40$ to $+85^\circ\text{C}$)

Manufacturer	Part Number	SMD/Lead	Frequency (MHz)	Recommended Circuit Constants		Oscillation Voltage Range	
				C1 (pF)	C2 (pF)	MIN. (V)	MAX. (V)
Murata Mfg.	CSTCC2M00G56-R0	SMD	2.00	Internal (47)	Internal (47)	2.5	5.5
	CSTCR4M00G55-R0		4.00	Internal (39)	Internal (39)		
	CSTCR4M19G55-R0		4.194	Internal (39)	Internal (39)		
	CSTCR4M91G55-R0		4.915	Internal (39)	Internal (39)		
	CSTCR5M00G55-R0		5.00	Internal (39)	Internal (39)		
	CSTCR6M00G55-R0		6.00	Internal (39)	Internal (39)		
	CSTCE8M00G55-R0		8.00	Internal (33)	Internal (33)		
	CSTCE10M0G55-R0		10.0	Internal (33)	Internal (33)		
	CSTCE12M0G55-R0		12.0	Internal (33)	Internal (33)		
	CSTCE13M0V53-R0		13.0	Internal (15)	Internal (15)		
	CSTCE14M0V53-R0		14.0	Internal (15)	Internal (15)		
	CSTCE16M0V53-R0		16.0	Internal (15)	Internal (15)		

Caution The oscillator constants shown above are reference values based on evaluation in a specific environment by the resonator manufacturer. If it is necessary to optimize the oscillator characteristics in the actual application, apply to the resonator manufacturer for evaluation on the implementation circuit. The oscillation voltage and oscillation frequency only indicate the oscillator characteristic. Use the 78K0/KF1+ so that the internal operation conditions are within the specifications of the DC and AC characteristics.

Internal Oscillator Characteristics

 (T_A = -40 to +85°C, 2.0 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.0 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Resonator	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Internal oscillator	Oscillation frequency (f _R)		120	240	480	kHz

Subsystem Clock Oscillator Characteristics

 (T_A = -40 to +85°C, 2.0 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.0 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f _{XT}) ^{Note}		32	32.768	35	kHz
External clock		XT1 input frequency (f _{XT}) ^{Note}		32		38.5	kHz
		XT1 input high-/low-level width (t _{xTH} , t _{xTL})		12		15.6	μs

Note Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

Cautions 1. When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figure to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
2. The subsystem clock oscillator is designed as a low-amplitude circuit for reducing power consumption, and is more prone to malfunction due to noise than the high-speed system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

Remark For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

DC Characteristics (1/3)

($T_A = -40$ to $+85^\circ\text{C}$, $2.0\text{ V} \leq V_{DD} = EV_{DD} \leq 5.5\text{ V}$ ^{Note 1}, $2.0\text{ V} \leq AV_{REF} \leq V_{DD}$ ^{Note 1}, $V_{SS} = EV_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Output current, high	I _{OH}	Per pin	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		-5	mA
		Total of P10 to P17, P30 to P33, P120, P130, P140, P141	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$		-25	mA

			Internal oscillator: ON		11	30.5	μA	

- Notes**
1. When high-speed system clock is used: 2.5 V ≤ V_{DD} ≤ 5.5 V, 2.5 V ≤ AV_{REF} ≤ V_{DD}
 2. Total current flowing through the internal power supply (V_{DD}). Peripheral operation current is included (however, the current that flows through the pull-up resistors of ports is not included).
 3. I_{DD1} includes peripheral operation current.
 4. When PCC = 00H.
 5. When the high-speed system clock (crystal/ceramic) oscillator is stopped.
 6. When the internal oscillator is stopped.
 7. Including the current that flows through the AV_{REF} pin.

AC Characteristics

(1) Basic operation

($T_A = -40$ to $+85^\circ\text{C}$, $2.0\text{ V} \leq V_{DD} = EV_{DD} \leq 5.5\text{ V}^{\text{Note 1}}$, $2.0\text{ V} \leq AV_{REF} \leq V_{DD}^{\text{Note 1}}$, $V_{SS} = EV_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions			MIN.	TYP.	MAX.	Unit
Instruction cycle (minimum instruction execution time)	T_{CY}	Main system clock operation	High-speed system clock (Crystal/ceramic oscillation clock)	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$	0.125		16	μS
				$3.5\text{ V} \leq V_{DD} < 4.0\text{ V}$	0.2		16	μS
				$3.0\text{ V} \leq V_{DD} < 3.5\text{ V}$	0.238		16	μS
				$2.5\text{ V} \leq V_{DD} < 3.0\text{ V}$	0.4		16	μS
		Internal oscillation clock			4.17	8.33	33.3	μS
Subsystem clock operation					114	122	125	μS
T1000, T1010, T1001, T1011 input high-level width, low-level width	t_{TIH0} , t_{TIL0}	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$			$2/f_{sam} + 0.1^{\text{Note 2}}$			μS
		$2.7\text{ V} \leq V_{DD} < 4.0\text{ V}$			$2/f_{sam} + 0.2^{\text{Note 2}}$			μS
		$2.5\text{ V} \leq V_{DD} < 2.7\text{ V}$			$2/f_{sam} + 0.5^{\text{Note 2}}$			μS

Write data setup time	t _{WDS}		60		ns
Write data hold time	t _{WDH}		10		ns
\overline{WR} low-level width	t _{WRL1}		(1.5 + 2n)t _{cy} - 30		ns
Delay time from ASTB \downarrow to $\overline{RD}\downarrow$	t _{ASTRD}		9		ns
Delay time from ASTB \downarrow to $\overline{WR}\downarrow$	t _{ASTWR}		(2 + 2n)t _{cy} - 30		ns
Delay time from $\overline{RD}\uparrow$ to ASTB \uparrow at external fetch	t _{RDAST}		0.8t _{cy} - 30	1.2t _{cy}	ns
Hold time from $\overline{RD}\uparrow$ to address at external fetch	t _{RDADH}		0.8t _{cy} - 30	1.2t _{cy} + 60	ns
Write data output time from $\overline{RD}\uparrow$	t _{RDWD}		40		ns
Write data output time from $\overline{WR}\downarrow$	t _{WRWD}			120	ns
Hold time from $\overline{WR}\uparrow$ to address	t _{WRADH}		0.8t _{cy} - 30	1.2t _{cy} + 60	ns
Delay time from $\overline{WAIT}\uparrow$ to $\overline{RD}\uparrow$	t _{WTRD}		0.5t _{cy}	3t _{cy} + 50	ns
Delay time from $\overline{WAIT}\uparrow$ to $\overline{WR}\uparrow$	t _{WTWR}		0.5t _{cy}	3t _{cy} + 50	ns

Caution T_{cy} can only be used at 0.4 μs (MIN).

Remarks 1. t_{cy} = T_{cy}/4

2. m indicates the number of address waits. n indicates the number of data waits.

3. C_L = 100 pF (C_L indicates the load capacitance of the AD0 to AD7, A8 to A15, \overline{RD} , \overline{WR} , \overline{WAIT} , and ASTB pins.)

(3) Serial interface
 $(T_A = -40 \text{ to } +85^\circ\text{C}, 2.5 \text{ V} \leq V_{DD} = EV_{DD} \leq 5.5 \text{ V}, 2.5 \text{ V} \leq AV_{REF} \leq V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 \text{ V})$
(a) UART mode (UART6, dedicated baud rate generator output)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Transfer rate					312.5	kbps

(b) UART mode (UART0, dedicated baud rate generator output)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Transfer rate					312.5	kbps

(c) 3-wire serial I/O mode (master mode, $\overline{SCK1n}$... internal clock output)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{SCK1n}$ cycle time	t_{KCY1}	$4.0 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$	200			ns
		$3.3 \text{ V} \leq V_{DD} < 4.0 \text{ V}$	240			ns
		$2.7 \text{ V} \leq V_{DD} < 3.3 \text{ V}$	400			ns
		$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$	800			ns
$\overline{SCK1n}$ high-/low-level width	$t_{KH1},$ t_{KL1}	$2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$	$t_{KCY1}/2-10$			ns
		$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$	$t_{KCY1}/2-50$			ns
SI1n setup time (to $\overline{SCK1n}\uparrow$)	t_{SIK1}	$2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$	30			ns
		$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$	70			ns
SI1n hold time (from $\overline{SCK1n}\uparrow$)	t_{KSI1}	$2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$	30			ns
		$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$	70			ns
Delay time from $\overline{SCK1n}\downarrow$ to SO1n output	t_{KSO1}	$C = 100 \text{ pF}^{\text{Note}}$	$2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$		30	ns
			$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$		120	ns

Note C is the load capacitance of the $\overline{SCK1n}$ and SO1n output lines.

(d) 3-wire serial I/O mode (slave mode, $\overline{SCK1n}$... external clock input)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{SCK1n}$ cycle time	t_{KCY2}	$2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$	400			ns
		$2.5 \text{ V} \leq V_{DD} < 2.7 \text{ V}$	800			ns
$\overline{SCK1n}$ high-/low-level width	$t_{KH2},$ t_{KL2}		$t_{KCY2}/2$			ns
SI1n setup time (to $\overline{SCK1n}\uparrow$)	t_{SIK2}		80			ns
SI1n hold time (from $\overline{SCK1n}\uparrow$)	t_{KSI2}		50			ns
Delay time from $\overline{SCK1n}\downarrow$ to SO1n output	t_{KSO2}	$C = 100 \text{ pF}^{\text{Note}}$			120	ns

Note C is the load capacitance of the SO1n output line.

Remark n = 0, 1

(e) 3-wire serial I/O mode with automatic transmit/receive function ($\overline{\text{SCKA0}}$... internal clock output)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
$\overline{\text{SCKA0}}$ cycle time	t_{CY3}	$4.0 \text{ V} \leq V_{\text{DD}} \leq 5.5 \text{ V}$	600			ns
		$2.7 \text{ V} \leq V_{\text{DD}} < 4.0 \text{ V}$	1200			ns

A/D Converter Characteristics

 (T_A = -40 to +85°C, 2.5 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.5 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Resolution			10	10	10	bit
Overall error ^{Notes 1, 2}		4.0 V ≤ AV _{REF} ≤ 5.5 V		±0.2	±0.4	%FSR
		2.7 V ≤ AV _{REF} < 4.0 V		±0.3	±0.6	%FSR
		2.5 V ≤ AV _{REF} < 2.7 V		±0.6	±1.2	%FSR
Conversion time	t _{CONV}	4.0 V ≤ AV _{REF} ≤ 5.5 V	14		100	μs
		2.7 V ≤ AV _{REF} < 4.0 V	17		100	μs
		2.5 V ≤ AV _{REF} < 2.7 V	48		100	μs
Zero-scale error ^{Notes 1, 2}		4.0 V ≤ AV _{REF} ≤ 5.5 V			±0.4	%FSR
		2.7 V ≤ AV _{REF} < 4.0 V			±0.6	%FSR
		2.5 V ≤ AV _{REF} < 2.7 V			±1.2	%FSR
Full-scale error ^{Notes 1, 2}		4.0 V ≤ AV _{REF} ≤ 5.5 V			±0.4	%FSR
		2.7 V ≤ AV _{REF} < 4.0 V			±0.6	%FSR
		2.5 V ≤ AV _{REF} < 2.7 V			±1.2	%FSR
Integral non-linearity error ^{Note 1}		4.0 V ≤ AV _{REF} ≤ 5.5 V			±2.5	LSB
		2.7 V ≤ AV _{REF} < 4.0 V			±4.5	LSB
		2.5 V ≤ AV _{REF} < 2.7 V			±8.5	LSB
Differential non-linearity error ^{Note 1}		4.0 V ≤ AV _{REF} ≤ 5.5 V			±1.5	LSB
		2.7 V ≤ AV _{REF} < 4.0 V			±2.0	LSB
		2.5 V ≤ AV _{REF} < 2.7 V			±3.5	LSB
Analog input voltage	V _{AIN}		AV _{SS}		AV _{REF}	V

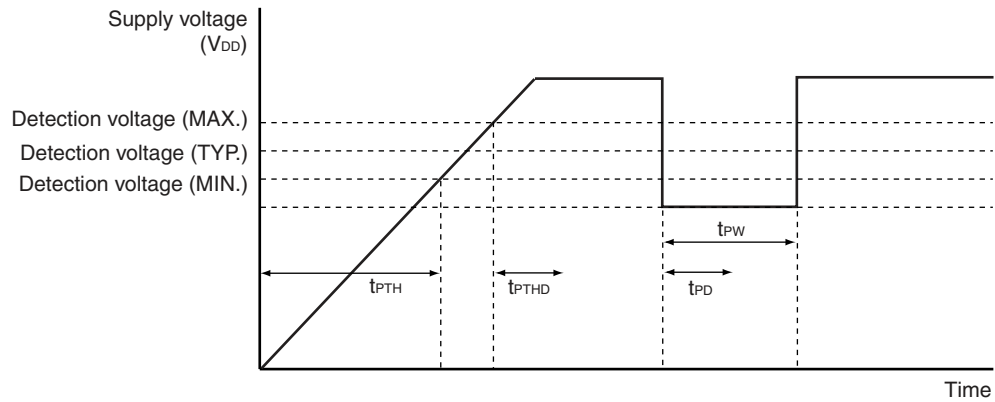

- Notes**
1. Excludes quantization error (±1/2 LSB).
 2. This value is indicated as a ratio (%FSR) to the full-scale value.

POC Circuit Characteristics ($T_A = -40$ to $+85^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Detection voltage	V_{POC}		2.0	2.1	2.2	V
Power supply rise time	t_{PTH}	$V_{DD}: 0\text{ V} \rightarrow 2.0\text{ V}$	0.0015			ms
Response delay time 1 ^{Note 1}	t_{PTHD}	When power supply rises, after reaching detection voltage (MAX.)			3.0	ms
Response delay time 2 ^{Note 2}	t_{PD}	When V_{DD} falls			1.0	ms
Minimum pulse width	t_{PW}		0.2			ms

- Notes**
1. Time required from voltage detection to reset release.
 2. Time required from voltage detection to internal reset output.

POC Circuit Timing

LVI Circuit Characteristics ($T_A = -40$ to $+85^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Detection voltage	V_{LVI0}		4.1	4.3	4.5	V
	V_{LVI1}		3.9	4.1	4.3	V
	V_{LVI2}		3.7	3.9	4.1	V
	V_{LVI3}		3.5	3.7	3.9	V
	V_{LVI4}		3.3	3.5	3.7	V
	V_{LVI5}		3.15	3.3	3.45	V
	V_{LVI6}		2.95	3.1	3.25	V
	V_{LVI7}		2.7	2.85	3.0	V
	V_{LVI8}		2.5	2.6	2.7	V
	V_{LVI9}		2.25	2.35	2.45	V
Response time ^{Note 1}	t_{LD}			0.2	2.0	ms
Minimum pulse width	t_{LW}		0.2			ms
Operation stabilization wait time ^{Note 2}	t_{LWAIT}			0.1	0.2	ms

- Notes**
- Time required from voltage detection to interrupt output or internal reset output.
 - Time required from setting LVION to 1 to operation stabilization.

- Remarks**
- $V_{LVI0} > V_{LVI1} > V_{LVI2} > V_{LVI3} > V_{LVI4} > V_{LVI5} > V_{LVI6} > V_{LVI7} > V_{LVI8} > V_{LVI9}$
 - $V_{POC} < V_{LVI_m}$ ($m = 0$ to 9)

LVI Circuit Timing

Data Memory STOP Mode Low Supply Voltage Data Retention Characteristics ($T_A = -40$ to $+85^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data retention supply voltage	V_{DDDR}		2.0		5.5	V
Release signal set time	t_{SREL}		0			μs

Flash Memory Programming Characteristics

($T_A = -10$ to $+65^\circ\text{C}$, $2.7\text{ V} \leq V_{DD} \leq 5.5\text{ V}$, $2.7\text{ V} \leq AV_{REF} \leq V_{DD}$, $V_{SS} = 0\text{ V}$)

Basic characteristics

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
V_{DD} supply current	I_{DD}	$f_{XP} = 16\text{ MHz}$, $V_{DD} = 5.5\text{ V}$			35	mA
Unit erase time ^{Note 1}	T_{erass}			10		ms
Erase time ^{Note 2}	All blocks	T_{eraca}		0.01	2.55	s
	Block unit	T_{erasa}		0.01	2.55	s
Write time	T_{wrwa}			50	500	μs
Number of rewrites per chip ^{Note 3}	C_{erwr}	1 erase + 1 write after erase = 1 rewrite ^{Note 4}			100	Times

- Notes**
1. Time required for one erasure execution
 2. The total time for repetition of the unit erase time (255 times max.) until the data is erased completely. Note that the prewrite time and the erase verify time (writeback time) before data erasure are not included.
 3. Number of rewrites per block
 4. If a block erasure is executed after word units of data are written 512 times to a block (2 KB), it is considered as one rewrite. Overwriting the same address without erasing the data in it is prohibited.

CHAPTER 31 ELECTRICAL SPECIFICATIONS ((A1) GRADE PRODUCTS)

Target product: μ PD78F0148H(A1)

Caution The external bus interface function cannot be used in (A1) grade products.

Absolute Maximum Ratings (T_A = 25°C) (1/2)

Parameter	Symbol	Conditions		Ratings	Unit
Supply voltage	V _{DD}			-0.3 to +6.5	V
	EV _{DD}			-0.3 to +6.5	V
	V _{SS}			-0.3 to +0.3	V
	EV _{SS}			-0.3 to +0.3	V
	AV _{REF}			-0.3 to V _{DD} + 0.3 ^{Note}	V
	AV _{SS}			-0.3 to +0.3	V
Input voltage	V _{I1}	P00 to P06, P10 to P17, P20 to P27, P30 to P33, P40 to P47, P50 to P57, P60, P61, P64 to p67, P70 to P77, P120, P140 to P145, X1, X2, XT1, XT2, $\overline{\text{RESET}}$		-0.3 to V _{DD} + 0.3 ^{Note}	V
	V _{I2}	P62, P63	N-ch open drain	-0.3 to +13	V
Output voltage	V _O			-0.3 to V _{DD} + 0.3 ^{Note}	V
Analog input voltage	V _{AN}			AV _{SS} - 0.3 to AV _{REF} + 0.3 ^{Note} and -0.3 to V _{DD} + 0.3 ^{Note}	V
Output current, high	I _{OH}	Per pin		-8	mA
		Total of all pins -48 mA	P00 to P06, P40 to P47, P50 to P57, P64 to P67, P70 to P77, P142 to P145	-24	mA
			P10 to P17, P30 to P33, P120, P130, P140, P141	-24	mA

Note Must be 6.5 V or lower.

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

Absolute Maximum Ratings (T_A = 25°C) (2/2)

Parameter	Symbol	Conditions		Ratings	Unit
Output current, low	I _{OL}	Per pin	P00 to P06, P10 to P17, P30 to P33, P40 to P47, P50 to P57, P64 to P67, P70 to P77, P120, P130, P140 to P145	16	mA
			P60 to P63	24	
		Total of all pins 56 mA	P00 to P06, P40 to P47, P50 to P57, P60, P61, P64 to P67, P70 to P77, P142 to P145	28	mA
			P10 to P17, P30 to P33, P62, P63, P120, P130, P140, P141	28	
Operating ambient temperature	T _A	In normal operation mode	-40 to +110	°C	
		In flash memory programming mode	-10 to +65		
Storage temperature	T _{stg}	In flash memory blank state	-65 to +150	°C	
		In flash memory programmed state	-40 to +125		

Caution Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.

Remark Unless specified otherwise, the characteristics of alternate-function pins are the same as those of port pins.

High-Speed System Clock (Crystal/Ceramic) Oscillator Characteristics

 (T_A = -40 to +110°C, 2.7 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.7 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Ceramic resonator		Oscillation frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.7 V ≤ V _{DD} < 3.0 V	2.0		5.0	
Crystal resonator		Oscillation frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.7 V ≤ V _{DD} < 3.0 V	2.0		5.0	
External clock ^{Note 2}		X1 input frequency (f _{XP}) ^{Note 1}	4.0 V ≤ V _{DD} ≤ 5.5 V	2.0		16	MHz
			3.5 V ≤ V _{DD} < 4.0 V	2.0		10	
			3.0 V ≤ V _{DD} < 3.5 V	2.0		8.38	
			2.7 V ≤ V _{DD} < 3.0 V	2.0		5.0	
		X1 input high-/low-level width (t _{xPH} , t _{xPL})	4.0 V ≤ V _{DD} ≤ 5.5 V	30		250	ns
			3.5 V ≤ V _{DD} < 4.0 V	46		250	
			3.0 V ≤ V _{DD} < 3.5 V	56		250	
			2.7 V ≤ V _{DD} < 3.0 V	96		250	

Notes 1. Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

2. Input a clock signal to the X1 pin and input the inverse clock signal to the X2 pin.

Cautions 1. When using the high-speed system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
- Do not cross the wiring with the other signal lines.
- Do not route the wiring near a signal line through which a high fluctuating current flows.
- Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
- Do not ground the capacitor to a ground pattern through which a high current flows.
- Do not fetch signals from the oscillator.

2. Since the CPU is started by the internal oscillation clock after reset, check the oscillation stabilization time of the high-speed system clock using the oscillation stabilization time counter status register (OSTC). Determine the oscillation stabilization time of the OSTC register and oscillation stabilization time select register (OSTS) after sufficiently evaluating the oscillation stabilization time with the resonator to be used.

Remark For the resonator selection and oscillator constant, users are required to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

Internal Oscillator Characteristics

 (T_A = -40 to +110°C, 2.0 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.0 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Resonator	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Internal oscillator	Oscillation frequency (f _R)		120	240	490	kHz

Subsystem Clock Oscillator Characteristics

 (T_A = -40 to +110°C, 2.7 V ≤ V_{DD} = EV_{DD} ≤ 5.5 V, 2.7 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = EV_{SS} = AV_{SS} = 0 V)

Resonator	Recommended Circuit	Parameter	Conditions	MIN.	TYP.	MAX.	Unit
Crystal resonator		Oscillation frequency (f _{XT}) ^{Note}		32	32.768	35	kHz
External clock		XT1 input frequency (f _{XT}) ^{Note}		32		38.5	kHz
		XT1 input high-/low-level width (t _{xTH} , t _{xTL})		12		15.6	μs

Note Indicates only oscillator characteristics. Refer to **AC Characteristics** for instruction execution time.

Cautions 1. When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figure to avoid an adverse effect from wiring capacitance.

- Keep the wiring length as short as possible.
 - Do not cross the wiring with the other signal lines.
 - Do not route the wiring near a signal line through which a high fluctuating current flows.
 - Always make the ground point of the oscillator capacitor the same potential as V_{SS}.
 - Do not ground the capacitor to a ground pattern through which a high current flows.
 - Do not fetch signals from the oscillator.
2. The subsystem clock oscillator is designed as a low-amplitude circuit for reducing power consumption, and is more prone to malfunction due to noise than the high-speed system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.

Remark For the resonator selection and oscillator constant, customers are requested to either evaluate the oscillation themselves or apply to the resonator manufacturer for evaluation.

DC Characteristics (1/3)
($T_A = -40$ to $+110^\circ\text{C}$, $2.7\text{ V} \leq V_{DD} = EV_{DD} \leq 5.5\text{ V}$, $2.7\text{ V} \leq AV_{REF} \leq V_{DD}$, $V_{SS} = EV_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	
Output current, high	I_{OH}	Per pin	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$			-4	mA
		Total of P10 to P17, P30 to P33, P120, P130, P140, P141	$4.0\text{ V} \leq V_{DD} \leq 5.5\text{ V}$			-20	mA

		$2.7 \text{ V} \leq V_{DD} < 3.3 \text{ V}$			20			μs

- Notes**
- When the internal oscillation clock is used, the CPU can operate at $2.0 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$. However, perform I/O operations at $2.7 \text{ V} \leq V_{DD} \leq 5.5 \text{ V}$ and $2.7 \text{ V} \leq AV_{REF} \leq V_{DD}$.
 - Selection of $f_{sam} = f_{XP}, f_{XP}/4, f_{XP}/256,$ or $f_{XP}, f_{XP}/16, f_{XP}/64$ is possible using bits 0 and 1 (PRM000, PRM001 or PRM010, PRM011) of prescaler mode registers 00 and 01 (PRM00, PRM01). Note that when selecting the TI000 or TI001 valid edge as the count clock, $f_{sam} = f_{XP}$.

T_{CY} vs. V_{DD} (Main System Clock Operation)

Remark The values indicated by the shaded section are only when the internal oscillation clock is selected.

		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			± 0.8	%FSR
Full-scale error ^{Notes 1, 2}		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			± 0.6	%FSR
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			± 0.8	%FSR
Integral non-linearity error ^{Note 1}		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			± 4.5	LSB
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			± 6.5	LSB
Differential non-linearity error ^{Note 1}		$4.0\text{ V} \leq AV_{REF} \leq 5.5\text{ V}$			± 2.0	LSB
		$2.7\text{ V} \leq AV_{REF} < 4.0\text{ V}$			± 2.5	LSB
Analog input voltage	V_{AIN}		AV_{SS}		AV_{REF}	V

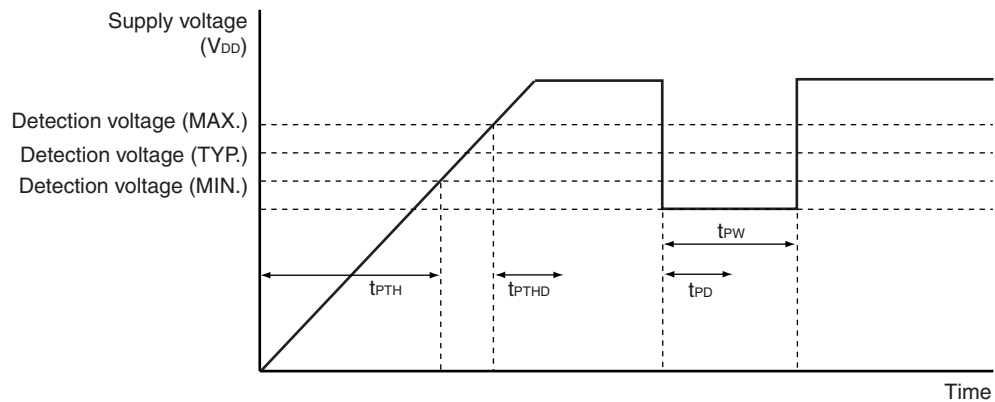

- Notes**
1. Excludes quantization error ($\pm 1/2$ LSB).
 2. This value is indicated as a ratio (%FSR) to the full-scale value.

POC Circuit Characteristics ($T_A = -40$ to $+110^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Detection voltage	V_{POC}		2.0	2.1	2.25	V
Power supply rise time	t_{PTH}	$V_{DD}: 0\text{ V} \rightarrow 2.0\text{ V}$	0.0015			ms
Response delay time 1 ^{Note 1}	t_{PTHD}	When power supply rises, after reaching detection voltage (MAX.)			3.0	ms
Response delay time 2 ^{Note 2}	t_{PD}	When V_{DD} falls			1.0	ms
Minimum pulse width	t_{PW}		0.2			ms

- Notes**
1. Time required from voltage detection to reset release.
 2. Time required from voltage detection to internal reset output.

POC Circuit Timing

LVI Circuit Characteristics ($T_A = -40$ to $+110^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Detection voltage	V_{LVI0}		4.1	4.3	4.52	V
	V_{LVI1}		3.9	4.1	4.32	V
	V_{LVI2}		3.7	3.9	4.12	V
	V_{LVI3}		3.5	3.7	3.92	V
	V_{LVI4}		3.3	3.5	3.72	V
	V_{LVI5}		3.15	3.3	3.50	V
	V_{LVI6}		2.95	3.1	3.30	V
	V_{LVI7}		2.7	2.85	3.05	V
	V_{LVI8}		2.5	2.6	2.75	V
	V_{LVI9}		2.25	2.35	2.50	V
Response time ^{Note 1}	t_{LD}			0.2	2.0	ms
Minimum pulse width	t_{LW}		0.2			ms
Operation stabilization wait time ^{Note 2}	t_{LWAIT}			0.1	0.2	ms

- Notes**
- Time required from voltage detection to interrupt output or internal reset output.
 - Time required from setting LVION to 1 to operation stabilization.

- Remarks**
- $V_{LVI0} > V_{LVI1} > V_{LVI2} > V_{LVI3} > V_{LVI4} > V_{LVI5} > V_{LVI6} > V_{LVI7} > V_{LVI8} > V_{LVI9}$
 - $V_{POC} < V_{LVI_m}$ ($m = 0$ to 9)

LVI Circuit Timing

Data Memory STOP Mode Low Supply Voltage Data Retention Characteristics ($T_A = -40$ to $+110^\circ\text{C}$)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Data retention supply voltage	V_{DDDR}		2.0		5.5	V
Release signal set time	t_{SREL}		0			μs

Flash Memory Programming Characteristics(T_A = -10 to +65°C, 2.7 V ≤ V_{DD} ≤ 5.5 V, 2.7 V ≤ AV_{REF} ≤ V_{DD}, V_{SS} = 0 V)**Basic characteristics**

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
V _{DD} supply current	I _{DD}	f _{XP} = 16 MHz, V _{DD} = 5.5 V			35	mA
Unit erase time ^{Note 1}	T _{erass}			10		ms
Erase time ^{Note 2}	All blocks	T _{eraca}		0.01	2.55	s
	Block unit	T _{erasa}		0.01	2.55	s
Write time	T _{wrwa}			50	500	μs
Number of rewrites per chip ^{Note 3}	C _{erwr}	1 erase + 1 write after erase = 1 rewrite ^{Note 4}			100	Times

- Notes**
1. Time required for one erasure execution
 2. The total time for repetition of the unit erase time (255 times max.) until the data is erased completely. Note that the prewrite time and the erase verify time (writeback time) before data erasure are not included.
 3. Number of rewrites per block
 4. If a block erasure is executed after word units of data are written 512 times to a block (2 KB), it is considered as one rewrite. Overwriting the same address without erasing the data in it is prohibited.

CHAPTER 33 RECOMMENDED SOLDERING CONDITIONS

These products should be soldered and mounted under the following recommended conditions.

For soldering methods and conditions other than those recommended below, please contact an NEC Electronics sales representative.

For technical information, see the following website.

Semiconductor Device Mount Manual (<http://www.necel.com/pkg/en/mount/index.html>)

Table 33-1. Surface Mounting Type Soldering Conditions (1/2)

(1) μ PD78F0148HGK-9EU, 78F0148HGK(A)-9EU, 78F0148HGK(A1)-9EU

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 seconds max. (at 210°C or higher), Count: 3 times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	IR35-207-3
VPS	Package peak temperature: 215°C, Time: 40 seconds max. (at 200°C or higher), Count: 3 times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	VP15-207-3
Partial heating	Pin temperature: 350°C max., Time: 3 seconds max. (per pin row)	-

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

Caution Do not use different soldering methods together (except for partial heating).

Table 33-1. Surface Mounting Type Soldering Conditions (2/2)

(2) μ PD78F0148HGC-8BT, 78F0148HGC(A)-8BT, 78F0148HGC(A1)-8BT

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 235°C, Time: 30 seconds max. (at 210°C or higher), Count: 3 times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	IR35-207-3
VPS	Package peak temperature: 215°C, Time: 40 seconds max. (at 200°C or higher), Count: 3 times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	VP15-207-3
Wave soldering	Solder bath temperature: 260°C max., Time: 10 seconds max., Count: Once, Preheating temperature: 120°C max. (package surface temperature), Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	WS60-207-1
Partial heating	Pin temperature: 350°C max., Time: 3 seconds max. (per pin row)	–

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

(3) μ PD78F0148HGK-9EU-A, 78F0148HGC-8BT-A,
 μ PD78F0148HGK(A)-9EU-A, 78F0148HGC(A)-8BT-A,
 μ PD78F0148HGK(A1)-9EU-A, 78F0148HGC(A1)-8BT-A

Soldering Method	Soldering Conditions	Recommended Condition Symbol
Infrared reflow	Package peak temperature: 260°C, Time: 60 seconds max. (at 220°C or higher), Count: Three times or less, Exposure limit: 7 days ^{Note} (after that, prebake at 125°C for 20 to 72 hours)	IR60-207-3
Partial heating	Pin temperature: 350°C max., Time: 3 seconds max. (per pin row)	–

Note After opening the dry pack, store it at 25°C or less and 65% RH or less for the allowable storage period.

Caution Do not use different soldering methods together (except for partial heating).

Remarks Products that have the part numbers suffixed by "-A" are lead-free products.

CHAPTER 34 CAUTIONS FOR WAIT

34.1 Cautions for Wait

This product has two internal system buses.

One is a CPU bus and the other is a peripheral bus that interfaces with the low-speed peripheral hardware.

Because the clock of the CPU bus and the clock of the peripheral bus are asynchronous, unexpected illegal data may be passed if an access to the CPU conflicts with an access to the peripheral hardware.

When accessing the peripheral hardware that may cause a conflict, therefore, the CPU repeatedly executes processing, until the correct data is passed.

As a result, the CPU does not start the next instruction processing but waits. If this happens, the number of execution clocks of an instruction increases by the number of wait clocks (for the number of wait clocks, refer to **Table 34-1**). This must be noted when real-time processing is performed.

34.2 Peripheral Hardware That Generates Wait

Table 34-1 lists the registers that issue a wait request when accessed by the CPU, and the number of CPU wait clocks.

Table 34-1. Registers That Generate Wait and Number of CPU Wait Clocks

Peripheral Hardware	Register	Access	Number of Wait Clocks
Watchdog timer	WDTM	Write	3 clocks (fixed)
Serial interface UART0	ASIS0	Read	1 clock (fixed)
Serial interface UART6	ASIS6	Read	1 clock (fixed)
A/D converter	ADM	Write	2 to 5 clocks ^{Note}
	ADS	Write	(when ADM.5 flag = "1")
	PFM	Write	2 to 9 clocks ^{Note}
	PFT	Write	(when ADM.5 flag = "0")
	ADCR	Read	1 to 5 clocks (when ADM.5 flag = "1") 1 to 9 clocks (when ADM.5 flag = "0")
<Calculating maximum number of wait clocks> $\{(1/f_{\text{MACRO}}) \times 2/(1/f_{\text{CPU}})\} + 1$ *The result after the decimal point is truncated if it is less than t_{CPUL} after it has been multiplied by $(1/f_{\text{CPU}})$, and is rounded up if it exceeds t_{CPUL} . f_{MACRO} : Macro operating frequency (When bit 5 (FR2) of ADM = "1": $f_x/2$, when bit 5 (FR2) of ADM = "0": $f_x/2^2$) f_{CPU} : CPU clock frequency t_{CPUL} : Low-level width of CPU clock			

Note No wait cycle is generated for the CPU if the number of wait clocks calculated by the above expression is 1.

Caution When the CPU is operating on the subsystem clock and the high-speed system clock is stopped (MCC = 1), do not access the registers listed above using an access method in which a wait request is issued.

Remark The clock is the CPU clock (f_{CPU}).

Table 34-2. RAM Accesses That Generate Wait and Number of CPU Wait Clocks

Target Area	Target Access	Number of Wait Clocks
Buffer RAM	Write	0 to 41 clocks ^{Note}
<Calculating maximum number of wait clocks> $\{(1/f_{\text{MACRO}}) \times 5/(1/f_{\text{CPU}})\} + 1$ * The result after the decimal point is truncated if it is less than t_{CPUL} after it has been multiplied by $(1/f_{\text{CPU}})$, and is rounded up if it exceeds t_{CPUL} . f_{MACRO} : Macro operating frequency f_{CPU} : CPU clock frequency t_{CPUL} : Low-level width of CPU clock		

Note No wait clock is generated if five macro operating clocks or more are inserted between writing from the macro to the buffer RAM and writing from the CPU to the buffer RAM.

34.3 Example of Wait Occurrence

<1> Watchdog timer

<On execution of MOV WDTM, A>

Number of execution clocks: 8

(5 clocks when data is written to a register that does not issue a wait (MOV sfr, A).)

<On execution of MOV WDTM, #byte>

Number of execution clocks: 10

(7 clocks when data is written to a register that does not issue a wait (MOV sfr, #byte).)

<2> Serial interface UART6

<On execution of MOV A, ASIS6>

Number of execution clocks: 6

(5 clocks when data is read from a register that does not issue a wait (MOV A, sfr).)

<3> A/D converter

Table 34-3. Number of Wait Clocks and Number of Execution Clocks on Occurrence of Wait (A/D Converter)

<On execution of MOV ADM, A; MOV ADS, A; or MOV A, ADCR>

- When $f_x = 10\text{ MHz}$, $t_{\text{CPUL}} = 50\text{ ns}$

Value of Bit 5 (FR2) of ADM Register	f_{CPU}	Number of Wait Clocks	Number of Execution Clocks
0	f_x	9 clocks	14 clocks
	$f_x/2$	5 clocks	10 clocks
	$f_x/2^2$	3 clocks	8 clocks
	$f_x/2^3$	2 clocks	7 clocks
	$f_x/2^4$	0 clocks (1 clock ^{Note})	5 clocks (6 clocks ^{Note})
1	f_x	5 clocks	10 clocks
	$f_x/2$	3 clocks	8 clocks
	$f_x/2^2$	2 clocks	7 clocks
	$f_x/2^3$	0 clocks (1 clock ^{Note})	5 clocks (6 clocks ^{Note})
	$f_x/2^4$	0 clocks (1 clock ^{Note})	5 clocks (6 clocks ^{Note})

Note On execution of MOV A, ADCR

Remark The clock is the CPU clock (f_{CPU}).

f_x : High-speed system clock oscillation frequency

t_{CPUL} : Low-level width of CPU clock

APPENDIX A DEVELOPMENT TOOLS

The following development tools are available for the development of systems that employ the 78K0/KF1+. Figure A-1 shows the development tool configuration.

- **Support for PC98-NX series**

Unless otherwise specified, products supported by IBM PC/AT™ compatibles are compatible with PC98-NX series computers. When using PC98-NX series computers, refer to the explanation for IBM PC/AT compatibles.

- **Windows™**

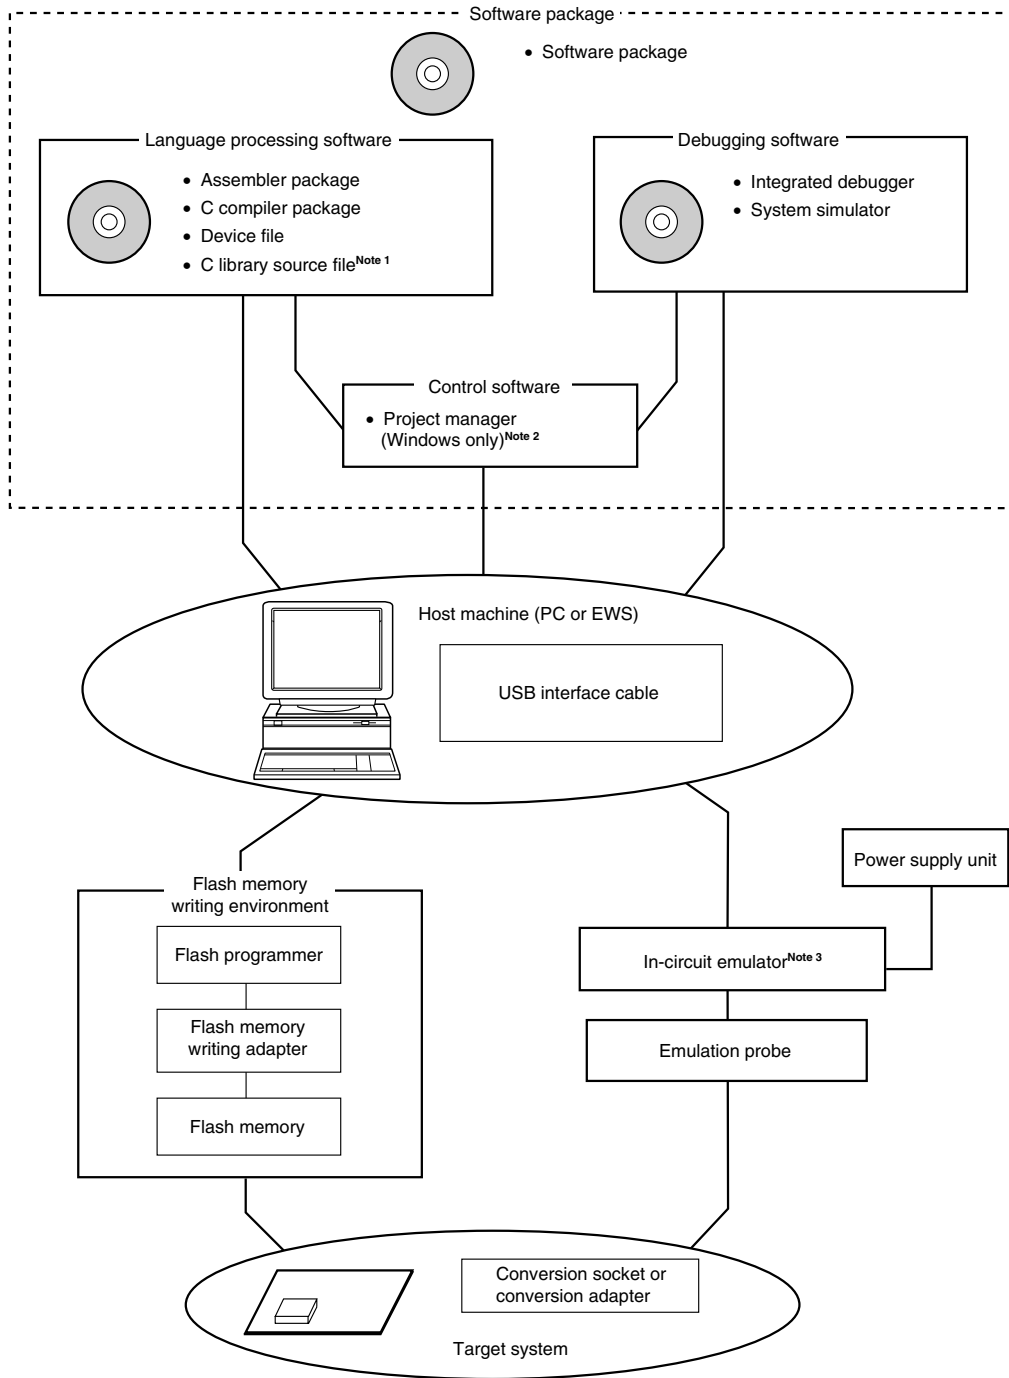

Unless otherwise specified, "Windows" means the following OSs.

- Windows 3.1
- Windows 95
- Windows 98
- Windows NT™ Ver 4.0
- Windows 2000
- Windows XP

Caution For the development tools of the 78K0/KF1+, contact an NEC Electronics sales representative.

Figure A-1. Development Tool Configuration (1/2)

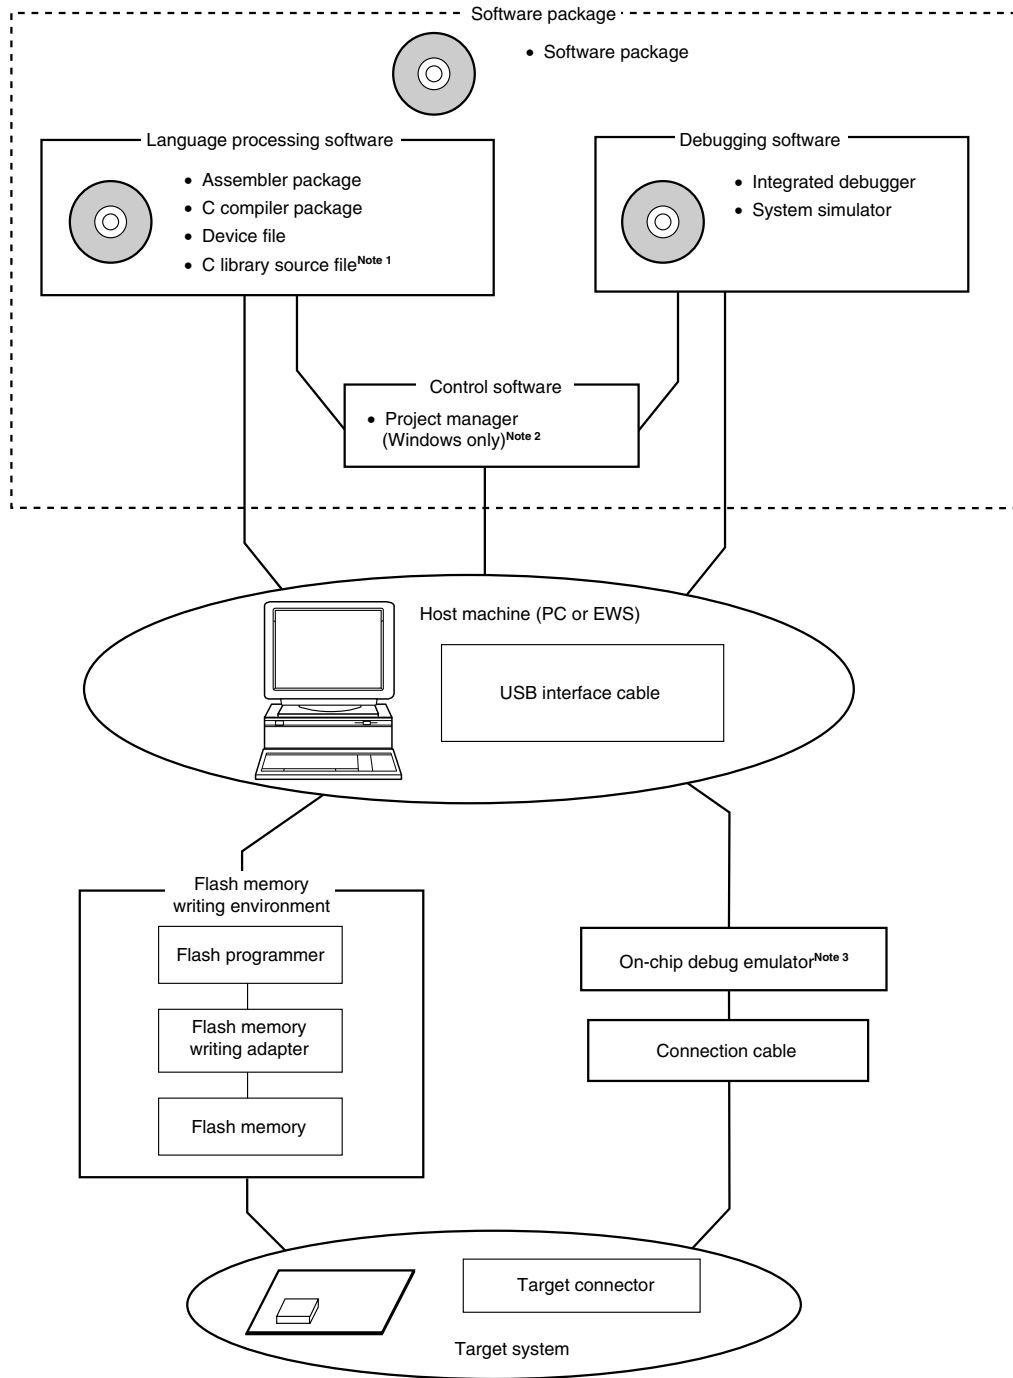

• When using the in-circuit emulator QB-78K0KX1H

- Notes**
1. The C library source file is not included in the software package.
 2. The project manager PM plus is included in the assembler package. PM plus is only used for Windows.
 3. In-circuit emulator QB-78K0KX1H is supplied with integrated debugger ID78K0-QB, flash memory programmer PG-FPL, power supply unit, and USB interface cable. Any other products are sold separately.

Figure A-1. Development Tool Configuration (2/2)

- When using the on-chip debug emulator QB-78K0MINI

- Notes**
1. The C library source file is not included in the software package.
 2. The project manager PM plus is included in the assembler package. PM plus is only used for Windows.
 3. On-chip debug emulator QB-78K0MINI is supplied with integrated debugger ID78K0-QB, USB interface cable, and connection cable. Any other products are sold separately.

A.1 Software Package

SP78K0 78K/0 Series software package	Development tools (software) common to the 78K/0 Series are combined in this package. Part number: μ SxxxxSP78K0
---	---

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxSP78K0

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series,	Windows (Japanese version)	CD-ROM
BB17	IBM PC/AT compatibles	Windows (English version)	

A.2 Language Processing Software

RA78K0 Assembler package	<p>This assembler converts programs written in mnemonics into object codes executable with a microcontroller.</p> <p>This assembler is also provided with functions capable of automatically creating symbol tables and branch instruction optimization.</p> <p>This assembler should be used in combination with a device file (DF780148) (sold separately).</p> <p><Precaution when using RA78K0 in PC environment></p> <p>This assembler package is a DOS-based application. It can also be used in Windows, however, by using the project manager (included in assembler package) on Windows.</p> <p>Part number: μSxxxxRA78K0</p>
CC78K0 C compiler package	<p>This compiler converts programs written in C language into object codes executable with a microcontroller.</p> <p>This compiler should be used in combination with an assembler package and device file (both sold separately).</p> <p><Precaution when using CC78K0 in PC environment></p> <p>This C compiler package is a DOS-based application. It can also be used in Windows, however, by using the project manager (included in assembler package) on Windows.</p> <p>Part number: μSxxxxCC78K0</p>
DF780148 ^{Note 1} Device file	<p>This file contains information peculiar to the device.</p> <p>This device file should be used in combination with a tool (RA78K0, CC78K0, SM+ for 78K0, and ID78K0-QB) (all sold separately).</p> <p>The corresponding OS and host machine differ depending on the tool to be used (all sold separately).</p> <p>Part number: μSxxxxDF780148</p>
CC78K/0-L ^{Note 2} C library source file	<p>This is a source file of the functions that configure the object library included in the C compiler package (CC78K0).</p> <p>This file is required to match the object library included in the C compiler package to the user's specifications.</p> <p>Part number: μSxxxxCC78K0-L</p>

- Notes**
1. The DF780148 can be used in common with the RA78K0, CC78K0, SM+ for 78K0, and ID78K0-QB.
 2. The CC78K0-L is not included in the software package (SP78K0).

Remark xxxx in the part number differs depending on the host machine and OS used.

μSxxxxRA78K0
 μSxxxxCC78K0
 μSxxxxCC78K0-L

xxxx	Host Machine	OS	Supply Medium
AB17	PC-9800 series, IBM PC/AT compatibles	Windows (Japanese version)	CD-ROM
BB17		Windows (English version)	
3P17	HP9000 series 700™	HP-UX™ (Rel. 10.10)	
3K17	SPARCstation™	SunOS™ (Rel. 4.1.4), Solaris™ (Rel. 2.5.1)	

μSxxxxDF780148

xxxx	Host Machine	OS	Supply Medium
AB13	PC-9800 series, IBM PC/AT compatibles	Windows (Japanese version)	3.5-inch 2HD FD
BB13		Windows (English version)	

A.3 Control Software

PM plus Project manager	This is control software designed to enable efficient user program development in the Windows environment. All operations used in development of a user program, such as starting the editor, building, and starting the debugger, can be performed from PM plus. <Caution> PM plus is included in the assembler package (RA78K0). It can only be used in Windows.
----------------------------	--

A.4 Flash Memory Writing Tools

Flashpro IV (part number: FL-PR4, PG-FP4) Flash programmer	Flash programmer dedicated to microcontrollers with on-chip flash memory.
PG-FPL Flash memory programmer	Flash memory programmer dedicated to microcontrollers with on-chip flash memory. Included with in-circuit emulator QB-78K0KX1H.
FA-80GK-9EU-A FA-80GC-8BT-A Flash memory writing adapter	Flash memory writing adapter used connected to the Flashpro IV. <ul style="list-style-type: none"> FA-80GK-9EU-A: For 80-pin plastic TQFP (GK-9EU type) FA-80GC-8BT-A: For 80-pin plastic QFP (GC-8BT type)

Remark FL-PR4, FA-80GK-9EU-A and FA-80GC-8BT-A are products of Naito Densai Machida Mfg. Co., Ltd.
 TEL: +81-45-475-4191 Naito Densai Machida Mfg. Co., Ltd.

A.5 Debugging Tools (Hardware)

A.5.1 When using in-circuit emulator QB-78K0KX1H

QB-78K0KX1H ^{Note} In-circuit emulator	The in-circuit emulator serves to debug hardware and software when developing application systems using the 78K0/Kx1 or 78K0/Kx1+. It supports the integrated debugger (ID78K0-QB). This emulator should be used in combination with a power supply unit and emulation probe. USB is used to connect this emulator to the host machine.
QB-144-CA-01 Check pin adapter	This adapter is used in waveform monitoring using the oscilloscope, etc.
QB-80-EP-01T Emulation probe	This is a flexible type probe used to connect the in-circuit emulator to the target system.
QB-80GK-EA-01T QB-80GC-EA-01T Exchange adapter	This adapter is used to perform the pin conversion from the in-circuit emulator to the target connector. <ul style="list-style-type: none"> • QB-80GK-EA-01T: For 80-pin plastic TQFP (GK-9EU type) • QB-80GC-EA-01T: For 80-pin plastic QFP (GC-8BT type)
QB-80GK-YS-01T QB-80GC-YS-01T Space adapter	This adapter is used to adjust the height between the target system and in-circuit emulator if required. <ul style="list-style-type: none"> • QB-80GK-YS-01T: For 80-pin plastic TQFP (GK-9EU type) • QB-80GC-YS-01T: For 80-pin plastic QFP (GC-8BT type)
QB-80GK-YQ-01T QB-80GC-YQ-01T YQ connector	This connector is used to connect the target connector to the exchange adapter. <ul style="list-style-type: none"> • QB-80GK-YQ-01T: For 80-pin plastic TQFP (GK-9EU type) • QB-80GC-YQ-01T: For 80-pin plastic QFP (GC-8BT type)
QB-80GK-HQ-01T QB-80GC-HQ-01T Mount adapter	This adapter is used to mount the target device onto the target device with socket. <ul style="list-style-type: none"> • QB-80GK-HQ-01T: For 80-pin plastic TQFP (GK-9EU type) • QB-80GC-HQ-01T: For 80-pin plastic QFP (GC-8BT type)
QB-80GK-NQ-01T QB-80GC-NQ-01T Target connector	This connector is used to mount the in-circuit emulator onto the target system. <ul style="list-style-type: none"> • QB-80GK-NQ-01T: For 80-pin plastic TQFP (GK-8EU type) • QB-80GC-NQ-01T: For 80-pin plastic QFP (GC-8BS type)

Note The QB-78K0KX1H is supplied with a power supply unit, USB interface cable, and flash memory programmer PG-FPL. It is also supplied with integrated debugger ID78K0-QB as control software.

Remark The package contents differ depending on the part number.

Package Contents Part Number	In-Circuit Emulator	Emulation Probe	Exchange Adapter	YQ Connector	Target Connector
QB-78K0KX1H-ZZZ	QB-78K0KX1H	Not included			
QB-78K0KX1H-T80GK		QB-80-EP-01T	QB-80GK-EA-01T	QB-80GK-YQ-01T	QB-80GK-NQ-01T
QB-78K0KX1H-T80GC			QB-80GC-EA-01T	QB-80GC-YQ-01T	QB-80GC-NQ-01T

A.5.2 When using on-chip debug emulator QB-78K0MINI

QB-78K0MINI On-chip debug emulator	The on-chip debug emulator serves to debug hardware and software when developing application systems using the 78K0/Kx1+. It supports the integrated debugger (ID78K0-QB). This emulator uses a connection cable and a USB interface cable that is used to connect the host machine.
Target connector specifications	10-pin general-purpose connector (2.54 mm pitch)

A.6 Debugging Tools (Software)

SM+ for 78K0 ^{Note} System simulator	<p>SM+ for 78K0 is Windows-based software. It is used to perform debugging at the C source level or assembler level while simulating the operation of the target system on a host machine. Use of SM+ for 78K0 allows the execution of application logical testing and performance testing on an independent basis from hardware development, thereby providing higher development efficiency and software quality. SM+ for 78K0 should be used in combination with the device file (DF780148) (sold separately).</p> <p>Part number: μSxxxxSM780000</p>
ID78K0-QB Integrated debugger	<p>This debugger supports the in-circuit emulators for the 78K0/Kx1+ Series. The ID78K0-QB is Windows-based software. It has improved C-compatible debugging functions and can display the results of tracing with the source program using an integrating window function that associates the source program, disassemble display, and memory display with the trace result. It should be used in combination with the device file (sold separately).</p> <p>Part number: μSxxxxID78K0-QB</p>

Note Under development

Remark xxxx in the part number differs depending on the host machine and OS used.

μ SxxxxSM780000

μ SxxxxID78K0-QB

xxxx	Host Machine	OS	Supply Medium

BB17	IBM PC/AT compatibles	Windows (English version)	

APPENDIX B NOTES ON TARGET SYSTEM DESIGN

This section shows areas on the target system where component mounting is prohibited and areas where there are component mounting height restrictions when using the QB-78K0KX1H.

(a) For 80-pin GK package

Figure B-1. Restricted Areas on Target System (80-Pin GK Package)

□: Exchange adapter area: Components up to 17.45 mm in height can be mounted^{Note}

■: Emulation probe tip area: Components up to 24.45 mm in height can be mounted^{Note}

Note Height can be regulated by using space adapters (each adds 2.4 mm)

(b) 80-pin GC package

Figure B-2. Restricted Areas on Target System (80-Pin GC Package)

- : Exchange adapter area: Components up to 17.45 mm in height can be mounted^{Note}
 - : Emulation probe tip area: Components up to 24.45 mm in height can be mounted^{Note}
- Note** Height can be regulated by using space adapters (each adds 2.4 mm)

APPENDIX C REGISTER INDEX

C.1 Register Index (In Alphabetical Order with Respect to Register Names)

[A]

A/D conversion result register (ADCR).....	263
A/D converter mode register (ADM)	260
Analog input channel specification register (ADS)	262
Asynchronous serial interface control register 6 (ASICL6).....	312
Asynchronous serial interface operation mode register 0 (ASIM0)	282
Asynchronous serial interface operation mode register 6 (ASIM6)	306
Asynchronous serial interface reception error status register 0 (ASIS0)	284
Asynchronous serial interface reception error status register 6 (ASIS6)	308
Asynchronous serial interface transmission status register 6 (ASIF6)	309
Automatic data transfer address count register 0 (ADTC0).....	360
Automatic data transfer address point specification register 0 (ADTP0)	365
Automatic data transfer interval specification register 0 (ADTI0).....	367

[B]

Baud rate generator control register 0 (BRGC0)	285
Baud rate generator control register 6 (BRGC6)	311

[C]

Capture/compare control register 00 (CRC00).....	156
Capture/compare control register 01 (CRC01).....	156
Clock monitor mode register (CLM)	449
Clock output selection register (CKS)	254
Clock selection register 6 (CKSR6).....	310

[D]

Divisor selection register 0 (BRGCA0)	365
---	-----

[E]

8-bit timer compare register 50 (CR50)	194
8-bit timer compare register 51 (CR51)	194
8-bit timer counter 50 (TM50).....	193
8-bit timer counter 51 (TM51).....	193
8-bit timer H carrier control register 1 (TMCYC1).....	217
8-bit timer H compare register 00 (CMP00).....	212
8-bit timer H compare register 01 (CMP01).....	212
8-bit timer H compare register 10 (CMP10).....	212
8-bit timer H compare register 11 (CMP11).....	212
8-bit timer H mode register 0 (TMHMD0)	213
8-bit timer H mode register 1 (TMHMD1)	213
8-bit timer mode control register 50 (TMC50).....	197
8-bit timer mode control register 51 (TMC51).....	197
External interrupt falling edge enable register (EGN).....	416

External interrupt rising edge enable register (EGP).....	416
[F]

APPENDIX D LIST OF CAUTIONS

This appendix lists cautions described in this document.

“Classification (hard/soft)” in table is as follows.

Hard: Cautions for microcontroller internal/external hardware

Soft: Cautions for software such as register settings or programs

(1/26)

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 1	Hard	Pin connection	–	Connect the AV _{SS} pin to V _{SS} .	p. 19 <input type="checkbox"/>
Chapter 2	Hard	Pin functions	P31	In the μ PD78F0148HD, be sure to pull the P31 pin down after reset to prevent malfunction.	p. 37 <input type="checkbox"/>
			Port4, Port5, Port6	The external bus interface function cannot be used in (A1) grade products.	p. 38 <input type="checkbox"/>
			P66	P66 can be used as an I/O port if the external wait is not used in external memory expansion mode.	p. 38 <input type="checkbox"/>
Chapter 3	Soft	Memory space	IXS: Internal expansion RAM size switching register	Because the initial value of the internal expansion RAM size switching register (IXS) is 0CH, set IXS = 0AH as the initial setting. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, set the following values to the internal memory size switching register (IMS) and IXS.	p. 46 <input type="checkbox"/>
			SFR area: Special function register	Do not access addresses to which SFRs are not assigned.	p. 50 <input type="checkbox"/>
			SP: Stack pointer	Since $\overline{\text{RESET}}$ input makes the SP contents undefined, be sure to initialize the SP before using the stack.	p. 54 <input type="checkbox"/>
Chapter 4	Soft	Port functions	P02, P03, P04	To use P02/ $\overline{\text{SO}}11$, P03/ $\overline{\text{SI}}11$, and P04/ $\overline{\text{SCK}}11$ as general-purpose ports, set serial operation mode register 11 (CSIM11) and serial clock selection register 11 (CSIC11) to the default status (00H).	p. 79 <input type="checkbox"/>
			P10, P11, P12	To use P10/ $\overline{\text{SCK}}10/\overline{\text{Tx}}D0$, P11/ $\overline{\text{SI}}10/\overline{\text{Rx}}D0$, and P12/ $\overline{\text{SO}}10$ as general-purpose ports, set serial operation mode register 10 (CSIM10) and serial clock selection register 10 (CSIC10) to the default status (00H).	p. 83 <input type="checkbox"/>
	Hard		P31	In the μ PD78F0148HD, be sure to pull the P31 pin down after reset to prevent malfunction.	p. 89 <input type="checkbox"/>
	P66		P66 can be used as an I/O port when an external wait is not used in external memory expansion mode.	p. 93 <input type="checkbox"/>	
	Soft		–	In the case of a 1-bit memory manipulation instruction, although a single bit is manipulated, the port is accessed as an 8-bit unit. Therefore, on a port with a mixture of input and output pins, the output latch contents for pins specified as input are undefined, even for bits other than the manipulated bit.	p. 108 <input type="checkbox"/>
Chapter 5	Hard	External bus interface	–	When the external wait function is not used, the $\overline{\text{WAIT}}$ pin can be used as a port in all modes.	p. 109 <input type="checkbox"/>
	Soft		MM: Memory expansion wait setting register	To control wait with external wait pin, be sure to set $\overline{\text{WAIT}}/\overline{\text{P66}}$ pin to input mode (set bit 6 (PM66) of port mode register 6 (PM6) to 1).	p. 113 <input type="checkbox"/>
	Hard			If the external wait pin is not used for wait control, the $\overline{\text{WAIT}}/\overline{\text{P66}}$ pin can be used as an I/O port pin.	p. 113 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 6	Soft	–	PCC: Processor clock control register	Be sure to clear bit 3 to 0.	p. 123 <input type="checkbox"/>
		Internal oscillator	RCM: internal oscillation mode register	Make sure that bit 1 (MCS) of the main clock mode register (MCM) is 1 before setting RSTOP.	p. 124 <input type="checkbox"/>
	Hard	Main clock	MCM: Main clock mode register	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the divided clock of the internal oscillator output (fx) is supplied to the peripheral hardware (fx = 240 kHz (TYP.)). Operation of the peripheral hardware with the internal oscillation clock cannot be guaranteed. Therefore, when the internal oscillation clock is selected as the clock supplied to the CPU, do not use peripheral hardware. In addition, stop the peripheral hardware before switching the clock supplied to the CPU from the high-speed system clock to the internal oscillation clock. Note, however, that the following peripheral hardware can be used when the CPU operates on the internal oscillation clock. <ul style="list-style-type: none"> • Watchdog timer • Clock monitor • 8-bit timer H1 when $f_{\text{H1}}/2^7$ is selected as count clock • Peripheral hardware selecting external clock as the clock source (Except when external count clock of TM0n (n = 0, 1) is selected (TI00n valid edge)) 	p. 125 <input type="checkbox"/>
		Subsystem clock		Set MCS = 1 and MCM0 = 1 before switching subsystem clock operation to high-speed system clock operation (bit 4 (CSS) of the processor clock control register (PCC) is changed from 1 to 0).	p. 125 <input type="checkbox"/>
	Soft	Main clock	MOC: Main OSC control register	Make sure that bit 1 (MCS) of the main clock mode register (MCM) is 0 before setting MSTOP.	p. 126 <input type="checkbox"/>
		Subsystem clock		To stop high-speed system clock oscillation when the CPU is operating on the subsystem clock, set bit 7 (MCC) of the processor clock control register (PCC) to 1 (setting by MSTOP is not possible).	p. 126 <input type="checkbox"/>
	Hard	Main clock	OSTC: Oscillation stabilization time counter status register	After the above time has elapsed, the bits are set to 1 in order from MOST11 and remain 1.	p. 127 <input type="checkbox"/>
				If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows. <ul style="list-style-type: none"> • Desired OSTC oscillation stabilization time ≤ Oscillation stabilization time set by OSTC The oscillation stabilization time counter counts up to the oscillation stabilization time set by OSTC. Note, therefore, that only the status up to the oscillation stabilization time set by OSTC is set to OSTC after STOP mode is released.	p. 127 <input type="checkbox"/>
				The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by $\overline{\text{RESET}}$ input or interrupt generation.	p. 127 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page		
Chapter 6	Soft	Main clock	OSTS: Oscillation stabilization time select register	To set the STOP mode when the high-speed system clock is used as the CPU clock, set OSTC before executing a STOP instruction.	p. 128 <input type="checkbox"/>		
				Before setting OSTC, confirm with OSTC that the desired oscillation stabilization time has elapsed.	p. 128 <input type="checkbox"/>		
				If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows. <ul style="list-style-type: none"> Desired OSTC oscillation stabilization time ≤ Oscillation stabilization time set by OSTC The oscillation stabilization time counter counts up to the oscillation stabilization time set by OSTC. Note, therefore, that only the status up to the oscillation stabilization time set by OSTC is set to OSTC after STOP mode is released.	p. 128 <input type="checkbox"/>		
				The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts ("a" below) regardless of whether STOP mode is released by $\overline{\text{RESET}}$ input or interrupt generation.	p. 128 <input type="checkbox"/>		
	Hard	High-speed system clock oscillator, subsystem clock oscillator	-	When using the high-speed system clock oscillator and subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the Figures 6-8 and 6-9 to avoid an adverse effect from wiring capacitance. <ul style="list-style-type: none"> Keep the wiring length as short as possible. Do not cross the wiring with the other signal lines. Do not route the wiring near a signal line through which a high fluctuating current flows. Always make the ground point of the oscillator capacitor the same potential as V_{SS}. Do not ground the capacitor to a ground pattern through which a high current flows. Do not fetch signals from the oscillator. Note that the subsystem clock oscillator is designed as a low-amplitude circuit for reducing power consumption.	p. 130 <input type="checkbox"/>		
				Prescaler	-	When the internal oscillation clock is selected as the clock supplied to the CPU, the prescaler generates various clocks by dividing the internal oscillator output ($f_x = 240 \text{ kHz (TYP.)}$).	p. 132 <input type="checkbox"/>
				Soft	Internal oscillator	-	The RSTOP setting is valid only when "Can be stopped by software" is set for the internal oscillator by the option byte.
	To calculate the maximum time, set $f_R = 120 \text{ kHz}$.	p. 140 <input type="checkbox"/>					
	Soft	CPU clock	-	Selection of the CPU clock cycle division factor (PCC0 to PCC2) and switchover from the high-speed system clock to the subsystem clock (changing CSS from 0 to 1) should not be set simultaneously. Simultaneous setting is possible, however, for selection of the CPU clock cycle division factor (PCC0 to PCC2) and switchover from the subsystem clock to the high-speed system clock (changing CSS from 1 to 0).	p. 141 <input type="checkbox"/>		
				While the CPU is operating on internal oscillator, setting the following values is prohibited. <ul style="list-style-type: none"> CSS, PCC2, PCC1, PCC0 = 0, 0, 1, 0 CSS, PCC2, PCC1, PCC0 = 0, 0, 1, 1 CSS, PCC2, PCC1, PCC0 = 0, 1, 0, 0 	p. 141 <input type="checkbox"/>

	Timer operation must be stopped before setting CRC00.	p. 156 <input type="checkbox"/>					

Chapter	Chapter Classification	Function	Details of Function	Cautions	Page		
Chapter 7	Soft	16-bit timer/event counters 00, 01 (TM00, TM01)	PRM00: Prescaler mode register 00	If the TI000 or TI010 pin is high level immediately after system reset, the rising edge is immediately detected after the rising edge or both the rising and falling edges are set as the valid edge(s) of the TI000 pin or TI010 pin to enable the operation of 16-bit timer counter 00 (TM00). Care is therefore required when pulling up the TI000 or TI010 pin. However, if the TI000 or TI010 pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.	p. 161 <input type="checkbox"/>		
				When the valid edge of the TI010 pin is used, P01 cannot be used as the timer output pin (TO00). When P01 is used as the TO00 pin, the valid edge of the TI010 pin cannot be used.	p. 161 <input type="checkbox"/>		
			PRM01: Prescaler mode register 01	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 16-bit timer/event counter 00 is not guaranteed. When an external clock is used and when the internal oscillation clock is selected and supplied to the CPU, the operation of 16-bit timer/event counter 00 is not guaranteed, either, because the internal oscillation clock is supplied as the sampling clock to eliminate noise.	p. 163 <input type="checkbox"/>		
	Soft				Always set data to PRM01 after stopping the timer operation.	p. 163 <input type="checkbox"/>	
					If the valid edge of the TI001 pin is to be set for the count clock, do not set the clear & start mode using the valid edge of the TI001 pin and the capture trigger.	p. 163 <input type="checkbox"/>	
					If the TI001 or TI011 pin is high level immediately after system reset, the rising edge is immediately detected after the rising edge or both the rising and falling edges are set as the valid edge(s) of the TI001 pin or TI011 pin to enable the operation of 16-bit timer counter 01 (TM01). Care is therefore required when pulling up the TI001 or TI011 pin. However, if the TI001 or TI011 pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.	p. 163 <input type="checkbox"/>	
					When the valid edge of the TI011 pin is used, P06 cannot be used as the timer output pin (TO01). When P06 is used as the TO01 pin, the valid edge of the TI011 pin cannot be used.	p. 163 <input type="checkbox"/>	
					CR01n: 16-bit timer capture/compare register 01n	To change the value of the duty factor (the value of the CR01n register) during operation, see Caution 2 in Figure 7-20 PPG Output Operation Timing.	p. 167 <input type="checkbox"/>
	Soft				CR00n, CR01n: 16-bit timer capture/compare registers 00n, 01n	Values in the following range should be set in CR00n and CR01n: $0000H \leq CR01n < CR00n \leq FFFFH$	p. 168 <input type="checkbox"/>
					The pulse generated through PPG output has a cycle of [CR00n setting value + 1], and a duty of [(CR01n setting value + 1)/(CR00n setting value + 1)].	p. 168 <input type="checkbox"/>	
					PPG output	In the PPG output operation, change the pulse width (rewrite CR01n) during TM0n operation using the following procedure. <1> Disable the timer output inversion operation by match of TM0n and CR01n (TOC0n4 = 0) <2> Disable the INTTM01n interrupt (TMMK01n = 1) <3> Rewrite CR01n <4> Wait for 1 cycle of the TM0n count clock <5> Enable the timer output inversion operation by match of TM0n and CR01n (TOC0n4 = 1) <6> Clear the interrupt request flag of INTTM01n (TMIF01n = 0) <7> Enable the INTTM01n interrupt (TMMK01n = 0)	p. 169 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 7	Soft	16-bit timer/event counters 00, 01 (TM00, TM01)	Pulse width measurement	To use two capture registers, set the TI00n and TI01n pins.	p. 170 <input type="checkbox"/>
			External event counter	When reading the external event counter count value, TM0n should be read.	p. 180 <input type="checkbox"/>
			One-shot pulse output: Software trigger	Do not set the OSPT0n bit to 1 while the one-shot pulse is being output. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.	p. 183 <input type="checkbox"/>
	When using the one-shot pulse output of 16-bit timer/event counter 0n with a software trigger, do not change the level of the TI00n pin or its alternate-function port pin. Because the external trigger is valid even in this case, the timer is cleared and started even at the level of the TI00n pin or its alternate-function port pin, resulting in the output of a pulse at an undesired timing.			p. 183 <input type="checkbox"/>	
	Soft		Do not set the CR00n and CR01n registers to 0000H.	p. 184 <input type="checkbox"/>	
			16-bit timer counter 0n starts operating as soon as a value other than 00 (operation stop mode) is set to the TMC0n3 and TMC0n2 bits.	p. 185 <input type="checkbox"/>	
	Hard		One-shot pulse output: External trigger	Do not input the external trigger again while the one-shot pulse is output. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.	p. 185 <input type="checkbox"/>
				Do not set the CR00n and CR01n registers to 0000H.	p. 186 <input type="checkbox"/>
	Soft		One-shot pulse output: External trigger	16-bit timer counter 0n starts operating as soon as a value other than 00 (operation stop mode) is set to the TMC0n3 and TMC0n2 bits.	p. 187 <input type="checkbox"/>
				Timer start errors	An error of up to one clock may occur in the time required for a match signal to be generated after timer start. This is because 16-bit timer counter 0n (TM0n) is started asynchronously to the count clock.
	Soft		16-bit timer capture/compare register setting	In the mode in which clear & start occurs on a match between TM0n and CR00n, set 16-bit timer capture/compare register 00n (CR00n) to other than 0000H. This means a 1-pulse count operation cannot be performed when 16-bit timer/event counter 0n is used as an external event counter.	p. 188 <input type="checkbox"/>
			Capture register data retention timing	The values of 16-bit timer capture/compare registers 00n and 01n (CR00n and CR01n) are not guaranteed after 16-bit timer/event counter 0n has been stopped.	p. 188 <input type="checkbox"/>
			Valid edge setting	Set the valid edge of the TI00n pin after setting bits 2 and 3 (TMC0n2 and TMC0n3) of 16-bit timer mode control register 0n (TMC0n) to 0, 0, respectively, and then stopping timer operation. The valid edge is set using bits 4 and 5 (ES0n0 and ES0n1) of prescaler mode register 0n (PRM0n).	p. 188 <input type="checkbox"/>
			One-shot pulse output: Software trigger	When a one-shot pulse is output, do not set the OSPT0n bit to 1 again. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.	p. 188 <input type="checkbox"/>
			One-shot pulse output: External trigger	Do not input the external trigger again while a one-shot pulse is output. To output the one-shot pulse again, wait until the current one-shot pulse output is completed.	p. 188 <input type="checkbox"/>
Hard	One-shot pulse output function	When using the one-shot pulse output of 16-bit timer/event counter 0n with a software trigger, do not change the level of the TI00n pin or its alternate function port pin. Because the external trigger is valid even in this case, the timer is cleared and started even at the level of the TI00n pin or its alternate function port pin, resulting in the output of a pulse at an undesired timing.	p. 188 <input type="checkbox"/>		

Chapter	Classification	Function	Details of Function	Caution	Page
Chapter 7	Soft	16-bit timer/event counters 00, 01 (TM00, TM01)	OVF0n flag operation	The OVF0n flag is also set to 1 in the following case. When any of the following modes is selected: the mode in which clear & start occurs on a match between TM0n and CR00n, the mode in which clear & start occurs at the TI00n valid edge, or the free-running mode → CR00n is set to FFFFH → TM0n is counted up from FFFFH to 0000H.	p. 189 <input type="checkbox"/>
				Even if the OVF0n flag is cleared before the next count clock is counted (before TM0n becomes 0001H) after the occurrence of TM0n overflow, the OVF0n flag is re-set newly so this clear is not valid.	p. 189 <input type="checkbox"/>
			Conflict operation	When a read period of the 16-bit timer capture/compare register (CR00n/CR01n) and a capture trigger input (CR00n/CR01n used as capture register) conflict, the priority is given to the capture trigger input. The data read from CR00n/CR01n is undefined.	p. 189 <input type="checkbox"/>
			Timer operation	Even if 16-bit timer counter 0n (TM0n) is read, the value is not captured by 16-bit timer capture/compare register 01n (CR01n).	p. 190 <input type="checkbox"/>
				Regardless of the CPU's operation mode, when the timer stops, the input signals to the TI00n/TI01n pins are not acknowledged.	p. 190 <input type="checkbox"/>
				The one-shot pulse output mode operates correctly only in the free-running mode and the mode in which clear & start occurs at the TI00n valid edge. In the mode in which clear & start occurs on a match between the TM0n register and CR00n register, one-shot pulse output is not possible because an overflow does not occur.	p. 190 <input type="checkbox"/>
			Capture operation	If the TI00n pin valid edge is specified as the count clock, a capture operation by the capture register specified as the trigger for the TI00n pin is not possible.	p. 190 <input type="checkbox"/>
	To ensure the reliability of the capture operation, the capture trigger requires a pulse longer than two cycles of the count clock selected by prescaler mode register 0n (PRM0n).			p. 190 <input type="checkbox"/>	
	The capture operation is performed at the falling edge of the count clock. An interrupt request input (INTTM00n/INTTM01n), however, is generated at the rise of the next count clock.			p. 190 <input type="checkbox"/>	
	Compare operation		A capture operation may not be performed for CR00n/CR01n set in compare mode even if a capture trigger has been input.	p. 190 <input type="checkbox"/>	
	Edge detection		If the TI00n or TI01n pin is high level immediately after system reset and the rising edge or both the rising and falling edges are specified as the valid edge of the TI00n or TI01n pin to enable the 16-bit timer counter 0n (TM0n) operation, a rising edge is detected immediately after the operation is enabled. Be careful therefore when pulling up the TI00n or TI01n pin. However, if the TI00n or TI01n pin is high level when re-enabling operation after the operation has been stopped, the rising edge is not detected.	p. 190 <input type="checkbox"/>	
			The sampling clock used to remove noise differs when the TI00n pin valid edge is used as the count clock and when it is used as a capture trigger. In the former case, the count clock is fx, and in the latter case the count clock is selected by prescaler mode register 0n (PRM0n). The capture operation is started only after a valid edge is detected twice by sampling, thus eliminating noise with a short pulse width.	p. 190 <input type="checkbox"/>

Chapter 8	Soft	8-bit timer/event counters 50, 51 (TM50, TM51)	CR5n: 8-bit timer compare register 5n	In the mode in which clear & start occurs on a match of TM5n and CR5n (TMC5n6 = 0), do not write other values to CR5n during operation.	p. 194 <input type="checkbox"/>
				In PWM mode, make the CR5n rewrite interval 3 count clocks of the count clock (clock selected by TCL5n) or more.	p. 194 <input type="checkbox"/>
	Hard		TCL50: Timer clock selection register 50	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer/event counter 50 is not guaranteed.	p. 195 <input type="checkbox"/>
				When rewriting TCL50 to other data, stop the timer operation beforehand.	p. 195 <input type="checkbox"/>
				Be sure to clear bits 3 to 7 to 0.	p. 195 <input type="checkbox"/>
				Soft	TCL51: Timer clock selection register 51
	When rewriting TCL51 to other data, stop the timer operation beforehand.		p. 196 <input type="checkbox"/>		
	Soft		TMC5n: 8-bit timer mode control register 5n	The settings of LVS5n and LVR5n are valid in other than PWM mode.	p. 198 <input type="checkbox"/>
				Perform <1> to <4> below in the following order, not at the same time. <1> Set TMC5n1, TMC5n6: Operation mode setting <2> Set TOE5n to enable output: Timer output enable <3> Set LVS5n, LVR5n (see Caution 1): Timer F/F setting <4> Set TCE5n Stop operation before rewriting TMC5n6.	p. 198 <input type="checkbox"/>
	Soft		Interval timer/square waveform output	Do not write other values to CR5n during operation.	pp. 200, 203 <input type="checkbox"/>
				PWM output	In PWM mode, make the CR5n rewrite interval 3 count clocks of the count clock (clock selected by TCL5n) or more.
	Soft		PWM output		When reading from CR5n between <1> and <2> in Figure 8-15, the value read differs from the actual value (read value: M, actual value of CR5n: N).
				Hard	Timer start error
	Chapter 9		Soft	8-bit timers H0, H1 (TMH0, TMH1)	CMP0n: 8-bit timer H compare register 0n
CMP1n: 8-bit timer H compare register 1n		In the PWM output mode and carrier generator mode, be sure to set CMP1n when starting the timer count operation (TMHEn = 1) after the timer count operation was stopped (TMHEn = 0) (be sure to set again even if setting the same value to CMP1n).			p. 212 <input type="checkbox"/>
Hard		TMHMD0: 8-bit timer H mode register 0	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the Internal oscillation clock, the operation of 8-bit timer H0 is not guaranteed.	p. 215 <input type="checkbox"/>	

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 9	Soft	8-bit timers H0, H1 (TMH0, TMH1)	TMHMD0: 8-bit timer H mode register 0	When TMHE0 = 1, setting the other bits of the TMHMD0 register is prohibited.	p. 215 <input type="checkbox"/>
				In the PWM output mode, be sure to set 8-bit timer H compare register 10 (CMP10) when starting the timer count operation (TMHE0 = 1) after the timer count operation was stopped (TMHE0 = 0) (be sure to set again even if setting the same value to CMP10).	p. 215 <input type="checkbox"/>
	Soft		TMHMD1: 8-bit timer H mode register 1	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the count clock is the internal oscillation clock, the operation of 8-bit timer H1 is not guaranteed (except when CKS12, CKS11, CKS10 = 1, 0, 1 ($f_{R/2^7}$)).	p. 217 <input type="checkbox"/>
				When TMHE1 = 1, setting the other bits of the TMHMD1 register is prohibited.	p. 217 <input type="checkbox"/>
				In the PWM output mode and carrier generator mode, be sure to set 8-bit timer H compare register 11 (CMP11) when starting the timer count operation (TMHE1 = 1) after the timer count operation was stopped (TMHE1 = 0) (be sure to set again even if setting the same value to CMP11).	p. 217 <input type="checkbox"/>
				When the carrier generator mode is used, set so that the count clock frequency of TMH1 becomes more than 6 times the count clock frequency of TM51.	p. 217 <input type="checkbox"/>
	Hard		PWM output	In PWM output mode, three operation clocks (signal selected using the CKSn2 to CKSn0 bits of the TMHMDn register) are required to transfer the CMP1n register value after rewriting the register.	p. 223 <input type="checkbox"/>
				Be sure to set the CMP1n register when starting the timer count operation (TMHEn = 1) after the timer count operation was stopped (TMHEn = 0) (be sure to set again even if setting the same value to the CMP1n register).	p. 223 <input type="checkbox"/>
				Make sure that the CMP1n register setting value (M) and CMP0n register setting value (N) are within the following range. 00H ≤ CMP1n (M) < CMP0n (N) ≤ FFH	p. 224 <input type="checkbox"/>
	Soft		Carrier generator mode (TMH1 only)	Do not rewrite the NRZB1 bit again until at least the second clock after it has been rewritten, or else the transfer from the NRZB1 bit to the NRZ1 bit is not guaranteed.	p. 229 <input type="checkbox"/>
				When 8-bit timer/event counter 51 is used in the carrier generator mode, an interrupt is generated at the timing of <1>. When 8-bit timer/event counter 51 is used in a mode other than the carrier generator mode, the timing of the interrupt generation differs.	p. 229 <input type="checkbox"/>
				Be sure to set the CMP11 register when starting the timer count operation (TMHE1 = 1) after the timer count operation was stopped (TMHE1 = 0) (be sure to set again even if setting the same value to the CMP11 register).	p. 231 <input type="checkbox"/>
				Set so that the count clock frequency of TMH1 becomes more than 6 times the count clock frequency of TM51.	p. 231 <input type="checkbox"/>
				Set the values of the CMP01 and CMP11 registers in a range of 01H to FFH.	p. 231 <input type="checkbox"/>
				In the carrier generator mode, three operating clocks (signal selected by CKS12 to CKS10 bits of TMHMD1 register) or more are required from when the CMP11 register value is changed to when the value is transferred to the register.	p. 231 <input type="checkbox"/>
Be sure to set the RMC1 bit before the count operation is started.				p. 231 <input type="checkbox"/>	
Chapter 10	Soft	Watch timer	WTM: Watch timer operation mode register	Do not change the count clock and interval time (by setting bits 4 to 7 (WTM4 to WTM7) of WTM) during watch timer operation.	p. 238 <input type="checkbox"/>
	Hard		Interrupt request	When operation of the watch timer and 5-bit counter is enabled by the watch timer mode control register (WTM) (by setting bits 0 (WTM0) and 1 (WTM1) of WTM to 1), the interval until the first interrupt request (INTWT) is generated after the register is set does not exactly match the specification made with bits 2 and 3 (WTM2 and WTM3) of WTM. Subsequently, however, the INTWT signal is generated at the specified intervals.	p. 241 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page		
Chapter 11	Soft	Watchdog timer	WDTM: Watchdog timer mode register	If data is written to WDTM, a wait cycle is generated. Do not write data to WDTM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 246 <input type="checkbox"/>		
				Set bits 7, 6, and 5 to 0, 1, and 1, respectively (when "Internal oscillator cannot be stopped" is selected by the option byte, other values are ignored).	p. 246 <input type="checkbox"/>		
				After reset is released, WDTM can be written only once by an 8-bit memory manipulation instruction. If writing attempted a second time, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.	p. 246 <input type="checkbox"/>		
				WDTM cannot be set by a 1-bit memory manipulation instruction.	p. 246 <input type="checkbox"/>		
				If "Internal oscillator can be stopped by software" is selected by the option byte and the watchdog timer is stopped by setting WDCS4 to 1, the watchdog timer does not resume operation even if WDCS4 is cleared to 0. In addition, the internal reset signal is not generated.	p. 246 <input type="checkbox"/>		
				WDTE: Watchdog timer enable register	If a value other than ACH is written to WDTE, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.	p. 246 <input type="checkbox"/>	
	Hard				If a 1-bit memory manipulation instruction is executed for WDTE, an internal reset signal is generated. If the source clock to the watchdog timer is stopped, however, an internal reset signal is generated when the source clock to the watchdog timer resumes operation.	p. 246 <input type="checkbox"/>	
					The value read from WDTE is 9AH (this differs from the written value (ACH)).	p. 246 <input type="checkbox"/>	
					When "Internal oscillator cannot be stopped" is selected by option byte	In this mode, operation of the watchdog timer absolutely cannot be stopped even during STOP instruction execution. For 8-bit timer H1 (TMH1), a division of the internal oscillation clock can be selected as the count source, so clear the watchdog timer using the interrupt request of TMH1 before the watchdog timer overflows after STOP instruction execution. If this processing is not performed, an internal reset signal is generated when the watchdog timer overflows after STOP instruction execution.	p. 248 <input type="checkbox"/>
					When "Internal oscillator can be stopped by software" is selected by option byte	In this mode, watchdog timer operation is stopped during HALT/STOP instruction execution. After HALT/STOP mode is released, counting is started again using the operation clock of the watchdog timer set before HALT/STOP instruction execution by WDTM. At this time, the counter is not cleared to 0 but holds its value.	p. 249 <input type="checkbox"/>
Chapter 13	Soft	A/D converter	ADM: A/D converter mode register	A/D conversion must be stopped before rewriting bits FR0 to FR2 to values other than the identical data.	p. 261 <input type="checkbox"/>		
				For the sampling time of the A/D converter and the A/D conversion start delay time, see (11) in 13.6 Cautions for A/D Converter.	p. 261 <input type="checkbox"/>		
				If data is written to ADM, a wait cycle is generated. Do not write data to ADM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 261 <input type="checkbox"/>		
	Soft			ADS: Analog input channel specification register	Be sure to clear bits 3 to 7 of ADS to 0.	p. 262 <input type="checkbox"/>	
					If data is written to ADS, a wait cycle is generated. Do not write data to ADS when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 262 <input type="checkbox"/>	

Chapter	Chapter Classification	Function	Details of Function	Cautions	Page
Chapter 13	Soft	A/D converter	ADCR: A/D conversion result register	When writing to the A/D converter mode register (ADM) and analog input channel specification register (ADS), the contents of ADCR may become undefined. Read the conversion result following conversion completion before writing to ADM and ADS. Using timing other than the above may cause an incorrect conversion result to be read.	p. 263 <input type="checkbox"/>
				If data is read from ADCR, a wait cycle is generated. Do not read data from ADCR when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 263 <input type="checkbox"/>
			PFM: Power-fail comparison mode register	If data is written to PFM, a wait cycle is generated. Do not write data to PFM when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 264 <input type="checkbox"/>
			PFT: Power-fail comparison threshold register	If data is written to PFT, a wait cycle is generated. Do not write data to PFT when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 264 <input type="checkbox"/>
			A/D conversion operation	Make sure the period of <1> to <3> is 14 μ s or more.	p. 270 <input type="checkbox"/>
				It is no problem if the order of <1> and <2> is reversed.	p. 270 <input type="checkbox"/>
				<1> can be omitted. However, do not use the first conversion result after <3> in this case.	p. 270 <input type="checkbox"/>
				The period from <4> to <7> differs from the conversion time set using bits 5 to 3 (FR2 to FR0) of ADM. The period from <6> to <7> is the conversion time set using FR2 to FR0.	p. 270 <input type="checkbox"/>
			Power-fail detection function	Make sure the period of <3> to <6> is 14 μ s or more.	p. 270 <input type="checkbox"/>
				It is no problem if order of <3>, <4>, and <5> is changed.	p. 270 <input type="checkbox"/>
				<3> must not be omitted if the power-fail function is used.	p. 270 <input type="checkbox"/>
				The period from <7> to <11> differs from the conversion time set using bits 5 to 3 (FR2 to FR0) of ADM. The period from <9> to <11> is the conversion time set using FR2 to FR0.	p. 270 <input type="checkbox"/>
	Hard		Operating current in standby mode	The A/D converter stops operating in the standby mode. At this time, the operating current can be reduced by clearing bit 7 (ADCS) of the A/D converter mode register (ADM) to 0 (see Figure 13-2).	p. 273 <input type="checkbox"/>
			ANI0 to ANI7 input range	Observe the rated range of the ANI0 to ANI7 input voltage. If a voltage of AV _{REF} or higher and AV _{SS} or lower (even in the range of absolute maximum ratings) is input to an analog input channel, the converted value of that channel becomes undefined. In addition, the converted values of the other channels may also be affected.	p. 273 <input type="checkbox"/>
	Soft		Conflict operation	Conflict between A/D conversion result register (ADCR) write and ADCR read by instruction upon the end of conversion: ADCR read has priority. After the read operation, the new conversion result is written to ADCR.	p. 273 <input type="checkbox"/>
				Conflict between ADCR write and A/D converter mode register (ADM) write or analog input channel specification register (ADS) write upon the end of conversion: ADM or ADS write has priority. ADCR write is not performed, nor is the conversion end interrupt signal (INTAD) generated.	p. 273 <input type="checkbox"/>
Hard		Noise countermeasures	To maintain the 10-bit resolution, attention must be paid to noise input to the AV _{REF} pin and pins ANI0 to ANI7. Because the effect increases in proportion to the output impedance of the analog input source, it is recommended that a capacitor be connected externally, as shown in Figure 13-19, to reduce noise.	p. 273 <input type="checkbox"/>	

Chapter	Classification	Function	Details of Function	Cautions	Page	
Chapter 13	Hard	A/D converter	ANI0/P20 to ANI7/P27	The analog input pins (ANI0 to ANI7) are also used as input port pins (P20 to P27). When A/D conversion is performed with any of ANI0 to ANI7 selected, do not access port 2 while conversion is in progress; otherwise the conversion resolution may be degraded.	p. 274 <input type="checkbox"/>	
				If a digital pulse is applied to the pins adjacent to the pins currently used for A/D conversion, the expected value of the A/D conversion may not be obtained due to coupling noise. Therefore, do not apply a pulse to the pins adjacent to the pin undergoing A/D conversion.	p. 274 <input type="checkbox"/>	
			Input impedance of ANI0 to ANI7 pins	In this A/D converter, the internal sampling capacitor is charged and sampling is performed for approx. one sixth of the conversion time. Since only the leakage current flows other than during sampling and the current for charging the capacitor also flows during sampling, the input impedance fluctuates and has no meaning. To perform sufficient sampling, however, it is recommended to make the output impedance of the analog input source 10 kΩ or lower, or connect a capacitor of around 100 pF to the ANI0 to ANI7 pins (see Figure 13-19).	p. 274 <input type="checkbox"/>	
			AV _{REF} pin input impedance	A series resistor string of several tens of kΩ is connected between the AV _{REF} and AV _{SS} pins. Therefore, if the output impedance of the reference voltage source is high, this will result in a series connection to the series resistor string between the AV _{REF} and AV _{SS} pins, resulting in a large reference voltage error.	p. 274 <input type="checkbox"/>	
	Soft			Interrupt request flag (ADIF)	The interrupt request flag (ADIF) is not cleared even if the analog input channel specification register (ADS) is changed. Therefore, if an analog input pin is changed during A/D conversion, the A/D conversion result and ADIF for the pre-change analog input may be set just before the ADS rewrite. Caution is therefore required since, at this time, when ADIF is read immediately after the ADS rewrite, ADIF is set despite the fact A/D conversion for the post-change analog input has not ended. When A/D conversion is stopped and then resumed, clear ADIF before the A/D conversion operation is resumed.	p. 275 <input type="checkbox"/>
				Conversion result just after A/D conversion start	The A/D conversion value immediately after A/D conversion starts may not fall within the rating range if the ADCS bit is set to 1 within 14 μs after the ADCE bit was set to 1, or if the ADCS bit is set to 1 with the ADCE bit = 0. Take measures such as polling the A/D conversion end interrupt request (INTAD) and removing the first conversion result.	p. 275 <input type="checkbox"/>
				A/D conversion result register (ADCR) read operation	When a write operation is performed to the A/D converter mode register (ADM) and analog input channel specification register (ADS), the contents of ADCR may become undefined. Read the conversion result following conversion completion before writing to ADM and ADS. Using a timing other than the above may cause an incorrect conversion result to be read.	p. 275 <input type="checkbox"/>
	Hard			A/D converter sampling time and A/D conversion start delay time	The A/D converter sampling time differs depending on the set value of the A/D converter mode register (ADM). The delay time exists until actual sampling is started after A/D converter operation is enabled. When using a set in which the A/D conversion time must be strictly observed, care is required for the contents shown in Figure 13-21 and Table 13-3.	p. 276 <input type="checkbox"/>
				Register generating wait cycle	Do not read data from the ADCR register and do not write data to the ADM, ADS, PFM, and PFT registers while the CPU is operating on the subsystem clock and while high-speed system clock oscillation is stopped.	p. 276 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 14	Soft	Serial interface UART0	UART mode	If clock supply to serial interface UART0 is not stopped (e.g., in the HALT mode), normal operation continues. If clock supply to serial interface UART0 is stopped (e.g., in the STOP mode), each register stops operating, and holds the value immediately before clock supply was stopped. The TXD0 pin also holds the value immediately before clock supply was stopped and outputs it. However, the operation is not guaranteed after clock supply is resumed. Therefore, reset the circuit so that POWER0 = 0, RXE0 = 0, and TXE0 = 0.	p. 278 <input type="checkbox"/>
				Set POWER0 = 1 and then set TXE0 = 1 (transmission) or RXE0 = 1 (reception) to start communication.	p. 278 <input type="checkbox"/>
				TXE0 and RXE0 are synchronized by the base clock (f _{CLK0}) set by BRGC0. To enable transmission or reception again, set TXE0 or RXE0 to 1 at least two clocks of base clock after TXE0 or RXE0 has been cleared to 0. If TXE0 or RXE0 is set within two clocks of base clock, the transmission circuit or reception circuit may not be initialized.	p. 278 <input type="checkbox"/>
			TXS0: Transmit shift register 0	Do not write the next transmit data to TXS0 before the transmission completion interrupt signal (INTST0) is generated.	p. 281 <input type="checkbox"/>
			ASIM0: Asynchronous serial interface operation mode register 0	At startup, set POWER0 to 1 and then set TXE0 to 1. To stop the operation, clear TXE0 to 0, and then clear POWER0 to 0.	p. 283 <input type="checkbox"/>
				At startup, set POWER0 to 1 and then set RXE0 to 1. To stop the operation, clear RXE0 to 0, and then clear POWER0 to 0.	p. 283 <input type="checkbox"/>
				Set POWER0 to 1 and then set RXE0 to 1 while a high level is input to the RxD0 pin. If POWER0 is set to 1 and RXE0 is set to 1 while a low level is input, reception is started.	p. 283 <input type="checkbox"/>
				TXE0 and RXE0 are synchronized by the base clock (f _{CLK0}) set by BRGC0. To enable transmission or reception again, set TXE0 or RXE0 to 1 at least two clocks of base clock after TXE0 or RXE0 has been cleared to 0. If TXE0 or RXE0 is set within two clocks of base clock, the transmission circuit or reception circuit may not be initialized.	p. 283 <input type="checkbox"/>
				Clear the TXE0 and RXE0 bits to 0 before rewriting the PS01, PS00, and CL0 bits.	p. 283 <input type="checkbox"/>
				Make sure that TXE0 = 0 when rewriting the SL0 bit. Reception is always performed with "number of stop bits = 1", and therefore, is not affected by the set value of the SL0 bit.	p. 283 <input type="checkbox"/>
				Be sure to set bit 0 to 1.	p. 283 <input type="checkbox"/>
			ASIS0: Asynchronous serial interface reception error status register 0	The operation of the PE0 bit differs depending on the set values of the PS01 and PS00 bits of asynchronous serial interface operation mode register 0 (ASIM0).	p. 284 <input type="checkbox"/>
				Only the first bit of the receive data is checked as the stop bit, regardless of the number of stop bits.	p. 284 <input type="checkbox"/>
				If an overrun error occurs, the next receive data is not written to receive buffer register 0 (RXB0) but discarded.	p. 284 <input type="checkbox"/>
				If data is read from ASIS0, a wait cycle is generated. Do not read data from ASIS0 when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 284 <input type="checkbox"/>
	BRGC0: Baud rate generator control register 0	Hard	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the base clock is the internal oscillation clock, the operation of serial interface UART0 is not guaranteed.	p. 286 <input type="checkbox"/>	
Make sure that bit 6 (TXE0) and bit 5 (RXE0) of the ASIM0 register = 0 when rewriting the MDL04 to MDL00 bits.			p. 286 <input type="checkbox"/>		
The baud rate value is the output clock of the 5-bit counter divided by 2.			p. 286 <input type="checkbox"/>		

Chapter	Chapter Classification	Function	Details of Function	Cautions	Page
Chapter 14	Soft	Serial interface UART0	POWER0, TXE0, RXE0: Bits 7, 6, and 5 of ASIM0	Clear POWER0 to 0 after clearing TXE0 and RXE0 to 0 to set the operation stop mode. To start the operation, set POWER0 to 1, and then set TXE0 and RXE0 to 1.	p. 287 <input type="checkbox"/>
			UART mode	Take relationship with the other party of communication when setting the port mode register and port register.	p. 288 <input type="checkbox"/>
			UART transmission	After transmit data is written to TXS0, do not write the next transmit data before the transmission completion interrupt signal (INTST0) is generated.	p. 291 <input type="checkbox"/>
			UART reception	Be sure to read receive buffer register 0 (RXB0) even if a reception error occurs. Otherwise, an overrun error will occur when the next data is received, and the reception error status will persist.	p. 292 <input type="checkbox"/>
				Reception is always performed with the "number of stop bits = 1". The second stop bit is ignored.	p. 292 <input type="checkbox"/>
				Be sure to read asynchronous serial interface reception error status register 0 (ASIS0) before reading RXB0.	p. 292 <input type="checkbox"/>
			Baud rate error	Keep the baud rate error during transmission to within the permissible error range at the reception destination.	p. 295 <input type="checkbox"/>
				Make sure that the baud rate error during reception satisfies the range shown in (4) Permissible baud rate range during reception.	p. 295 <input type="checkbox"/>
			Allowable baud rate range during reception	Make sure that the baud rate error during reception is within the permissible error range, by using the calculation expression shown below.	p. 297 <input type="checkbox"/>
			Chapter 15	Hard	Serial interface UART6
Soft	If clock supply to serial interface UART6 is not stopped (e.g., in the HALT mode), normal operation continues. If clock supply to serial interface UART6 is stopped (e.g., in the STOP mode), each register stops operating, and holds the value immediately before clock supply was stopped. The TXD6 pin also holds the value immediately before clock supply was stopped and outputs it. However, the operation is not guaranteed after clock supply is resumed. Therefore, reset the circuit so that POWER6 = 0, RXE6 = 0, and TXE6 = 0.	p. 299 <input type="checkbox"/>			
	If data is continuously transmitted, the communication timing from the stop bit to the next start bit is extended two operating clocks of the macro. However, this does not affect the result of communication because the reception side initializes the timing when it has detected a start bit. Do not use the continuous transmission function if UART6 is used in the LIN communication operation.	p. 299 <input type="checkbox"/>			
	TXB6: Transmit buffer register 6	Do not write data to TXB6 when bit 1 (TXBF6) of asynchronous serial interface transmission status register 6 (ASIF6) is 1.			
Do not refresh (write the same value to) TXB6 by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of asynchronous serial interface operation mode register 6 (ASIM6) are 1 or when bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 are 1).		p. 305 <input type="checkbox"/>			
Soft	ASIM6: Asynchronous serial interface operation mode register 6	At startup, set POWER6 to 1 and then set TXE6 to 1. To stop the operation, clear TXE6 to 0, and then clear POWER6 to 0.		p. 307 <input type="checkbox"/>	
		At startup, set POWER6 to 1 and then set RXE6 to 1. To stop the operation, clear RXE6 to 0, and then clear POWER6 to 0.		p. 307 <input type="checkbox"/>	
		Set POWER6 to 1 and then set RXE6 to 1 while a high level is input to the RxD6 pin. If POWER6 is set to 1 and RXE6 is set to 1 while a low level is input, reception is started.		p. 307 <input type="checkbox"/>	

Chapter	Chapter Classification	Function	Details of Function	Cautions	Page
Chapter 15	Soft	Serial interface UART6	ASIM6: Asynchronous serial interface operation mode register 6	Clear the TXE6 and RXE6 bits to 0 before rewriting the PS61, PS60, and CL6 bits.	p. 307 <input type="checkbox"/>
				Fix the PS61 and PS60 bits to 0 when UART6 is used in the LIN communication operation.	p. 307 <input type="checkbox"/>
				Make sure that TXE6 = 0 when rewriting the SL6 bit. Reception is always performed with "the number of stop bits = 1", and therefore, is not affected by the set value of the SL6 bit.	p. 307 <input type="checkbox"/>
				Make sure that RXE6 = 0 when rewriting the ISRM6 bit.	p. 307 <input type="checkbox"/>
			ASIS6: Asynchronous serial interface reception error status register 6	The operation of the PE6 bit differs depending on the set values of the PS61 and PS60 bits of asynchronous serial interface operation mode register 6 (ASIM6).	p. 308 <input type="checkbox"/>
				The first bit of the receive data is checked as the stop bit, regardless of the number of stop bits.	p. 308 <input type="checkbox"/>
				If an overrun error occurs, the next receive data is not written to receive buffer register 6 (RXB6) but discarded.	p. 308 <input type="checkbox"/>
				If data is read from ASIS6, a wait cycle is generated. Do not read data from ASIS6 when the CPU is operating on the subsystem clock and the high-speed system clock is stopped. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 308 <input type="checkbox"/>
			ASIF6: Asynchronous serial interface transmission status register 6	To transmit data continuously, write the first transmit data (first byte) to the TXB6 register. After that, be sure to check that the TXBF6 flag is "0". If so, write the next transmit data (second byte) to the TXB6 register. If data is written to the TXB6 register while the TXBF6 flag is "1", the transmit data cannot be guaranteed.	p. 309 <input type="checkbox"/>
				To initialize the transmission unit upon completion of continuous transmission, be sure to check that the TXSF6 flag is "0" after generation of the transmission completion interrupt, and then execute initialization. If initialization is executed while the TXSF6 flag is "1", the transmit data cannot be guaranteed.	p. 309 <input type="checkbox"/>
	Hard	CKSR6: Clock selection register 6	When the internal oscillation clock is selected as the clock to be supplied to the CPU, the clock of the internal oscillator is divided and supplied as the count clock. If the base clock is the internal oscillation clock, the operation of serial interface UART6 is not guaranteed.	p. 310 <input type="checkbox"/>	
			Make sure POWER6 = 0 when rewriting TPS63 to TPS60.	p. 310 <input type="checkbox"/>	
	Soft	BRGC6: Baud rate generator control register 6	Make sure that bit 6 (TXE6) and bit 5 (RXE6) of the ASIM6 register = 0 when rewriting the MDL67 to MDL60 bits.	p. 311 <input type="checkbox"/>	
			The baud rate is the output clock of the 8-bit counter divided by 2.	p. 311 <input type="checkbox"/>	
	Soft	ASICL6: Asynchronous serial interface control register 6	ASICL6 can be refreshed (the same value is written) by software during a communication operation (when bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1 or bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1). Note, however, that communication is started by the refresh operation because bit 6 (SBRT6) of ASICL6 is cleared to 0 when communication is completed (when an interrupt signal is generated).	p. 312 <input type="checkbox"/>	
			In the case of an SBF reception error, return the mode to the SBF reception mode. The status of the SBRF6 flag is held (1).	p. 313 <input type="checkbox"/>	
Before setting the SBRT6 bit, make sure that bit 7 (POWER6) and bit 5 (RXE6) of ASIM6 = 1.			p. 313 <input type="checkbox"/>		
The read value of the SBRT6 bit is always 0. SBRT6 is automatically cleared to 0 after SBF reception has been correctly completed.			p. 313 <input type="checkbox"/>		
Before setting the SBTT6 bit to 1, make sure that bit 7 (POWER6) and bit 6 (TXE6) of ASIM6 = 1.			p. 313 <input type="checkbox"/>		

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 15	Soft	Serial interface UART6	ASICL6: Asynchronous serial interface control register 6	The read value of the SBTT6 bit is always 0. SBTT6 is automatically cleared to 0 at the end of SBF transmission.	p. 313 <input type="checkbox"/>
				Before rewriting the DIR6 and TXDLV6 bits, clear the TXE6 and RXE6 bits to 0.	p. 313 <input type="checkbox"/>
				When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, set the SBTT6, SBL62, SBL61, and SBL60 bits to 0, 1, 0, 1, respectively.	p. 313 <input type="checkbox"/>
			POWER6, TXE6, RXE6: Bits 7, 6, and 5 of ASIM6	Clear POWER6 to 0 after clearing TXE6 and RXE6 to 0 to set the operation stop mode. To start the operation, set POWER6 to 1, and then set TXE6 and RXE6 to 1.	p. 315 <input type="checkbox"/>
			UART mode	Take relationship with the other party of communication when setting the port mode register and port register.	p. 316 <input type="checkbox"/>
			Parity type and operation	Fix the PS61 and PS60 bits to 0 when the device is incorporated in LIN.	p. 320 <input type="checkbox"/>
			Continuous transmission	The TXBF6 and TXSF6 flags of the ASIF6 register change from "10" to "11", and to "01" during continuous transmission. To check the status, therefore, do not use a combination of the TXBF6 and TXSF6 flags for judgment. Read only the TXBF6 flag when executing continuous transmission.	p. 322 <input type="checkbox"/>
				When the device is incorporated in a LIN, the continuous transmission function cannot be used. Make sure that asynchronous serial interface transmission status register 6 (ASIF6) is 00H before writing transmit data to transmit buffer register 6 (TXB6).	p. 322 <input type="checkbox"/>
			TXBF6 during continuous transmission: Bit 1 of ASIF6	To transmit data continuously, write the first transmit data (first byte) to the TXB6 register. Be sure to check that the TXBF6 flag is "0". If so, write the next transmit data (second byte) to the TXB6 register. If data is written to the TXB6 register while the TXBF6 flag is "1", the transmit data cannot be guaranteed.	p. 322 <input type="checkbox"/>
			TXSF6 during continuous transmission: Bit 0 of ASIF6	To initialize the transmission unit upon completion of continuous transmission, be sure to check that the TXSF6 flag is "0" after generation of the transmission completion interrupt, and then execute initialization. If initialization is executed while the TXSF6 flag is "1", the transmit data cannot be guaranteed.	p. 322 <input type="checkbox"/>
				During continuous transmission, an overrun error may occur, which means that the next transmission was completed before execution of INTST6 interrupt servicing after transmission of one data frame. An overrun error can be detected by developing a program that can count the number of transmit data and by referencing the TXSF6 flag.	p. 322 <input type="checkbox"/>
			Normal reception	Be sure to read receive buffer register 6 (RXB6) even if a reception error occurs. Otherwise, an overrun error will occur when the next data is received, and the reception error status will persist.	p. 326 <input type="checkbox"/>
				Reception is always performed with the "number of stop bits = 1". The second stop bit is ignored.	p. 326 <input type="checkbox"/>
				Be sure to read asynchronous serial interface reception error status register 6 (ASIS6) before reading RXB6.	p. 326 <input type="checkbox"/>
			Serial clock generation	Keep the baud rate error during transmission to within the permissible error range at the reception destination.	p. 332 <input type="checkbox"/>
				Make sure that the baud rate error during reception satisfies the range shown in (4) Permissible baud rate range during reception.	p. 332 <input type="checkbox"/>
Permissible baud rate range during reception	Make sure that the baud rate error during reception is within the permissible error range, by using the calculation expression shown below.	p. 334 <input type="checkbox"/>			

Chapter	Classification	Function	Details of Function	Caution	Page				
Chapter 16	Soft	Serial interfaces CSI10, CSI11	SOTB1n:	Do not access SOTB1n when CSOT1n = 1 (during serial communication).	p. 339 <input type="checkbox"/>				
			Transmit buffer register 1n	The $\overline{\text{SSI11}}$ pin can be used in the slave mode. For details of the transmission/reception operation, see 16.4.2 (2) Communication operation.	p. 339 <input type="checkbox"/>				
			SIO1n: Serial I/O shift register 1n	Do not access SIO1n when CSOT1n = 1 (during serial communication).	p. 339 <input type="checkbox"/>				
				The $\overline{\text{SSI11}}$ pin can be used in the slave mode. For details of the reception operation, see 16.4.2 (2) Communication operation.	p. 339 <input type="checkbox"/>				
	Hard	Hard	Serial operation mode register 1n	CSIM1n: Serial operation mode register 1n	Be sure to clear bit 5 to 0.	p. 340 <input type="checkbox"/>			
				CSIC10: Serial clock selection register 10	When the internal oscillation clock is selected as the clock supplied to the CPU, the clock of the internal oscillator is divided and supplied as the serial clock. At this time, the operation of serial interface CSI10 is not guaranteed.	p. 343 <input type="checkbox"/>			
					Do not write to CSIC10 while CSIE10 = 1 (operation enabled).	p. 343 <input type="checkbox"/>			
					To use P10/SCK10/TxD0, P11/SI10/RxD0, and P12/SO10 as general-purpose ports, set CSIC10 in the default status (00H).	p. 343 <input type="checkbox"/>			
					The phase type of the data clock is type 1 after reset.	p. 343 <input type="checkbox"/>			
				CSIC11: Serial clock selection register 11	When the internal oscillation clock is selected as the clock supplied to the CPU, the clock of the internal oscillator is divided and supplied as the serial clock. At this time, the operation of serial interface CSI11 is not guaranteed.	p. 344 <input type="checkbox"/>			
					Do not write to CSIC11 while CSIE11 = 1 (operation enabled).	p. 344 <input type="checkbox"/>			
					To use P02/SO11, P03/SI11, and P04/SCK11 as general-purpose ports, set CSIC11 in the default status (00H).	p. 344 <input type="checkbox"/>			
					The phase type of the data clock is type 1 after reset.	p. 344 <input type="checkbox"/>			
				Soft	Soft	3-wire serial I/O mode	Take relationship with the other party of communication when setting the port mode register and port register.	p. 347 <input type="checkbox"/>	
							Communication operation	Do not access the control register and data register when CSOT1n = 1 (during serial communication).	p. 350 <input type="checkbox"/>
								When using serial interface CSI11, wait for the duration of at least one clock before the clock operation is started to change the level of the $\overline{\text{SSI11}}$ pin in the slave mode; otherwise, malfunctioning may occur.	p. 350 <input type="checkbox"/>
SO1n output	If a value is written to TRMD1n, DAP1n, and DIR1n, the output value of SO1n changes.	p. 356 <input type="checkbox"/>							
Chapter 17	Soft	Serial interface CSIA0	SIOA0: Serial I/O shift register 0	A communication operation is started by writing to SIOA0. Consequently, when transmission is disabled (bit 3 (TXEA0) of CSIMA0 = 0), write dummy data to the SIOA0 register to start the communication operation, and then perform a receive operation.	p. 360 <input type="checkbox"/>				
				Do not write data to SIOA0 while the automatic transmit/receive function is operating.	p. 360 <input type="checkbox"/>				
			CSIMA0: Serial operation mode specification register 0	When CSIAE0 = 0, the buffer RAM cannot be accessed.	p. 361 <input type="checkbox"/>				
				When CSIAE0 is changed from 1 to 0, the registers and bits mentioned in Note above are asynchronously initialized. To set CSIAE0 = 1 again, be sure to re-set the initialized registers.	p. 361 <input type="checkbox"/>				
				When CSIAE0 is re-set to 1 after CSIAE0 is changed from 1 to 0, it is not guaranteed that the value of the buffer RAM will be retained.	p. 361 <input type="checkbox"/>				
			CSIS0: Serial status register 0	Be sure to clear bit 7 to 0.	p. 362 <input type="checkbox"/>				

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 17	Soft	Serial interface CSIA0	CSIS0: Serial status register 0	When TSF0 is 1, rewriting serial operation mode specification register 0 (CSIMA0), serial status register 0 (CSIS0), divisor selection register 0 (BRGCA0), automatic data transfer address point specification register 0 (ADTP0), automatic data transfer interval specification register 0 (ADTI0), and serial I/O shift register 0 (SIOA0) are prohibited. However, these registers can be read and re-written to the same value. In addition, the buffer RAM can be rewritten during transfer.	p. 363 <input type="checkbox"/>
			CSIT0: Serial trigger register 0	Even if ATSTP0 or ATSTA0 is set to 1, automatic transfer cannot be started/stopped until 1-byte transfer is complete.	p. 364 <input type="checkbox"/>
				ATSTP0 and ATSTA0 change to 0 automatically after the interrupt signal INTACSI is generated.	p. 364 <input type="checkbox"/>
				After automatic data transfer is stopped, the data address when the transfer stopped is stored in automatic data transfer address count register 0 (ADTC0). However, since no function to restart automatic data transfer is incorporated, when transfer is stopped by setting ATSTP0 = 1, start automatic data transfer by ATSTA0 after re-setting the registers.	p. 364 <input type="checkbox"/>
			ADTP0: Automatic data transfer address point specification register 0	Be sure to clear bits 7 to 5 to 0.	p. 365 <input type="checkbox"/>
			ADTI0: Automatic data transfer interval specification register 0	Because the setting of bit 5 (STBE0) and bit 4 (BUSYE0) of serial status register 0 (CSIS0) takes priority over the ADTI0 setting, the interval time based on the setting of STBE0 and BUSYE0 is generated even when ADTI0 is cleared to 00H.	p. 367 <input type="checkbox"/>
			3-wire serial I/O mode	Take relationship with the other party of communication when setting the port mode register and port register.	pp. 370, 377 <input type="checkbox"/>
			1-byte transmission/reception	The SOA0 pin becomes low level by an SIOA0 write.	p. 372 <input type="checkbox"/>
			Communication start	If CSIAE0 is set to 1 after data is written to SIOA0, communication does not start.	p. 374 <input type="checkbox"/>
			Automatic transmission/reception mode	A wait state may be generated when data is written to the buffer RAM. For details, see CHAPTER 34 CAUTIONS FOR WAIT.	p. 375 <input type="checkbox"/>
				Because, in the automatic transmission/reception mode, the automatic transmit/receive function writes/reads data to/from the internal buffer RAM after 1-byte transmission/reception, an interval is inserted until the next transmission/reception. As the buffer RAM write/read is performed at the same time as CPU processing, the interval is dependent upon the value of automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see (5) Automatic transmit/receive interval time).	p. 378 <input type="checkbox"/>
				If an access to the buffer RAM by the CPU conflicts with an access to the buffer RAM by serial interface CSIA0 during the interval period, the interval time specified by automatic data transfer interval specification register 0 (ADTI0) may be extended.	pp. 378, 382, 386 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 17	Soft	Serial interface CSIA0	Automatic transmission mode	Because, in the automatic transmission mode, the automatic transmit/receive function reads data from the internal buffer RAM after 1-byte transmission, an interval is inserted until the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon the value of automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see (5) Automatic transmit/receive interval time).	p. 382 <input type="checkbox"/>
			Repeat transmission mode	Because, in the repeat transmission mode, a read is performed on the buffer RAM after the transmission of one byte, the interval is included in the period up to the next transmission. As the buffer RAM read is performed at the same time as CPU processing, the interval is dependent upon automatic data transfer interval specification register 0 (ADTI0) and the set values of bits 5 and 4 (STBE0, BUSYE0) of serial status register 0 (CSIS0) (see (5) Automatic transmit/receive interval time).	p. 386 <input type="checkbox"/>
			Automatic transmission/reception suspension and restart	If the HALT instruction is executed during automatic transmission/reception, communication is suspended and the HALT mode is set if during 8-bit data communication. When the HALT mode is cleared, automatic transmission/reception is restarted from the suspended point. When suspending automatic transmission/reception, do not change the operating mode to 3-wire serial I/O mode while TSF0 = 1.	p. 391 <input type="checkbox"/> p. 391 <input type="checkbox"/>
			Busy control	Busy control cannot be used simultaneously with the interval time control function of automatic data transfer interval specification register 0 (ADTI0).	p. 392 <input type="checkbox"/>
			Busy & strobe control	When TSF0 is cleared, the SOA0 pin goes low.	p. 394 <input type="checkbox"/>
			Chapter 18	Soft	Multiplier/divider
SDR0 is reset when the operation is started (when DMUE is set to 1).	p. 399 <input type="checkbox"/>				
MDA0H, MDA0L: Multiplication/division data register A0	MDA0H is cleared to 0 when an operation is started in the multiplication mode (when multiplier/divider control register 0 (DMUC0) is set to 81H).	p. 399 <input type="checkbox"/>			
	Do not change the value of MDA0 during operation processing (while bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is 1). Even in this case, the operation is executed, but the result is undefined. The value read from MDA0 during operation processing (while DMUE is 1) is not guaranteed.	p. 399 <input type="checkbox"/> p. 399 <input type="checkbox"/>			
MDB0: Multiplication/division data register B0	Do not change the value of MDB0 during operation processing (while bit 7 (DMUE) of multiplier/divider control register 0 (DMUC0) is 1). Even in this case, the operation is executed, but the result is undefined.	p. 400 <input type="checkbox"/>			
	Do not clear MDB0 to 0000H in the division mode. If set, undefined operation results are stored in MDA0 and SDR0.	p. 400 <input type="checkbox"/>			
DMUC: Multiplier/divider control register 0	If DMUE is cleared to 0 during operation processing (when DMUE is 1), the operation result is not guaranteed. If the operation is completed while the clearing instruction is being executed, the operation result is guaranteed, provided that the interrupt flag is set.	p. 401 <input type="checkbox"/>			
	Do not change the value of DMUSEL0 during operation processing (while DMUE is 1). If it is changed, undefined operation results are stored in multiplication/division data register A0 (MDA0) and remainder data register 0 (SDR0).	p. 401 <input type="checkbox"/>			

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 18	Soft	Multiplier/divider	DMUC: Multiplier/divider control register 0	If DMUE is cleared to 0 during operation processing (while DMUE is 1), the operation processing is stopped. To execute the operation again, set multiplication/division data register A0 (MDA0), multiplication/division data register B0 (MDB0), and multiplier/divider control register 0 (DMUC0), and start the operation (by clearing DMUE to 1).	p. 401 <input type="checkbox"/>
Chapter 19	Soft	Interrupt	IF1H: Interrupt request flag register	Be sure to clear bits 4 to 7 of IF1H to 0.	p. 412 <input type="checkbox"/>
			IF0L, IF0H, IF1L, IF1H: Interrupt request flag registers	When operating a timer, serial interface, or A/D converter after standby release, operate it once after clearing the interrupt request flag. An interrupt request flag may be set by noise.	p. 412 <input type="checkbox"/>
		Use the 1-bit memory manipulation instruction (CLR1) for manipulating the flag of the interrupt request flag register. A 1-bit manipulation instruction such as "IF0L.0 = 0;" and "_asm("clr1 IF0L, 0");" should be used when describing in C language, because assembly instructions after compilation must be 1-bit memory manipulation instructions (CLR1). If an 8-bit memory manipulation instruction "IF0L & = 0xfe;" is described in C language, for example, it is converted to the following three assembly instructions after compilation: mov a, IF0L and a, #0FEH mov IF0L, a In this case, at the timing after "mov a, IF0L" to "mov IF0L, a", if the request flag of another bit of the identical interrupt request flag register (IF0L) is set to 1, it is cleared to 0 by "mov IF0L, a". Therefore, care must be exercised when using the 8-bit memory manipulation instruction in C language.		p. 413 <input type="checkbox"/>	
		MK1H: Interrupt mask flag register	Be sure to set bits 4, 6, and 7 of MK1H to 1. Be sure to clear bit 5 of MK1H to 0.	p. 414 <input type="checkbox"/>	
		PR1H: Priority specification flag register	Be sure to set bits 4 to 7 of PR1H to 1.	p. 415 <input type="checkbox"/>	
		EGP, EGN: External interrupt rising/falling edge enable registers	Select the port mode by clearing EGPn and EGNn to 0 because an edge may be detected when the external interrupt function is switched to the port function.	p. 416 <input type="checkbox"/>	
		Software interrupt request acknowledgement	Do not use the RETI instruction for restoring from the software interrupt.	p. 420 <input type="checkbox"/>	
		Interrupt request hold	The BRK instruction is not one of the above-listed interrupt request hold instructions. However, the software interrupt activated by executing the BRK instruction causes the IE flag to be cleared. Therefore, even if a maskable interrupt request is generated during execution of the BRK instruction, the interrupt request is not acknowledged.	p. 424 <input type="checkbox"/>	
Chapter 20	Soft	Key interrupt function	KRM: Key return mode register	If any of the KRM0 to KRM7 bits used is set to 1, set bits 0 to 7 (PU70 to PU77) of the corresponding pull-up resistor register 7 (PU7) to 1.	p. 426 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 20	Soft	Key interrupt function	KRM: Key return mode register	If KRM is changed, the interrupt request flag may be set. Therefore, disable interrupts and then change the KRM register. After that, clear the interrupt request flag and then enable interrupts.	p. 426 <input type="checkbox"/>
				The bits not used in the key interrupt mode can be used as normal ports.	p. 426 <input type="checkbox"/>
Chapter 21	Soft	Standby function	-	The RSTOP setting is valid only when “Can be stopped by software” is set for the internal oscillator by the option byte.	p. 427 <input type="checkbox"/>
				STOP mode can be used only when the CPU is operating on the high-speed system clock or internal oscillation clock. HALT mode can be used when the CPU is operating on the high-speed system clock, internal oscillation clock, or subsystem clock. However, when the STOP instruction is executed during internal oscillation clock operation, the high-speed system clock oscillator stops, but the internal oscillator does not stop.	p. 428 <input type="checkbox"/>
				When shifting to the STOP mode, be sure to stop the peripheral hardware operation before executing STOP instruction.	p. 428 <input type="checkbox"/>
	Hard		STOP mode, HALT mode	The following sequence is recommended for operating current reduction of the A/D converter when the standby function is used: First clear bit 7 (ADCS) of the A/D converter mode register (ADM) to 0 to stop the A/D conversion operation, and then execute the HALT or STOP instruction.	p. 428 <input type="checkbox"/>
				STOP mode	If the internal oscillator is operating before the STOP mode is set, oscillation of the internal oscillation clock cannot be stopped in the STOP mode. However, when the internal oscillation clock is used as the CPU clock, the CPU operation is stopped for $17/f_R$ (s) after STOP mode is released.
	Soft		OSTC: Oscillation stabilization time counter status register	After the above time has elapsed, the bits are set to 1 in order from MOST11 and remain 1.	p. 429 <input type="checkbox"/>
				If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows. <ul style="list-style-type: none"> Desired OSTC oscillation stabilization time ≤ Oscillation stabilization time set by OSTC The oscillation stabilization time counter counts only during the oscillation stabilization time set by OSTC. Therefore, note that only the statuses during the oscillation stabilization time set by OSTC are set to OSTC after STOP mode has been released.	p. 429 <input type="checkbox"/>
	Hard		OSTC: Oscillation stabilization time counter status register	The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by RESET input or interrupt generation.	p. 429 <input type="checkbox"/>
				Soft	OSTS: Oscillation stabilization time select register
	Before setting OSTC, confirm with OSTC that the desired oscillation stabilization time has elapsed		p. 430 <input type="checkbox"/>		
Hard	OSTS: Oscillation stabilization time select register	If the STOP mode is entered and then released while the internal oscillation clock is being used as the CPU clock, set the oscillation stabilization time as follows. <ul style="list-style-type: none"> Desired OSTC oscillation stabilization time ≤ Oscillation stabilization time set by OSTC The oscillation stabilization time counter counts only during the oscillation stabilization time set by OSTC. Therefore, note that only the statuses during the oscillation stabilization time set by OSTC are set to OSTC after STOP mode has been released.	p. 430 <input type="checkbox"/>		
		The wait time when STOP mode is released does not include the time after STOP mode release until clock oscillation starts (“a” below) regardless of whether STOP mode is released by RESET input or interrupt generation.	p. 430 <input type="checkbox"/>		

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 21	Soft	Standby function	STOP mode setting and operation status	Because the interrupt request signal is used to release the standby mode, if there is an interrupt source with the interrupt request flag set and the interrupt mask flag reset, the standby mode is immediately released if set. Thus, the STOP mode is reset to the HALT mode immediately after execution of the STOP instruction and the system returns to the operating mode as soon as the wait time set using the oscillation stabilization time select register (OSTS) has elapsed.	p. 436 <input type="checkbox"/>
Chapter 22	Hard	Reset function	-	For an external reset, input a low level for 10 μ s or more to the $\overline{\text{RESET}}$ pin.	p. 440 <input type="checkbox"/>
				During reset input, the high-speed system clock and the internal oscillation clock stop oscillating.	p. 440 <input type="checkbox"/>
				When the STOP mode is released by a reset, the STOP mode contents are held during reset input. However, the port pins become high-impedance, except for P130, which is set to low-level output.	p. 440 <input type="checkbox"/>
				An LVI circuit internal reset does not reset the LVI circuit.	p. 441 <input type="checkbox"/>
	Soft	Reset timing due to watchdog timer overflow	A watchdog timer internal reset resets the watchdog timer.	p. 442 <input type="checkbox"/>	
		RESF: Reset control flag register	Do not read data by a 1-bit memory manipulation instruction.	p. 447 <input type="checkbox"/>	
Chapter 23	Soft	Clock monitor	CLM: Clock monitor mode register	Once bit 0 (CLME) is set to 1, it cannot be cleared to 0 except by $\overline{\text{RESET}}$ input or the internal reset signal.	p. 449 <input type="checkbox"/>
				If the reset signal is generated by the clock monitor, CLME is cleared to 0 and bit 1 (CLMRF) of the reset control flag register (RESF) is set to 1.	p. 449 <input type="checkbox"/>
Chapter 24	Soft	Power-on-clear circuit (POC)	Power-on-clear circuit functions	If an internal reset signal is generated in the POC circuit, the reset control flag register (RESF) is cleared to 00H.	p. 455 <input type="checkbox"/>
				The supply voltage is $V_{DD} = 2.0$ to 5.5 V when the internal oscillation clock or subsystem clock is used, but be sure to use the product in a voltage range of 2.2 to 5.5 V because the detection voltage (V_{POC}) of the POC circuit is $2.1 \text{ V} \pm 0.1 \text{ V}$.	p. 455 <input type="checkbox"/>
	Hard	Cautions for power-on-clear circuit	In a system where the supply voltage (V_{DD}) fluctuates for a certain period in the vicinity of the POC detection voltage (V_{POC}), the system may be repeatedly reset and released from the reset status. In this case, the time from release of reset to the start of the operation of the microcontroller can be arbitrarily set by taking the following action.	p. 457 <input type="checkbox"/>	
Chapter 25	Soft	Low-voltage detector (LVI)	LVIM: Low-voltage detection register	To stop LVI, follow either of the procedures below. <ul style="list-style-type: none"> • When using 8-bit memory manipulation instruction: Write 00H to LVIM. • When using 1-bit memory manipulation instruction: Clear LVION to 0. 	p. 460 <input type="checkbox"/>
				LVIS: Low-voltage detection level selection register	Be sure to clear bits 4 to 7 to 0.
			When used as reset		Clear all port pins after the supply voltage (V_{DD}) exceeds the preset detection voltage (V_{LVI}) after POC release in the (A1) grade products.
				<1> must always be executed. When LVIMK = 0, an interrupt may occur immediately after the processing in <3>.	p. 462 <input type="checkbox"/>
			If supply voltage (V_{DD}) \geq detection voltage (V_{LVI}) when LVIMD is set to 1, an internal reset signal is not generated.	p. 462 <input type="checkbox"/>	

Chapter	Classification	Function	Details of Function	Cautions	Page			
Chapter 25	Soft	Low-voltage detector (LVI)	Caution for low-voltage detector	<p>In a system where the supply voltage (V_{DD}) fluctuates for a certain period in the vicinity of the LVI detection voltage (V_{LVI}), the operation is as follows depending on how the low-voltage detector is used.</p> <p>(1) When used as reset The system may be repeatedly reset and released from the reset status. In this case, the time from release of reset to the start of the operation of the microcontroller can be arbitrarily set by taking action (a) below.</p> <p>(2) When used as interrupt Interrupt requests may be frequently generated. Take action (b) below.</p>	p. 466 <input type="checkbox"/>			
Chapter 26	Hard	Option byte	0084H/1084H	<p>Be sure to set 00H (disabling on-chip debug operation) to 0084H for products not equipped with the on-chip debug function (μPD78F0148H). Also set 00H to 1084H because 0084H and 1084H are switched at boot swapping.</p> <p>To use the on-chip debug function with a product equipped with the on-chip debug function (μPD78F0148HD), set 02H or 03H to 0084H. Set a value that is the same as that of 0084H to 1084H because 0084H and 1084H are switched at boot swapping.</p>	p. 469 <input type="checkbox"/>			
						0081H/1081H, 0082H/1082H, 0083H/1083H	<p>Be sure to set 00H to 0081H, 0082H, and 0083H (0081H/1081H, 0082H/1082H, and 0083H/1083H when the boot swap function is used).</p> <p>If LSROSC = 0 (oscillation can be stopped by software), the count clock is not supplied to the watchdog timer in the HALT and STOP modes, regardless of the setting of bit 0 (RSTOP) of the internal oscillation mode register (RCM). When 8-bit timer H1 operates with the internal oscillation clock, the count clock is supplied to 8-bit timer H1 even in the HALT/STOP mode.</p> <p>Be sure to clear bit 1 to 7 to 0.</p>	p. 469 <input type="checkbox"/>
			0080H/1080H	<p>If LSROSC = 0 (oscillation can be stopped by software), the count clock is not supplied to the watchdog timer in the HALT and STOP modes, regardless of the setting of bit 0 (RSTOP) of the internal oscillation mode register (RCM). When 8-bit timer H1 operates with the internal oscillation clock, the count clock is supplied to 8-bit timer H1 even in the HALT/STOP mode.</p> <p>Be sure to clear bit 1 to 7 to 0.</p>	p. 470 <input type="checkbox"/>			
			Chapter 27	Hard	Flash memory	-	<p>There are differences in noise immunity and noise radiation between the flash memory and mask ROM versions. When pre-producing an application set with the flash memory version and then mass-producing it with the mask ROM version, be sure to conduct sufficient evaluations for the commercial samples (not engineering samples) of the mask ROM versions.</p>	p. 472 <input type="checkbox"/>
Soft	Flash memory	IMS: Internal memory size switching register		<p>The initial value of IMS is CFH. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, be sure to set the values shown in Table 27-2.</p>	p. 473 <input type="checkbox"/>			
		IXS: Internal expansion RAM size switching register		<p>Since the initial value of IXS is 0CH, be sure to set IXS to 0AH. When using the 78K0/KF1+ to evaluate the program of a mask ROM version of the 78K0/KF1, be sure to set the values shown in Table 27-3.</p>	p. 474 <input type="checkbox"/>			
		UART6		<p>When UART6 is selected, the receive clock is calculated based on the reset command sent from the dedicated flash programmer after the FLMD0 pulse has been received.</p>	p. 488 <input type="checkbox"/>			
		FLPMC: Flash-programming mode control register		<p>Be sure to keep FWEDIS at 0 until writing or erasing of the flash memory is completed.</p> <p>Make sure that FWEDIS = 1 in the normal mode.</p>	p. 492 <input type="checkbox"/>			
				<p>Manipulate FLSPM1 and FLSPM0 after execution branches to the internal RAM. The address of the flash memory is specified by an address signal from the CPU when FLSPM1 = 0 or the set value of the firmware written when FLSPM1 = 1. In the on-board mode, the specifications of FLSPM1 and FLSPM0 are ignored.</p>	p. 492 <input type="checkbox"/>			

APPENDIX D LIST OF CAUTIONS

(25/26)

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 28	Hard	On-chip debug function	μ PD78F0148 HD	The μ PD78F0148HD has an on-chip debug function. Do not use this product for mass production because its reliability cannot be guaranteed after the on-chip debug function has been used, given the issue of the number of times the flash memory can be rewritten. NEC Electronics does not accept complaints concerning this product.	p. 498 <input type="checkbox"/>
			When using X1 and X2 pins	Input the clock from the X1 pin during on-chip debugging.	p. 498 <input type="checkbox"/>
				Control the X1 and X2 pins by externally pulling down the P31 pin.	p. 498 <input type="checkbox"/>
Chapter 30, 31	Hard	Electrical specifications (standard products, (A) grade products), Electrical specifications ((A1) grade products)	μ PD78F0148 HD	The μ PD78F0148HD has an on-chip debug function. Do not use this product for mass production because its reliability cannot be guaranteed after the on-chip debug function has been used, given the issue of the number of times the flash memory can be rewritten. NEC Electronics does not accept complaints concerning this product.	p. 513 <input type="checkbox"/>
			Absolute maximum ratings	Product quality may suffer if the absolute maximum rating is exceeded even momentarily for any parameter. That is, the absolute maximum ratings are rated values at which the product is on the verge of suffering physical damage, and therefore the product must be used under conditions that ensure that the absolute maximum ratings are not exceeded.	pp. 513, 514, 536, 537 <input type="checkbox"/>
			High-speed system clock (crystal/ceramic) oscillator	When using the high-speed system clock oscillator, wire as follows in the area enclosed by the broken lines in the above figures to avoid an adverse effect from wiring capacitance. <ul style="list-style-type: none"> • Keep the wiring length as short as possible. • Do not cross the wiring with the other signal lines. • Do not route the wiring near a signal line through which a high fluctuating current flows. • Always make the ground point of the oscillator capacitor the same potential as V_{SS}. • Do not ground the capacitor to a ground pattern through which a high current flows. • Do not fetch signals from the oscillator. 	pp. 515, 538 <input type="checkbox"/>
				Since the CPU is started by the internal oscillation clock after reset, check the oscillation stabilization time of the high-speed system clock using the oscillation stabilization time status register (OSTC). Determine the oscillation stabilization time of the OSTC register and oscillation stabilization time select register (OSTS) after sufficiently evaluating the oscillation stabilization time with the resonator to be used.	pp. 515, 538 <input type="checkbox"/>
			Recommended oscillator constants	The oscillator constants shown above are reference values based on evaluation in a specific environment by the resonator manufacturer. If it is necessary to optimize the oscillator characteristics in the actual application, apply to the resonator manufacturer for evaluation on the implementation circuit. The oscillation voltage and oscillation frequency only indicate the oscillator characteristic. Use the 78K0/KF1+ so that the internal operation conditions are within the specifications of the DC and AC characteristics.	p. 516 <input type="checkbox"/>

Chapter	Classification	Function	Details of Function	Cautions	Page
Chapter 30, 31	Hard	Electrical specifications (standard products, (A) grade products), Electrical specifications ((A1) grade products)	Subsystem clock oscillator	When using the subsystem clock oscillator, wire as follows in the area enclosed by the broken lines in the above figure to avoid an adverse effect from wiring capacitance. <ul style="list-style-type: none"> • Keep the wiring length as short as possible. • Do not cross the wiring with the other signal lines. • Do not route the wiring near a signal line through which a high fluctuating current flows. • Always make the ground point of the oscillator capacitor the same potential as V_{SS}. • Do not ground the capacitor to a ground pattern through which a high current flows. • Do not fetch signals from the oscillator. 	pp. 517, 539 <input type="checkbox"/>
				The subsystem clock oscillator is designed as a low-amplitude circuit for reducing power consumption, and is more prone to malfunction due to noise than the high-speed system clock oscillator. Particular care is therefore required with the wiring method when the subsystem clock is used.	pp. 517, 539 <input type="checkbox"/>
			AC characteristics	T_{CY} can only be used at 0.238 μs (MIN).	p. 523 <input type="checkbox"/>
				T_{CY} can only be used at 0.4 μs (MIN).	p. 524 <input type="checkbox"/>
			–	The external bus interface function cannot be used in (A1) grade products.	p. 536 <input type="checkbox"/>
Chapter 33	Hard	Recommended soldering conditions	–	Do not use different soldering methods together (except for partial heating).	pp. 556, 557 <input type="checkbox"/>
Chapter 34	Soft	Wait	–	When the CPU is operating on the subsystem clock and the high-speed system clock is stopped ($MCC = 1$), do not access the registers listed above using an access method in which a wait request is issued.	p. 559 <input type="checkbox"/>

APPENDIX E REVISION HISTORY

E.1 Major Revisions in This Edition

Page	Description
Throughout	Addition of product name, specification, and classification by case on (A) grade products and (A1) grade products
	Modification of Note and Caution in serial operation mode register (CSIM10, CSIM11) and serial clock selection register (CSIC10, CSIC11)
p. 18	Modification of 1.3 Ordering Information
p. 47	Modification of Figure 3-1. Memory Map (μPD78F0148H)
p. 48	Modification of Figure 3-2. Memory Map (μPD78F0148HD)
p. 52	Modification of Notes 1 and 2 in Figure 3-4. Correspondence Between Data Memory and Addressing (μPD78F0148HD)
p. 123	Addition of Note 5 to Figure 6-2. Format of Processor Clock Control Register (PCC)
p. 461	Modification of Note and addition of Caution 2 in Figure 25-3. Format of Low-Voltage Detection Level Selection Register (LVIS)
p. 469	Revision of CHAPTER 26 OPTION BYTE
p. 488	Modification of Table 27-8. Communication Modes
p. 497	Modification of Notes 1 and 2 in Figure 27-23. Memory Map and Boot Area (2) μPD78F0148HD
p. 498	Revision of CHAPTER 28 ON-CHIP DEBUG FUNCTION (μPD78F0148HD ONLY)
pp. 523, 524	Modification of condition of AC Characteristics (2) Read/write operation in CHAPTER 30 ELECTRICAL SPECIFICATIONS (STANDARD PRODUCTS, (A) GRADE PRODUCTS)
p. 536	Addition of CHAPTER 31 ELECTRICAL SPECIFICATIONS ((A1) GRADE PRODUCTS)
p. 556	Revision of CHAPTER 33 RECOMMENDED SOLDERING CONDITIONS

E.2 Revision History up to Previous Edition

The following table shows the revision history up to this edition. The “Applied to:” column indicates the chapters of each edition in which the revision was applied.

(1/3)

Edition	Description	Applied to:
2nd edition	Addition of μPD78F0148HD	Throughout
	Modification of 1.5 Kx1 Series Lineup	CHAPTER 1 OUTLINE
	Modification of recommended connection for unused $\overline{\text{RESET}}$ pin in Table 2-2 Pin I/O Circuit Types	CHAPTER 2 PIN FUNCTIONS
	Addition of Cautions 1 and 2 to Figure 6-7 Format of Oscillation Stabilization Time Select Register (OSTS)	CHAPTER 6 CLOCK GENERATOR
	Deletion of (7) System wait control register (VSWC) in 6.3 Registers Controlling Clock Generator	
	Addition of description for when used as capture register to Interrupt request generation column in Figure 7-6 Format of 16-Bit Timer Mode Control Register 00 (TMC00)	CHAPTER 7 16-BIT TIMER/EVENT COUNTERS 00 AND 01
	Addition of description for when used as capture register to Interrupt request generation column in Figure 7-7 Format of 16-Bit Timer Mode Control Register 01 (TMC01)	

Edition	Description	Applied to:
2nd edition	Modification of Note 1 and correction of Cautions 4 and 5 in Figure 7-12 Format of Prescaler Mode Register 00 (PRM00)	CHAPTER 7 16-BIT TIMER/EVENT COUNTERS 00 AND 01
	Modification of Note 1 and correction of Cautions 4 and 5 in Figure 7-13 Format of Prescaler Mode Register 01 (PRM01)	
	Modification of Note in Figure 8-5 Format of Timer Clock Selection Register 50 (TCL50)	CHAPTER 8 8-BIT TIMER/EVENT COUNTERS 50 AND 51
	Modification of Note in Figure 8-6 Format of Timer Clock Selection Register 51 (TCL51)	
	Modification of Note 1 in Figure 9-5 Format of 8-Bit Timer H Mode Register 0 (TMHMD0)	CHAPTER 9 8-BIT TIMERS H0 AND H1
	Modification of Note in Figure 9-6 Format of 8-Bit Timer H Mode Register 1 (TMHMD1)	
	Correction of Table 11-1 Loop Detection Time of Watchdog Timer	CHAPTER 11 WATCHDOG TIMER
	Addition of Note to Figure 12-2 Format of Clock Output Selection Register (CKS)	CHAPTER 12 CLOCK OUTPUT/BUZZER OUTPUT CONTROLLER
	Modification of Note 1 in Figure 14-4 Format of Baud Rate Generator Control Register 0 (BRGC0)	CHAPTER 14 SERIAL INTERFACE UART0
	Modification of Note 1 in Figure 15-8 Format of Clock Selection Register 6 (CKSR6)	CHAPTER 15 SERIAL INTERFACE UART6
	Modification of (h) SBF transmission in 15.4.2 Asynchronous serial interface (UART) mode	
	Modification of Note in Figure 16-5 Format of Serial Clock Selection Register 10 (CSIC10)	CHAPTER 16 SERIAL INTERFACES CSI10 AND CSI11
	Modification of Note in Figure 16-6 Format of Serial Clock Selection Register 11 (CSIC11)	
	Modification of Caution 3 in Figure 19-2 Format of Interrupt Request Flag Registers (IF0L, IF0H, IF1L, IF1H)	CHAPTER 19 INTERRUPT FUNCTIONS
	Addition of Cautions 1 and 2 to Figure 21-2 Format of Oscillation Stabilization Time Select Register (OSTS)	CHAPTER 21 STANDBY FUNCTION
	Modification of Figure 22-1 Block Diagram of Reset Function	CHAPTER 22 RESET FUNCTION
	Modification of Note in Figure 25-3 Format of Low-Voltage Detection Level Selection Register (LVIS)	CHAPTER 25 LOW- VOLTAGE DETECTOR
	Modification of Figure 27-11 FLMD1 Pin Connection Example	CHAPTER 27 FLASH MEMORY
	Addition of description to 27.6.7 Power supply	
	Revision of CHAPTER 30 ELECTRICAL SPECIFICATIONS from target specifications to official specifications	CHAPTER 30 ELECTRICAL SPECIFICATIONS
Addition of CHAPTER	CHAPTER 32 PACKAGE DRAWINGS	

APPENDIX E REVISION HISTORY

(3/3)

Edition	Description	Applied to:
2nd edition	Revision of APPENDIX	APPENDIX A DEVELOPMENT TOOLS
	Revision of APPENDIX	APPENDIX B NOTES ON TARGET SYSTEM DESIGN
	Addition of APPENDIX	APPENDIX D LIST OF CAUTIONS
	Addition of APPENDIX	APPENDIX E REVISION HISTORY
2nd edition (Modified version)	Addition of lead-free products to 1.3 Ordering Information	CHAPTER 1 OUTLINE
	Addition of lead-free products to CHAPTER	CHAPTER 32 RECOMMENDED SOLDERING CONDITIONS
