## CHARGE PUMP RGBW LED DRIVER WITH PROGRAMMABLE SELF-RUNNING PATTERNS

January 2023

### GENERAL DESCRIPTION

The IS31FL3195 is a compact and efficient 4-channel charge pump LED driver with programmable sequence operation for automated RGBW lighting effects. It is capable of driving 1 to 4 LEDs with a low drop-out and current matching so all 4 LEDs maintain consistent brightness. Each channel can support up to 20mA of current.

The built-in charge pump (CP) structure will automatically toggle between 1x, 1.5x operation depending on the battery's state of charge. This DC/DC converter operates at a high switching frequency which enables the use of small external capacitors and achieves 92% peak total efficiency. The IS31FL3195 is optimized for battery applications. To conserve battery life, the charge pump goes into high impedance mode whenever the IS31FL3195 is shutdown consuming less than 1 $\mu$ A.

The IS31FL3195 can operate in either "Current Level" or "Programmable Sequence" mode. In Current Level mode, the output current of each output is independently programmed and controlled in 256 steps to simplify color mixing. In programmable sequence mode, the timing characteristics for each output can be individually adjusted to maintain a pre-established pattern sequence without requiring any additional MCU interaction, thus saving valuable system resources.

The IS31FL3195 is available in a small QFN-16 (4mm  $\times$  4mm) and WLCSP-16 (1.88mm $\times$ 2.08mm, 0.45mm ball pitch, 0.2mm ball diameter) packages. It operates from 2.7V to 5.5V over the temperature range of -40°C to +85°C.

With automated lighting effects and a DC/DC charge pump, the small package IS31FL3195 is ideal for low power battery applications.

### FEATURES

- 2.7V to 5.5V supply voltage
- Charge pump
  - 1x, 1.5x operating modes
  - Highly efficient across battery state of charge
  - 1MHz constant frequency
  - Enter 1.5x mode if any of the four OUTx pins < 150mV (50mV~300mV selectable)
- Power saving operating
  - 1 $\mu$ A Shutdown current
  - 640 $\mu$ A Quiescent operating current (CP1x mode)-Two selectable sleep modes
    - Sleep 1 Mode: 38 $\mu$ A
    - Sleep 2 Mode: 1 $\mu$ A
  - Auto sleep mode if all OUTx outputs are off for >30s.
- Support four LEDs - RGBW
  - Resistor sets LED current up to 20mA
  - 8-bit dot correction
- LEDs can operate with pre-established lighting patterns
  - Run without a micro
  - Fixed number of iterations or non-stop operation
  - Each channel has its own fade registers (TS-T4) with independent start/stop
- 1MHz I2C bus interface
  - Automatic address increment function
  - 4 selectable I2C address locations
- Over-temperature protection
- QFN-16 (4mm $\times$ 4mm) and WLCSP-16 (1.88mm $\times$ 2.08mm, 0.45mm ball pitch, 0.2mm ball diameter) packages
- Operating temperature range is -40°C ~ +85°C
- RoHS & Halogen-Free Compliance
- TSCA Compliance

### APPLICATIONS

- Internet-of-Things (IOT)
- Low-power battery applications
- Wearable applications
- Hand-held devices requiring visual notifications

## PIN CONFIGURATION

Package	Pin Configuration (Top View)
QFN-16	 <p>Pin configuration diagram for QFN-16 package. The chip is shown with 16 pins arranged in a square. The top pins are labeled SCL (16), SDA (15), AD (14), and SDB (13). The right pins are ISET (12), GND (11), C2P (10), and C2N (9). The bottom pins are VOUT (5), VCC (6), CIP (7), and CIN (8). The left pins are OUT1 (1), OUT2 (2), OUT3 (3), and OUT4 (4). A dot is located at pin 1.</p>
WLCSP-16	 <p>Pin configuration diagram for WLCSP-16 package. The chip is shown with 16 pins arranged in a 4x4 grid. The top-left pin is ISET (A1). The top row pins are ISET (A1), SDA (A2), OUT1 (A3), and OUT2 (A4). The second row pins are GND (B1), SDB (B2), SCL (B3), and OUT3 (B4). The third row pins are C2P (C1), C2N (C2), AD (C3), and OUT4 (C4). The bottom row pins are CIP (D1), CIN (D2), VCC (D3), and VOUT (D4). A dot is located at pin A1.</p>

# IS31FL3195

## PIN DESCRIPTION

No.		Pin	Description
QFN	WLCSP		
1~4	A3, A4, B4, C4	OUT1~OUT4	LED current sink pins, connect the corresponding LED cathode to this pin. The anode of the associated LED must to be connected to the VOUT pin. The unused channel can be float but need to shut down by 01h register.
5	D4	VOUT	Charge pump output supplies the LED current. In shutdown mode this pin is high impedance. Connect a 1 $\mu$ F capacitor from VOUT to GND.
6	D3	VCC	Power supply input, requires 1.0 $\mu$ F and 0.1 $\mu$ F capacitor between this pin and ground pin.
7,8	D1, D2	C1P,C1N	Stage 1 charge pump flying capacitor, C1N negative terminal, C1P positive terminal. (Note 1)
9,10	C2, C1	C2N,C2P	Stage 2 charge pump flying capacitor, C2N negative terminal, C2P positive terminal. (Note 1)
11	B1	GND	Ground reference signal for the charge pump and the output current control. A PCB ground plane strongly recommended.
12	A1	ISET	Connect external resistor R <sub>ISET</sub> to ground to set global max current I <sub>GMAX</sub> .
13	B2	SDB	Pull below 0.4V to activate low power shutdown mode.
14	C3	AD	I2C address setting.
15	A2	SDA	I2C data pin. The SDA byte is used to program the device operating mode.
16	B3	SCL	I2C serial clock associated with SDA signal.
		Thermal Pad	Connect to GND.

**Note 1:** The flying capacitors should be placed as close as possible to the IC and the signal trace between the capacitor and CP terminals kept as short as possible.

## ABSOLUTE MAXIMUM RATINGS

Supply voltage, $V_{CC}$ , $V_{OUT}$	-0.3V ~ +6.0V
Voltage at any input pin	-0.3V ~ $V_{CC}+0.3V$
Maximum junction temperature, $T_{JMAX}$	+150°C
Operating temperature range, $T_A=T_J$	-40°C ~ +125°C
Storage temperature range, $T_{STG}$	-65°C ~ +150°C
Package thermal resistance, junction to ambient (4-layer standard test PCB based on JEDEC 51-2A standard), $\theta_{JA}$	53.8°C/W (QFN) 71.41°C/W (WLCSP)
ESD (HBM)	±8kV
ESD (CDM)	±750V

**Note 2:** Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

$T_A = -40^\circ\text{C} \sim +85^\circ\text{C}$ ,  $V_{CC} = 3.6\text{V}$ , unless otherwise noted. Typical value are  $T_A = 25^\circ\text{C}$ .

Symbol	Parameter	Condition	Min.	Typ.	Max.	Unit
$V_{CC}$	Supply voltage		2.7		5.5	V
$I_{CC}$	Quiescent operating current	1x mode, all outputs disable		640		$\mu\text{A}$
		1.5x mode, all outputs disable		1.2		mA
		Sleep 1 Mode: CP stops, Bandgap working and all OUTx are off without any bias		38		$\mu\text{A}$
		Sleep 2 Mode: CP, Bandgap stop and all OUTx are off without any bias		1		$\mu\text{A}$

## FUNCTION BLOCK DIAGRAM

# IS31FL3195

## DETAILED DESCRIPTION

### I2C INTERFACE

The IS31FL3195 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3195 has a constant 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

**Table 1 Slave Address:**

AD	A7:A3	A2:A1	A0
GND	10101	00	0/1
SCL		01	
SDA		10	
VCC		11	

AD connected to GND, A2:A1=00;  
 AD connected to VCC, A2:A1=11;  
 AD connected to SCL, A2:A1=01;  
 AD connected to SDA, A2:A1=10;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7kΩ when SCL frequency is 400kHz). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS31FL3195.

The timing diagram for the I2C is shown in Figure 2. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31FL3195's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3195 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3195, the register address byte is sent, most significant bit first. IS31FL3195 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3195 must generate another acknowledge to indicate that the data was received.

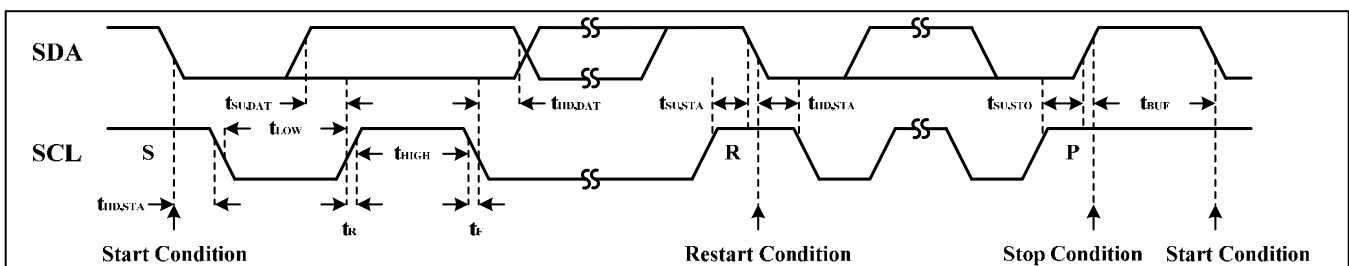

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

### ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3195, load the address of the data register that the first data byte is intended for. During the IS31FL3195 acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3195 will be placed in the new address, and so on (Figure 5).

### READING PORT REGISTERS

To read the device data, the bus master must first send the IS31FL3195 address with the R/W bit set to "0", followed by the command byte, which determines which register is accessed. After a restart, the bus master must then send the IS31FL3195 address with the R/W bit set to "1". Data from the register defined by the command byte is then sent from the IS31FL3195 to the master (Figure 6).

5Fh	Reset Register	Reset the registers value to default	W	-	0000 0000

**Note:** When T1 or T3= 0.03s, GAM will be set to 10 (Linearity).

# IS31FL3195

**Table 3 01h Shutdown Control Register**

Bit	D7:D4	D3	D2:D1	D0
Name	EN4:EN1	CPPM	SLE	SSD
Default	1111	0	00	0

The Shutdown Control Register sets software shutdown and sleep modes of IS31FL3195.

The Output Enable Register enables/disables the outputs independently. The ENx is only effective when SSD= "1".

Sleep 1 (power saving standby 1) Mode: CP in 1x mode and all OUTx are off without any bias. I\_SLEEP1=35µA (Typ.)

Sleep 2 (power saving standby 2) Mode: CP off and all OUTx are off without any bias. I\_SLEEP2=1µA (Typ.)

When SLE bits are set to "01" or "10", IS31FL3195 puts itself in Sleep 1 or Sleep 2 Modes if all OUTx outputs are off for >30s. MCU command to the IS31FL3195 will wake it up and disable the sleep mode.

The CPPM bit selects the default charge pump power up mode. When CPPM= "0", the default power up mode is 1x mode, otherwise it will run in 1.5x mode to ensure the LEDs can work with enough forward voltage.

**SSD Software Shutdown Enable**

- 0 Software shutdown mode
- 1 Normal operation

**SLE Sleep Mode Enable**

- 00/11 Sleep mode disable
- 01 Sleep1 mode enable
- 10 Sleep2 mode enable

**CPPM Charge Pump Power Up Mode**

- 0 1x
- 1 1.5x

**Enx Output Enable Control**

- 0 Output disable
- 1 Output enable

**Table 4 02h Operating Configure Register**

Bit	D7:D4	D3:D1	D1:D0
Name	OUT4:OUT1	-	LM
Default	0000	00	00

The Operating Configure Register sets operation modes of IS31FL3195.

When LM= "00/11", the OUTx can be "0" current level mode or "1" pattern mode, when LM= "01", the OUT4 can be "0" current level mode or "1" pattern mode, OUT1~3 are not needed to set. When LM= "10", OUT1~4 are not needed to set.

**LM LED Mode**

- 00/11 Single mode
- 01 RGB + W mode, OUT1, OUT2 and OUT3 work together, OUT4 work independent
- 10 RGBY mode, OUT1, OUT2, OUT3 and OUT4 work together thru Pattern 1-3

**OUTx Output Operating Mode**

- 0 Current Level Mode
- 1 Pattern Mode

**Table 5 03h Charge Pump Setting-1**

Bit	D7:D2	D1:D0
Name	-	CPM
Default	0010 00	00

The Charge Pump Setting Register-1 sets the charge pump working mode.

**CPM Charge Pump Working Mode**

- 00 Auto mode
- 01 1x mode
- 10 1.5x mode

**Table 6 04h Charge Pump Setting-2**

Bit	D7	D6:D4	D3:D0
Name	-	HRT	CPDE4:CPDE1
Default	0	011	0000

The Charge Pump Setting Register-2 sets headroom detect threshold voltage and enables OUTx charge pump detection. Disable charge pump detection on OUTx if LED anode not connected to VOUT or OUTx floating.

**CPDEx Charge Pump Detection Enable of OUTx**

- 0 Enable
- 1 Disable

# IS31FL3195

HRT	Headroom Threshold Voltage
000	50mV
001	100mV
010	125mV
011	150mV
100	175mV
101	200mV
110	250mV
111	300mV

**Table 7 05h Current Band Register**

Bit	D7:D6	D5:D4	D3:D2	D1:D0
Name	CB4	CB3	CB2	CB1
Default	01	01	01	01

The Current Band Register stores the current band of each LED output.

$I_{GMAX}=20mA$  when  $R_{ISET}=12k\Omega$ . When current level register is 0xFF and CBx is "01",  $I_{BAND}= I_{GMAX} \times 2/4=10mA$ , when current level register is 0x00,  $I_{OUT}=0mA$ .

**CBx Current Band Setting**

00	Band 1: $0mA \sim I_{GMAX} \times 1/4$ , $I_{BAND}= I_{GMAX} \times 1/4$
01	Band 2: $0mA \sim I_{GMAX} \times 1/2$ , $I_{BAND}= I_{GMAX} \times 1/2$
10	Band 3: $0mA \sim I_{GMAX} \times 3/4$ , $I_{BAND}= I_{GMAX} \times 3/4$
11	Band 4: $0mA \sim I_{GMAX}$ , $I_{BAND}= I_{GMAX}$

**Table 8 06h Hold Function Register**

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	HF4	HT4	HF3	HT3	HF2	HT2	HF1	HT1
Default	0	0	0	0	0	0	0	0

The Hold Function Register configures hold time for each output in Pattern Mode.

**HTx Hold Time Selection**

0	Hold at end of T4 when pattern loop done (always off)
1	Hold at end of T2 when pattern loop done (always on)

**HFx Hold Function Enable**

0	Hold function disable
1	Hold function enable

**Table 9 07h Phase Delay Register**

Bit	D7:D0	D1:D0
Name	-	PD
Default	0000 00	01

IS31FL3195 features the output current phase delay function, default is mode 1

**PD Phase Delay Mode**

01	Phase delay mode 1
11	Phase delay mode 2

**Table 10 0Ch/0Dh/0Eh/0Fh P1/P2/P3/P4 State Register (Read Only)**

Bit	D7	D6	D5	D4	D3	D2:D0
Name	PSx	CS3x	CS2x	CS1x	-	TXx
Default	0	0	0	0	0	000

The Pattern State Registers store the four patterns. PS is the pattern enable or not, CSx is the color enable or not, TX will show the running position of Pattern 1.

0Dh, 0Eh and 0Fh store the state of Pattern 2, 3 and 4.

**TXx Time State**

000	Running at TS
001	Running at T1
010	Running at T2

**Table 11 10h/21h/32h/40h OUT1/OUT2/OUT3/OUT4 Current Level Register**

Bit	D7:D0
Name	CL
Default	0000 0000

When IS31FL3195 operates in Current Level Mode, the value of Current Level Registers will decide the output current of OUTx in 256 levels.

# IS31FL3195

The output current may be computed using the Formula (1):

$$I_{OUT} = \frac{I_{BAND}}{256} \sum_{n=0}^7 D[n] 2^n \quad (1)$$

Where D[n] stands for the individual bit value, 1 or 0, in location n.

For example: if D7:D0 = 10110101,

$$I_{OUT} = I_{BAND} (2^7 + 2^5 + 2^4 + 2^2 + 2^0)/256$$

I<sub>BAND</sub> is defined in Table 7.

If P<sub>L</sub>T<sub>x</sub>\_H(D7)=0, P<sub>L</sub>T<sub>x</sub>\_L=0, endless

If P<sub>L</sub>T<sub>x</sub>\_H(D7)=1, P<sub>L</sub>T<sub>x</sub>\_L!=0

Pattern loop times:

$$Looptime = 16 \sum_{n=0}^6 D[n] 2^n \quad (4)$$

If P<sub>L</sub>T<sub>x</sub>\_H(D7)=1, P<sub>L</sub>T<sub>x</sub>\_L=0, endless

Where D[n] stands for the individual bit value.

## 50h Color Update Register

Write 0xC5 to 50h will update the data of 10h~18h/20h~28h/30h~38h

## 51h/52h/53h/54h P1/P2/P3/P4 Update Register

Write 0xC5 to these registers will update the time parameters of Pattern x, and start to run Pattern x.

## 5Fh Reset Register

Once user writes "0xC5" to the Reset Register, IS31FL3195 will reset all registers to their default value. On initial power-up, the IS31FL3195 registers are reset to their default values for a blank display.

# IS31FL3195

## TYPICAL APPLICATION INFORMATION

### GENERAL DESCRIPTION

IS31FL3195 is a 4-channel LED driver which features two-dimensional auto breathing mode. It has Pattern Mode and Current Level Mode for RGB+W lighting effects.

The IS31FL3195 LED driver integrates a switched capacitor charge pump to power four LEDs with a programmable regulated current, up to 20mA (max) per channel.

Upon power up, the built-in charge pump converter will initialize base on CPPM bit of 01h register. To prevent a large in-rush current; the IS31FL3195 will first charge the C1P/N, C2P/N capacitors to near VIN. The 1x mode provides maximum efficiency and minimum noise. The IS31FL3195 will remain in this mode until one of the LED current source drivers begins to drop out of regulation.

The current delivered through the LED load is controlled by an internal configurable low dropout (135mV Typ.) current source. The current is set by the value of the Current Setting Resistor.

### CHARGE PUMP

The converter is based on a charge pump technique to efficiently generate a DC voltage to supply the RGBW or RGBY LED current. The system regulates the current flowing into each LED, not the DC VOUT value. The built-in OVP circuit continuously monitors the VOUT voltage and in 1.5x charge pump mode, IS31FL3195 continuously calculates the expected current sink headroom if it exits 1.5x charge pump mode and enters 1x mode. It exits the 1.5x mode if the expected headroom is sufficient. The IS31FL3195 can operate under no load conditions.

The integrated capacitive charge pump is designed for  $V_{OUT} = V_{CC} \times Mode$ , where Mode= 1, or 1.5. The charge pump converter only needs four external components: supply decoupling capacitor, output bypass capacitor and two flying capacitors.

To maintain the lowest output resistance and highest efficiency, use capacitors with low ESR (Equivalent Series Resistance). The charge-pump output resistance is a function of CP and C<sub>OUT</sub>'s ESR and the internal switch resistance. Minimizing the charge-pump capacitor's ESR minimizes the total resistance.

Using larger flying capacitors for the Charge Pump (CP) reduces the output impedance and improves efficiency however, above a certain point, increasing CP's capacitance has a negligible effect because the output resistance becomes dominated by the internal switch resistance and capacitor ESR. But when space is a constraint, it may be necessary to sacrifice

low output resistance for the sake of small capacitor size.

Increasing the output capacitance (C<sub>OUT</sub>) reduces the output ripple voltage. Decreasing its ESR reduces both output resistance and ripple. Smaller capacitance values can be used with light loads. Use the following equation to calculate the peak-to-peak ripple:

$$V_{RIPPLE} = \frac{I_{OUT}}{f_{OSC} C_{OUT}} + 2 I_{OUT} ESR_{C_{OUT}} \quad (1)$$

A bypass capacitor on the incoming supply will reduce its AC impedance and the impact of the charge pump switching noise. A 0.1μF bypass capacitor is sufficient, place this next to the VIN pin.

### POWER ON SEQUENCE

IS31FL3195 provides a power-on reset feature that is controlled by VCC supply voltage. When the VIN supply voltage exceeds 2.6V (Typ.), the internal circuit starts to work. The reset signal will be generated to perform a power-on reset (POR) operation, which will reset all control circuits and configuration registers until the internal power voltage becomes stable.

I2C operation is allowed before SDB is pulled to high, the rising edge of SDB will reset the I2C bus.

Figure 7 SDB Pin Sequence

Note 1: I2C operation is allowed when SDB is low.

Note 2: There should be no I2C operation 10μs before or after SDB rising edge.

### SET MAX CURRENT

The maximum output current of OUT1~OUT4 can be adjusted by the external resistor, R<sub>ISSET</sub>, as described in Formula (2).

$$I_{GMAX} = \frac{240}{R_{ISSET}} \quad (2)$$

# IS31FL3195

The recommended value of R<sub>ISSET</sub> is 12kΩ, when R<sub>ISSET</sub>=12kΩ, I<sub>GMAX</sub>=20mA.

The minimum I<sub>OUT</sub> of each out is 2.5mA and to achieve this, when minimum CBx of 04h is “11” (I<sub>BAND</sub>=1/4 I<sub>GMAX</sub>), maximum R<sub>ISSET</sub> is 96kΩ, when minimum CBx of 04h is “10” (I<sub>BAND</sub>=2/4 I<sub>GMAX</sub>), maximum R<sub>ISSET</sub> is 72kΩ, when minimum CBx of 04h is “01” (I<sub>BAND</sub>=3/4 I<sub>GMAX</sub>), maximum R<sub>ISSET</sub> is 48kΩ, when minimum CBx of 04h is “00” (I<sub>BAND</sub>=4/4 I<sub>GMAX</sub>), maximum R<sub>ISSET</sub> is 24kΩ.

If R<sub>ISSET</sub> is smaller than 12kΩ, the output current will increase according the Formula 2, recommend absolute minimum R<sub>ISSET</sub> is 10kΩ (I<sub>GMAX</sub>=25mA).

## CURRENT LEVEL MODE

There are four programmed current bands which can be set by the Current Band Register (03h). It is used to set the global maximum of each output current, I<sub>GMAX</sub>.

By setting the OUTx bits of the Operating Configure Register to “0”, the corresponding OUTx will operate in Current Level Mode. The Current Level Registers are active and can modulate LED brightness of each output with 256 steps independently. For example, if the data in Current Level Register is “0000 0100”, then the current level is the fourth step, with a current level of 4/256.

In Current Level Mode, the user doesn’t need to turn on the CEx, a new value must be written to the Current Level registers to change the output current. Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve breathing, blinking, or any other effects that the user defines.

## PATTERN MODE

By setting the OUTx bits of the Operating Configure Register (01h) to “1”, the corresponding OUTx will operate in Pattern Mode. In Pattern Mode, the timing characteristics for output current – current rising (T1), holding (T2), falling (T3) and off time (TS, TP, T4), can be adjusted individually so that each output can independently maintain a pre-established pattern. Thus, achieving mixing color breathing or a single color breathing without requiring any additional interface activity which will save valuable system resources. The IS31FL3195 will continuously cycle through the pre-programmed patterns; the system including the micro can be powered off to significantly save battery power.

## PATTERN COLOR SETTING

In Pattern Mode, the LED color is defined by PxCOLy\_Oz (x,y,z= 1,2,3,4) bits in Color Setting Registers. There are 3 RGBW current combinations to generate 3 pre-defined colors for display. More than one of the 3 pre-defined colors can be chosen by setting CEx bits in Color Enable Register

(1Ch/2Ch/3Ch/4Ch). When CEx is set, the color x is allowed to be displayed in current pattern.

Table 26, 27 show the registers for each mode, for example, in the Current Level Mode, the current level register is 10H for OUT1, 21H for OUT2, 32H for OUT3, 40H for OUT4, in Single mode and pattern mode, Pattern 1 has 3 current level registers and enabled/disabled by CEx.

**Table 26 Color Register of Single Mode**

Mode		Color EN	P1 OUT1	P2 OUT2	P3 OUT3	P4 OUT4
Single Mode	Pattern Mode	CE1	10H	21H	32H	40H
		CE2	13H	24H	35H	41H
		CE3	16H	27H	38H	42H
	Current Level Mode		10H	21H	32H	40H

**Table 27 Color Register of RGB/RGBY Mode**

RGB Mode	Color EN	P1 OUT1	P2 OUT2	P3 OUT3	P4 OUT4
Pattern 1	CE1(1Ch)	10H	11H	12H	40h
	CE2(1Ch)	13H	14H	15H	41h
	CE3(1Ch)	16H	17H	18H	42h
Pattern 2	CE1(2Ch)	20H	21H	22H	43H
	CE2(2Ch)	23H	24H	25H	44H
	CE3(2Ch)	26H	27H	28H	45H
Pattern 3	CE1(3Ch)	30H	31H	32H	46H
	CE2(3Ch)	33H	34H	35H	47H
	CE3(3Ch)	36H	37H	38H	48H

## PATTERN TIME SETTING

User should configure the related pattern time setting registers according to actual timing requirements via I2C interface before starting pattern. There are three groups of pattern time that can be set for P1~P4, including TS, T1~T4 and TP. And each pattern has three continue lighting cycle as Color 1~Color 3.

## PHASE DELAY

The outputs automatically delay the phase to minimize audible ceramic hum EMI.

### Phase Delay Mode 1

By setting PD (Phase delay mode) bits to “01”, the 4 outputs work in Phase Delay mode 1, each output will have a 125μs delay compare to previous channel, for example, OUT2 has 125μs delay than OUT1, OUT3 has 125μs delay than OUT2.

# IS31FL3195

Figure 8 Phase Delay Mode 1 Timing

## Phase Delay Mode 2

By setting PD (Phase delay mode) bits to “11”, the 4 outputs work in Phase Delay mode 2, each output will have a 62.5µs delay compare to previous channel, which is half of mode 1.

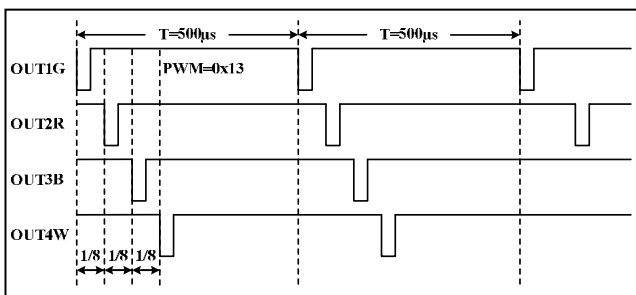

Figure 9 Phase Delay Mode 2 Timing

## GAMMA CORRECTION

In order to perform a better visual LED breathing effect, the device integrates gamma correction to the Pattern Mode. The gamma correction function causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of LED brightness. Since the IS31FL3195 can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye’s brightness curve.

The IS31FL3195 provides three gamma corrections which can be set by GAM bits of NXT Registers (1Eh/2Eh/3Eh/4Eh) for each pattern. The gamma correction is shown as below.

Figure 10 Gamma Correction

## SHUTDOWN MODE

Shutdown mode can either be used as a means of reducing power consumption or generating a flashing display (repeatedly entering and leaving shutdown mode). During shutdown mode all registers retain their data.

### Software Shutdown

By setting SSD bit of the Shutdown Register (01h) to “0”, the IS31FL3195 will operate in software shutdown mode, wherein it will consume only 1.0µA (Typ.) current. When the IS31FL3195 is in software shutdown mode, all current sources are switched off.

### Hardware Shutdown

The chip enters hardware shutdown mode when the SDB pin is pulled low, wherein it will consume only 1.0µA (Typ.) current. When set SDB high, the rising edge will reset the I2C module, but the registers retain their data.

### Sleep 1 Mode

When SLE bits is set to “01”, the chip will enter sleep 1 mode whenever the OUTx outputs are off for >30s, wherein they consume only 38µA (Typ.) current. In sleep 1 mode, CP stops, Bandgap working and all OUTx are off without any bias. MCU command to the IS31FL3195 will wake it up and disable the sleep mode.

### Sleep 2 Mode

When SLE bits is set to “10”, the chip will enter sleep 2 mode whenever the OUTx outputs are off for >30s, wherein they consume only 1.0µA (Typ.) current. In sleep 2 mode, CP, Bandgap stop and all OUTx are off without any bias. MCU command to the IS31FL3195 will wake it up and disable the sleep mode.

# IS31FL3195

## LED OPERATING MODE

The IS31FL3195 has three operating modes which can be chosen by the RGBW bits of Operating Configure Register (01h).

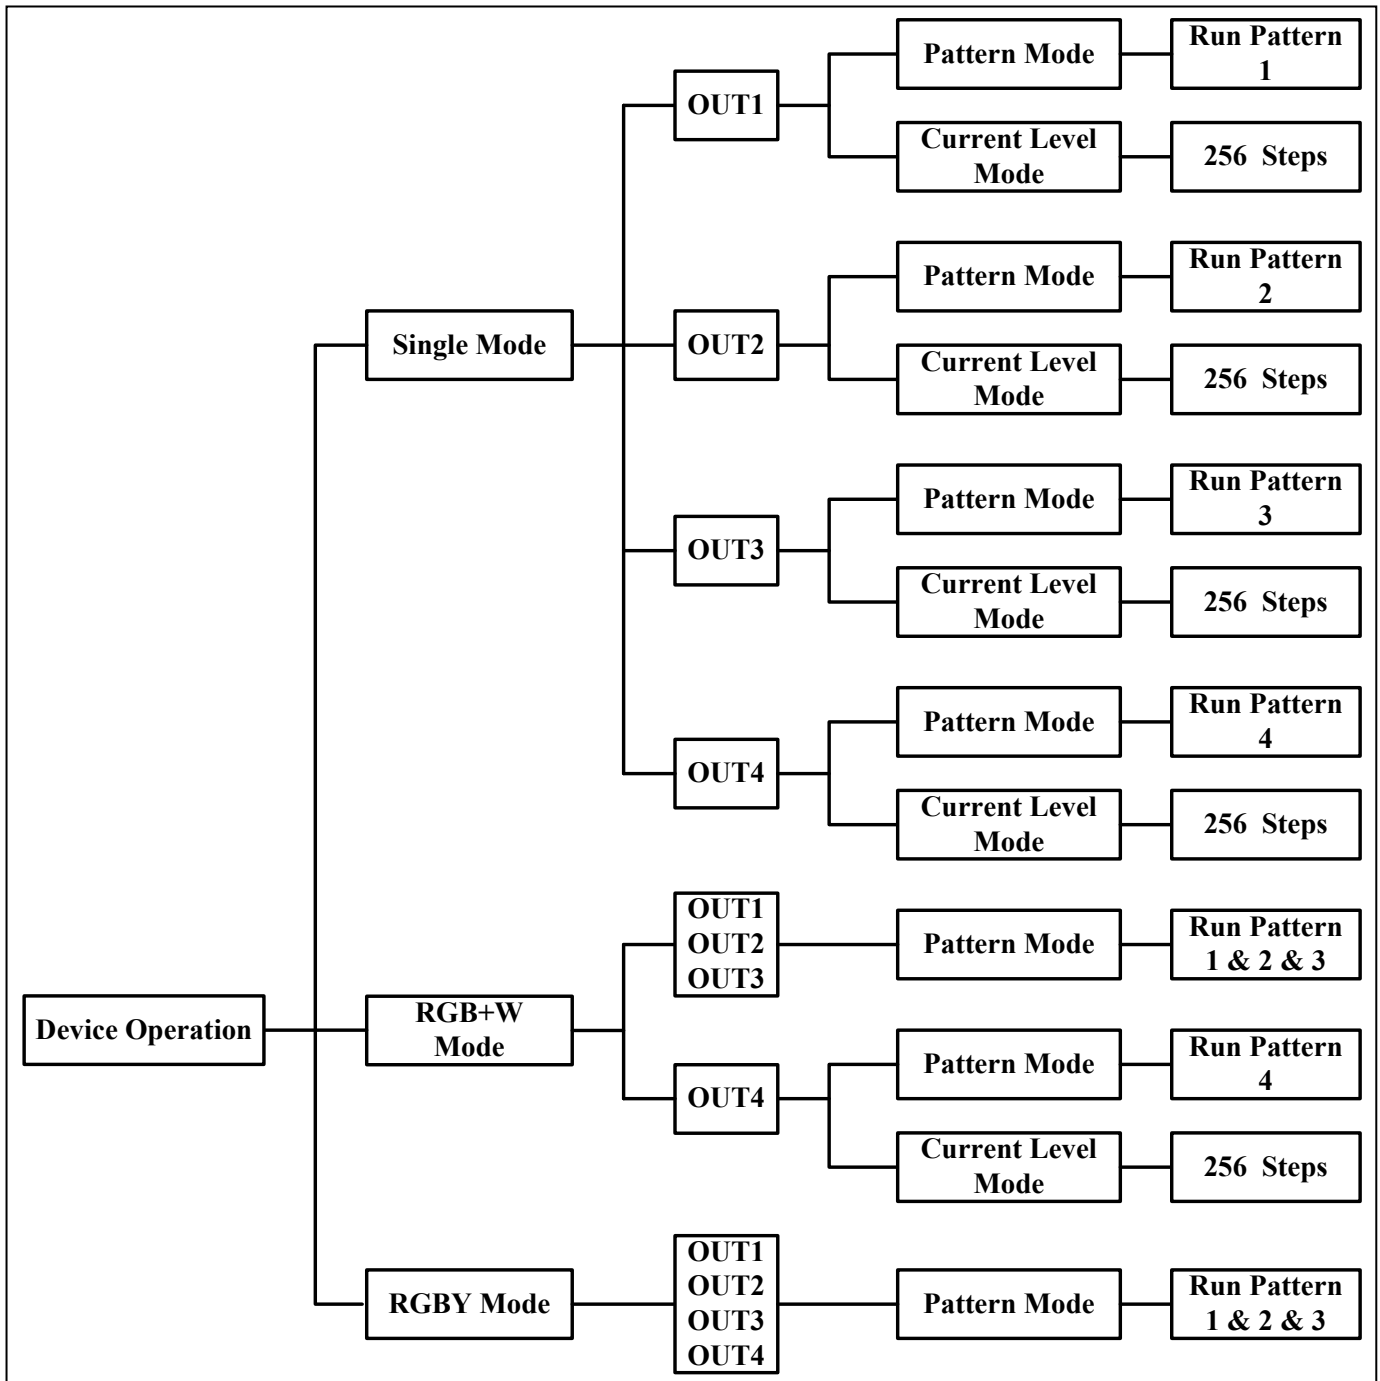

Figure 11 Operating Mode Map

# IS31FL3195

## Single Mode

If RGB=00/11 (Single Mode), OUTx runs Px independently in Pattern Mode or operates in Current Level Mode.

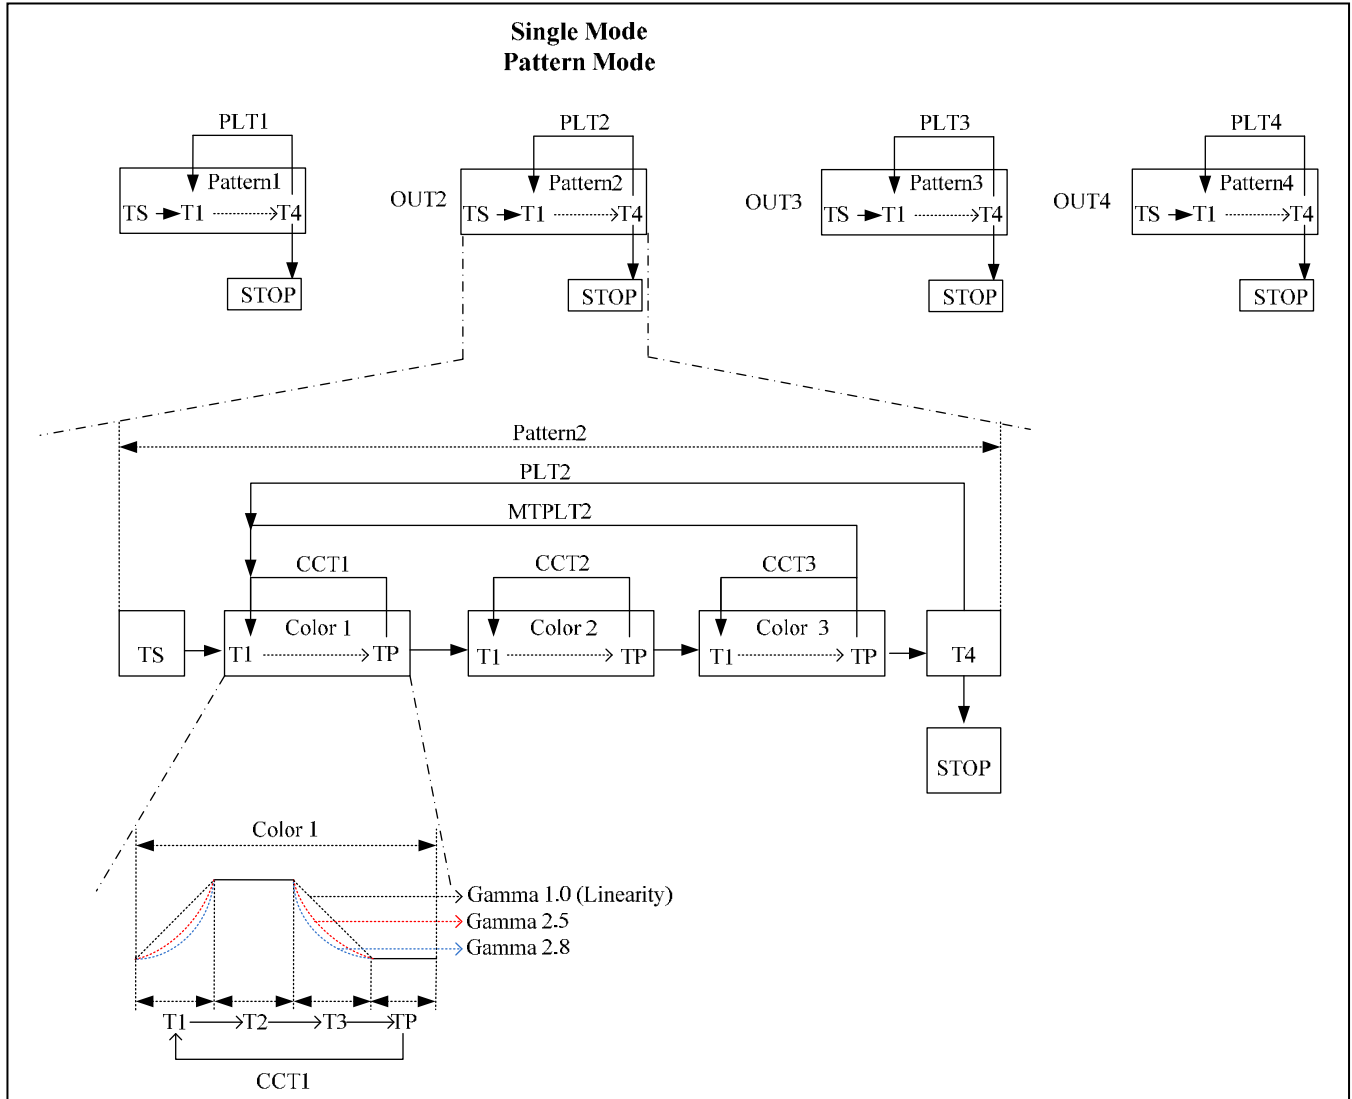

Figure 12 Single Mode

# IS31FL3195

## RGB+W Mode

If RGB=01 (RGB+W Mode), OUT1, OUT2 and OUT3 can operate in Pattern Mode only and run in the same pattern (P1~P3). OUT4 can be both mode and run in Pattern 4 independently. OUT1, OUT2 and OUT3 bits can't be set.

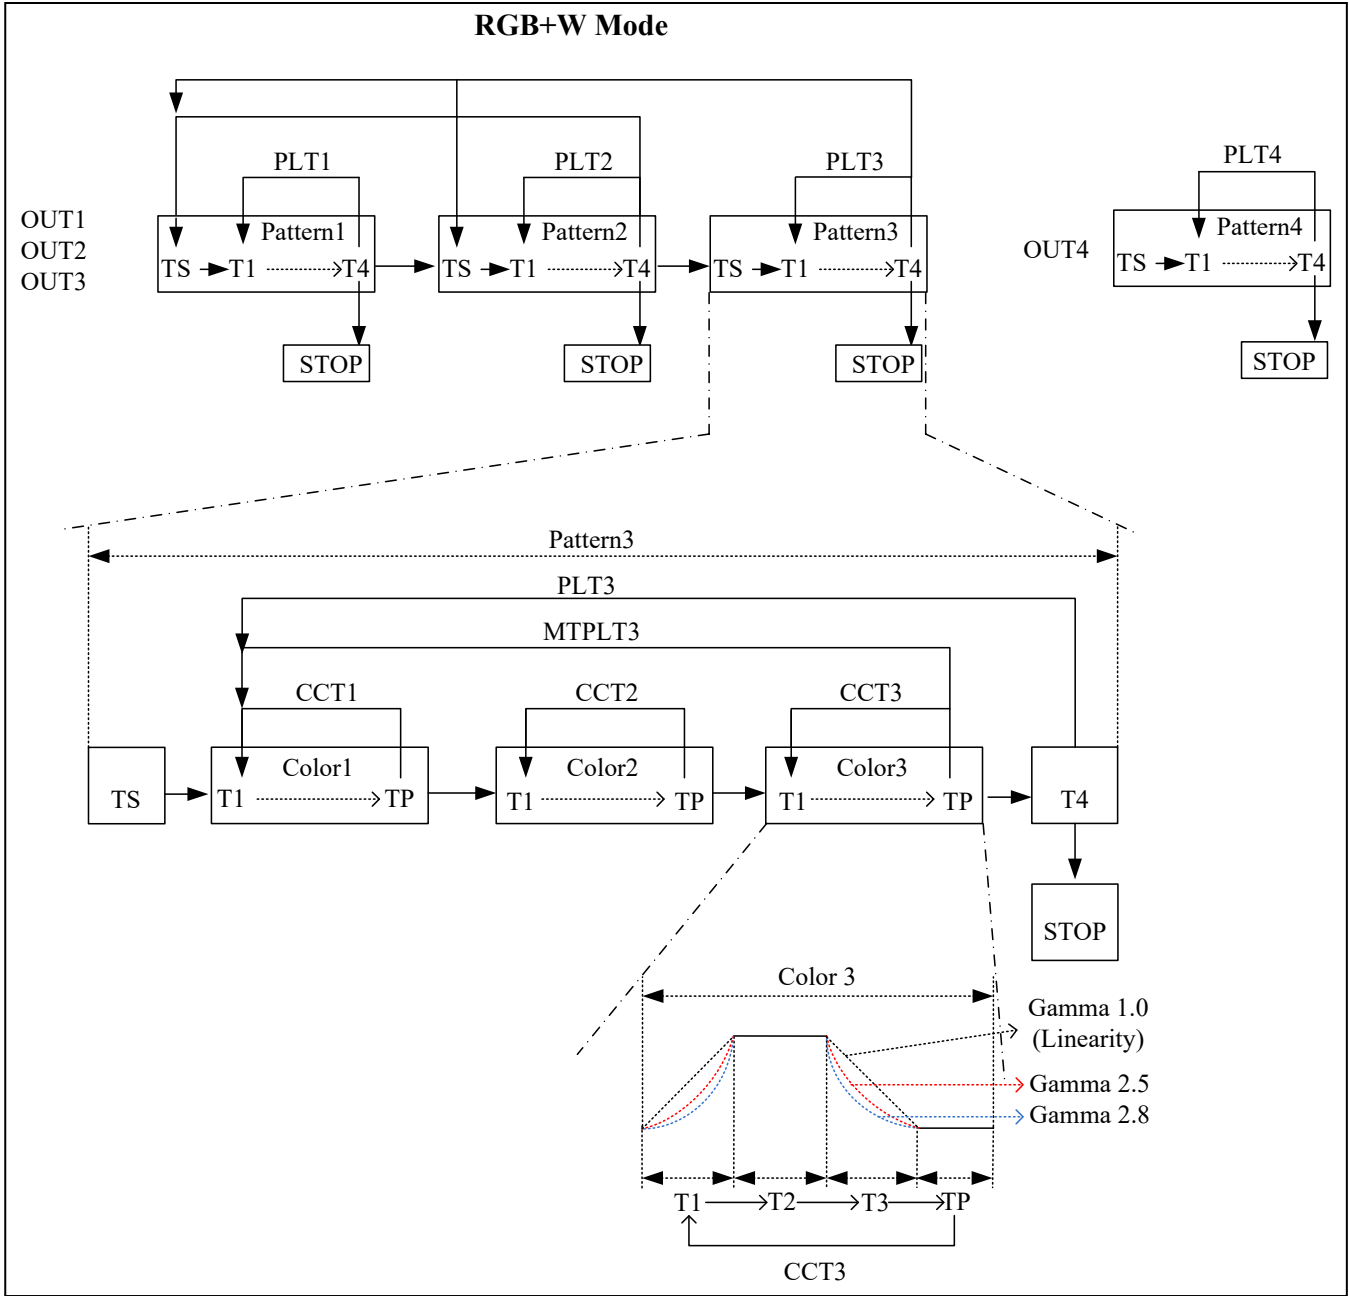

Figure 13 RGB+W Mode

# IS31FL3195

## RGBY Mode

If LM=10 (RGBY Mode), OUT1, OUT2, OUT3 and OUT4 can operate in Pattern Mode only and run in the same pattern (P1~P3). OUT1, OUT2 and OUT3 bits can't be set.

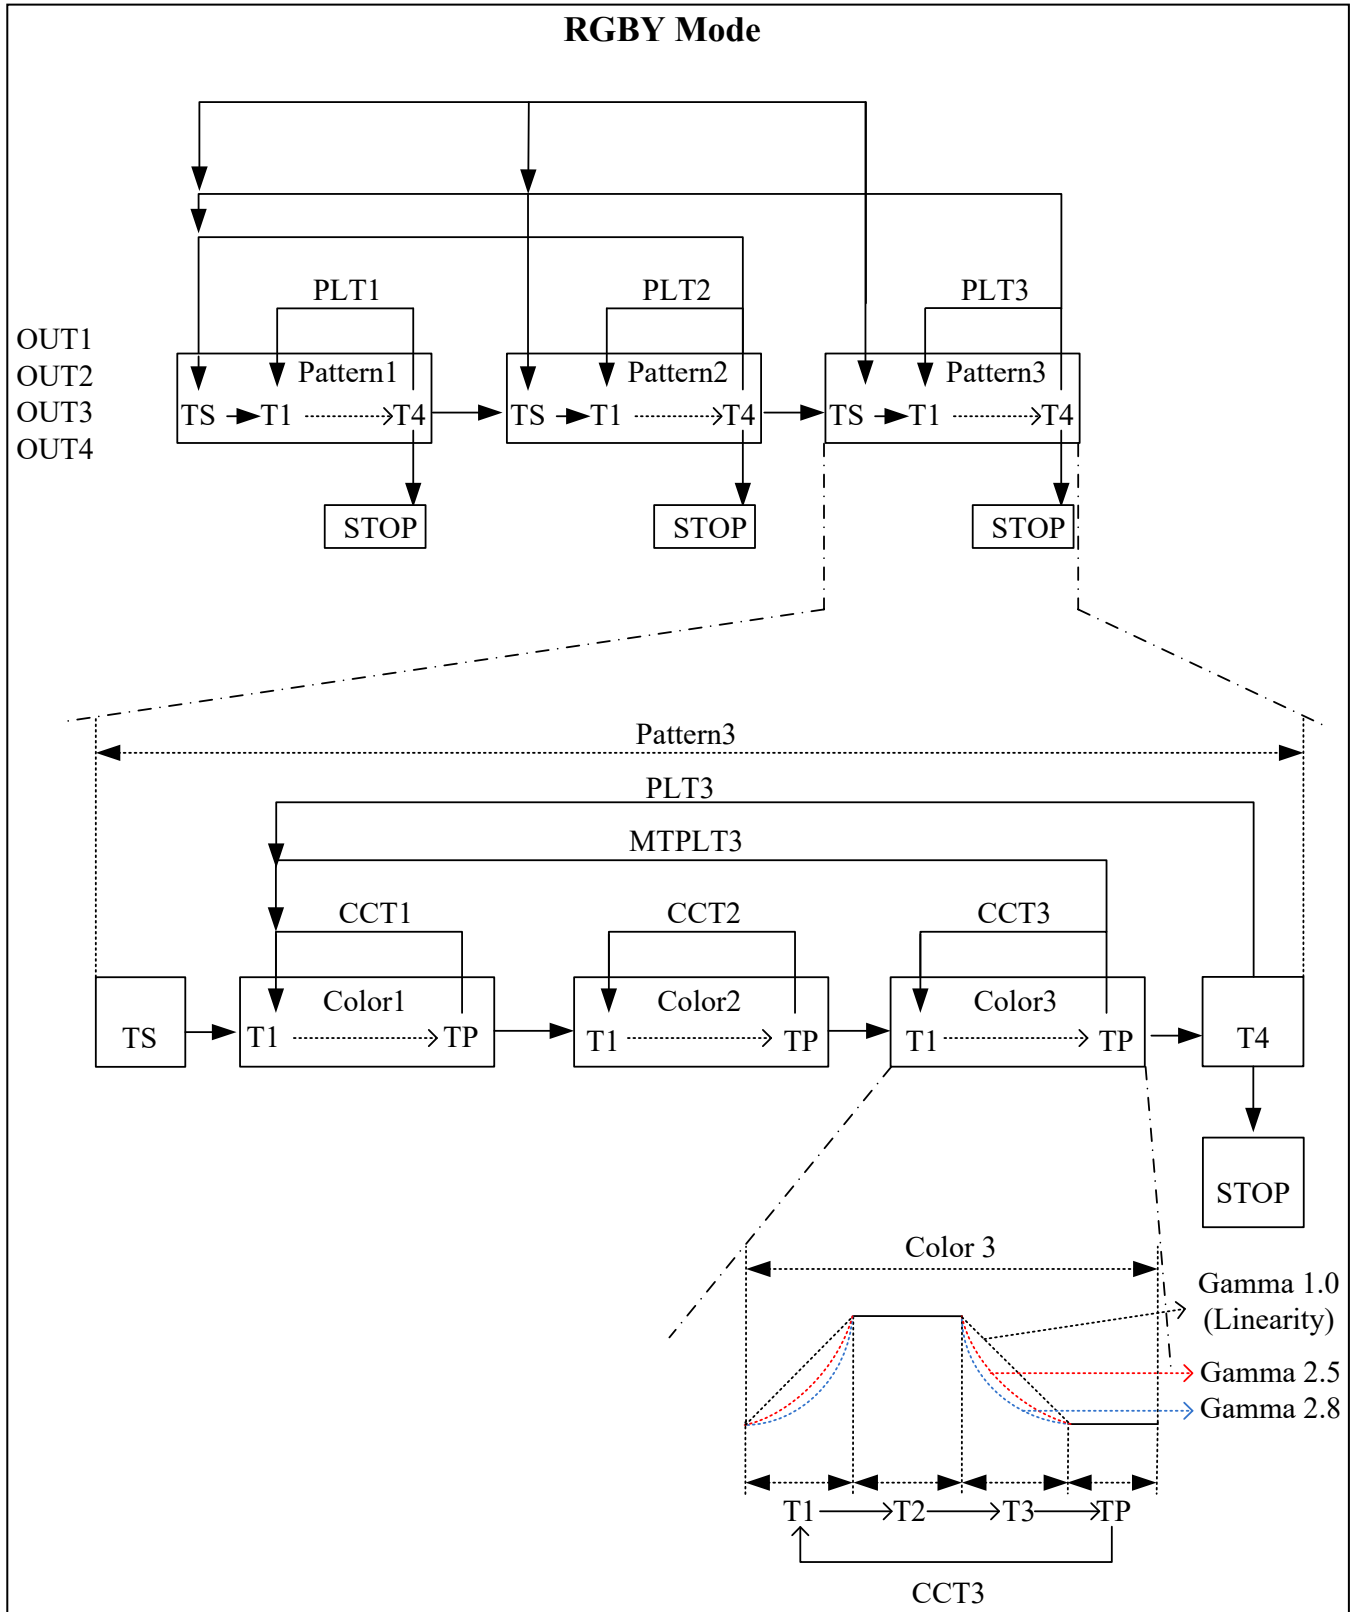

Figure 14 RGBY Mode
