I<sub>OH</sub> = 6.4 x I<sub>REF</sub> and V<sub>OH</sub> = 0.7V @ Z<sub>O</sub>=85Ω differential impedance.

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate of Clock / falling edge rate of Clock#. It is measured in a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope uses for the edge rate calculations.

<sup>5</sup> Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all Vcross measurements in any particular system. Note that this is a subset of V<sub>cross\_min</sub>/max (V<sub>cross</sub> absolute) allowed. The intent is to limit Vcross induced modulation by setting V<sub>cross\_delta</sub> to be smaller than V<sub>cross</sub> absolute.

### 9ZX21201 Differential Test Loads

## General SMBus serial interface information for the 9ZX21201

### How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address  $XX_{(H)}$
- IDT clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- IDT clock will **acknowledge**
- Controller (host) sends the data byte count = X
- IDT clock will **acknowledge**
- Controller (host) starts sending **Byte N through Byte N + X - 1**
- IDT clock will **acknowledge** each byte **one at a time**
- Controller (host) sends a Stop bit

### How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the write address  $XX_{(H)}$
- IDT clock will **acknowledge**
- Controller (host) sends the beginning byte location = N
- IDT clock will **acknowledge**
- Controller (host) will send a separate start bit.
- Controller (host) sends the read address  $YY_{(H)}$
- IDT clock will **acknowledge**
- IDT clock will send the data byte count = X
- IDT clock sends **Byte N + X - 1**
- IDT clock sends **Byte 0 through byte X (if  $X_{(H)}$  was written to byte 8).**
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit
