

- Single 5V power supply
- All  $V_{CC}$  pins isolated on chip
- Differentially drive balanced lines
- $t_{PD}$  1.3ns typical
- Fully compatible with MC10H351
- Available in 20-pin PLCC package

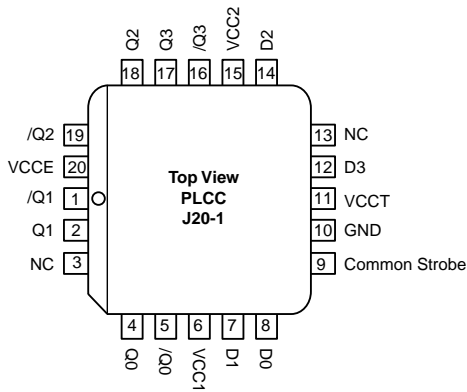

The SY10H351 is a quad translator for interfacing data between a saturated logic selection and the PECL section of digital systems when only a +5.0V  $V_{DC}$  power supply is available. The SY10H351 has TTL/NMOS compatible inputs and PECL complementary open-emitter outputs that allow use as an inverting/non-inverting translator or as a differential line driver. When the common strobe input is at a low logic level, it forces all true outputs to the PECL low logic state ( $\approx +3.2V$ ) and all inverting outputs to the PECL high logic state ( $\approx 4.1V$ ).

The SY10H351 can also be used with the SY10H350 to transmit and receive TTL/NMOS information differentially via balanced twisted pair lines.

$V_{CC}$  (+5  $V_{DC}$ ) = Pins 6, 11, 15, 20;  
GND = Pin 10

Pin	Function
D0 – D3	Inputs
Q0 – Q3	Outputs
/Q0 – /Q3	Inverted outputs
VCC1	PECL $V_{CC}$ (5.0V)
VCCE	PECL $V_{CC}$ (5.0V)
VCCT	TTL $V_{CC}$ (5.0V)
VCC2	PECL $V_{CC}$ (5.0V)
Common Strobe	Common Strobe
GND	Ground

**Note:**

1. Permanent device damage may occur if absolute maximum ratings are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
