General Description

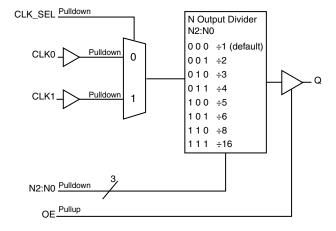

The ICS87001I-01 is a low skew, $\div 1$, $\div 2$, $\div 3$, $\div 4$, $\div 5$, $\div 6$, $\div 8$, $\div 16$ LVCMOS/LVTTL Clock Divider. The ICS87001I-01 has selectable clock inputs that accept single ended input levels. Output enable pin controls whether the output is in the active or high impedance state.

The ICS87001I-01 is characterized at 3.3V, 2.5V and mixed 3.3V/2.5V, 3.3V/1.8V, 2.5V/1.8V input/output supply operating modes.Guaranteed part-to-part skew characteristics make the ICS87001I-01 ideal for those applications demanding well defined performance and repeatability.

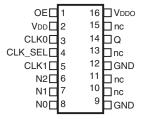

Features

- One LVCMOS / LVTTL output
- Selectable LVCMOS / LVTTL clock inputs
- Maximum output frequency: 250MHz
- Part-to-part skew: 135ps (typical)
- Power supply modes: Core/Output 3.3V/3.3V 3.3V/2.5V
- 3.3V/1.8V 2.5V/2.5V
- 2.5V/1.8V
- -40°C to 85°C ambient operating temperature
- · Available in lead-free (RoHS 6) package

Recommendations for Unused Input Pins

Inputs:

CLK Inputs

For applications not requiring the use of a clock input, it can be left floating. Though not required, but for additional protection, a $1k\Omega$ resistor can be tied from the CLK input to ground.

LVCMOS Control Pins

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A $1k\Omega$ resistor can be used.

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS87001I-01. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS87001I-01 is the sum of the core power plus the analog power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

- Power (core)_{MAX} = V_{DD MAX} * I_{DD} = 3.465V * 55mA = 190.6mW
- Power $(output)_{MAX} = V_{DDO-MAX} * I_{DDO} = 3.465 V * 5 mA = 17.3 mW$

LVCMOS Output Power Dissipation

- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$ Output Current $I_{OUT} = V_{DD\ MAX} / [2 * (50\Omega + R_{OUT})] = 3.465 V / [2 * (50\Omega + 17\Omega)] = 25.9mA$
- Power Dissipation on the R_{OUT} per LVCMOS output Power (R_{OUT}) = R_{OUT} * (I_{OUT})² = 17Ω * (25.9mA)² = **11.4mW**
- Total Power (R_{OLIT}) = 11.4mW * 1 = 11.4mW

Dynamic Power Dissipation at f_{OUT_MAX} (250MHz)

```
Power (250MHz) = C_{PD} * Frequency * (V_{DDO})^2 = 6pF * 250MHz * (3.465V)^2 = 18mW per output Total Power (250MHz) = 18mW * 1 = 18mW
```

Total Power Dissipation

- Total Power
 - = Power (core)_{MAX} + Power (output)_{MAX} + Total Power (R_{OUT}) + Total Power (250MHz)
 - = 190.6 mW + 17.3 mW + 11.4 mW + 18 mW
 - = 237.3mW

2. Junction Temperature.

Junction temperature, Tj, is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, Tj, to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

```
The equation for Tj is as follows: Tj = \theta_{JA} * Pd_total + T<sub>A</sub>
```

Tj = Junction Temperature

 θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 100.3°C/W per Table 6 below.

Therefore, Tj for an ambient temperature of 85°C with all outputs switching is:

```
85^{\circ}\text{C} + 0.237\text{W} * 100.3^{\circ}\text{C/W} = 109^{\circ}\text{C}. This is below the limit of 125^{\circ}\text{C}.
```

This calculation is only an example. Tj will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).
