

Atmel LED Driver-MSL2100

8-string, High-power, White or RGB LED Drivers for TVs,
Monitors, or Intelligent Solid-state Lighting

Datasheet Brief

Atmel LED Driver-MSL2100

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

General Description

The Atmel® LED Driver MSL2100 compact, high-power LED string driver uses external MOSFETs to provide up to 1A per string, with current accuracy and matching better than $\pm 1\%$. The MSL2100 drives eight parallel strings of LEDs, and offers fault detection and management of open and short circuit LEDs.

The MSL2100 features a 1MHz I²C serial interface. The interface supports video frame-by-frame LED string intensity control for up to 16 interconnected devices, allowing active area dimming when used for video displays. The advanced PWM engine synchronizes with the video signal, and offers phase shifted string drive, virtually eliminating waterfall noise and motion blur.

The MSL2100 adaptively controls up to three DC-DC converters, which power the LED strings, using patented Atmel's Driver Adaptive SourcePower™ technology. These Efficiency Optimizers minimize power use while maintaining LED current accuracy, and allow up to 16 interconnected devices to automatically negotiate the optimum power supply voltages.

A unique combination of peak current control and pulse width dimming management offers simple full-screen brightness control, versatile area dimming, and a consistent white point. LED string current is set for each string using a current sense (FET source) resistor. LED current is also digitally controlled for all eight LED strings. Global string drive pulse width is adjusted with a 6-bit global intensity register, and individual string pulse width is modulated with 8-bit control. Additionally, the MSL2100 optionally throttles back the PWM on time of all strings when the temperature of the LEDs exceeds a programmable threshold.

The MSL2100 monitors for string open circuit, LED short circuit, loss-of-sync and over temperature faults, and provides a hardware fault output to notify the MCU. Detailed fault status and control are available through the serial interface. Additionally, the MSL2100 includes an on-chip EEPROM that allows the power-up default register settings to be customized via the serial interface.

The MSL2100 is offered in a 6 x 6 x 0.85mm, 48-pin QFN package, and operates over a -40°C to +85°C temperature range.

Applications

- Edge-lit LED Backlit TVs
- High-contrast Monitors
- Medical and Industrial Displays
- High-power LED Arrays
- Multi-string LED Lighting
- Solid-State Lighting (SSL)

Ordering Information

PART	DESCRIPTION	PACKAGE
MSL2100BR	8-Ch LED driver	48 pin, 6x6x0.85mm QFN

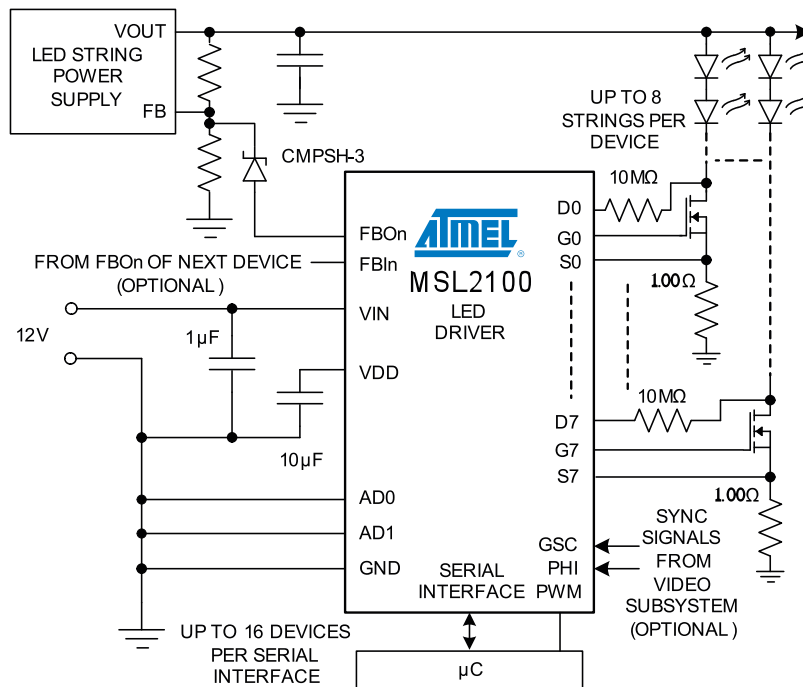

Atmel LED Driver-MSL2100

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

Key Features

- 8-bit PWM String Dimming
- Fast, 1MHz I²C/SMBus Interface Supports up to 16 Devices per Bus
- 4-Bit Adaptive Power Correction Maximizes Efficiency of up to Three Power Supplies
- External MOSFETs allow >0.5A LED String Current
- Drives up to Eight Parallel High Power LED Strings
- Multiple MSL2100s Share String Supplies and Automatically Negotiate Optimum Voltages
- Supports Adaptive, Real-time 2-D Area Dimming for Highest Dynamic Range LCD TVs and Monitors
- Programmable String Phase Virtually Eliminates Motion Blur and Improves Efficiency
- Global LED Intensity Control via Serial Interface
- Supports Direct PWM Control of all LED Strings with a Single PWM Input Signal
- ±1% Current Accuracy and Current Balance
- Video Frame (VSYNC) and Line (HSYNC) Sync Inputs
- Sync Loss Detectors Optionally Disable LED Strings
- Internal EEPROM Allows Custom Power-up Default Settings
- String Open Circuit and LED Short Circuit Fault Detection
- <1μA LED String off Leakage Current
- External Resistors Set Individual String Peak Current
- Programmable LED Over-temperature Compensation
- Automatic Die Over-temperature Protection
- I²C/SMBus Broadcast Mode Simplifies Configuration
- -40°C To +85°C Operating Temperature Range
- Lead-free, Halogen-free, RoHS-compliant Package

Application Circuit

Quick Start Guide

The MSL2100 controls eight strings of series-connected LEDs at up to 1A per string, and up to sixteen devices may share the serial interface. The MSL2100 FET gate drive output is optimized for FETs requiring no more than 10nC of charge. The MSL2100 PWM engine generates the PWM signal that drives the strings or, optionally, accepts an external PWM signal.

How Many LEDs and Drivers?

The MSL2100 drives eight strings of series-connected LEDs using external N-channel MOSFETs and current sense resistors. The LED drive capability (maximum number of LEDs per string) is limited only by the MOSFETs and the LED string power supplies, not by the MSL2100. Up to 16 MSL2100s may share an I²C/SMBus serial interface, with both individual and broadcast (all MSL2100s on a bus) addressing. The high LED drive power of the MSL2100 makes it suitable for large LCD TV and monitor backlights, as well as for LED signage and general lighting.

LEDs, String Power Supplies, and the Efficiency Optimizer

The MSL2100 features three Efficiency Optimizer outputs that dynamically adjust the LED string power supplies to the minimum voltage necessary to drive the LED strings, minimizing power use while assuring accurate LED current flow. The Efficiency Optimizers feature an input that allows up to 16 devices to be connected in a chain configuration. When implemented, the chains automatically negotiate, control and optimize the string power supplies for all LED strings driven by each chain.

The power supplies can use any topology that employs external feedback resistors with a maximum feedback voltage of 1.5V, and are typically DC-DC boost converters. The Efficiency Optimizers rely on close matching of the LEDs connected to a string supply; the better the matching, the better the overall efficiency.

Differences between Atmel LED Driver-MSL2100 and MSL3082

The MSL2100 includes three independent Efficiency Optimizer circuits to control three separate string supplies (for RGB LEDs for example). The MSL3082 includes a single Efficiency Optimizer, is more suited for single-color LEDs, and is ideal for driving white backlight LEDs in an LCD monitor or TV application.

Timing, PWM, Intensity Controls, and Synchronization

The PWM LED drive signals synchronize to video frame timing via the PHI input, and to pixel timing via the GSC input. Suitability for LED backlight architectures is shown in Table 1 and Table 2. Area LED dimming for direct backlighting is supported for contrast and color gamut improvement. With area dimming, motion blur is reduced by setting each LED string's PWM phasing to synchronize string off times with the LCD update timing. Also, the individual PWM intensity registers for eight LED strings are updated with only 92 I²C/SMBus clocks. Sixteen drivers (128 LED strings) update in 1.47ms with a 1MHz bus speed, offering area dimming support for frame rates up to 640Hz.

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

Table 1. Atmel LED Driver-MSL2100 LED Common Backlight Drive Architectures

BACKLIGHT TYPE	STRING SUPPLY OPTIONS	MOTION BLUR REMOVAL	LED ZONE MANAGEMENT
White LED - bottom edge-lit	One or more MSL2100 per Efficiency Optimized supply	No	No
White LED - top/bottom edge-lit		No	No
White LED - four sides edge-lit		No	No
White LED - direct back-lit		Yes - LED strip phasing	Higher contrast ratio (area dimming)
RGB LED - direct back-lit		Yes - LED strip phasing	Higher contrast ratio and color gamut

Table 2. Atmel LED Driver-MSL2100 Timing and LED Intensity Control Capability

LED INENSITY CONTROL	RESOLUTION
Individual LED string current	External resistors set maximum current for each LED string, up to at least 500mA
Individual LED string current	6-bit ISTR registers reduce string current from maximum set by global resistor
Global LED string pulse width	6-bit GINT register or PWM input (accepts 20Hz To 50kHz, 0% to 100% duty cycle)
Individual LED string pulse width	8-bit PWM registers set individual string pulse width
Global temperature derating	6-bit temperature pulse width derating individually applied to each string
Total LED string pulse width control	10-bit LED string pulse width computed from global and individual pulse width settings

Pin Descriptions

PIN	NAME	DESCRIPTION
1	AD1	I²C slave ID selection inputs AD1 and AD0 select the device I ² C slave address.
2	SCL	I²C serial clock input SCL is the I ² C serial interface clock input.
3	SDA	I²C serial data I/O SDA is the I ² C serial interface data I/O.
4	AD0	I²C slave ID selection inputs AD0 and AD1 select the device I ² C slave address.
5	FLTB	Fault output (open drain, active low) FLTB sinks current to GND when the MSL2100 detects a fault. FLTB remains low until the fault registers have been read or EN is toggled low.
6	FBI1	Efficiency Optimizer input Connect FBI1 to FBO1 of the next device when chaining the Efficiency Optimizers. If unused, connect FBI1 to GND.
7	FBO1	Efficiency Optimizer output Connect FBO1 through a Schottky diode to the string power supply's feedback node (Figure 4) or to FBI1 of the previous device (Figure 5). If unused, leave FBO1 unconnected.
8	FBI2	Efficiency Optimizer input Connect FBI2 to FBO2 of the next device when chaining the efficiency optimizers. If unused, connect FBI2 to GND.
9	FBO2	Efficiency Optimizer output Connect FBO2 through a Schottky diode to the string power supply's feedback node (Figure 4) or to FBI2 of the previous device (Figure 5). If unused, leave FBO2 unconnected.
10	FBI3	Efficiency Optimizer input Connect FBI3 to FBO3 of the next device when chaining the efficiency optimizers. If unused connect FBI3 to GND.
11	FBO3	Efficiency Optimizer output Connect FBO3 through a Schottky diode to the string power supply's feedback node (Figure 4) or to FBI3 of the previous device (Figure 5). If unused, leave FBO3 unconnected.
12, 40	GND	Power ground Connect GND to system ground, to CGND, and to EP with short, wide traces.
13, 16, 19, 22, 25, 28, 31, 34	S0 - S7	String 0 thru 7 source sense inputs Connect S _n to the source of external MOSFET _n and to the current sense resistor for LED string _n . The full-scale LED current is reached when 500mV is across the current sense resistor.
14, 17, 20, 23, 26, 29, 32, 35	G0 - G7	String 0 thru 7 external MOSFET gate drive outputs Connect G _n to the gate of external MOSFET _n .
15, 18, 21, 24, 27, 30, 33, 36	D0 - D7	String 0 thru 7 external MOSFET drain sense inputs Connect D _n to the drain of external MOSFET _n through a 10MΩ resistor.
37	VIN	Supply voltage input Connect a 12V ±10% supply to VIN. Bypass VIN to GND with a 1μF ceramic capacitor placed close to VIN.
38	VDD	Internal 2.5V regulator capacitor connection Bypass VDD to GND with a 10μF ceramic capacitor placed close to the device.

PIN	NAME	DESCRIPTION
39	EN	Enable input (active high) Drive EN high to turn on the MSL2100, and drive it low to turn it off. For automatic startup, connect EN to VIN through a 100kΩ resistor.
41, 45	N/C	No internal connection. Recommended to leave open.
42, 43, 44	CGND	Connect to ground Connect CGND to system ground, to GND, and to EP using short, wide traces.
46	PHI	Phase synchronization input Drive PHI with an external signal from 40Hz to 10kHz to synchronize the PWM dimming to the signal at PHI. Connect PHI to GND if unused.
47	GSC	Gate shift clock input Drive GSC with the gate shift clock of the video signal, up to 5MHz. GSC sets the resolution of PWM dimming. Connect GSC to GND if unused.
48	PWM	PWM input Drive PWM with a pulse-width-modulated signal with a duty cycle of 0% to 100% and frequency of 20Hz to 50kHz to control the brightness of all LED strings.
Exposed pad	EP	Power ground Connect EP to system ground, GND, and CGND using short, wide traces. EP offers thermal relief to the die.

Absolute Maximum Ratings

Voltage (With Respect to GND)

VIN, EN, D0-D7, G0-G7	-0.3V to +16V
SDA, SCL, AD0, AD1, FLTB.....	-0.3V to +5.5V
PHI, GSC, PWM, S0-S7, FBI1, FBI2, FBI3, FBO1, FBO2, FBO3	-0.3V to (V _{DD} + 0.3V)
VDD	-0.3V to +2.75V

Current (Into Pin)

VIN	50mA
GND.....	-500mA
All other pins.....	20mA

Continuous Power Dissipation (See Note 8, Note 9)

48-pin, 6mm x 6mm x 0.85mm QFN (derate 45.5mW/°C above 70°C)	2500mW
--	--------

Ambient Operating Temperature Range T_A = T_{MIN} to T_{MAX}..... -40°C to +85°C

Junction Temperature +125°C

Storage Temperature Range -65°C to +125°C

Lead Soldering Temperature, 10s +300°C

Electrical Characteristics

(Circuit of Figure 3, VIN = 12V, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at VIN = 12V, T_A = +25°C)

PARAMETER	CONDITIONS AND NOTES	MIN	TYP	MAX	UNIT
DC ELECTRICAL CHARACTERISTICS					
VIN operating supply voltage		10.8	12.0	13.2	V
VIN operating supply current	All drivers on at 100% duty, I ² C serial interface idle		25.0	32.5	mA
VIN shutdown supply current	EN = 0, all digital inputs tied to VDD or GND		10	20	μA
VDD regulation voltage		2.3	2.5	2.6	V
Input high voltage SDA, SCL, AD0, AD1		2.31			V
Input low voltage SDA, SCL, AD0, AD1				0.9	V
Input high voltage PHI, GSC, PWM		1.8			V
Input low voltage PHI, GSC, PWM				0.7	V
Input high voltage EN		0.9	1.36		V
Input low voltage EN				0.7	V
Input hysteresis EN			50		mV
Input quiescent current EN			1	20	μA
SDA, FLTB output low voltage	Sinking 6mA			0.4	V
S0 thru S7 regulation resolution			1		% of Full Scale
Open circuit detect voltage		7.3	8.3	9.0	V
Short circuit detect voltage		6.5	7.8	9.0	V
D0 thru D7 leakage current	Voltage under 9V		0.1		μA
	Voltage between 9V to 16V			15	
G0 thru G7 maximum gate drive voltage			10		V
G0 thru G7 gate drive current		-20		20	mA
Current sense regulation voltage	ISTRn = 0x3F	488	500	508	mV
	ISTRn = 0x1F	235	250	255	mV
G0 thru G7 output current slew rate	Current rising (Note 7, Note 8)		10		mA/μs
	Current falling (Note 7, Note 8)		10		
Thermal cut-off temperature			135		°C
FBI _n to FBO _n current transfer error	Up to FBO _n maximum output current		±2		%
FBO _n current step size			3		μA
FBO _n feedback output current maximum	V _{FBO_} = 0 to 1.8V	35	45	55	μA

PARAMETER	CONDITIONS AND NOTES		MIN	TYP	MAX	UNIT
AC ELECTRICAL CHARACTERISTICS						
OSC initial accuracy	f_{OSC}	OSCCTRL = 0x04 (f_{OSC} = 20MHz); T_A = 25°C	18	20	22	MHz
PHI frequency	f_{PHI}	(Note 7)	40		10,000	Hz
GSC frequency	f_{GSC}	(Note 7)			5	MHz
PWM frequency	f_{PWM}	PWMDIRECT = PWMEN = 1	20		50,000	Hz
PWM duty cycle		PWMDIRECT = PWMEN = 1	0		100	%
PHI DLL lock cycles				4		PHI Cycles

PARAMETER	CONDITIONS AND NOTES		MIN	TYP	MAX	UNIT
I²C SWITCHING CHARACTERISTICS						
SCL clock frequency	$1/t_{SCL}$	Bus timeout disabled (Note 1)	0		1,000	kHz
Bus timeout period	$t_{TIMEOUT}$	OSCCTRL = 0x04 (f_{OSC} = 20MHz); T_A = 25°C	27	30	33	ms
STOP to START condition bus free time	t_{BUF}		0.5			µs
Repeated START condition hold time	$t_{HD:STA}$		0.26			µs
Repeated START condition set-up time	$t_{SU:STA}$		0.26			µs
STOP condition set-up time	$t_{SU:STOP}$		0.26			µs
SDA data hold time	$t_{HD:DAT}$		15			ns
SDA data valid acknowledge time	$t_{VD:ACK}$	(Note 2)	0.05		0.55	µs
SDA data valid time	$t_{VD:DAT}$	(Note 3)	0.05		0.55	µs
SDA data set-up time	$t_{SU:DAT}$		100			ns
SCL clock low period	t_{LOW}		0.5			µs
SCL clock high period	t_{HIGH}		0.26			µs
SDA, SCL fall time	t_F	(Note 4, Note 5)			120	ns
SDA, SCL rise time	t_R				120	ns
SDA, SCL input suppression filter period	t_{SP}	(Note 6)		50		ns

Note 1. Minimum SCL clock frequency is limited by the bus timeout feature, which resets the serial bus interface if either SDA or SCL is held low for $t_{TIMEOUT}$. Disable bus timeout feature for DC operation

Note 2. $t_{VD:ACK}$ = SCL low to SDA (out) low acknowledge time

Note 3. $t_{VD:DAT}$ = minimum SDA output data-valid time following SCL low transition

Note 4. A master device must internally provide an SDA hold time of at least 300ns to ensure an SCL low state

Note 5. The maximum SDA and SCL rise times are 300ns. The maximum SDA fall time is 250ns. This allows series protection resistors to be connected between SDA and SCL inputs and the SDA/SCL bus lines without exceeding the maximum allowable rise time

Note 6. The MSL2100 includes input filters on SDA, SCL, AD0, and AD1 inputs that suppress noise less than 50ns

Note 7. Parameter is guaranteed by design, and is not production tested

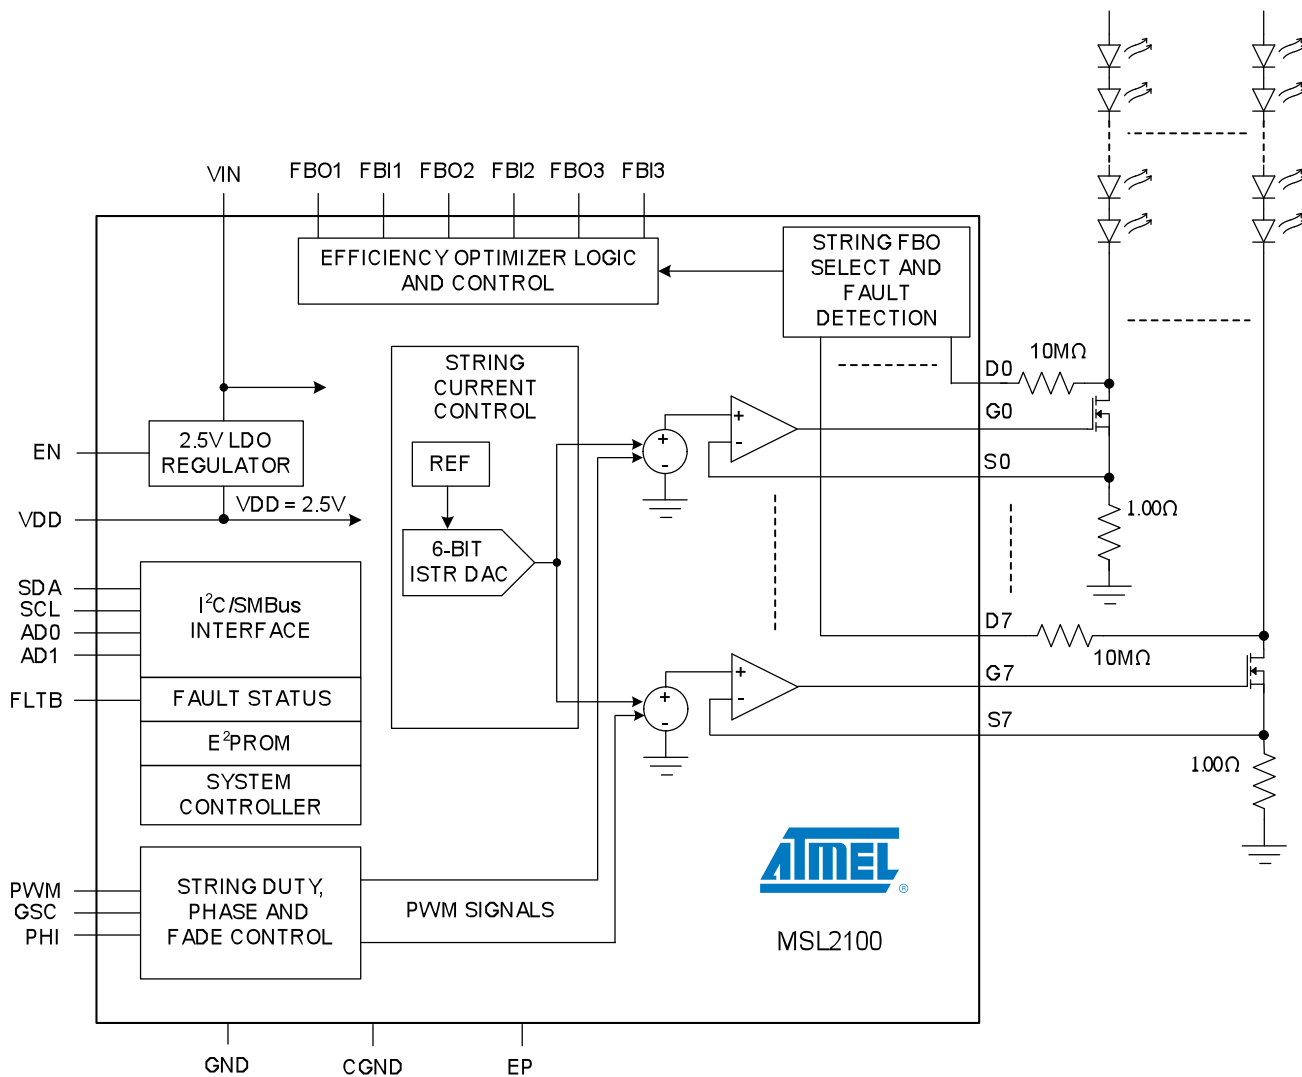

Note 8. Subject to thermal dissipation characteristics of the device

Note 9. When mounted according to JEDEC JEP149 and JESD51-12 for a one-layer PCB, θ_{JA} = 22°C/W and θ_{JC} = 1.3°C/W

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

Detailed Description

The MSL2100 is a highly integrated, flexible, multi-string LED driver that uses external MOSFETs to allow high LED string currents and includes power supply control for three supplies to maximize efficiency. The driver optionally connects to a video subsystem to offer easy synchronization for use in LCD TV backlight applications. Up to sixteen devices may be connected together to drive a large number of LED strings in a system. The drivers provide multiple methods of controlling LED brightness through both peak current control and pulse width control of the string drive signals. Peak current control offers excellent color consistency, while pulse width control allows brightness management. An on-chip EEPROM holds all the default control register values. At power-up, the data in the EEPROM are automatically copied directly to the control registers, setting up the device for operation. The factory programmed EEPROM values are changeable through the serial interface if a different power-up condition is desired.

The device interfaces to an MCU via the I²C/SMBus interface. The robust 1MHz I²C/SMBus interface supports up to sixteen devices on the bus, and is fast enough to support area dimming for 16 interconnected devices. While typically the LED drive PWM signal is internally generated by the PWM engine, the device also accepts an external direct PWM drive signal applied to the PWM input to set the duty cycle and the frequency of the LED drive signals. When using the PWM engine, the MSL2100 allows phase spreading of the LED drive signals, which helps reduce the transient load on the LED power supplies. Phase spreading is not supported for direct PWM drive.

The PWM frequency of the drivers is easily synchronized to an external video signal applied to PHI. Typically, the VSYNC signal from the video system is used as the PHI input. A frame-rate multiplier (1x to 16x) processes this signal for use by the PWM engine. The on time of each string is individually programmed via the device registers, providing a peak resolution of 10 bits when using the on-chip PWM generator. The actual resolution

of the PWM frequency depends on the ratio of the GSC frequency (typically provided by a systems HSYNC signal) to the PHI frequency because the on time of a string is programmed as a function (8-bit count) of the number of GSC cycles. This count can be further scaled by a 6-bit global intensity register, when enabled. The GSC clock is also used to precisely set each string's phase delay to be synchronized with its physical position relative to the video frame. Additionally, the MSL2100 features programmable temperature compensation, which throttles back the PWM on time of all strings when the temperature of the LEDs exceeds a programmable threshold.

The Efficiency Optimizers control a wide range of different external DC-DC and AC-DC converter architectures. Multiple drivers in a system communicate in real time among themselves to select an optimized operating voltage for the LEDs. This allows design of the power supplies for the worst case forward voltage (V_f) of the LEDs without concern about excessive power dissipation issues. During the start-up sequence, the MSL2100 automatically reduces the power supply voltage to the minimum required to keep the LEDs in current regulation. The devices are configured to periodically perform this optimization to compensate for changes in LED forward voltage, and to assure continued optimum power savings.

Internal Regulators and Enable Input

The MSL2100 includes an internal linear regulator powered from VIN that provides 2.5V, VDD, to power the internal circuitry. Bypass VDD to GND with a 10 μ F or greater capacitor.

The enable input, EN, turns the VDD regulator on and off. To turn on the MSL2100, force EN high with a 5V logic level, and force EN low to turn it off. When EN is low, the MSL2100 enters low-power mode, and the serial interface is ignored. Toggling EN low also clears all fault registers and releases FLTb. Faults re-establish if the conditions that generated them persist.

Setting LED String Currents

The maximum string current, I_{LED} , for each string is set by a resistor, R_{Sn} , connected to ground from the source terminal of the external string drive MOSFET. The feedback threshold is 500mV. Determine the resistor value using:

$$R_{Sn} = \frac{0.5}{I_{LED}}, \quad \text{where } I_{LED} \text{ is in amperes and } R_{Sn} \text{ is in ohms.}$$

For example, a full-scale LED current of 500mA returns $R_{Sn} = 1.00\Omega$. The current for the LED strings is individually reduced from the full-scale resistor set value with 6-bit resolution using $ISTR_n$, the string current control registers 0x10 through 0x1F.

Connecting an LED String Power Supply to an Efficiency Optimizer Output

The MSL2100 is designed to control up to three external LED string power supplies that use voltage dividers (R_{TOP} and R_{BOTTOM} in Figure 4) to set the output voltage, and whose regulation feedback voltage is not more than 1.5V. The Efficiency Optimizer improves power efficiency by injecting a current of between 0 and 45 μ A into the voltage dividers of the external power supplies, dynamically adjusting their outputs to the minimum voltage required by the LED strings. To select the resistors, first determine $V_{OUT(MIN)}$ and $V_{OUT(MAX)}$, the minimum and maximum string supply voltage limits, using:

$$V_{OUT(MIN)} = (V_{f(MIN)} * [\#ofLEDs]) + 0.5,$$

and

$$V_{OUT(MAX)} = (V_{f(MAX)} * [\#ofLEDs]) + 0.5,$$

where $V_{f(MIN)}$ and $V_{f(MAX)}$ are the LED minimum and maximum forward voltage drops at the peak current set by R_{Sn} (page_). For example, if the LED data are $V_{f(MIN)} = 3.5V$ and $V_{f(MAX)} = 3.8V$, and ten LEDs are used in a string, then the total minimum and maximum voltage drops across a string are 35V and 38V, respectively. Adding an allowance of 0.5V for the string drive MOSFET headroom brings $V_{OUT(MIN)}$ to 35.5V and $V_{OUT(MAX)}$ to 38.5V. Then, determine R_{TOP} using:

$$R_{TOP} = \frac{V_{OUT(MAX)} - V_{OUT(MIN)}}{I_{FBOn(MAX)}},$$

where $I_{FBOn(MAX)}$ is the 45 μ A maximum output current of the Efficiency Optimizer outputs, FBO1, FBO2, and FBO3. Finally, determine R_{BOTTOM} using:

$$R_{BOTTOM} = R_{TOP} * \frac{V_{FB}}{V_{OUT(MAX)} - V_{FB}},$$

where V_{FB} is the regulation feedback voltage of the power supply. Place a Schottky diode (CMPSH-3 or similar) between FBO $_n$ and the supply's feedback node to protect the MSL2100 against current flow into FBO $_n$.

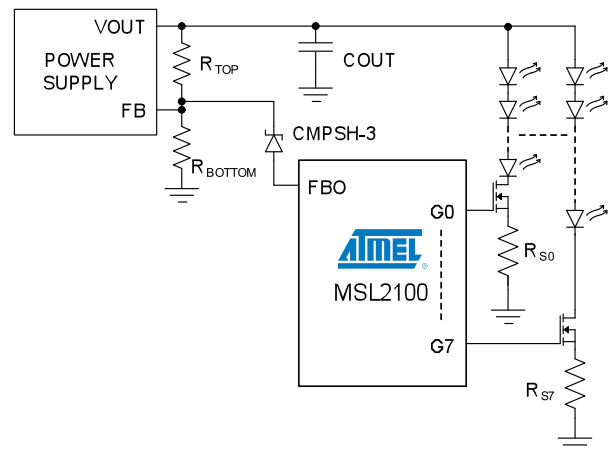

Figure 4. FBO $_n$ Connection to Power Supply Voltage Divider

Atmel LED Driver-MSL2100

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

Using Multiple Atmel LED Driver-MSL2100s to Control a Single Power Supply

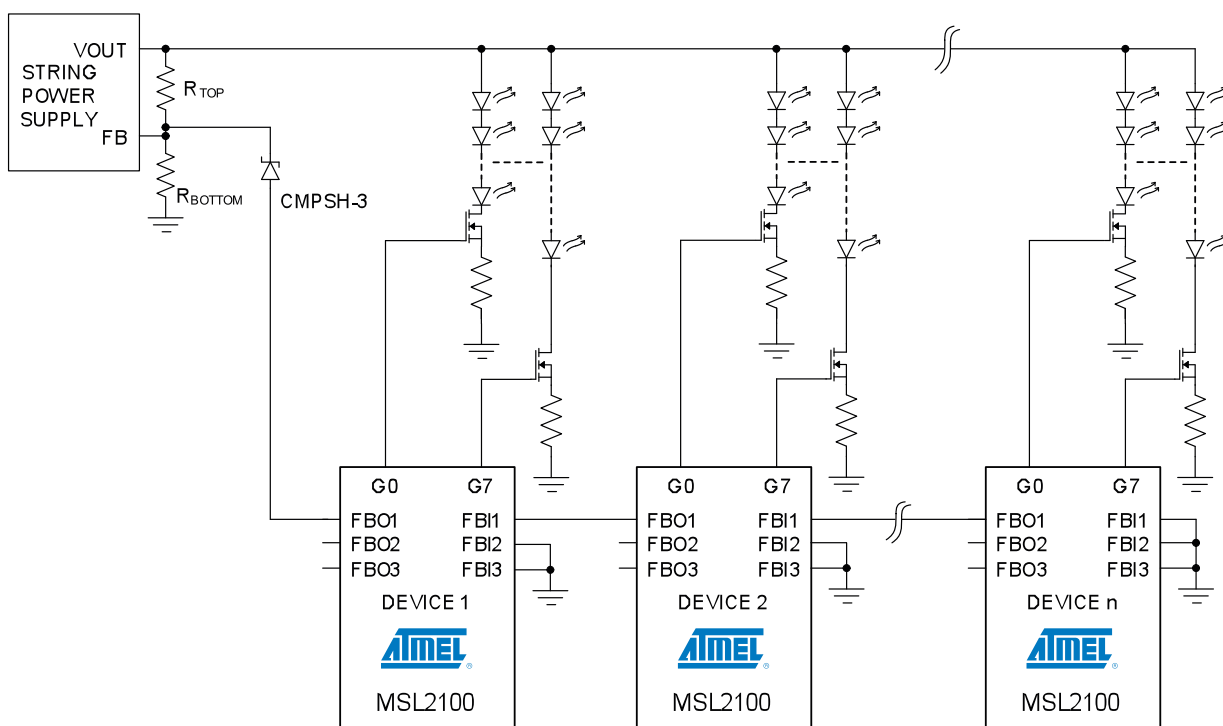

Cascade multiple MSL2100 devices into a chain configuration (Figure 5) with the FBIn of one device connected to the FBO_n of the next. Connect the first FBO_n to the power supply feedback resistor node through a CMPSH-3 or similar Schottky diode, and the unused FBIn input to ground as close to the MSL2100 as possible. The chained devices work together to ensure that the system operates at optimum efficiency. Note that the accuracy of the feedback chain has the potential to degrade through each link of the FBIn/FBO_n chain by as much as 2%. Determine the worst case maximum FBO_n current, $I_{FBO_n(MAX/MIN)}$, using:

$$I_{FBO_n(MAX/MIN)} = 45\mu A * (0.98)^{N-1},$$

where N is the number of MSL2100s connected in series. Use this result in the above R_{TOP} resistor equation for the term $I_{FBO_n(MAX)}$ instead of using the 45 μ A figure shown here.

Take care in laying out the traces for the Efficiency Optimizer connections. Minimize the FBIn/FBO_n trace lengths as much as possible. Do not route the signals close to traces with large variations in voltage or current because noise may couple into FBIn. If these traces must be routed near noisy signals, shield them from noise by using ground planes and/or guard traces.

Figure 5. Cascade Multiple Atmel LED Driver-MSL2100s to Control a Common Power Supply

Register Map Summary

Control the MSL2100 using the registers in the range 0x00 through 0x57 (Table 3). Two additional registers, 0x90 and 0x91, allow access to, and programming of, the EEPROM. The power-up default values for all control registers are stored within the on-chip EEPROM, and any of these EEPROM values may be changed through the serial interface.

DO NOT ACCESS ADDRESS RANGE 0X5A TO 0X8F										
E2ADDR	0x90	User EEPROM read/write access	-	E2ADDR[6:0]						
E2CTRLSTA	0x91		E2BUSY	BLDACT	E2ERR	-	-	RWCTRL[1:0]		

* Read-only registers

Register Power-up Defaults

Register power-up default values are shown in Table 4.

Table 4. Atmel LED Driver-MSL2100 Register Power-up Defaults

REGISTER NAME AND ADDRESS		POWER-UP CONDITION REGIASTERS INITIALIZED FROM EEPROM	REGISTER DATA									
			D7	D6	D5	D4	D3	D2	D1	D0	HEX	
0x00	CONTROL	All LED strings drive outputs are enabled	1	1	1	1	1	1	1	1	1	FF
0x02	POWERCTRL	String phase delay enabled Efficiency Optimizer feedback output enabled I ² C bus timeout enabled Direct PWM disabled String open circuit detection enabled String short circuit detection enabled Device awake	0	1	1	1	0	1	1	1	1	77
0x03	OSCCTRL	Internal oscillator f_{osc} set to 20MHz	0	0	0	0	0	1	0	0	0	04
0x04	OTTEMP	Over-temperature threshold is 90°C	0	1	0	1	1	0	1	0	0	5A
0x05	SYSTEMP	System temperature set to 30°C	0	0	0	1	1	1	1	0	0	1E
0x06	OTSLOPE	Over-temperature slope set to 50°C	0	0	1	1	0	0	1	0	0	32
0x08	PWMCTRL	PWM operation enabled String on times truncated at end of frame GSC low frequency fault detection disabled PHI high frequency fault detection disabled Over-temperature derating of string on times enabled PWM frame synchronized to rising edge at PHI input GINT global intensity control enabled GSC input frequency division disabled	0	1	1	1	0	0	0	0	1	71
0x0B	GINT	Global intensity PWM duty cycle $GINT = 15/64 = 23.4\%$	0	0	0	0	1	1	1	1	1	0F
0x0C	GSCDIV	GSC input frequency is divided by 2 ⁰	0	0	0	0	0	0	0	0	0	00
0x0D	PHIMUL	PHI input frequency is multiplied by 1	0	0	0	0	0	0	0	0	1	01
0x0E	STR03FBO	All strings are monitored by the Efficiency Optimizer and are assigned to the FBO outputs as follows: FBO1: Strings 0 and 4 FBO2: Strings 1, 2, 5 and 6 FBO3: Strings 3 and 7	1	1	1	0	1	0	0	0	1	E9
0x0F	STR47FBO		1	1	1	0	1	0	0	0	1	E9
0x10 0x17	ISTR0 thru ISTR7	Individual peak string current $= \frac{0.5}{R_{Sn}} * \frac{32}{63}$	0	0	1	0	0	0	0	0	0	20

Atmel LED Driver-MSL2100

8-string, High-power, White or RGB LED Drivers for TVs, Monitors, or Intelligent Solid-state Lighting

REGISTER NAME AND ADDRESS		POWER-UP CONDITION REGIASTERS INITIALIZED FROM EEPROM	REGISTER DATA								
			D7	D6	D5	D4	D3	D2	D1	D0	HEX
0x20 0x27	PHDLY0 thru PHDLY7	All string phase delays set to zero processed GSC cycles	0	0	0	0	0	0	0	0	00
0x30 0x37	PWM0 thru PWM7	All strings PWM settings equal 48 processed GSC cycles	0	0	1	1	0	0	0	0	30
0x40	GSCMAX	Maximum GSC pulse count is 0	0	0	0	0	0	0	0	0	00
0x41			0	0	0	0	0	0	0	0	00
