

Features

- Automatic power-down when deselected
- Output Enable (\overline{OE}) feature (7C195 and 7C196)
- CMOS for optimum speed/power
- High speed
— $t_{AA} = 25$ ns
- Low active power
— 880 mW
- Low standby power
— 220 mW
- TTL-compatible inputs and outputs

- Capable of withstanding greater than 2001V electrostatic discharge

Functional Description

The CY7C194, CY7C195, and CY7C196 are high-performance CMOS static RAMs organized as 65,536 by 4 bits. Easy memory expansion is provided by active LOW chip enable(s) (\overline{CE} on the CY7C194 and CY7C195, \overline{CE}_1 , \overline{CE}_2 on the CY7C196) and three-state drivers. They have an automatic power-down feature, reducing the power consumption by 75% when deselected.

Writing to the device is accomplished when the chip enable(s) (\overline{CE} on the CY7C194

and CY7C195, \overline{CE}_1 , \overline{CE}_2 on the CY7C196) and write enable (\overline{WE}) inputs are both LOW. Data on the four input pins (I/O_0 through I/O_3) is written into the memory location, specified on the address pins (A_0 through A_{15}).

Reading the device is accomplished by taking the chip enable(s) (\overline{CE} on the CY7C194 and CY7C195, \overline{CE}_1 , \overline{CE}_2 on the CY7C196) LOW, while write enable (\overline{WE}) remains HIGH. Under these conditions the contents of the memory location specified on the address pins will appear on the four data output pins.

A die coat is used to ensure alpha immunity.

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature - 65°C to +150°C
- Ambient Temperature with Power Applied - 55°C to +125°C
- Supply Voltage to Ground Potential - 0.5V to +7.0V
- DC Voltage Applied to Outputs in High Z State - 0.5V to +7.0V
- DC Input Voltage - 3.0V to +7.0V
- Output Current into Outputs (LOW) 20 mA

- Static Discharge Voltage >2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current >200 mA

Operating Range

Range	Ambient Temperature ^[1]	V _{CC}
Commercial	0°C to +70°C	5V ± 10%
Military	- 55°C to +125°C	5V ± 10%

Shaded area contains advanced information.

- Notes:**
1. T_A is the "instant on" case temperature.
 2. See the last page of this specification for Group A subgroup testing information.
 3. Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.
 4. A pull-up resistor to V_{CC} on the \overline{CE} input is required to keep the device deselected during V_{CC} power-up, otherwise I_{SB} will exceed values given.

t _{HZWE}	\overline{WE} LOW to High Z ^[7,8]		7		7		10		13		15		20	ns

Notes:

6. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30 pF load capacitance.
7. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} and t_{HZWE} is less than t_{LZWE} for any given device.
8. t_{HZOE}, t_{HZCE}, and t_{HZWE} are specified with C_L = 5 pF as in part (b) of AC Test Loads. Transition is measured ±500 mV from steady state voltage.

9. The internal write time of the memory is defined by the overlap of \overline{CE}_1 LOW, \overline{CE}_2 LOW, and \overline{WE} LOW. All signals must be LOW to initiate a write and any signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

Read Cycle No. 1 [10, 11]

C194-8

Read Cycle No. 2 [10, 12]

C194-9

Write Cycle No. 1 (\overline{CE} Controlled) [9, 13, 14]

C194-10

Notes:

10. \overline{WE} is HIGH for read cycle.
11. Device is continuously selected: $\overline{CE}_1 = V_{IL}$, $\overline{CE}_2 = V_{IL}$ (7C196), and $\overline{OE} = V_{IL}$ (7C195 and 7C196).
12. Address valid prior to or coincident with \overline{CE}_1 and \overline{CE}_2 transition LOW.
13. Data I/O will be high impedance if $\overline{OE} = V_{IH}$ (7C195 and 7C196).
14. If any \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.
15. The minimum write cycle time for Write Cycle No. 3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .
