Notes:

1. This module has an internal flash memory and a function to erase/sort unnecessary data if certain HCI commands are issued and consume more than a certain level of free space in the EEPROM. This operation occurs at every module initialization (power-on).

   If supply voltage becomes non-defined states during initialization or writing in EEPROM, data in EEPROM might be destroyed. If the data in EEPROM is destroyed, module will not work correctly. Therefore   please be sure to stabilize power source before /RESET release.

   In addition please design module peripheral circuits to avoid temporary blackout of power   source during operation. Please refer HD-AE-C080180 for HCI command which rewrites flash memory data.

2. Input /RESET signal of 10ms and more in condition of VDD at over 3.0V.

3. When the module is ready to accept the command, its module outputs the "04 0F 04 00 01 00 00" (Hex) to the UART TX Data Line. After that, please access to the module.

4. The Typ. is a reference value. The value may change depending on the firmware version, conditions of use and types of flash memory.

5. It may change due to the firmware version.
