

ISL91302B

Dual/Single Output Power Management IC

FN8828
Rev.3.01
Feb 2, 2022

The [ISL91302B](#) is a highly efficient, dual or single output, synchronous multiphase buck switching regulator that can deliver up to 5A per phase continuous output current. The ISL91302B features four integrated power stages and two controllers. The ISL91302B can assign its power stages and controllers to two dual-phase outputs (2+2) or one three-phase and one-phase output (3+1) or one four-phase output (4+0). This flexibility allows seamless design-in for a wide range of applications in which dual, triple, or quad phase outputs are needed, such as CPU and GPU core power mobile applications.

The ISL91302B integrated low ON-resistance MOSFETs, programmable PWM frequency, and automatic diode emulation, which maximizes efficiency while minimizing the external component count and solution size.

The ISL91302B uses the proprietary Renesas R5 modulator technology to deliver a highly robust power solution capable of ultra-fast transient response, excellent loop stability, and seamless DCM/CCM transitions without requiring external compensation.

The ISL91302B is widely configurable through the factory OTP settings. Available features include:

- SPI and I²C interface
- External signal telemetry with an internal ADC
- Dynamic Voltage Scaling (DVS) with selectable slew rate

Contact Renesas [support](#) for additional configurations.

Features

- Dual output 3+1 or 2+2, or single output 4-phase
- 2.5V to 5.5V supply voltage
- 5A per phase output current capability
- Small solution size
- High efficiency (94.7% peak for 3.8V V_{IN}, 1.8V V_{OUT}, L = 470nH)
- Low I_Q in low power mode
- Proprietary control scheme reduces the output capacitor and supports fast load transients (such as 50A/μs per phase)
- Voltage, current, and temperature telemetry through integrated ADC plus auxiliary inputs
- ±0.7% system accuracy with remote voltage sensing
- OTP programmable PWM frequency from 2MHz to 6MHz
- I²C and SPI programmable output from 0.3V to 2.0V
- Independent Dynamic Voltage Scaling (DVS) for each output
- Soft-start and fault detection (UV, OV, OC, OT), short-circuit protection
- 2.551mm x 3.670mm 54 ball WLCSP with 0.4mm pin pitch

Applications

- Smart phones and tablets
- FPGA and ASIC power
- Industrial MPU power
- Human machine interface

1.3 Ordering Information

Part Number (Notes 1, 3, 4)	Part Marking	Package Description (RoHS Compliant)	Pkg. Dwg. #	Carrier Type (Note 2)	Temp Range
ISL91302BIIZ-T	91302B	2.551mmx3.670mm, 54 Ball 6x9 WLCSP	W6x9.54	Reel, 3k	-40 to +85°C
ISL91302B22-EVZ	ISL91302B - Evaluation board 1, 2+2 PMIC, WLCSP RoHS compliant				
ISL91302B31-EVZ	ISL91302B - Evaluation board 1, 3+1 PMIC, WLCSP RoHS compliant				
ISL91302B40-EVZ	ISL91302B - Evaluation board 1, 4+0 PMIC, WLCSP RoHS compliant				

Notes:

- For additional part options contact your local sales office.
- See [TB347](#) for details about reel specifications.
- These Pb-free WLCSP packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAgCu - e6 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Pb-free WLCSP packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J-STD-020.
- For Moisture Sensitivity Level (MSL), see the [ISL91302B](#) device page. For more information about MSL, see [TB363](#).

Table 1. Key Differences Between Family of Parts

Part Number	Pin Configuration	Pitch	Output Configuration	Maximum Load
ISL91302B	54 Ball 6x9 WLCSP	0.4mm	Single Output (4 + 0 Phase)	5A
	54 Ball 6x9 WLCSP	0.4mm	Dual Output (3 + 1 Phase)	5A
	54 Ball 6x9 WLCSP	0.4mm	Dual Output (2 + 2 Phase)	5A
ISL91301A	42 Ball 6x7 WLCSP	0.4mm	Triple Output (2+1+1 Phase)	4A

1.5 Pin Descriptions

Pin Number	Pin Name	Type	Description
A1, B1	PVIN_A	Input	Power supply for Power Stage A.
A2, B2, C2	PH_A	Output	Switching node for Power Stage A.
A3, B3, C3	PGND_A	Input	Ground connection for Power Stage A.
A4, B4, C4	PGND_B	Input	Ground connection for Power Stage B.
A5, B5, C5	PH_B	Input	Switching node for Power Stage B.
A6, B6	PVIN_B	Input	Power supply for Power Stage B.
C1	GPIO0	Input/Output	General purpose I/O pin, see Table 2 .
C6	WDOG_RST	Input	Digital input, resets the bucks to default output voltage.
D1	EN	Input	Master chip enable input, NMOS logic threshold.
D2	GPIO1	Input/Output	General purpose I/O pin, see Table 2 .
D3	INT	Output	Interrupt line.
D4, D5, E2, E3, E4, E5	GND	Input	Analog chip ground. Ensure a low impedance connection to the internal ground layer.
D6	RTN1	Input	Remote ground voltage sense for Buck #1.
E1	VOOUT2	Input	Remote output voltage sense for Buck #2.
E6	VOOUT1	Input	Remote output voltage sense for Buck #1.
F1	RTN2	Input	Remote ground voltage sense for Buck #2.
F2	AVIN_FILT	Output	Filtered analog supply voltage, 2.5 to 5.5V. Place a decoupling capacitor close to the IC.
F3	VIO	Input	I/O supply voltage for digital communications. Normally connected to 1.8V supply.
F4	MPIO0	Input/Output	Multipurpose I/O, see Table 2 .
F5	MPIO1		
F6	MPIO2		
G1	AVIN	Input	Analog supply voltage, 2.5V to 5.5V.
G2, H2, J2	PH_C	Output	Switching node for Power Stage C.
G3, H3, J3	PGND_C	Input	Ground connection for Power Stage C.
G4, H4, J4	PGND_D	Input	Ground connection for Power Stage D.
G5, H5, J5	PH_D	Output	Switching node for Power Stage D.
G6	MPIO3	Input/Output	Multipurpose I/O, see Table 2 .
H1, J1	PVIN_C	Input	Power supply connection for Power Stage C.
H6, J6	PVIN_D	Input	Power supply connection for Power Stage D.

Table 2. I/O Pin Configuration

IO_PINMODE	MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1	Description
0x0	SCK	SS_B	MOSI	MISO	SCL	SDA	I ² C/SPI both available
0x1	SCK	SS_B	MOSI	MISO	EN_A	EN_B	SPI mode with hardware buck enable pins
0x2	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
0x3	SCK	SS_B	MOSI	MISO	DVS1_0	DVS2_0	SPI with hardware DVS pins
0x4	DVS_PIN1	DVS_PIN0	PGOOD1	PGOOD2	SCL	SDA	I ² C with global DVS mode with PGOOD1 and PGOOD2

Table 2. I/O Pin Configuration (Continued)

IO_PINMODE	MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1	Description
0x5	DVS1_0	DVS1_1	DVS2_0	DVS2_1	SCL	SDA	I ² C with full pin controlled DVS for Buck1 and Buck2
0x6	DVS1_0	DVS2_0	PGOOD1	PGOOD2	SCL	SDA	I ² C with DVS and PGOOD for Buck1 and Buck2
0x7- 0xC	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved
0xD	ADC_IN0	ADC_IN1	PGOOD1	PGOOD2	SCL	SDA	I ² C with ADC input and PGOOD for Buck1 and Buck2
0xE	ADC_IN0	ADC_IN1	DVS_PIN1	DVS_PIN0	SCL	SDA	I ² C with ADC input and global DVS
0xF	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved	Reserved

Table 3. Pin Mode Name Description

Name	Definition
SCK	SPI clock.
SS_B	SPI slave select (must be pulled to VIO when using I ² C in Pin Mode 0x0)
MOSI	SPI master out slave in.
MISO	SPI master in slave out.
SCL	I ² C clock.
SDA	I ² C data.
PGOOD1, PGOOD2	Power-good output pins.
EN_A, EN_B	Buck enable input pins.
DVS_PIN1, DVS_PIN0	Global DVS logic pins which references a look-up table to allow complete DVS control.
DVS1_0, DVS1_1	DVS input logic pins for Buck1.
DVS2_0, DVS2_1	DVS input logic pins for Buck2.
ADC_IN0, ADC_IN1	Input pins for auxiliary ADC.

2. Specifications

2.1 Absolute Maximum Ratings

Parameter	Minimum	Maximum	Unit
PVIN and AVIN Pins to PGND	-0.3	+6	V
VOUT Pin BUCKx_VOUTFBDIV = 0x0	-0.3	+2.0	V
VOUT Pin BUCKx_VOUTFBDIV = 0x1	-0.3	+2.4	V
VOUT Pin BUCKx_VOUTFBDIV = 0x2	-0.3	+3.0	V
PH to PGND	-0.3	+0.3 + PVIN	V
VIO, EN Pins to GND	-0.3	+0.3 + AVIN	V
RTN, GND to PGND Pins	-0.3	+0.3	V
INT, WDOG_RST, MPIO, GPIO pins to GND	-0.3	+0.3 + VIO	V
ESD Ratings (Note 5)		Value	Unit
Human Body Model (Tested per JS-001-2014)		2	kV
Charged Device Model (Tested per JS-002-2014)		750	V
Latch-Up (Tested per JESD78E; Class 2, Level A)		100	mA

Note:

5. ESD ratings apply to external pins only.

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions can adversely impact product reliability and result in failures not covered by warranty.

2.2 Thermal Information

Thermal Resistance (Typical)	θ_{JA} (°C/W)	θ_{JC} (°C/W)
54 Ball WLCSP Package (Notes 6, 7)	42	0.5

Notes:

6. θ_{JA} is measured in free air with the component mounted on a high-effective thermal conductivity test board with "direct attach" features. See [TB379](#).

7. For θ_{JC} , the "case temp" location is taken at the package top center.

Parameter	Minimum	Maximum	Unit
Maximum Junction Temperature (T_J)		+150	°C
Storage Temperature Range (T_S)	-65	+150	°C
Pb-Free Reflow Profile	see TB493		

2.3 Recommended Operation Conditions

Parameter	Minimum	Maximum	Unit
Ambient Operating Temperature Range (T_A)	-40	+85	°C
Operating Junction Temperature (T_J)	-40	+125	°C
Supply Voltage			
AVIN to GND	2.5	5.5	V
PVIN to PGND	2.5	5.5	V
VIO Voltage (VIO to GND)	1.7	AVIN	V
INT, WDOG_RST, MPIO, GPIO Pins to GND	0	VIO	V

2.4 Analog Specifications

AVIN/PVIN = 3.7V, V_{OUT} = 1V, L = 220nH, Frequency = 4MHz, V_{IO} = 1.8V, T_A = +25°C. **Boldface limits apply across the ambient operating temperature range, -40°C to +85°C unless otherwise noted.**

Parameter	Symbol	Test Conditions	Min (Note 8)	Typ	Max (Note 8)	Unit	
Input Supply							
Supply Voltage	AVIN		2.5		5.5	V	
Supply Voltage	PVIN		2.5		5.5	V

		3.0V < V _{IN} < 5.0V I _{LOAD} = 500mA (minus offset)	-15		15	%
MPIO/GPIO Operating Conditions						
Allowable Range of Supply for Operation	V _{IO}		1.70	1.80	AVIN	V
Chip Enable Logic Threshold Level						
Low-Level Input Voltage	V _{IL}				0.5	V
High-Level Input Voltage	V _{IH}		1.35			V
Serial Interfaces						
I ² C Frequency Capability	f _{I2C}				3.4	MHz
SPI Frequency Capability	f _{SPI}			26		MHz
MPIO/GPIO Logic Threshold Levels						
Low Level Input Voltage	V _{IL}				0.25 x VIO	V
High Level Input Voltage	V _{IH}		0.75 x VIO			V

AVIN/PVIN = 3.7V, V_{OUT} = 1V, L = 220nH, Frequency = 4MHz, V_{IO} = 1.8V, T_A = +25°C. **Boldface limits apply across the ambient operating temperature range, -40°C to +85°C unless otherwise noted. (Continued)**

Parameter	Symbol	Test Conditions	Min (Note 8)	Typ	Max (Note 8)	Unit
Hysteresis on Input	V _{HYS}		0.1 x V_{IO}			V
Low Level Output	V _{OL}	1mA			0.4	V
High Level Output	V _{OH}	1mA (250µA for 20% drive configuration)	V_{IO} - 0.4			V

Notes:

8. Compliance to datasheet limits is assured by one or more methods: production test, characterization, and/or design.
9. V_{OUT} feedback divider ratio equals 1 (BUCKx_VOUTFBDIV[1:0] = 0x00).
10. As per ["Thermal Information" on page 11](#), operating beyond thermal limits can cause permanent damage.

3. Output Configurations

Table 4. Output Configurations

Output Configuration	Power Stage Assignment	Diagram
4-Phase Connect VOUT2 and RTN2 to PGND Plane	4-Phase: Buck #1 (VOUT1) • Ph1: PH_A • Ph2: PH_B • Ph3: PH_D • Ph4: PH_C	<p style="text-align: center;">4+0 Configuration</p>

Table 4. Output Configurations (Continued)

Figure 20. Dual-Phase Transient, $C_{OUT} = 9 \times 22\mu F$ and $L = 220nH/Phase$

5. Applications Information

5.1 Inductor Selection

The ISL91302B is a high efficiency, high performance, dual output multiphase/single-phase synchronous buck converter that can deliver up to 5A of continuous current per phase at 0.3V to 2.0V regulated voltage from a single Li-Ion battery to power portable and handheld devices. The ISL91302B is designed to provide one or two output voltage rails with operational modes setup to 4+0, 3+1, and 2+2 at a nominal switching frequency of 2MHz~4MHz. Contact [support](#) for questions relating to switching frequency of 6MHz. Switching MOSFETs are fully integrated and no additional external MOSFETs or diodes are needed. Each phase requires an equal external inductor that can deliver the maximum load current divided by the number of phases used.

Table 5. Recommended Output Inductors

Manufacturer	Part Number	L x W x H (mm)	Value (nH)	DCR mΩ (Typ)	I _{SAT} (Typ)
Cyntec	HMLB25201T	2.5x2.0x1.0	220	9.4	7.0
Taiyo Yuden	MAKK2520HR22M	2.5x2.0x1.0	220	16	8.5
Cyntec	HTTN2016T	2.0x1.6x1.0	220	13	7.2
Murata	DFE2016E	2.0x1.6x1.0	240	16	7.0
Murata	DFE252012F	2.5x2.0x1.2	470	23	6.7

5.2 Output Capacitor Selection

Output capacitors are needed to provide filtering of square voltage at the phase node into a regulated output voltage. The amount of output capacitance required is based on the parameters of the maximum load step, the slew rate of the load step, and the maximum allowable voltage regulation tolerance during the transient. The amount of ripple voltage at the output capacitor is also a design constraint; the total peak-to-peak ripple voltages produced from the output capacitor is equal to its ESR multiplied by the worst case inductor ripple current.

Make sure to select X7R or X5R type capacitors and consider for DC bias effects. A wide range of output capacitor values can be used.

Table 6. Recommended Output Capacitors

Manufacturer	Part Number	Case Size	Value (μF)	Voltage Rating (V)
TDK	C1608X5R1A226M080AC	0603	22	10
TDK	C0510X6S0G105M030AC	0204	1	4
Murata	LLD154R60G435ME01	0402	4.3	4
Murata	LLL1U4R60G435ME22	0204	4.3	4

5.3 Input Capacitor Selection

Ceramic input capacitors source the AC component of the input current flowing into the high-side MOSFETs. Place them as close to the IC as possible. If long wires are used to bring power to the IC, use additional bulk capacitors between C_{IN} and the battery/power supply to dampen ringing and overshoot at startup.

Internal analog reference circuits also require additional filtering at the AVIN_FLTR pin. A 10 μ F local decoupling capacitor is recommended for each phase on PVIN.

Table 7. Recommended Input Capacitors

Manufacturer	Part Number	Case Size	Value (μ F)	Volt (V)	Input
TDK Corp	CGB2A1X5R1A105M033BC	0402	1	10	AVIN
Kemet	C0402C104K8RACTU	0402	0.1	10	AVIN
Samsung	CL05A10MP5NUNC	0402	10	10	PVIN
Murata	GRM188R61A106MAAL	0603	10	10	PVIN

5.4 ADC Telemetry

The device features a 12-bit (effective) SAR ADC telemetry function that supports internal silicon temperature, individual phase current, total buck output current, output voltage, and input voltage measurements. Two additional channels provide additional internal or external monitoring. Using these channels requires OTP programming from the factory. The ADC is OTP programmed to be turned off during Discontinuous Conduction mode to save current and improve light-load efficiency. The ADC supports two operating modes: Continuous Mode, and Non-continuous (or Single-shot or One-shot) Mode.

The telemetry uses a 16-bit output data format (S13.2). It consists of 1-bit sign and 15-bit data. The two LSB bits represent fractional data (after the decimal point). Reading the ADC output is accomplished by reading the respective MSB (8-bit) and LSB (8-bit). [Table 8](#) shows the registers that hold the ADC data. See [“Register Description by Address” on page 42](#) for more information.

Table 8. ADC Register Addresses

ADC Channel	Register Name	Register Address (hex): ADC MSB Data	Register Address (hex): ADC LSB Data
Temperature	ADC_SAMPLE0MSB/LSB	0x16	0x17
Buck1 Ph1 Current	ADC_SAMPLE1PH1MSB/LSB	0x18	0x19
Buck1 Ph2 Current	ADC_SAMPLE1PH2MSB/LSB	0x1A	0x1B
Buck1 Ph3 Current	ADC_SAMPLE1PH3MSB/LSB	0x1C	0x1D
Buck1 Ph4 Current	ADC_SAMPLE1PH4MSB/LSB	0x1E	0x1F
Buck1 Total Current	ADC_SAMPLE1TMSB/LSB	0x20	0x21
PVIN for Buck1	ADC_SAMPLE2MSB/LSB	0x22	0x23
V _{OUT1}	ADC_SAMPLE3MSB/LSB	0x24	0x25
Buck2 Ph1 Current	ADC_SAMPLE4PH1MSB/LSB	0x26	0x27
Buck2 Ph2 Current	ADC_SAMPLE4PH2MSB/LSB	0x28	0x29
Buck2 Total Current	ADC_SAMPLE4TMSB/LSB	0x2A	0x2B
PVIN for Buck2	ADC_SAMPLE5MSB/LSB	0x2C	0x2D
V _{OUT2}	ADC_SAMPLE6MSB/LSB	0x2E	0x2F
AUX INPUT0	ADC_AUX0MSB/LSB	0x30	0x31
AUX INPUT1	ADC_AUX1MSB/LSB	0x32	0x33

The ADC 16-bit output data LSB is 0.25 when referring to temperature, voltage, or individual phase current. The total buck current measurement has an LSB of 1. See [Table 9](#).

Each channel is filtered through an internally programmable infinite impulse response (IIR) filter. AUX input 0 and AUX input 1 allow you to read the external values with the ISL91302B ADC. Setting the IIR coefficient of a channel to 1 provides no filtering, whereas the 1/128 setting provides the most filtering. The IIR filter coefficient should be set to 1 (code 0x0) in one-shot mode of operation.

Contact [support](#) for questions relating to the ADC.

Table 9. ADC Result Mapping

16-bit ADC Data (hex)	Phase Current (mA)	Total Buck Output Current (mA)	Die Temperature (°C)	Buck Output Voltage (mV)
0x0000	0	0	0	0
0x0001	0.25	1	0.25	0.25
0x0002	0.5	2	0.5	0.5
0x0003	0.75	3	0.75	0.75
0x0004	1	4	1	1
...
0x0010	4	16	4	4
...
0x0100	64	256	64	64
...
0x7FFF	8191.75	32767	8191.75	8191.75
0x8000	-8192	-32768	-8192	-8192
0x8001	-8191.75	-32767	-8191.75	-8191.75
...
0xFFFF	-0.25	-1	-0.25	-0.25

5.5 Dynamic Voltage Scaling (DVS)

The ISL91302B has several options to achieve DVS. Each buck controller has four independently programmable voltage settings to set the output voltage. The settings are DVS0, DVS1, DVS2, and DVS3. Changing the selected DVS number selects the corresponding output voltage. The two methods to select the DVS are:

Method 1) - Use internal registers to select DVS by writing to the BUCKx_DVSSELECT[1:0] bits in the BUCKx_DVSSEL register for each respective buck using SPI or I²C.

To use this method, the BUCKx_DVSCTRL[0] bit has to be set to 0x0 for the corresponding buck. The BUCKxDVSSELECT[1:0] setting allows the user to switch between the four different DVS settings, each of which corresponds to a set of DVS registers holding the DVS information.

For example, DVS0 corresponds to BUCKx_DVS0VOUT92[7:0] and BUCKx_DVS0VOUT10[1:0]. The two register values combined represent the complete 10-bit DAC code for DVS0.

Table 10. DVS Method Selection

BUCKx_DVSCTRL[0]	
0x0	Use BUCKx_DVSSELECT[1:0] to select active DVS configuration
0x1	Use DVS pin(s) to control DVS selection

Table 11. DVS Pointers

BUCKx_DVSSELECT[1:0]	Active DVS for BUCKx
0x0	DVS0

Table 11. DVS Pointers

BUCKx_DVSSELECT[1:0]	Active DVS for BUCKx
0x1	DVS1
0x2	DVS2
0x3	DVS3

Each output voltage is set writing a 10-bit word to DVS Configuration 1 (BUCKx_DVS0CFG1 register) and DVS Configuration 0 (BUCKx_DVS0CFG0 register) in each buck. Configuration 1 holds the eight most significant bits and Configuration 0 holds the last two bits of the 10-bit word. The output voltage does not change until the LSB register has been written.

[Equation 1](#) relates the DVS word and V_{OUT} target.

$$V_{OUT} = \frac{1.234V}{FBDIV} \times \frac{DAC_CODE}{1024} \quad (EQ. 1)$$

DAC_CODE: 0 ~ 1023d; FBDIV(selection): 1, 0.8, or 0.6

In the application, the 10-bit DVS word should be set to ensure the buck output voltage target is always 0.3V or above.

Method 2) - Using GPIO/MPIO pins to achieve DVS, there are five variations depending on the IO_PINMODE register setting. See [Table 2](#).

NOTE: To use DVS by GPIO/MPIO pins requires IO_PINMODE to be OTP programmed before a start-up boot sequence is initiated. On-the-fly programming is not recommended for the following configurations.

(i) **IO_PINMODE = 0x3:** SPI with two Independent Buck DVS pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
SCK	SS_B	MOSI	MISO	DVS1_0	DVS2_0

BUCKx_DVSCTRL[0] should be OTP programmed high before the start-up sequence. The active DVS follows the DVSx_0 pin logic for the respective buck. See [Table 12](#) for more information.

Table 12. Single DVS Pin Logic

Function	
DVS1_0	Active DVS for BUCK1
0	DVS0
1	DVS1
DVS2_0	Active DVS for BUCK2
0	DVS0
1	DVS1

(ii) **IO_PINMODE = 0x4:** I²C with Global DVS and PGOOD pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS_PIN1	DVS_PIN0	PGOOD1	PGOOD2	SCL	SDA

BUCKx_DVSPIN_CTRL[1:0] bits in BUCKx_DVSCFG register in combination with the DVS_PIN1 and DVS_PIN2 sets the active DVS for the respective BUCK. See [Table 13](#) for more information.

BUCKx_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

Table 13. Global DVS Pin Logic

BUCKx_DVSPIN_CTRL[1:0]	DVS_PIN1	DVS_PIN0	Active DVS
0x0	X	X	DVS0
0x1	X	0	DVS0
	X	1	DVS1
0x2	0	X	DVS0
	1	X	DVS2
0x3	0	0	DVS0
	0	1	DVS1
	1	0	DVS2
	1	1	DVS3

Note: The 'X' indicates that either a 0 or 1 is acceptable.

(iii) **IO_PINMODE = 0x5:** I²C with 2 DVS pins for Buck1 and 2 DVS pins for Buck2

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS1_0	DVS1_1	DVS2_0	DVS2_1	SCL	SDA

The active DVS is selected based off the combined DVSx_1 and DVSx_2 input pin logic. See [Table 14](#) for more information. BUCKx_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

Table 14. Active DVS for 2 DVS Pins Configuration

DVSx_1	DVSx_0	Active DVS for BUCKx
0	0	DVS0
0	1	DVS1
1	0	DVS2
1	1	DVS3

(iv) **IO_PINMODE = 0x6:** I²C with 2 DVS pins and 2 PGOOD pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
DVS1_0	DVS2_0	PGOOD1	PGOOD2	SCL	SDA

BUCKx_DVSCTRL[0] should be OTP programmed high before the start-up sequence. DVS1_0 and DVS2_0 follows the same active DVS table as in IO_PINMODE = 0x3. See [Table 12](#) for more information.

(v) **IO_PINMODE = 0xE:** I2C with 2 DVS pins and 2 AUX ADC pins

MPIO0	MPIO1	MPIO2	MPIO3	GPIO0	GPIO1
ADC_IN0	ADC_IN1	DVS_PIN1	DVS_PIN2	SCL	SDA

DVS_PIN0 and DVS_PIN1 behave the same as in IO_PINMODE = 0x4. See [Table 13](#) for more information. BUCKx_DVSCTRL[0] should be OTP programmed high before the start-up sequence.

5.6 Configuring DVS Speed

5.6.1 Power-Up and Shutdown Slew Rate Setting

The BUCK_x_RSPUP[2:0] bits in the BUCK_x_RSPCFG0 register set the slew rates (DVS speed) in BUCK_x only during V_{OUTx} power-up. Similarly, the BUCK_x_RSPDN[2:0] in the BUCK_x_RSPCFG0 register sets the slew rates in BUCK_x during normal V_{OUTx} shutdown. The achievable slew rates varies with different FB DIV settings (factory OTP programmed). For more details, see Register [BUCK1_RSPCFG0](#).

5.6.2 DVS Transition Slew Rate Setting

BUCK_x_RSPUP[2:0] and BUCK_x_RSPDN[2:0] in the BUCK_x_RSPCFG1 register sets the slew rates (DVS speed) in BUCK_x during normal DVS transition. The achievable slew rates varies with different FB DIV settings (factory OTP programmed). For more details, see Register [BUCK1_RSPCFG1](#).

5.7 Output Voltage Setting

Each output voltage is set by writing a 10-bit word to DVS Configuration 1 (BUCK_x_DVS0CFG1 register) and DVS Configuration 0 (BUCK_x_DVS0CFG0 register) in each buck. Configuration 1 holds the MSB and Configuration 0 holds the last two bits of the 10-bit word. The output voltage does not change until the LSB register has been written. [BUCK1_DVS0CFG1](#) shows the relationship between the DVS word and V_{OUT}.

5.8 Power Sequencing

When the master chip Enable (EN) pin is brought above an NMOS threshold, the ISL91302B powers up its key biasing circuits, loads the OTP configuration registers, and does one of two things based on the preprogrammed OTP setting:

(1) Manual buck start-up:

Program the internal IO_BUCK_x_EN bits to 1 from I²C/SPI to enable the respective buck. When IO_PINMODE = 0x1, the EN_A and EN_B pins can also be used to enable the respective bucks. If using IO_PINMODE = 0x1, the internal IO_BUCK_x_EN bits should be set high in OTP. The slew rate of each buck during its soft-start is specified by the BUCK_x_RSPUP[2:0] bits.

Note: The programmable (1ms to 63ms) delay using BUCK_x_EN_DLY[5:0] is not used for Manual Buck start-up.

(2) Auto Buck start-up from master chip enable pin:

Run a predetermined start-up sequence for the buck outputs as soon as BOOT is complete. The slew rate of each buck during its soft-start is specified in BUCK_x_RSPUP[2:0].

Note: The delay, BUCK_x_EN_DLY[5:0] shown in [Figure 21](#) as EN_dlyx, is programmable from 0 to 63ms in 1ms steps.

[Figure 21](#) provides an example of power-up configurability. The master chip enable pin (EN) transitions from 0 to 1 and OTP is loaded over 1.4ms. After the initial 1.4ms boot interval, the buck output start-up sequence begins. In the [Figure 21](#) example, BUCK1_EN_DLY is set for 0ms and BUCK2_EN_DLY is set for 1ms.

Figure 21. Master Chip Enable Power-Up Example

The buck outputs can also be programmed to execute a controlled shutdown in two ways:

(1) **Manual buck power-down:**

Program the internal IO_BUCKx_EN bit to 0 through I²C/SPI or lower the Buck Enable pin (EN_A or EN_B when IO_PINMODE = 0x1). The manual method can be used to power down a specific buck (with a controlled slew rate) while keeping the rest of the chip alive.

Note: The programmable (0ms to 63ms) delay from BUCKx_SHUTDOWN_DLY[5:0] is not used for manual buck power-down.

(2) **Auto Buck power-down from master chip enable pin:**

When the master chip Enable pin (EN) is brought below the falling threshold of the comparator, the Bucks are ramped down at a controlled rate using preprogrammed delays. This is then followed by the power-down of the bias circuits forcing the chip into shutdown. The slew rate of each buck during its power-down (down to ~250mV) is specified in BUCKx_RSPPDN[2:0].

Note: The delay, BUCKx_SHUTDOWN_DLY[5:0] shown in [Figure 22](#) as Dis_dlyx, is programmable from 0 to 63ms in 1ms steps.

[Figure 22](#) provides an example of power-down configurability. The master chip enable pin (EN) transitions from logic 1 to 0. In the [Figure 22](#) example, BUCK1_SHUTDOWN_DLY is set for 1ms and BUCK2_SHUTDOWN_DLY is set for 2ms.

Figure 22. Auto Chip Power-Down Example

The actual slew rate that each buck ramps down to is specified by the register BUCKx_RSPSHUTDOWN. This slew rate is controlled until the output voltage is ~250mV, at which point the ISL91302B engages a weak resistive pull-down (if enabled by factory OTP) that can keep $V_{OUT} = 0V$ when the buck is not enabled. [Figure 23](#) shows an example of the weak pull-down behavior.

- **Option 1:** If the disable event for a buck output is the master chip enable pin (EN) falling below its logic low threshold, then when the output falls below 250mV, the output voltage decay is dictated by the system load passively discharging the buck output capacitance. PULL_DOWN_DISCHARGE IO_MPIO_DATA[4] bit per the IO_MPIO_DATA register is **not** used in this method.

- **Option 2:** If the disable event for a buck output is the master chip enable pin (EN) remaining high and the enable register bit (IO_BUCKx_EN) transitioning from a logic 1 to a logic 0, then PULL_DOWN_DISCHARGE IO_MPIO_DATA[4] bit per the IO_MPIO_DATA register is used enabling an internal weak pull down.

Note: The weak pull-down can be disabled (using factory OTP).

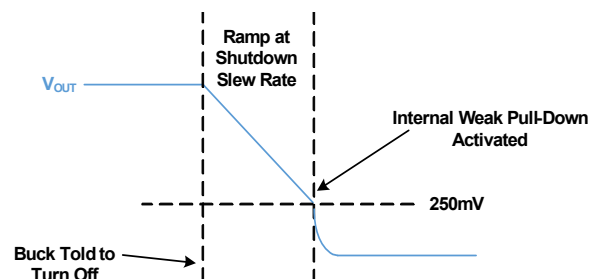

Figure 23. Buck Disable Waveform

5.9 Watchdog Time (WDOG_RST Pin)

The ISL91302B implements a watchdog function that allows the output voltages to return to a safe default when communication to the processor host is lost. If the WDOG_RST pin goes into the failure state for a duration greater than the programmed debounce time, the default voltages from OTP are restored.

The IO_RSTDVS_CTRL[1:0] bits select which buck(s) respond to the WDOG_RST pin. The polarity of the WDOG_RST pin is active low.

Table 15. WDOG_RST Function

Action	
At Boot Up	DVS registers are loaded with values stored in OTP.
After Debounce Time	Restore selected output voltages to their original values stored in OTP (DVS0), and slew the buck outputs to that voltage.

The total recovery time for the buck is the sum of t_{SLEW} and $t_{DEBOUNCE}$. The target voltage WDOG_RST pin resets the ISL91302B buck output(s), set by DVS0, that are in the BUCKx_DVS0CFG1 and BUCKx_DVS0CFG0 registers.

t_{SLEW} is determined by BUCKx_RSPUP[2:0] and BUCKx_RSPDN[2:0]. $t_{DEBOUNCE}$ is factory programmable.

Figure 24. Watchdog Timer Example Case

5.10 Interrupt Pin

The ISL91302B can alert the host when a warning or a fault has occurred through an IRQ interrupt request signal with configurable masking options that is connected to a configurable interrupt (INT) pin. The interrupt pin can be programmed to be active high, active low, an open drain, or a CMOS output.

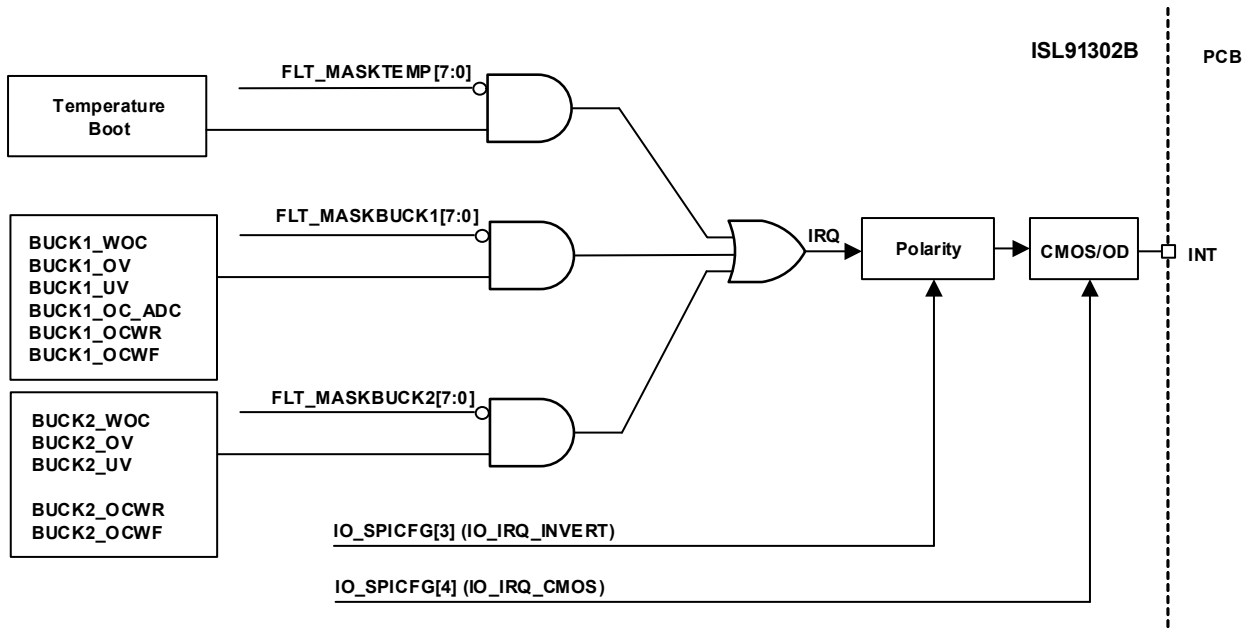

Figure 25. Interrupt Tree

5.11 Decay Mode

When the output voltage is programmed to a lower value than the present voltage, you can use Decay mode to reduce the output voltage only at the rate that the output load it is pulling down. This can improve efficiency when lowering the voltage at a controlled rate is not necessary. `BUCKx_DVS0DECAY` can be programmed to enable or disable Decay mode.

6. Protection Features (Faults)

The ISL91302B has integrated Overcurrent (OC), Overvoltage (OV), Undervoltage (UV), and Over-Temperature (OT) protection features.

6.1 Over-Temperature Protection

The ISL91302B provides protection against over-temperature conditions. An over-temperature protection circuit continuously monitors the die temperature of the chip and raises a fault when the temperature exceeds a predefined limit programmed by Register “[FLT_TEMP SHUTDN](#)”. The ISL91302B also contains a programmable thermal warning threshold set by Register “[FLT_TEMP WARN](#)”. Programmable Hysteresis enables the circuit to clear the fault or warning once the temperature is below a user-defined safe temperature. The warning and shutdown hysteresis level are factory programmable. Contact Renesas [support](#) for custom settings. The over-temperature protection is disabled if all bucks are operating in PFM mode or in the off state.

6.2 Overcurrent Protection Mode

The ISL91302B has a comparator-based OCP and an ADC-based OCP mechanism. The comparator based OCP or ‘WOC’ block has a current comparator that compares the load current through the high-side power FET with the reference current level through a replica device. If the sensed FET current is higher than the WOC threshold, the WOC is triggered immediately, preventing a catastrophic condition. The WOC disables the buck and latches the power-stage into tri-state until the fault is cleared. The WOC fault is self-cleared when the OC condition is removed. The buck attempts to re-enable in a “hiccup” type fashion. The ADC-based OCP monitors the averaged high-side and low-side MOSFET current for each phase and is slower but more accurate than the comparator-based WOC. If the Buck total current is higher than the ADC based OCP threshold, the ADC OCP is triggered, which shuts down the Buck and latches the power-stage into tri-state. ADC-based OCP can be cleared only by recycling the PVIN/AVIN or by toggling the EN pin. Note that the ADC-based OC cannot be cleared by toggling the IO_BUCKx_EN bit by I²C/SPI.

Overcurrent protection can be enabled or disabled using the fault register setting in FLT_BUCKx_CTRL. ADC-based current warning limits can be adjusted with the FLT_BUCKx_ISENSEWARN register. ADC-based current shutdown limits can be adjusted with the FLT_BUCKx_ISENSESHUTDN register.

6.3 Overvoltage (OV)/Undervoltage (UV) Protection

The OV/UV protection circuitry has low power comparators configured with differential input and single-ended outputs capable of working over large common-mode input ranges. This comparator monitors the output voltage in both DCM and CCM for faults. By default, when an OV/UV event is triggered, the buck converter is shut down until the fault is cleared. Fault control register FLT_BUCKx_CTRL enables or disables the functionality. The OV/UV limits are adjustable using the BUCKx_UVOVTH[1:0] bits in the BUCKx_PROTCFG register. See [Table 16](#) for more details.

Table 16. OV/UV Protection Thresholds

BUCKxUVOVTH[1:0]	OV/UV Threshold
0x0	±150mV around DAC target
0x1	±200mV around DAC target
0x2	±250mV around DAC target
0x3	±300mV around DAC target

7. Serial Communication Interface

The ISL91302B has two serial interface protocols to read/write the registers.

- SPI
- I²C

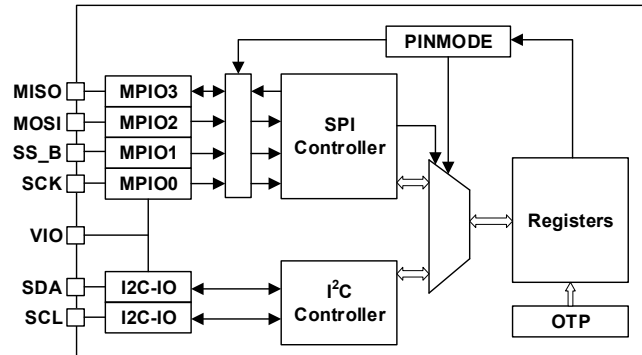

Figure 26. SPI and I²C Interface Block Diagram

The arbitration of the register access bus between SPI and I²C is determined by the pad MPIO1 when using IO_PINMODE = 0x0, as shown in [Table 17](#):

Table 17. SPI/I²C Register Access

Register IO_PINMODE	Pad MPIO_1 (SS_B)	Register Access
0	0	SPI (read/write access (Note 11))
	1	I ² C (Note 12)

Notes:

- When the device is configured for SPI access, the I²C should not be addressed with the device ID.
- When the device is configured for I²C access in PINMODE 0, the SS_B line must be held high.

After switching from SPI to I²C or vice versa, a minimum of 50ns wait time is required before starting a transaction.

7.1 SPI Serial Interface

The SPI interface is a general specification 4-wire slave interface capable of operating at a clock speed of up to 26MHz. It is based on byte transfers. The ISL91302B does not support SPI reads on the MISO bus when using multiple slave devices on the same bus.

7.1.1 SPI Data Protocol

Both Read and Write SPI transactions begin when SS_B goes low and end when SS_B goes high.

7.1.1.1 Write Operation

To write to the ISL91302B, the master (controller) needs to drive SS_B low, then send the Control Byte followed by the register address, packet length (if IO_SPI MODE = 1), and data bytes to be written. The controller drives SS_B high to terminate the transaction as shown in [Figure 27](#).

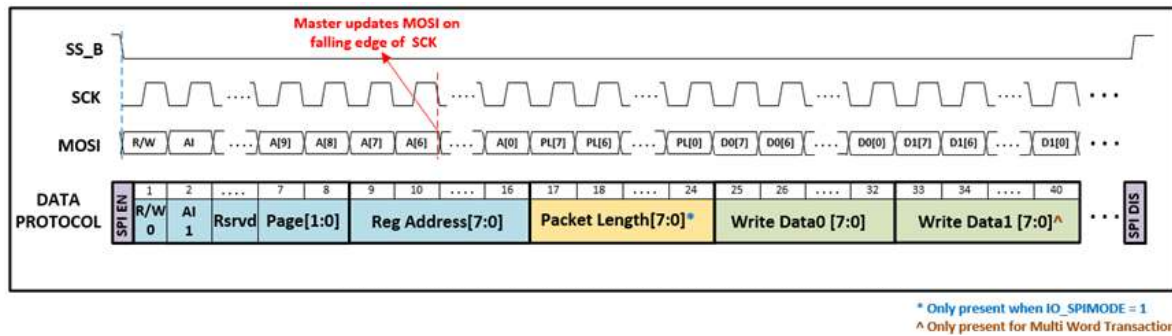

Figure 27. SPI Write Transaction with IO_SPIMODE = 1; IO_SPICPOL = 0; IO_SPICPHA = 0

The MSB of the Control byte is the R/W bit, which needs to be set to ‘write’ operation (see [“IO_SPIRWPOL” on page 52](#)). Bit 6, AI indicates whether the operation is a single-byte write a multi-byte write. Bits 1 and 0 of the Control byte indicate the page number of the register location to be written (MSBs of the register address). The register address byte is the 8-bit address of the register within the page specified by the Page[1:0] bits. If IO_SPIMODE = 1, the register address needs to be followed by an 8-bit packet length that indicates the number of bytes to be written. After the packet length field, the master needs to send the data bytes. When all eight bits of data are received, they are written to the specified register address and the ISL91302B increments the register address.

In single byte transactions, (AI = 0 or Packet length = 1), the ISL91302B goes into the wait state and waits for SS_B to go high.

In multi-byte transactions with IO_SPIMODE = 1, the ISL91302B writes the subsequently received data bytes to sequentially incrementing addresses until the number of bytes, as specified by ‘packet length’, are received, then goes into the wait state and waits for SS_B to go high. For multi-byte transactions with IO_SPIMODE = 0 and AI = 1, the ISL91302B keeps writing the subsequently received data bytes to sequentially incrementing addresses until SS_B goes high. If SS_B goes high in the middle of a transaction, the transaction is terminated. The data byte is written if all eight bits are received.

7.1.1.2 Read Operation

To read from the ISL91302B, the master (controller) needs to drive SS_B low then send the Control Byte followed by the register address and packet length (if IO_SPIMODE = 1). The ISL91302B then sends the data bytes from the requested registers. Finally, the master drives SS_B high to terminate the transaction. The MSB of the Control byte is the R/W bit, which needs to be set to ‘read’ operation (see [“IO_SPIRWPOL” on page 52](#)). Bit 6, whether the operation is a single-byte read or a multi-byte read. Bits 1 and 0 of the Control byte indicate the page number of the register location be read (MSBs of the register address). The register address byte is the 8-bit address of the register within the page specified by the Page[1:0] bits. If IO_SPIMODE = 1, the register address needs to be followed by an 8-bit packet length that indicates the number of bytes to be written. Following the packet length field, the ISL91302B will send the data from the requested register. When all eight bits of data from the requested register address are sent, the ISL91302B increments the register address.

In a single-byte transaction, (AI = 0 or Packet length = 1), the ISL91302B goes into a wait state and waits for SS_B to go high.

In a multi-byte transaction with IO_SPIMODE = 1, the ISL91302B sends the data bytes from sequentially incrementing addresses until the number of bytes as specified by ‘packet length’ are sent and then goes into a wait state and waits for SS_B to go high. For multi-byte transactions with IO_SPIMODE = 0 and AI = 1, the ISL91302B keeps sending data bytes from sequentially incrementing addresses until SS_B goes high.

Note: The MISO pin is pulled low while SS_B is high.

Figure 28. SPI Read Transaction with IO_SPIMODE = 1; IO_SPICPOL = 0; IO_SPICPHA = 0

R/W	Read/Write Bit Indicating Read or Write Operation
AI	Auto Increment. 1 indicates a multi-byte transfer, 0 indicates a single byte transfer
Page	2-bit page address of the register to be written or read
Address	8-bit register address of the register to be written or read
Packet Length	8-bit packet length indicating number of data bytes to be transferred. Overrides AI when IO_SPIMODE = 1
Read Data	Data in the register at Address [7:0] + n
Write Data	Data to be written to the register at Address [7:0] + n

7.1.2 SPI Configuration

The following register bits configure the SPI operation:

- **IO_SPICPOL:** SPI clock polarity, ISL91302B is configured as active high, IO_SPICPOL = 0
- **IO_SPICPHA:** SPI clock phase, ISL91302B samples data on rising edge of SPI clock, IO_SPICPHA = 0

The four possible clocking modes are shown in [Figure 29](#).

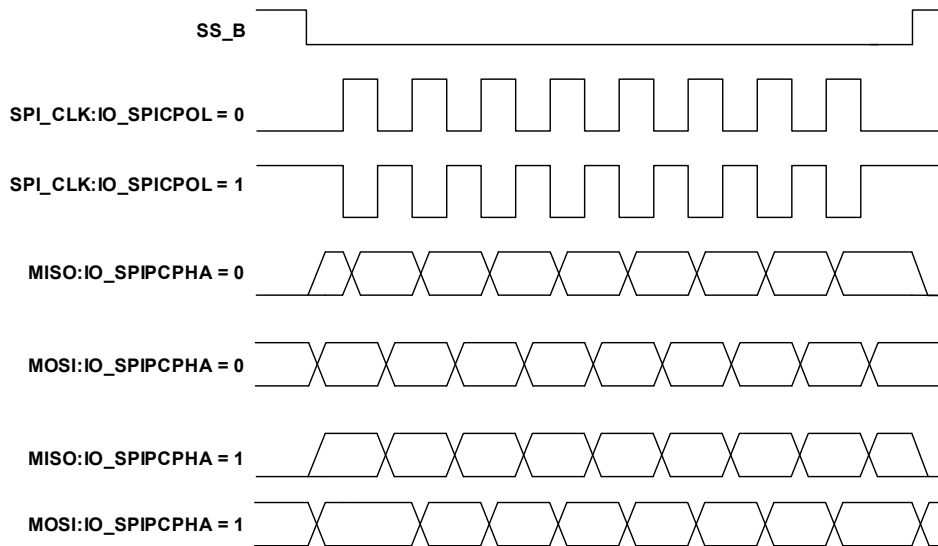

Figure 29. Four Possible Clocking Modes

- **IO_SPIWPOL**: R/W bit polarity, ISL91302B SPI_RWPOL is set to 0. 1 = Read, 0 = Write

SPI_RWPOL	R/W	Operation
0	0	Write
0	1	Read

- **IO_SPIMODE**: Packet length enable. The ISL91302B uses packet length mode by default, meaning the third data byte from master is the packet length and indicates the total number of data words to be sent or received in a burst transaction

7.1.3 SPI Timing

Figure 30 on page 34 shows SPI timing for IO_SPICPOL = 0; IO_SPICPHA = 0. The timing values in Table 18 on page 34 hold true for other values of IO_SPICPOL, IO_SPICPHA as well.

Table 18. Timing Values

Parameter	Symbol	Min	Max	Units
Clock Period	t_1	38.4		ns
Enable Lead Time	t_2	12		ns
Enable Lag Time	t_3	12		ns
Clock High or Low Time	t_4	15		ns
Data Setup Time (Input)	t_5	12		ns
Data Hold Time (Input)	t_6	10		ns
Time MISO is Stable before the Next Rising Edge of CLK	t_7	5		ns
Data Held after Clock Edge (Output)	t_8	5		ns
Load Capacitance	C_L		10	pF

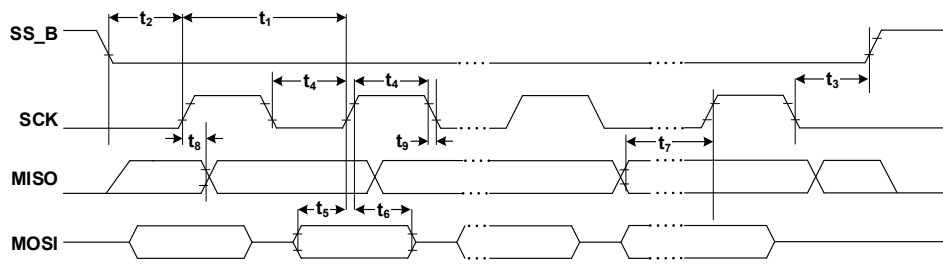

Figure 30. SPI Timing for IO_SPICPHA = 0, IO_SPICPOL = 0

7.2 I²C Interface

The I²C interface is a simple bidirectional 2-wire bus protocol that consists of the Serial Clock Control (SCL) and the Serial Data Signal (SDA). The ISL91302B hosts a slave I²C interface that supports data speeds up to 3.4Mbps. SCL is an input to the ISL91302B and is supplied by the controller. SDA is bidirectional. The ISL91302B has an open-drain output to transmit data on SDA. An external pull-up resistor must be placed on the serial data line to pull the drain output high during data transmission.

The ISL91302B uses a 7-bit hardware address scheme. The default address is set to 0x1D by a one-time programmable fuse.

7.2.1 I²C Bus Operation

The chip supports 7-bit addressing. The ISL91302B I²C device address is reconfigurable through the OTP.

All communication over the I²C interface is conducted by sending the MSB of each byte of data first. Data states on the SDA line can change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (see [Figure 35 on page 36](#)).

All I²C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL91302B continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met. All I²C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH.

An Acknowledge (or ACK), is a software convention that indicates a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data ([Figure 35 on page 36](#)). The ISL91302B responds with an ACK after recognizing a START condition, followed by a valid Identification Byte (also known as I²C Address). The ISL91302B also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

7.2.1.1 Write Operation

A Write operation requires a START condition, followed by an ISL91302B I²C Address byte with the R/W bit set to 0, a Register Address Byte, Data Bytes, and a STOP condition. After each byte, the ISL91302B responds with an ACK. After every data byte, the ISL91302B auto increments the register address so subsequent data bytes get written to sequentially incremental register locations. A STOP condition that terminates the write operation must be sent by the master after sending at least one full data byte and its associated ACK signal. If a STOP byte is issued in the middle of a data byte, the write is not performed.

Figure 31. 1-Byte Write to Register M

Figure 32. L-Byte Sequential Data Write Starting Register M

7.2.1.2 Read Operation

A Read operation consists of a three-byte “dummy write” instruction to send the register address to begin reading from, followed by a Current Address Read operation. The master initiates the operation, issuing the following sequence: a START condition, followed by an ISL91302B I²C Address byte with the R/W bit set to “0”, a Register Address Byte, a second START, and a second ISL91302B I²C Address byte with the R/W bit set to “1”. After each of the three bytes, the ISL91302B responds with an ACK. The ISL91302B then transmits Data Bytes. The master terminates the Read operation from the ISL91302B by issuing a STOP condition following the last bit of the last data byte. After every data byte, the ISL91302B auto increments the register address so subsequent data bytes are sent from sequentially incremental register locations.

Figure 33. 1-Byte Data Read from Register M

Figure 34. L-Byte Sequential Data Read Starting Register M

7.2.2 I²C Timing

The timing specifications of the I²C I/O from the I²C specification are shown in [Figure 35](#) and [Table 19 on page 37](#). The I²C controller provides a slave I²C transceiver capable of interpreting I²C protocol in Standard, Fast, Fast+, and High Speed modes.

Figure 35. I²C Timing

Table 19. I²C Specification

Parameter	Symbol	Standard Mode		Fast Mode		Fast Mode Plus		High Speed Mode		Unit
		Min	Max	Min	Max	Min	Max	Min	Max	
Clock Frequency	f _{SCL}	0	100	0	400	0	1000	0	3400	kHz
Hold Time (repeated) START Condition (after this period, the first clock pulse is generated)	t _{HD;STA}	4000	-	600	-	260	-	160	-	ns
LOW Period of the SCL Clock	t _{LOW}	4700	-	1300	-	500	-	160	-	ns
HIGH Period of the SCL Clock	t _{HIGH}	4000	-	600	-	260	-	60	-	ns
Setup Time for a Repeated START Condition	t _{SU;STA}	4700	-	600	-	260	-	160	-	ns
Data Hold Time	t _{HD;DAT}	15	-	15	-	15	-	15	70	ns
Data Setup Time	t _{SU;DAT}	250	-	100	-	50	-	10	-	ns
Rise Time of SCL	t _{rCL}	-	1000	-	300	-	120	-	40	ns
Fall Time of SCL	t _{fCL}	-	300	-	300	20 × (V _{DD} /5.5V)-	120	-	40	ns
Rise Time of SDA	t _{rDA}	-	1000	20	300	-	120	10 (Note 14)	80	ns
Fall Time of SDA	t _{fDA}	-	300	20 × (V _{DD} /5.5V) (Note 13)	300	20 × (V _{DD} /5.5V) (Note 13)	120	10 (Note 14)	80	ns
Setup Time for STOP Condition	t _{SU;STO}	4000	-	600	-	260	-	160	-	ns
Bus Free Time between a STOP and START Condition	t _{BUF}	4700	-	1300	-	500	-	-	-	ns
Capacitive Load for each Bus Line	C _b	-	400	-	400	-	400	-	100	pF
Output Fall Time from VIHmin to VILmax	t _{of}	-	250[5]	20 × (V _{DD} /5.5V)[6]	250[5]	20 × (V _{DD} /5.5V)[6]	120[7]	10 (Note 14)	80	ns
Pulse Width of Spikes Suppressed by the Input Filter	t _{SP}	-	-	0	50	0	50	0	10	ns

Notes:

13. Only valid for V_{DD} < 4V.14. Only valid for V_{DD} < 1.9V.15. V_{DD} is the pull-up source to the I²C lines (GPIO0, GPIO1).

8. Board Layout Recommendations

Proper PCB layout is a very important design practice to ensure a satisfactory performance from the ISL91302B high frequency multiphase switching regulator. The power loop consists of the output inductor L, the output capacitor C_{OUT}, the PH pin, and the PGND pin. It is important to make the power loop as small as possible. The connecting traces among them should be direct, short, and wide. The same practice should be applied to the connections of the PVIN pin, the input capacitor, and PGND. The switching node of the converter, the PH pin, and the traces connected to this node are very noisy, so keep the VOUT and RTN lines and other noise sensitive traces away from these traces. Place the input capacitors as close as possible to the PVIN(s) and PGND(s) pins. Connect the ground of the input and output capacitors as close as possible. A solid ground plane is helpful for a good EMI performance.

Inductor placement should be as close to the phase pins as possible. Use wide traces and reduce the length to improve the overall efficiency and reduce the amount of radiated EMI. For the phase traces, Renesas recommends descending one layer to reduce the effective path to the inductor. Match the length and width of each inductor trace and number of microvias to help ensure proper current sharing between phases.

Place an AVIN filter capacitor as close as possible to the AVIN_FILT pin but away from noise sources. Always reference the GND pad of the decoupling capacitor to a quiet GND plane.

Do not use plated through-holes when passing the WLCSP pins to lower layers. If microvias are required to pass down multiple layers, Renesas recommends staggering them.

The VOUT and RTN lines are used to sense the output voltage and should be routed directly to the load. Connecting the RTN line to ground away from the load causes a ground error in the output voltage load regulation due to parasitic ground resistance. Keep these traces away from switching nodes such as converter phase nodes or high-speed digital signals. Use small low inductance capacitors at the load to improve noise immunity and transient response to the ISL91302B.

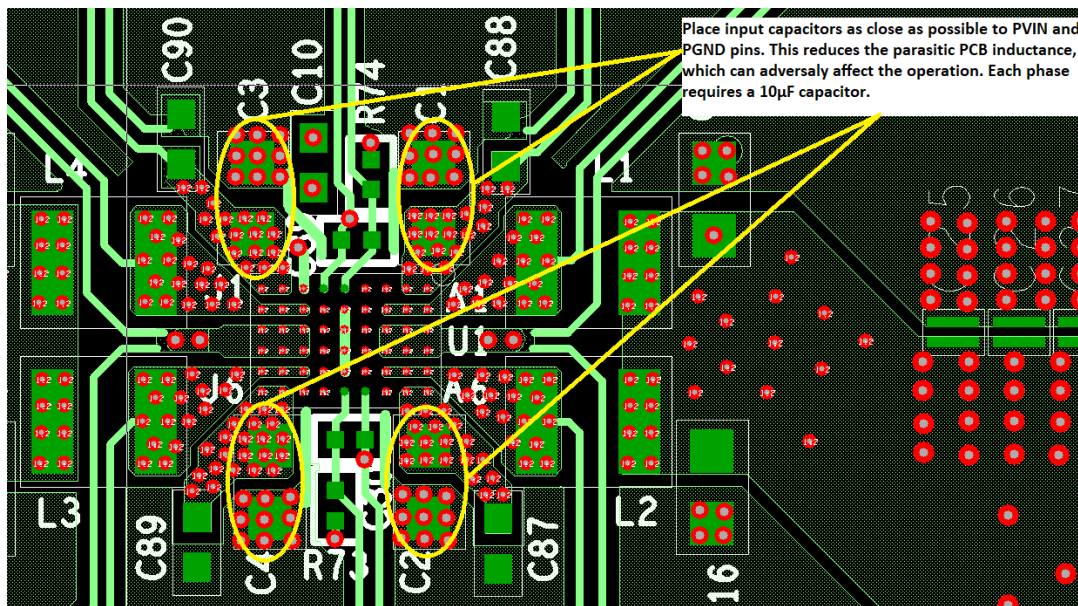

Figure 36. Recommended PCB Layout Top Layer

Provide a solid ground plane in the adjacent layer to provide a low impedance path to support high current flow. Copper planes need to be parallel with the phase traces on the top layer to minimize resistance, and they must be surrounded by a GND plane to prevent noise coupling.

Figure 37. Recommended PCB Layout Second Layer

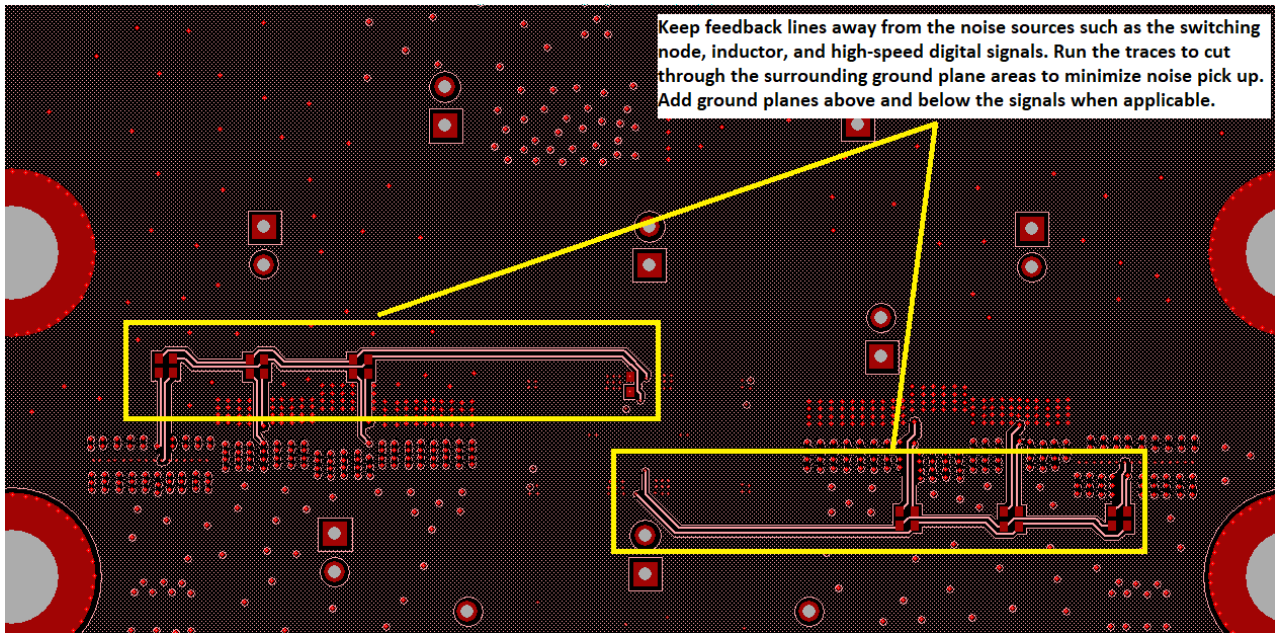

Figure 38. Recommended PCB Layout Bottom Layer

8.1 PCB Layout Summary

- Place input capacitors as close as possible to their respective PVIN and PGND pins
- Route phase nodes with short, wide traces and avoid any sensitive nodes
- Route VOUT and RTN lines differentially to the load and use small low ESL capacitors at the load for bypassing
- Output capacitors should be close to the inductors and have a low impedance path to the PGND pins
- Keep digital and phase nodes from intersecting AVIN_FILT, VOUT, and RTN lines on adjacent layers

8.2 PCB Design for WLCSP Recommendations

Design Feature	Design Specification
Cu Pad Diameter	0.4mm pitch: 0.215 ±0.012mm
Microvia Structure	All microvias should be copper filled.
Microvia Stacking	Avoid microvia stacking if possible. Use staggered vias instead. If microvia stacking is absolutely necessary for the layout, the maximum number of recommended via stacks is two.
Plated Through-Hole (PTH) Location	No PTH should be placed under the CSP bump pads. Microvias and trace routing should be used to fan the PTH away from the CSP bump array.

9. Register Address Map

When communicating with registers that contain reserved bits, Renesas recommends performing a masked write/read to avoid modifying sensitive register values.

Address	Register	Address	Register	Address	Register

FLT_BUCK1_CTRL						
0x64	7:5	Reserved	R	0x0	Reserved	
	4	FLT_BUCK1_CTRLLOC	R/W	0x0	Overcurrent (OC) fault response	
					0x0	The buck shuts down on Overcurrent (OC) detection faults, measured by the ADC (FLT_OCSDR[0] = 0x0 → 0x1). The overcurrent detection fault state can only be cleared by cycling the EN pin or by issuing a soft-reset command. (IO_SOFTRESET[0] = 0x1)
					0x1	The buck does not shut down on Overcurrent (OC) detection faults, measured by the ADC. (FLT_OCSDR[0] = 0x0 → 0x1)
3	FLT_BUCK1_CTRLWOC	R/W	0x0	Way Overcurrent (WOC) fault response		
				0x0	The buck shuts down on Way Overcurrent (WOC) detection faults, measured by the buck (FLT_WOC[0] = 0x0 → 0x1). The buck is quickly re-enabled using the same register configuration. If the fault still exists, the buck shuts down (and restarts) until the fault is removed	
				0x1	The buck does not shut down on Way Overcurrent (WOC) detection faults, measured by the buck (FLT_WOC[0] = 0x0 → 0x1)	
2:1	FLT_BUCK1_CTRLLOV	R/W	0x2	Overvoltage (OV) fault response		
				0x0/ 0x2	The buck crowbars the output driver (turns on the NMOS) on Overvoltage (OV) detection faults, measured by the buck (FLT_OV[0] = 0x0 → 0x1). After 32 to 64 μs, the buck shuts down and exits crowbar mode. The buck is quickly re-enabled using the same configuration. If the fault still exists the buck shuts down (and restarts) until the fault is removed	
				0x1/ 0x3	The buck does not shut down on Overvoltage (OV) detection faults, measured by the Buck (FLT_OV[0] = 0x0 → 0x1)	
0	FLT_BUCK1_CTRLUV	R/W	0x0	Undervoltage (UV) Fault Response		
				0x0	Buck will shut down on Undervoltage (UV) detection faults, measured by the buck. (FLT_UV[0] = 0x0 → 0x1)	
				0x1	Buck will not shut down on Undervoltage (UV) detection faults, measured by the buck. (FLT_UV[0] = 0x0 → 0x1)

11. Revision History

Rev.	Date	Description
3.01	Feb 2, 2022	<p>Removed Related Literature section.</p> <p>Updated Ordering Information table formatting.</p> <p>Updated Table 2 to show pinmode 0x2 and 0xF options, and mark as reserved.</p> <p>Clarify and correct temperature ratings and conditions in the Thermal Information, Recommended Operation Conditions, and Analog Specifications sections.</p> <p>Fixed incorrect IC part number in the Dynamic Voltage Scaling (DVS) and Power Sequencing sections.</p> <p>Added Eq.1 for 10-bit DAC to V_{OUT} transfer function and removed Table 12.</p> <p>Updated and added numerous registers and details to Register Address Map and Register Description by Address sections.</p> <p>Added FBDIV settings to the description table for 0x66[7:6].</p> <p>Corrected Table of V_{OUT} voltages in register 0x72.</p> <p>Updated ADC Telemetry section.</p>
3.00	Feb 20, 2020	<p>Updated Typical App Circuits.</p> <p>Added Note 1 to Ordering Information table.</p> <p>Updated Figure titles for Figures 16-11.</p> <p>Updated Figures 19, 20, 36, 38.</p> <p>Updated Table 12.</p> <p>Added the following sentence to section 7.1 on page 30: "The ISL91302B does not support SPI reads on the MISO bus when using multiple slave devices on the same bus."</p> <p>Removed registers 0x78 (BUCK1_DVS3CFG1), and 0x82 (BUCK2EA2) and added registers 0x78 (BUCK2_DCM) and 0x86 (BUCK_CFG3) to Register Address Map on page 40.</p> <p>Added descriptions for registers BUCK1_DCM, BUCK1_CFG3, BUCK2_DCM, BUCK2_CFG3, ADC_BUCK1CFG, and ADC_BUCK2CFG to section 10, Register Descriptions.</p> <p>Updated disclaimer.</p>
2.00	Apr 5, 2018	<p>Updated Figures 3-5: INT (output) WDOG_RST (Input)</p> <p>Updated Note 2.</p> <p>Updated Parameter from "PVIN to GND" to "PVIN to PGND" on page 10.</p> <p>Updated the test condition for CCM Frequency Tolerance from 3MHz to 4MHz on page 12.</p> <p>Updated Figures 24 and 26.</p>
1.00	Feb 28, 2018	<p>Updated Title</p> <p>Updated Figure 1</p> <p>Added Table 1 on page 6.</p> <p>Updated the Analog Specifications Conditions in table heading.</p> <p>Added Buck Output Voltage Range, and Output Voltage Step Size for BUCKx_VOUTFBDIV[1:0] = 0x00, BUCKx_VOUTFBDIV[1:0] = 0x01, BUCKx_VOUTFBDIV[1:0] = 0x02 in Spec table on page 11.</p> <p>Added High-Side and Low-Side Switch On-Resistance specs on page 12.</p> <p>Updated Table 5.</p> <p>Updated Figure 30.</p> <p>Updated Data Hold Time minimum specifications for all modes in Table 18 on page 35 (changed from 0ns to 15ns).</p> <p>Updated IO_CHIPNAME description on page 41.</p> <p>Updated FLT_RECORDBUCK2 Bits 1, 3, 5 names on page 44.</p> <p>Added Default information for FLT_OT_CTRL on page 61 and BUCK1_RSPCFG1 on page 67.</p> <p>Updated description for BUCK1_DVS0CFG1 on page 64 (changed 0.4V to 0.3V).</p> <p>Removed About Intersil section.</p> <p>Updated disclaimer.</p>
0.00	Sep 22, 2017	Initial release

12. Package Outline Drawing

For the most recent package outline drawing, see [W6x9.54](#).

W6x9.54

54 Ball Wafer Level Chip Scale Package (WLCSP 0.4mm PITCH)

Rev 0, 10/15

NOTES:

1. All dimensions are in millimeters.
2. Dimensions and tolerance per ASME Y 14.5M - 1994.
3. Primary datum Z and seating plane are defined by the spherical crowns of the bump.
4. Dimension is measured at the maximum bump diameter parallel to primary datum Z .
5. Bump position designation per JESD 95-1, SPP-010.
6. NSMD refers to non-solder mask defined pad design per [TB451](#).
