8.4 Reset Timing Characteristics

When RESETB of the reset pin equals to Low, it will be in the condition of reset.
When it is in the condition of reset, it will make the device recover the initial set.

However, in order to avoid the reset noise cause reset, there is a mechanism to judge about whether the reset is needed or not.

The closed interval of Low can be shown as the following.

(Test condition: VDDIO=2.3V~3.6V, VSS=0V, TA=-20 ~+85)

Test Conditions:

1. IF= 30mA (one channel), the ambient temperature is 25°C.

2. The test systems refer to Note 1 and Note 2.

Note 1: Definition of optical measurement system.

The optical characteristics should be measured in dark room. After 5 minutes operation, the optical properties are measured at the center point of the LCD screen. All input terminals LCD panel must be ground when measuring the center area of the panel.

Item	Photo detector	Field
Contrast Ratio		
Luminance	SR-3A	1°

Lum Uniformity		
Response Time	BM-7A	2°

Note 2: Definition of viewing angle range and measurement system.
Viewing angle is measured at the center point of the LCD by CONOSCOPE (ergo-80).

Fig. 1 Definition of viewing angle

Note 3: Definition of contrast ratio

$$\text{Contrast ratio (CR)} = \frac{\text{Luminance measured when LCD on the "White"}}{\text{Luminance measured when LCD on the "Black"}}$$

"White state": The state is that the LCD should be driven by Vwhite.
"Black state": The state is that the LCD should be driven by Vblack.
Vwhite: To be determined,   Vblack: To be determined.

Note 4: Definition of Response time
The response time is defined as the LCD optical switching time interval between "White" state and "Black" state. Rise time (TON) is the time between photo detector output intensity changed from 90% to 10%. And fall time (TOFF) is the time between photo detector output intensity changed from 10% to 90%.
Note 5: Definition of color chromaticity (CIE1931)

Color coordinates measured at center point of LCD.

Note 6: Definition of Luminance Uniformity

Active area is divided into 9 measuring areas (Refer Fig. 2). Every measuring point is placed at the center of each measuring area.

Luminance Uniformity (U) = Lmin/ Lmax x 100%

L: Active area length, W: Active area width

Fig. 2 Definition of uniformity

Lmax: The measured maximum luminance of all measurement position.

Lmin: The measured minimum luminance of all measurement position.

Note 7: Definition of Luminance:

Measure the luminance of white state at center point.

13.6 Mechanics specification

As for the outside dimension, weight of the modules, please refer to product specification
For more details

14. Precautions for Use of LCD modules

14.1 Handling Precautions

14.1.1. The display panel is made of glass. Do not subject it to a mechanical shock by dropping it from a high place, etc.

14.1.2. If the display panel is damaged and the liquid crystal substance inside it leaks out, be sure not to get any in your mouth, if the substance comes into contact with your skin or clothes, promptly wash it off using soap and water.

14.1.3. Do not apply excessive force to the display surface or the adjoining areas since this may cause the color tone to vary.

14.1.4. The polarizer covering the display surface of the LCD module is soft and easily scratched. Handle this polarizer carefully.

14.1.5. If the display surface is contaminated, breathe on the surface and gently wipe it with a soft dry cloth. If still not completely clear, moisten cloth with one of the following solvents:
  － Isopropyl alcohol
  － Ethyl alcohol
  Solvents other than those mentioned above may damage the polarizer. Especially, do not use the following:
  － Water
  － Ketene

14.1.6. Do not attempt to disassemble the LCD Module.

14.1.7. If the logic circuit power is off, do not apply the input signals.

14.1.8. To prevent destruction of the elements by static electricity, be careful to maintain an optimum work environment.

14.1.8.1. Be sure to ground the body when handling the LCD Modules.

14.1.8.2. Tools required for assembly, such as soldering irons, must be properly ground.

14.1.8.3. To reduce the amount of static electricity generated, do not conduct assembly and other work under dry conditions.

14.1.8.4. The LCD Module is coated with a film to protect the display surface. Be care when peeling off this protective film since static electricity may be generated.

14.2 Storage Precautions

14.2.1. When storing the LCD modules, avoid exposure to direct sunlight or to the light of fluorescent lamps.

14.2.2. The LCD modules should be stored under the storage temperature range If the LCD modules will be stored for a long time, the recommend condition is:
Temperature: 0℃ ~ 40℃, Relatively humidity: ≤80%

14.2.3. The LCD modules should be stored in the room without acid, alkali and harmful gas.

14.3 Transportation Precautions

The LCD modules should be no falling and violent shocking during transportation, and also should avoid excessive press, water, damp and sunshine.
