ADZS-U4050LF-EZKIT User Guide
UG-1163

ADZS-U4050LF-EZKIT for the ADuCM4050 Microcontroller

INTRODUCTION

This user guide describes the ADZS-U4050LF-EZKIT that is used to evaluate the ADuCM4050 microcontroller. This guide describes the different parts and components of the ADZS-U4050LF-EZKIT evaluation board, as well as the functionalities and configurations of the ADZS-U4050LF-EZKIT that enable the user to develop applications with the device.

DOCUMENTS NEEDED

ADuCM4050 EZ-Kit® Manual

GENERAL DESCRIPTION

The ADuCM4050 is an ultra low power, integrated, mixed signal microcontroller units (MCUs) used for processing, control, and connectivity. The MCU system is based on an ARM® Cortex-M4F processor, which is a 32-bit reduced instruction set computer (RISC) processor and runs up to 52 MHz. The device has 512 kB of embedded flash memory with error correction code (ECC) and 128 kB of system RAM with parity.

The ADuCM4050 also features a collection of digital peripherals, and an analog subsystem that provides clocking, reset, and power management capabilities in addition to an analog-to-digital converter (ADC) subsystem.

Refer to the ADuCM4050 product page for future updates.

For full details, see the ADuCM4050 data sheet, which must be used in conjunction with this user guide when using the evaluation board.

TABLE OF CONTENTS

REVISION HISTORY

5/2018—Revision 0: Initial Version

OVERVIEW

The ADZS-U4050LF-EZKIT allows the user to program, debug, and evaluate the performance of the ADuCM4050 microcontroller.

CONTENTS

The ADZS-U4050LF-EZKIT package contains the following items (see Figure 2):

- ADZS-U4050LF-EZKIT board
- USB 2.0 cable
- J-Link LITE emulator

J-Link LITE Emulator

The J-Link LITE emulator board provides a debug path interface via serial wire, power supply, and UART communication with the ADZS-U4050LF-EZKIT board. Figure 3 shows a top view of the emulator board.

The serial wire debug connector is a 20-pin device, but only three connections are made: SWDIO and SWCLK are used for debug purposes and the RESET connection is used to provide a reset from the PC if required. Table 1 shows the JTAG connector pin configuration.

Table 1. JTAG Connector Pinouts

Pin Number	Signal
1	VDD
4, 6, 8, 10, 12, 14, 16, 18, 20	GND
7	SWDIO
9	SWCLK
15	RESET

When measuring current consumption using an external supply on the ADZS-U4050LF-EZKIT board IOVDD pins, it is recommended that the emulator be disconnected.

The connection on the board is used in P4 a debug port.

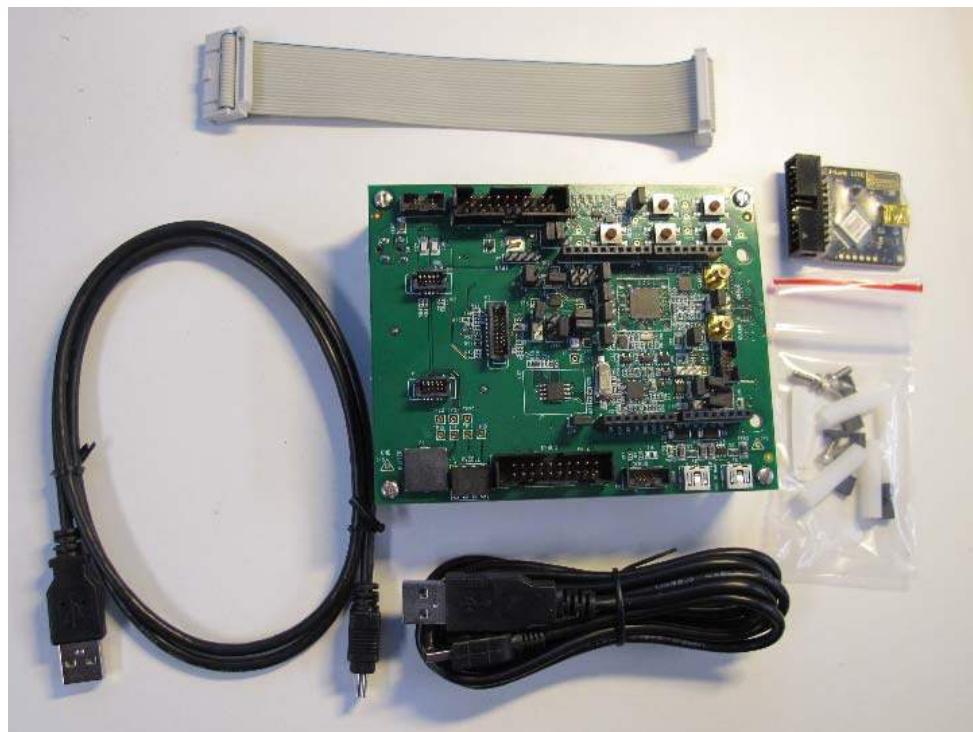

Figure 2. ADZS-U4050LF-EZKIT Package Contents
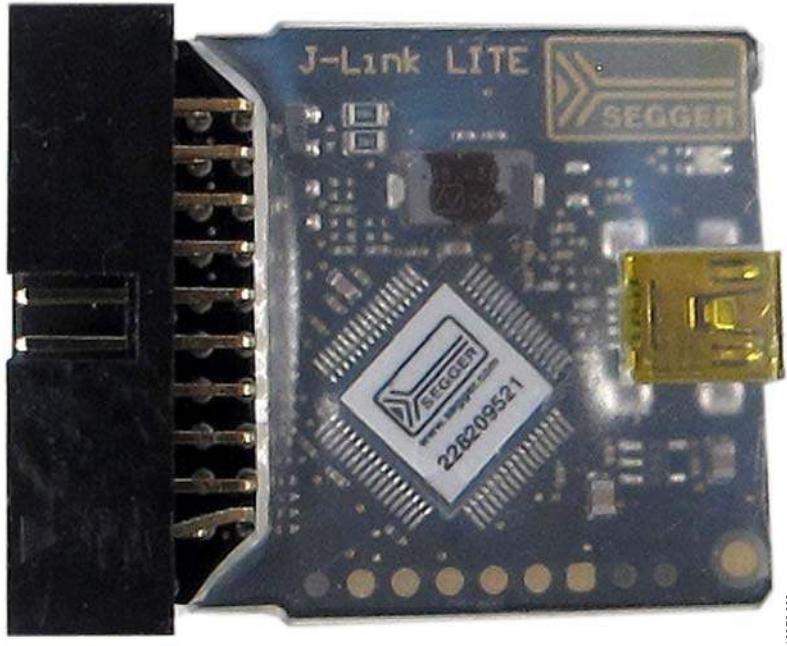

Figure 3. J-Link LITE Emulator

BOARD FEATURES

Power Supply

The ADZS-U4050LF-EZKIT evaluation board can be powered by numerous sources to evaluate the capability of the ADuCM4050 microcontroller.

The following sources are the options for powering the board:

- External power supply. The ADZS-U4050LF-EZKIT board package has a 5 V dc regulated power adapter included. To use the adapter to supply the microcontroller, Pin 3 and Pin 5 of JP12, and Pin 1 and Pin 3 of JP14 must be shorted; then, connect the adapter to the P8 power jack.
- J-Link LITE emulator. The J-Link LITE emulator can power the evaluation board while debugging and programming the microcontroller. Pin 1 and Pin 3 of JP12 and Pin 1 and Pin 3 of JP14 must be shorted to use this option. To power the board by this option, the user must also command the J-Link LITE to power on the board. Run the J-Link LITE commander, and then execute the **power on perm** command.

- USB power supply. The ADZS-U4050LF-EZKIT board can draw power from the USB to the UART port on the lower right side of the board. The configuration for this setup is shorting Pin 3 and Pin 4 of JP12 and Pin 1 and Pin 3 of JP14.
- USB mbed. The ADZS-U4050LF-EZKIT board can draw power from the USB to the mbed interface on the lower side of the board. The jumper configuration is the same as the previous one.
- Coin cell battery. The ADZS-U4050LF-EZKIT board can be powered by a 3 V coin cell battery (included in the kit). To use the coin cell battery, Pin 1 and Pin 2 of JP16 and Pin 3 and Pin 4 of JP14 must be shorted.
- AA battery. To use an AA battery, Pin 2 and Pin 3 of JP16 and Pin 3 and Pin 4 of JP14 must be shorted.
- Photovoltaic (PV) cell. The ADZS-U4050LF-EZKIT board can be also be powered by energy harvesting kits provided by Analog Devices, Inc. To use this option, Pin 3 and Pin 5 of JP14 must be shorted.

The configurations for the power options are listed in Table 2. The pin numbers indicate the pins to be shorted.

Table 2. Power Option Configurations of the ADZS-U4050LF-EZKIT Board

Source	Pin Number		
	JP12[1]	JP14	JP16[1]
External Power Adapter	3, 5	1, 3	X
Emulator/J-Link LITE	1, 3	1, 3	X
USB Power	3, 4	1, 3	X
USB mbed	3, 4	1, 3	X
Coin Cell Battery	X	3, 4	1, 2
AA Battery	X	3, 4	2, 3
PV Cell	X	3, 5	X

[1] X means don't care

The 5 V sources (external power, emulator, and USBs) are connected to the on-board 3.0 V low dropout regulator (LDO) before they power the components and the microcontroller on the board.

The battery and the PV cell supplies are directly connected to the ADZS-U4050LF-EZKIT internal components (microcontroller, flash, temperature sensor, and accelerometer). Do not supply more than 3.6 V on the battery and PV cell terminals to avoid damaging the microcontroller.

Power Indicator/General-Purpose LEDs

The ADZS-U4050LF-EZKIT board has seven LEDs to indicate different board statuses. LED1 (red) indicates if the board has been reset. LED2 (green) indicates that the board is powered up. LED7 (yellow) indicates mbed enabled.

The general-purpose yellow LEDs (LED3, LED4, and LED5) are programmable and connected to the pins of the microcontroller. These are all active low LEDs; this means that writing low to the pins where the LED is connected lights up the LEDs.

The red, green, blue (RGB) LED (LED6) is a multicolor LED, which internally uses three monocolor LEDs, one per primary color, to combine the lights and create new colors. The monocolor LEDs can be controlled independently from the microcontroller. JP9 must be closed.

The LED to MCU pin connections are described in Table 3.

Table 3. LED to MCU Pin Connections

LED No.	Pin No.
LED1	SYS_HWRST
LED2	Not applicable, LED2 is directly connected to the power line
LED3	P0_13
LED4	P1_12
LED5	P1_13
LED6	P1_06, P1_07, P1_08
LED7	Not applicable (LED7 is controlled by mbed circuit)

Crystal Circuits

The ADZS-U4050LF-EZKIT board uses two crystals to clock the system: a 26 MHz and a 32.768 kHz crystal. The 26 MHz crystal is a possible clock source for the full system such as the core, SRAM, bus, flash, and others. The 32.768 kHz crystal is a possible clock source of the low frequency multiplexer (LFMUX) block, connected to the low speed peripherals, such as the beeper controller or timers.

Emulator Interface

Application, download, and emulation are possible on the ADuCM4050 via a serial wire by using the J-Link LITE emulator through the P4 connector of the ADZS-U4050LF-EZKIT board.

Reset, Wake, Boot, and General-Purpose Push-Buttons

The ADZS-U4050LF-EZKIT board has five push-buttons (see Figure 4) responsible for different operations.

- The boot mode select switch (SW1) determines the boot mode of the processor. By default, the processor boots from the internal flash memory. When pressed, the UART download mode is triggered. For full details, see the *ADuCM4050 EZ-Kit® Manual*, Revision 1.0 for further information, which can be found in the **Documentation** section of the ADuCM4050 product page (this manual is included in the downloadable board support package for the ADuCM4050).

- The reset switch (SW2) resets the ADuCM4050 processor.

- The wake switch (SW3) is connected to the processor wake signals, and is used to wake up the processor during low power modes. Depending on the configuration of JP10, the different external interrupts to wake up the microcontroller.

- The PB1 switch (SW4) is a general-purpose switch connected to general-purpose input/output (GPIO) P2_09.
- The PB2 switch (SW5) is a general-purpose switch connected to GPIO P2_06.
- Table 4 shows which pins must be shorted on JP10 to choose which external interrupt is connected to the WAKE switch.
- The PB1 switch (SW4) is a general-purpose switch connected to general-purpose input/output (GPIO) P2_09.
- The PB2 switch (SW5) is a general-purpose switch connected to GPIO P2_06.

Table 4. External Interrupt Choice for the WAKE Switch

| Pin Number	Signal Name
1, 2	SYS_WAKE0
3, 4	SYS_WAKE1
5, 6	SYS_WAKE2
7, 8	SYS_WAKE3
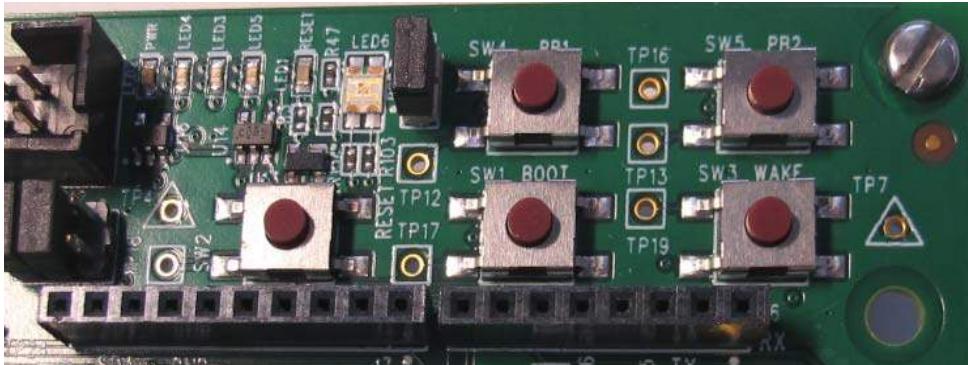

Figure 4. ADZS-U4050LF-EZKIT Push-Buttons Located Near the LEDs

USB to UART Interface

The ADZS-U4050LF-EZKIT has an on-board USB to UART interface circuit used to connect the ADuCM4050 microcontrollers to a PC. The USB to UART functionality is provided by an FT232RQ (U4) chip. The chip handles the entire USB protocol on-chip and no USB firmware development is required. The FT232RQ can transfer data at rates from 300 baud to 3 Mbaud at transistor to transistor (TTL) levels.

The ADuCM4050 microcontroller UART0 pins are connected directly to the interface pins of the FT232RQ chip (U4). If another USB to UART module is used, the UART1 signals can be tapped on the P7 4 × 1 header.

mbed Interface

mbed is a platform based on Cortex-M that features several components including an operating system and protocols. One of these components is the programming interface CMSIS-DAP compliant.

The ADZS-U4050LF-EZKIT board has a programming interface, which enables the device to be programmed and debugged via USB. When connected to a PC, an external unit called DAPLINK and a new COM port appears; if not, installing the mbed Windows® serial port driver is required. For further information, see the ARM mbed web page.

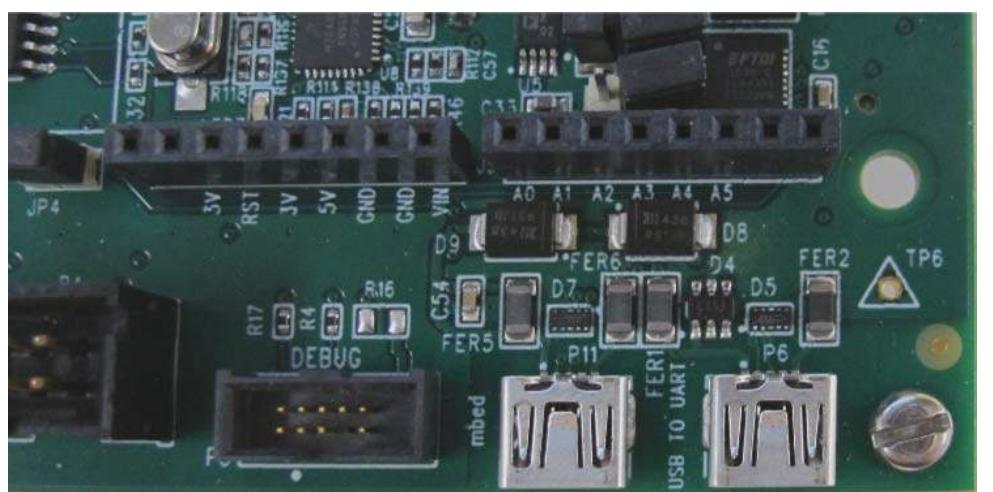

Figure 5. USB to UART Circuit (Right) and USB to mbed Circuit (Left)

On-Board Trisensor Circuit (Accelerometer, Temperature, and ADC)

The ADZS-U4050LF-EZKIT board has an on-board trisensor circuit consisting of a 3-axis micro electromechanical systems (MEMS) accelerometer, a temperature sensor, and an ADC, which is provided by the ADXL363 (U2), shown in Figure 6.

The entire system consumes less than 2 μA at a 100 Hz output data rate and 270 nA that, when in motion, triggers the wake-up mode. The ADXL363 communicates with the ADuCM4050 microcontroller via the serial port interface (SPI2). The accelerometer provides selectable measurements of 2G, 4G, and 8G with a resolution of 1 mG per least significant bit (LSB) on the 2G range. The temperature sensor operates with a scale factor of 0.065°C. The ADC has no external connections, but can be used by tapping to the TP8 test point.

This circuit can be powered down by unshorting the JP6 header.
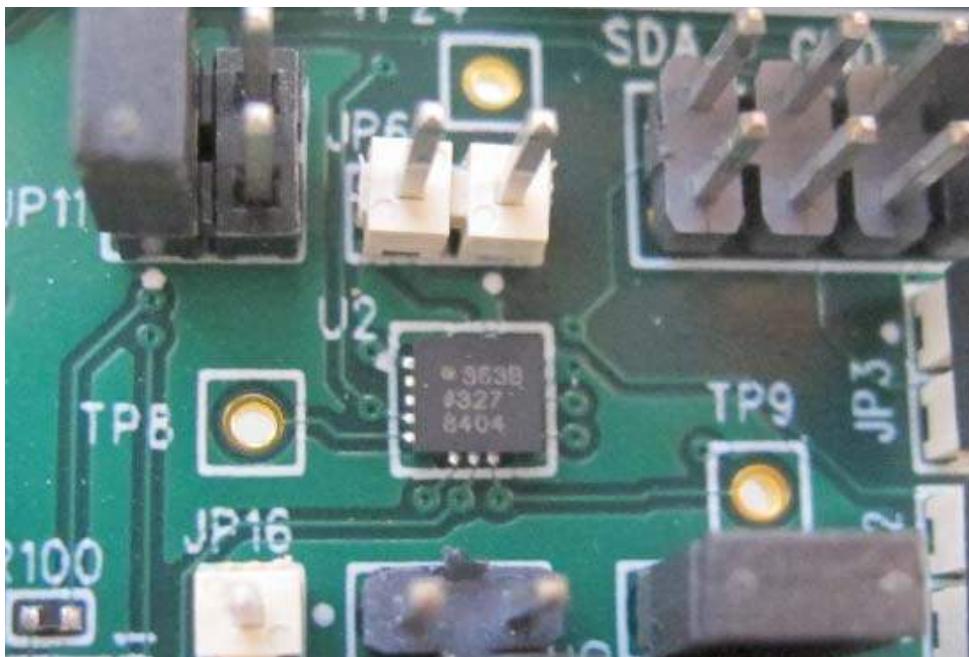

Figure 6. Trisensor Circuit

On-Board Digital I²C Temperature Sensor

The ADZS-U4050LF-EZKIT board has an on-board I²C digital temperature sensor, ADT7420. The ADT7420 (U6) is rated for operation over the −40°C to +150°C temperature range.

The ADT7420 operates from 2.7 V to 5.5 V. Operating at 3.3 V, the average supply current is typically 210 µA and the shutdown current is typically 2.0 µA.

The ADT7420 has two available pins for address selection with four possible I²C addresses. The user can configure the address by soldering resistors in R39 and R40 (to VCC), and R41 and R42 (to GND). The default address is 0x48.

The ADT7420 is connected to the I²C interface and can generate an interrupt signal to interrupt the microcontroller. The interrupt signal pin of the ADT7420 is connected to Pin P1_14 of the ADuCM4050.

The temperature sensor can be disconnected from the board supply by unshorting the JP5 header. Figure 7 shows the circuit with the ADT7420 chip in the middle and the JP5 header above the chip.

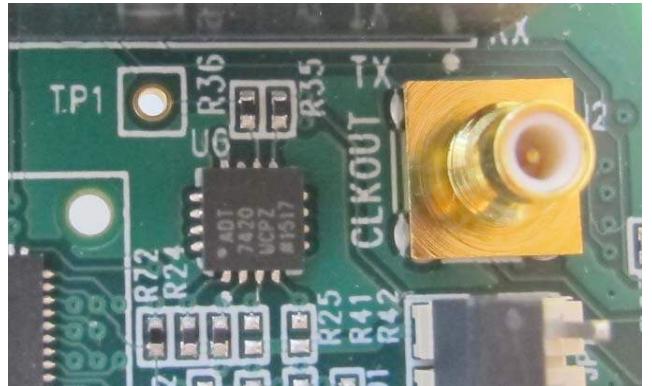

Figure 7. I²C Temperature Circuit

On-Board 32 Mb Serial Flash Memory

The ADZS-U4050LF-EZKIT board has an on-board, serial flash memory that can be used to store voice, text, and data.

The serial flash memory (U7) is a W25Q32 chip that has a storage size of 32 Mb. This chip supports a standard serial peripheral interface (SPI) with speeds up to 104 MHz. The chip is interfaced with the SPI2 of the microcontroller and can be disconnected to the board by unshorting the JP4 header.

Figure 8 shows the circuit with the W25Q32 chip in the middle and the JP4 header below the flash chip.

On-Board Buzzer

The ADZS-U4050LF-EZKIT has a buzzer (D1) that generates tones and alarms with the beeper controller inside the ADuCM4050 microcontroller. Figure 9 shows the buzzer chip next to the PV cell connector.

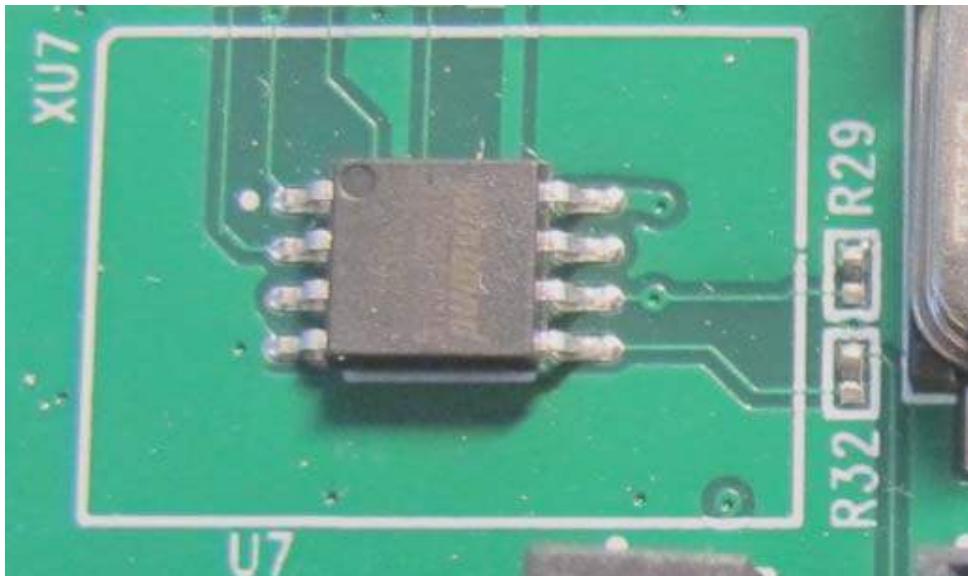

*Figure 8. External 32 Mb Serial Flash Memory*
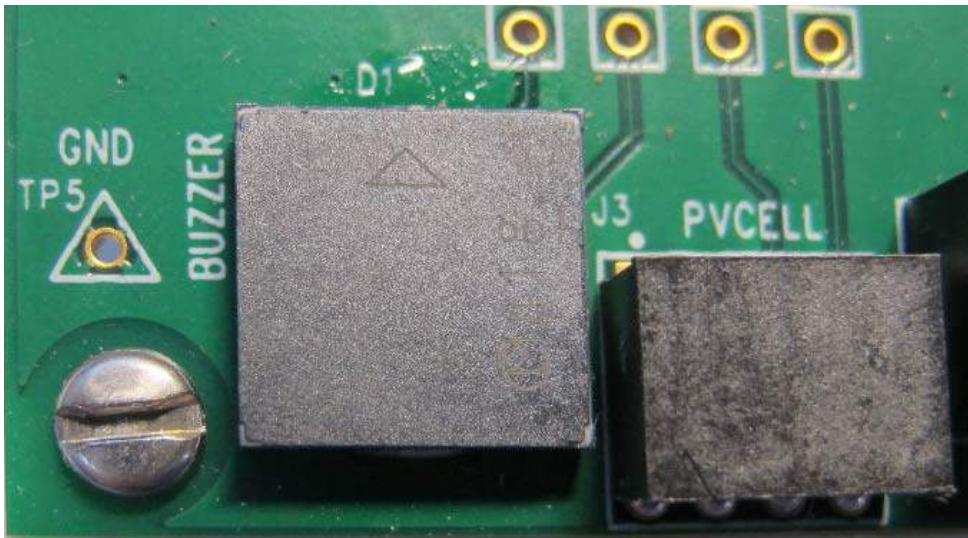

Figure 9. Buzzer Circuit

ADZS-U4050LF-EZKIT BOARD CONNECTORS

The ADZS-U4050LF-EZKIT board has a number of connectors used to connect different boards and kits for evaluation. The locations of these connectors are shown in Figure 10.

ARDUINO UNO CONNECTORS (J4, J5, J6, AND J7)

The ADZS-U4050LF-EZKIT board has an Arduino Uno compatible form factor interface that can accept Arduino shields and daughter boards. The pinout of the Arduino interface is described in Table 5 through Table 8.

Table 5. Arduino Interface J4 Connector Pinout

J4 Pin No.	Arduino Pin Name	ADuCM4050 Pin Name

EXPANSION INTERFACE 3 (EI3)

The ADZS-U4050LF-EZKIT board includes one expansion interface connector located on the bottom side of the board. EI3 supports connection to other EI3 daughter boards designed by Analog Devices, extending the capabilities of the evaluation board. The connectors provide power, ground, reset, ADC, I²C, SPI, UART, serial port (SPORT), and GPIO signals.

An EI3 SDP breakout board (sold separately), as shown in Figure 15, is required to tap and probe the signals in this connector.

Figure 14. EI3 Connector
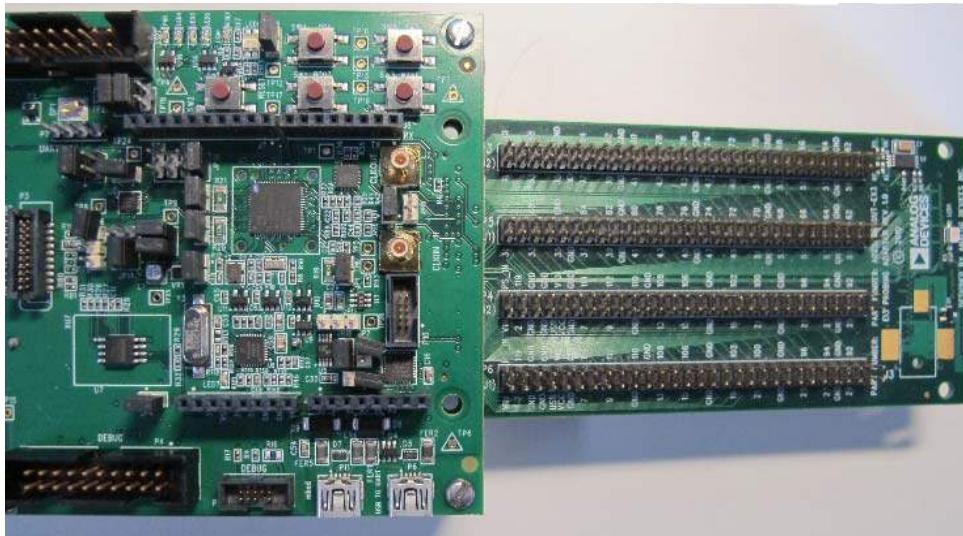

Figure 15. EI3 SDP Breakout Board Connected to the ADZS-U4050LF-EZKIT Board

WIRELESS TRANCEIVERS INTERFACE (P1, P2, AND P3)

The wireless transceiver daughterboard interface supports the ADF7023, ADF7024, ADF7242, ADF7030, and ADF7030-1 wireless transceivers. These are low power, high performance, integrated radio transceivers supporting a wide range of modulation schemes and channel widths in the sub GHz and 2.4 GHz frequency ranges.

EMULATION AND SERIAL INTERFACE CONNECTOR (P4, P5, AND P9)

The P4, P5, and P9 connectors provide a connection from the ADZS-U4050LF-EZKIT board to the emulator board. P4 is a 20-pin standard JTAG connector compatible with the J-Link LITE emulator.

P5 and P9 are 10-pin debug/emulator connectors with serial wire, power source, and UART signal lines for debugging purposes.

I^2C refers to a communications protocol originally developed by Philips Semiconductors (now NXP Semiconductors).

ESD Caution

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Legal Terms and Conditions

By using the evaluation board discussed herein (together with any tools, components documentation or support materials, the "Evaluation Board"), you are agreeing to be bound by the terms and conditions set forth below ("Agreement") unless you have purchased the Evaluation Board, in which case the Analog Devices Standard Terms and Conditions of Sale shall govern. Do not use the Evaluation Board until you have read and agreed to the Agreement. Your use of the Evaluation Board shall signify your acceptance of the Agreement. This Agreement is made by and between you ("Customer") and Analog Devices, Inc. ("ADI"), with its principal place of business at One Technology Way, Norwood, MA 02062, USA. Subject to the terms and conditions of the Agreement, ADI hereby grants to Customer a free, limited, personal, temporary, non-exclusive, non-sublicensable, non-transferable license to use the Evaluation Board FOR EVALUATION PURPOSES ONLY. Customer understands and agrees that the Evaluation Board is provided for the sole and exclusive purpose referenced above, and agrees not to use the Evaluation Board for any other purpose. Furthermore, the license granted is expressly made subject to the following additional limitations: Customer shall not (i) rent, lease, display, sell, transfer, assign, sublicense, or distribute the Evaluation Board; and (ii) permit any Third Party to access the Evaluation Board. As used herein, the term "Third Party" includes any entity other than ADI, Customer, their employees, affiliates and in-house consultants. The Evaluation Board is NOT sold to Customer; all rights not expressly granted herein, including ownership of the Evaluation Board, are reserved by ADI. CONFIDENTIALITY. This Agreement and the Evaluation Board shall all be considered the confidential and proprietary information of ADI. Customer may not disclose or transfer any portion of the Evaluation Board to any other party for any reason. Upon discontinuation of use of the Evaluation Board or termination of this Agreement, Customer agrees to promptly return the Evaluation Board to ADI. ADDITIONAL RESTRICTIONS. Customer may not disassemble, decompile or reverse engineer chips on the Evaluation Board. Customer shall inform ADI of any occurred damages or any modifications or alterations it makes to the Evaluation Board, including but not limited to soldering or any other activity that affects the material content of the Evaluation Board. Modifications to the Evaluation Board must comply with applicable law, including but not limited to the RoHS Directive. TERMINATION. ADI may terminate this Agreement at any time upon giving written notice to Customer. Customer agrees to return to ADI the Evaluation Board at that time. LIMITATION OF LIABILITY. THE EVALUATION BOARD PROVIDED HEREUNDER IS PROVIDED "AS IS" AND ADI MAKES NO WARRANTIES OR REPRESENTATIONS OF ANY KIND WITH RESPECT TO IT. ADI SPECIFICALLY DISCLAIMS ANY REPRESENTATIONS, ENDORSEMENTS, GUARANTEES, OR WARRANTIES, EXPRESS OR IMPLIED, RELATED TO THE EVALUATION BOARD INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTY OF MERCHANTABILITY, TITLE, FITNESS FOR A PARTICULAR PURPOSE OR NONINFRINGEMENT OF INTELLECTUAL PROPERTY RIGHTS. IN NO EVENT WILL ADI AND ITS LICENSORS BE LIABLE FOR ANY INCIDENTAL, SPECIAL, INDIRECT, OR CONSEQUENTIAL DAMAGES RESULTING FROM CUSTOMER'S POSSESSION OR USE OF THE EVALUATION BOARD, INCLUDING BUT NOT LIMITED TO LOST PROFITS, DELAY COSTS, LABOR COSTS OR LOSS OF GOODWILL. ADI'S TOTAL LIABILITY FROM ANY AND ALL CAUSES SHALL BE LIMITED TO THE AMOUNT OF ONE HUNDRED US DOLLARS ($100.00). EXPORT. Customer agrees that it will not directly or indirectly export the Evaluation Board to another country, and that it will comply with all applicable United States federal laws and regulations relating to exports. GOVERNING LAW. This Agreement shall be governed by and construed in accordance with the substantive laws of the Commonwealth of Massachusetts (excluding conflict of law rules). Any legal action regarding this Agreement will be heard in the state or federal courts having jurisdiction in Suffolk County, Massachusetts, and Customer hereby submits to the personal jurisdiction and venue of such courts. The United Nations Convention on Contracts for the International Sale of Goods shall not apply to this Agreement and is expressly disclaimed.
