

32K x 8 Static RAM

Features

- 55, 70 ns access time
- CMOS for optimum speed/power
- Wide voltage range: 2.7V–3.6V
- Low active power (70 ns, LL version)
— 108 mW (max.)
- Low standby power (70 ns, LL version)
— 18 μ W (max.)
- Easy memory expansion with \overline{CE} and OE features
- TTL-compatible inputs and outputs
- Automatic power-down when deselected

Functional Description

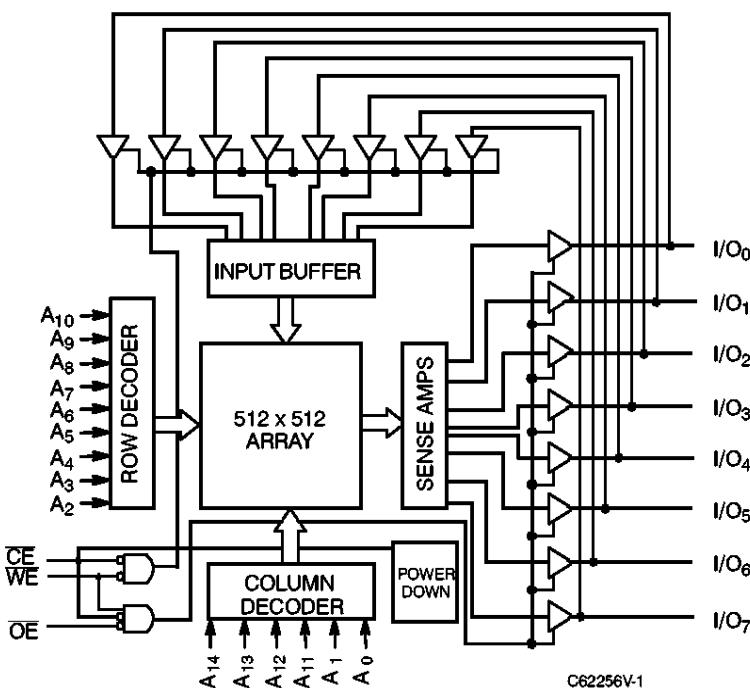

The CY62256V is a high-performance CMOS static RAM organized as 32,768 words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and three-state drivers. This device has an automatic power-down feature, reducing the power consumption by 98% when deselected. The CY62256V is in the standard 450-mil-wide (300-mil body width) SOIC, TSOP, and reverse TSOP packages.

An active LOW write enable signal (\overline{WE}) controls the writing/reading operation of the memory. When \overline{CE} and \overline{WE} inputs are both LOW, data on the eight data input/

output pins (I/O_0 through I/O_7) is written into the memory location addressed by the address present on the address pins (A_0 through A_{14}). Reading the device is accomplished by selecting the device and enabling the outputs, \overline{CE} and \overline{OE} active LOW, while \overline{WE} remains inactive or HIGH. Under these conditions, the contents of the location addressed by the information on address pins is present on the eight data input/output pins.

The input/output pins remain in a high-impedance state unless the chip is selected, outputs are enabled, and write enable (\overline{WE}) is HIGH. A die coat is used to ensure alpha immunity.

Notes:

- No input may exceed $V_{CC} + 0.3V$.
- Test conditions assume signal transition time of 5 ns or less timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
- t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in part (b) of AC Test Loads. Transition is measured ± 500 mV from steady-state voltage.

Notes:

8. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
9. The minimum write cycle time for write cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD}.
10. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$.
11. \overline{WE} is HIGH for read cycle.
12. Address valid prior to or coincident with \overline{CE} transition LOW.

Write Cycle No. 2 (\overline{CE} Controlled)[8, 13, 14]

Write Cycle No. 3 (\overline{WE} Controlled, \overline{OE} LOW)[9, 14]

Notes:

13. Data I/O is high impedance if $\overline{OE} = V_{IH}$.

14. If \overline{CE} goes HIGH simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.

15. During this period, the I/Os are in output state and input signals should not be applied.
