Description

The HA-5177 is a monolithic, all bipolar, precision operational amplifier, utilizing Harris dielectric isolation and advance processing techniques. This design features a combination of precision input characteristics, wide bandwidth (1.4MHz) and high speed (0.8 V/ μ s).

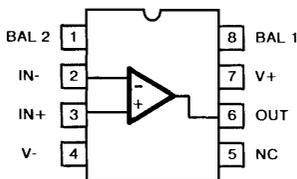

The HA-5177 uses advanced matching techniques and laser trimming to produce low offset voltage (25 μ V) and low offset voltage drift (0.3 μ V/ $^{\circ}$ C). This design also features low voltage noise (9.0nV/ $\sqrt{\text{Hz}}$), low current noise (0.12pA/ $\sqrt{\text{Hz}}$), nanoamp input currents, and 120dB minimum gain.

These outstanding features along with high CMRR (140dB) and high PSRR (135dB) make this unity gain stable amplifier ideal for high resolution data acquisition systems, precision integrators, and low level transducer amplifiers.

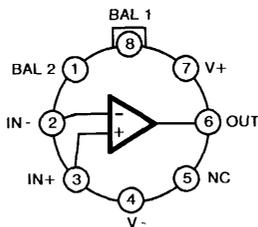

The HA-5177 can be used as a direct replacement for the OP05, OP07, and OP77 while offering higher bandwidth and slew rate. The HA-5177 is packaged in a 8 pin (TO-99) Metal Can and Ceramic 8 pin Mini-DIP and is pin compatible with many existing op amps. See the HA-5177/883 data sheet for military grade parts and LCC package.

NOTES:

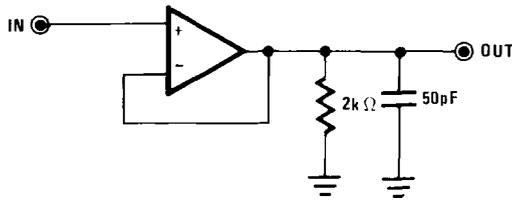

1. Absolute maximum ratings are limiting values, applied individually beyond which the serviceability of the circuit may be impaired. Functional operability under any of these conditions is not necessarily implied.
2. Sample Tested.
3. $V_{\text{OUT}} = \pm 10\text{V}, R_L = 2\text{k}\Omega$
4. $\Delta V_{\text{CM}} = \pm 10\text{V D.C.}$
5. $R_L = 2\text{k}$
6. Full power bandwidth guaranteed based on slew rate measurement using $\text{FPBW} = \frac{\text{Slew Rate}}{2\pi V_{\text{PEAK}}} V_{\text{PEAK}} = 10\text{V}$.
7. $V_{\text{OUT}} = \pm 10$.
8. Refer to test circuits section of the data sheet.
9. Settling time is measured to 0.1% of final value for a 10V output step and $A_V = -1$.
10. $\Delta V_{\text{SUPPLY}} = \pm 10\text{V D.C. to } \pm 20\text{V D.C.}$
