- (PCI) Power Management 1.0 Compliant
- ACPI 1.0 Compliant
- Packaged in GFN 256-Pin BGA or GJG MicroStar BGA
- PCI Local Bus Specification Revision 2.2 Compliant
- 1997 PC Card™ Standard Compliant
- PC 99 Compliant
- 3.3-V Core Logic With Universal PCI Interfaces Compatible With 3.3-V and 5-V PCI Signaling Environments
- Mix-and-Match 5-V/3.3-V PC Card16 Cards and 3.3-V CardBus Cards
- Supports Two PC Card or CardBus Slots With Hot Insertion and Removal
- Uses Serial Interface to TI<sup>™</sup> TPS2206 Dual Power Switch
- Supports Burst Transfers to Maximize Data Throughput on the PCI Bus and the CardBus Bus
- Supports Serialized Interrupt Request (IRQ)
   With PCI Interrupts
- 8-Way Legacy IRQ Multiplexing
- System Interrupts Can Be Programmed as PCI Style or Industry Standard Architecture (ISA-IRQ) Style
- ISA-IRQ Interrupts Can Be Serialized Onto a Single IRQ Serial (IRQSER) Pin
- EEPROM Interface for Loading Subsystem ID and Subsystem Vendor ID

- Pipelined Architecture Allows Greater Than 130M-Bytes-Per-Second Throughput From CardBus to PCI and From PCI to CardBus
- Supports Zoomed Video With Internal Buffering
- Four General Purpose I/Os
- Multifunction PCI Device With Separate Configuration Space for Each Socket
- Five PCI Memory Windows and Two I/O Windows Available for Each PC Card16 Socket
- Two I/O Windows and Two Memory Windows Available to Each CardBus Socket
- Exchangeable Card Architecture (ExCA)
   Compatible Registers Are Mappable in
   Memory and I/O Space
- Supports Distributed DMA (DDMA) and PC/PCI DMA
- Intel™ 82365SL-DF Register Compatible
- Supports 16-Bit DMA on Both PC Card Sockets
- Supports Ring Indicate, SUSPEND, PCI CLKRUN, and CardBus CCLKRUN
- Advanced Submicron, Low-Power CMOS Technology
- Provides VGA/Palette Memory and I/O and Subtractive Decoding Options
- LED Activity Pins
- Supports PCI Bus Lock (LOCK)

### PCI1251B GFN/GJG PC CARD CONTROLLER

SCPS043A - OCTOBER 1998

#### description

The TI PCI1251B is a high-performance PC Card controller with a 32-bit PCI interface. The device supports two independent PC Card sockets compliant with the 1997 PC Card Standard. The PCI1251B provides features that make it the best choice for bridging between PCI and PC Cards in both notebook and desktop computers. The 1997 PC Card Standard retains the 16-bit PC Card specification defined in PCMCIA Release 2.2, and defines the new 32-bit PC Card, CardBus, capable of full 32-bit data transfers at 33 MHz. The PCI1251B supports any combination of 16-bit and CardBus PC Cards in the two sockets, powered at 5 V or 3.3 V, as required.

The PCI1251B is compliant with the latest *PCI Bus Power Management Specification*. It is also compliant with the PCI Local Bus Specification 2.2, and its PCI interface can act as either a PCI master device or a PCI slave device. The PCI bus mastering is initiated during 16-bit PC Card direct memory access (DMA) transfers or CardBus PC Card bridging transactions.

Multiple system-interrupt signaling options are provided and they include:

- Parallel PCI interrupts
- Parallel ISA interrupts
- Serialized ISA interrupts
- Serialized ISA and PCI interrupts

Additionally, general-purpose inputs and outputs are provided for the board designer to implement sideband functions.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI1251B is register compatible with the Intel 82365SL-DF ExCA controller. The PCI1251B internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI1251B can also be programmed to accept fast posted writes to improve system-bus utilization.

The PCI1251B provides an internally buffered zoomed video (ZV) path. This reduces the design effort of PC board manufacturers to add a ZV-compatible solution and guarantees compliance with the CardBus loading specifications. Many other features, such as socket activity light-emitting diode (LED) outputs, are designed into the PCI1251B. These features are discussed in detail throughout the design specification.

An advanced complementary metal-oxide semiconductor (CMOS) process is used to achieve low system-power consumption while operating at PCI clock rates up to 33 MHz. Several low-power modes enable the host power management system to further reduce power consumption.

Unused PCI1251B inputs must be pulled up using a 43 k $\Omega$  resistor.

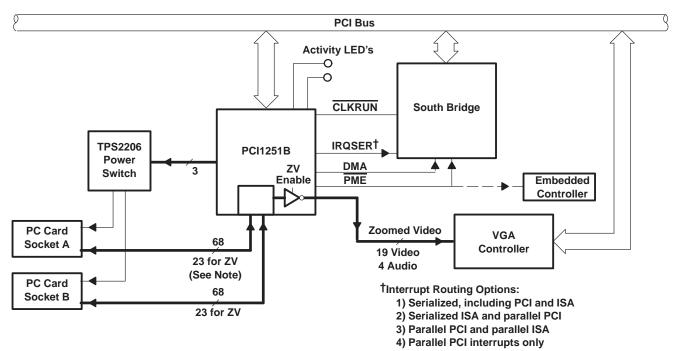

### system block diagram

A simplified system block diagram using the PCI1251B is provided below. The zoomed video (ZV) capability can be used to route the ZV data directly to the VGA controller.

The PCI interface includes all address/data and control signals for PCI protocol. The 68-pin PC Card interface includes all address/data and control signals for CardBus and 16-bit (R2) protocols. When zoomed video (ZV) is enabled (in 16-bit PC Card mode), 23 of the 68 signals are redefined to support the ZV protocol.

The interrupt interface includes terminals for parallel PCI, parallel ISA, and serialized PCI and ISA signaling. The ring indicate terminal is included in the interrupt interface because its function is to perform system wake up on incoming PC Card modem rings. Other miscellaneous system interface terminals available on the PCI1251B include:

- Programmable general purpose multifunction terminals
- SUSPEND, RI OUT/PME (power management control signal)
- SPKROUT

NOTE: The PC Card interface is 68 pins for CardBus and 16-bit PC Cards. In zoomed-video mode, 23 pins are used for routing the zoomed video signals to the VGA controller.

### signal names and terminal assignments

Signal names and their terminal assignments are shown in Tables 1 through 4 sorted alphanumerically by the assigned terminal.

Table 1. GFN Terminals Sorted Alphanumerically for CardBus and 16-Bit Signals

| GFN | SIGNAL NAME                  | GFN | SIGNAL NAME                 | GFN | SIGNAL NAME     |
|-----|------------------------------|-----|-----------------------------|-----|-----------------|
| A1  | GND                          | C9  | B_CCD2//B_CD2               | G17 | B_CAD7//B_D7    |

#### **Terminal Functions**

The terminals are grouped in tables by functionality, such as PCI system function, power-supply function, etc. The terminal numbers are also listed for convenient reference.

**Table 5. Power Supply** 

|      | TERMINAL  | -  | FUNCTION  |  |  |
|------|---|--|---|--|--|
| NAME | GFN NO.   | GJG NO.  | FUNCTION  |  |  |
| GND  | A1, D4, D8, D13, D17, H4, H17,<br>N4, N17, U4, U8, U13, U17 | B14, D4, D7, F5, F9, G16, H5,<br>J19, K5, N2, N14, R13, U1, V6,<br>V9, W11 |   |  |  |
| VCC  | D6, D11, D15, F4, F17, K4, L17,<br>R4, R17, U6, U10, U15    | A8, F6, F12, F14, G2, J6, K19,<br>M6, P5, P8, R15, V12                     | Power supply terminal for core logic (3.3 V)  |  |  |
| VCCA | K2, R3, W5  | J4, N6, W5   | Clamping voltage for PC Card A interface.   |  |  |
| VCCB | B16, C10, F18,  | A15, B10, F19  | Clamping voltage for PC Card B interface.   |  |  |
| VCCI | V10   | P9   | Clamping voltage for interrupt subsystem interface and miscellaneous I/O. Indicates signaling level of the following inputs and shared outputs: IRQSER, PCGNT, PCREQ, SUSPEND, SPKROUT, GPIO1:0, IRQMUX7-IRQMUX0, INTA, INTB, CLOCK, DATA, LATCH, and RI_OUT. |  |  |
| VCCP | K20, P18, V15, W20  | K14, N18, V14, V18   | Clamping voltage for PCI signaling (3.3 V or 5 V)   |  |  |
| VCCZ | A4, D1  | D6, E4   | Clamping voltage for zoomed video interface (3.3 V or 5 V)  |  |  |

### **Table 6. PC Card Power Switch**

|       | TERMINAL |         | I/O  | FUNCTION   |  |  |
|-------|----------|---------|------|--|--|--|
| NAME  | GFN NO.  | GJG NO. | TYPE | FUNCTION   |  |  |
| CLOCK | U12      | R11     | I/O  | 3-line power switch clock. Information on the DATA line is sampled at the rising edge of CLOCK. CLOCK defaults to an input, but can be changed to a PCI1251B output by using the P2CCLK bit in the system control register. The TPS2206 defines the maximum frequency of this signal to be 2 MHz. If a system design defines this terminal as an output, then CLOCK requires an external pulldown resistor. The frequency of the PCI1251B output CLOCK is derived by dividing the PCI CLK by 36. |  |  |
| DATA  | V12      | T11     | 0    | 3-line power switch data. DATA is used to serially communicate socket power control information to the power switch.   |  |  |
| LATCH | W12      | V11     | 0    | 3-line power switch latch. LATCH is asserted by the PCI1251B to indicate to the PC Card power switch that the data on the DATA line is valid.  |  |  |

# **Terminal Functions (Continued)**

# Table 7. PCI System

|        | TERMINAL |         | I/O  | FUNCTION   |
|--------|----------|---------|------|--|
| NAME   | GFN NO.  | GJG NO. | TYPE | FUNCTION   |
| CLKRUN | J18      | J16     | I/O  | PCI clock run. CLKRUN is used by the central resource to request permission to stop the PCI clock or to slow it down, and the PCI1251B responds accordingly. If CLKRUN is not implemented, then this pin should be tied low. CLKRUN is enabled by default by bit 1 (KEEPCLK) in the system control register.   |
| PCLK   | J17      | J15     | I    | PCI bus clock. PCLK provides timing for all transactions on the PCI bus. All PCI signals are sampled at the rising edge of PCLK.   |
| PRST   | J19      | J18     | I    | PCI reset. When the PCI bus reset is asserted, PRST causes the PCI1251B to place all output buffers in a high-impedance state and reset all internal registers. When PRST is asserted, the device is completely nonfunctional. After PRST is deasserted, the PCI1251B is in its default state. When the SUSPEND mode is enabled, the device is protected from the PRST, and the internal registers are preserved. All outputs are placed in a high-impedance state, but the contents of the registers are preserved. |

Table 8. PCI Address and Data

|                                  | TERMINA                  | L                        | I/O  | FUNCTION   |

| AD6                              | U14                      | W14                      |      |  |
| AD5                              | Y16                      | P13                      |      |  |
| AD4                              | W15                      | T13                      |      |  |
| AD3                              | V14                      | V13                      |      |  |
| AD2                              | Y15                      | W13                      |      |  |
| AD1                              | W14                      | N13                      |      |  |
| AD0                              | Y14                      | R12                      |      |  |
| C/BE3<br>C/BE2<br>C/BE1<br>C/BE0 | M17<br>T20<br>W19<br>Y17 | M16<br>P15<br>V17<br>R14 | I/O  | PCI bus commands and byte enables. These signals are <u>multiplexed on</u> the same PCI terminals. During the address phase of a primary bus PCI cycle, C/BE3–C/BE0 define the bus command. During the data phase, this 4-bit bus is used as byte enables. The byte enables determine which byte paths of the full 32-bit data bus carry meaningful data. C/BE0 applies to byte 0 (AD7–AD0), C/BE1 applies to byte 1 (AD15–AD8), C/BE2 applies to byte 2 (AD23–AD16), and C/BE3 applies to byte 3 (AD31–AD24). |
| PAR                              | Y20                      | W18                      | I/O  | PCI bus parity. In all PCI bus read and write cycles, the PCI1251B calculates even parity across the AD31–AD0 and C/BE3–C/BE0 buses. As an initiator during PCI cycles, the PCI1251B outputs this parity indicator with a one-PCLK delay. As a target during PCI cycles, the calculated parity is compared to the initiator's parity indicator. A compare error results in the assertion of a parity error (PERR).   |

**Table 9. PCI Interface Control** 

| TE         | ERMINAL |         | I/O  | FUNCTION   |
|------------|---------|---------|------|--|
| NAME       | GFN NO. | GJG NO. | TYPE | FUNCTION   |
| DEVSEL     | V20     | T18     | I/O  | PCI device select. The PCI1251B asserts DEVSEL to claim a PCI cycle as the target device. As a PCI initiator on the bus, the PCI1251B monitors DEVSEL until a target responds. If no target responds before timeout occurs, then the PCI1251B terminates the cycle with an initiator abort.  |
| FRAME      | T19     | R18     | I/O  | PCI cycle frame. FRAME is driven by the initiator of a bus cycle. FRAME is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When FRAME is deasserted, the PCI bus transaction is in the final data phase.  |
| GNT        | J20     | J14     | Ι    | PCI bus grant. GNT is driven by the PCI bus arbiter to grant the PCI1251B access to the PCI bus after the current data transaction has completed. GNT may or may not follow a PCI bus request, depending on the PCI bus parking algorithm.   |
| GPIO2/LOCK | V19     | V19     | I/O  | PCI bus general-purpose I/O pins or PCI bus lock. GPIO2/LOCK can be configured as PCI LOCK and used to gain exclusive access downstream. Since this functionality is not typically used, a general-purpose I/O may be accessed through this terminal. GPIO2/LOCK defaults to a general-purpose input and can be configured through the GPIO2 control register.                                 |
| IDSEL      | N20     | M18     | I    | Initialization device select. IDSEL selects the PCI1251B during configuration space accesses. IDSEL can be connected to one of the upper 24 PCI address lines on the PCI bus.  |
| ĪRDY       | T18     | R19     | I/O  | PCI initiator ready. IRDY indicates the PCI bus initiator's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK where both IRDY and TRDY are asserted. Until IRDY and TRDY are both sampled asserted, wait states are inserted.  |
| PERR       | U18     | U18     | I/O  | PCI parity error indicator. PERR is driven by a PCI device to indicate that calculated parity does not match PAR when PERR is enabled through bit 6 of the command register.   |
| REQ        | K17     | K15     | 0    | PCI bus request. $\overline{\text{REQ}}$ is asserted by the PCI1251B to request access to the PCI bus as an initiator.   |
| SERR       | U19     | U19     | 0    | PCI system error. SERR is an output that is pulsed from the PCI1251B when enabled through the command register, indicating a system error has occurred. The PCI1251B need not be the target of the PCI cycle to assert this signal. When SERR is enabled in the bridge control register, this signal also pulses, indicating that an address parity error has occurred on a CardBus interface. |
| STOP       | T17     | T19     | I/O  | PCI cycle stop signal. STOP is driven by a PCI target to request the initiator to stop the current PCI bus transaction. STOP is used for target disconnects and is commonly asserted by target devices that do not support burst data transfers.   |
| TRDY       | U20     | R16     | I/O  | PCI target ready. TRDY indicates the primary bus target's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK when both IRDY and TRDY are asserted. Until both IRDY and TRDY are asserted, wait states are inserted.   |

# **Terminal Functions (Continued)**

Table 10. System Interrupt

| TERMIN   | TERMINAL                                  |  | I/O  | FUNCTION  |
|--|---|--|------|---|
| NAME   | GFN NO.                                   | GJG NO.  | TYPE | FUNCTION  |
| GPIO3/INTA   | V13                                       | T12  | I/O  | Parallel PCI interrupt. INTA can be optionally mapped to GPI03 when parallel PCI interrupts are used.  See programmable interrupt subsystem on page 32 for details on interrupt signaling. GPIO3/INTA defaults to a general-purpose input.  |
| IRQSER/INTB  | W13                                       | W12  | I/O  | Serial interrupt signal. IRQSER provides the IRQSER-style serial interrupting scheme. Serialized PCI interrupts can also be sent in the IRQSER stream. See <i>programmable interrupt subsystem</i> on page 32 for details on interrupt signaling. This terminal can be used to signal PCI INTB when one of the parallel interrupt modes is selected in the device control register.   |
| IRQMUX7<br>IRQMUX6<br>IRQMUX5<br>IRQMUX4<br>IRQMUX3<br>IRQMUX2<br>IRQMUX1<br>IRQMUX0 | Y12<br>U11<br>W10<br>Y9<br>W9<br>V9<br>U9 | P11<br>R10<br>R9<br>W9<br>T9<br>R8<br>T8<br>V8 | 0    | Interrupt request/secondary functions multiplexed. The primary function of these terminals is to provide the ISA-type IRQ signaling supported by the PCI1251B. These interrupt multiplexer outputs can be mapped to any of 15 IRQs. The device control register must be programmed for the ISA IRQ interrupt mode and the IRQMUX routing register must have the IRQ routing programmed before these terminals are enabled.  All of these terminals have secondary functions, such as PCI INTB, PC/PCI DMA request/grant, ring indicate output, and zoomed video status, that can be selected with the appropriate programming of this register. When the secondary functions are enabled, the respective terminals are not available for IRQ routing.  See the IRQMUX routing register for programming options. |
| RI_OUT/PME   | Y13                                       | P12  | 0    | Ring indicate out and power management event output. Terminal provides an output for ring-indicate or PME signals.  |

### Table 11. PC/PCI DMA

|                   | TERMINAL |         | I/O  | FUNCTION   |  |  |  |
|-------------------|----------|---------|------|--|--|--|--|
| NAME              | GFN NO.  | GJG NO. | TYPE | FUNCTION   |  |  |  |
|                   |          |         |      | PC/PCI DMA grant. PCGNT is used to grant the DMA channel to a requester in a system supporting the PC/PCI DMA scheme.  |  |  |  |
| PCGNT/<br>IRQMUX6 | U11      | R10     | I/O  | Interrupt request MUX 6. When configured for IRQMUX6, this terminal provides the IRQMUX6 interrupt output of the interrupt multiplexer, and can be mapped to any of 15 ISA-type IRQs. IRQMUX6 takes precedence over PCGNT, and should not be enabled in a system using PC/PCI DMA. |  |  |  |
|                   |          |         |      | This terminal is also used for the serial EEPROM interface.  |  |  |  |
|                   |          |         |      | PC/PCI DMA request. PCREQ is used to request DMA transfers as DREQ in a system supporting the PC/PCI DMA scheme.   |  |  |  |
| PCREQ/<br>IRQMUX7 | V12 P11  |         | 0    | Interrupt request MUX7. When configured for IRQMUX7, this terminal provides the IRQMUX7 interrupt output of the interrupt multiplexer, and can be mapped to any of 15 ISA-type IRQs. IRQMUX7 takes precedence over PCREQ, and should not be enabled in a system using PC/PCI DMA.  |  |  |  |
|                   |          |         |      | This terminal is also used for the serial EEPROM interface.  |  |  |  |

Table 12. Zoomed Video

| TERMINAL   |  |  | I/O AND MEMORY                                       | 1/0  |  |  |  |
|--|--|--|--|------|--|--|--|
| NAME   | GFN<br>NO.                                   | GJG NO.                                      | INTERFACE<br>SIGNAL                                  | TYPE | FUNCTION   |  |  |
| ZV_HREF  | A6   | G7   | A10  | 0    | Horizontal sync to the zoomed video port   |  |  |
| ZV_VSYNC   | C7   | A7   | A11  | 0    | Vertical sync to the zoomed video port   |  |  |
| ZV_Y7<br>ZV_Y6<br>ZV_Y5<br>ZV_Y4<br>ZV_Y3<br>ZV_Y2<br>ZV_Y1<br>ZV_Y0         | A3<br>B4<br>C5<br>B5<br>C6<br>D7<br>A5<br>B6 | B5<br>A5<br>E6<br>B6<br>A6<br>F7<br>E7<br>B7 | A20<br>A14<br>A19<br>A13<br>A18<br>A8<br>A17         | 0    | Video data to the zoomed video port in YV:4:2:2 format   |  |  |
| ZV_UV7<br>ZV_UV6<br>ZV_UV5<br>ZV_UV4<br>ZV_UV3<br>ZV_UV2<br>ZV_UV1<br>ZV_UV1 | D2<br>C3<br>B1<br>B2<br>A2<br>C4<br>B3<br>D5 | C1<br>A2<br>B2<br>A3<br>B3<br>A4<br>B4<br>D5 | A25<br>A12<br>A24<br>A15<br>A23<br>A16<br>A22<br>A21 | 0    | Video data to the zoomed video port in YV:4:2:2 format   |  |  |
| ZV_SCLK  | C2   | B1   | A7   | 0    | Audio SCLK PCM   |  |  |
| ZV_MCLK  | D3   | C2   | A6   | 0    | Audio MCLK PCM   |  |  |
| ZV_PCLK  | E1   | E2   | IOIS16   | 0    | Pixel clock to the zoomed video port   |  |  |
| ZV_LRCLK   | E3   | E5   | INPACK   | 0    | Audio LRCLK PCM  |  |  |
| ZV_SDATA   | E2   | E1   | SPKR   | 0    | Audio SDATA PCM  |  |  |
| NC   | F1   | F4   |  | 0    | Reserved. No connection.   |  |  |
| ZV_RSVD1<br>ZV_RSVD0   | C1<br>E4                                     | D2<br>D1                                     | A5<br>A4   | 0    | Reserved. No connection in the PC Card. ZV_RSVD1 and ZV_RSVD0 are put into the high-impedance state by host adapter. |  |  |

Table 13. Miscellaneous

| TE          | RMINAL  |            | 1/0  |   |
|-------------|---------|------------|------|---|
| NAME        | GFN NO. | GJG<br>NO. | TYPE | FUNCTION  |
| GPIO0/LEDA1 | V11     | T10        | I/O  | GPIO0/socket activity LED indicator 1. When GPIO0/LEDA1 is configured as LEDA1, it provides an output indicating PC Card socket 0 activity. Otherwise, GPIO0/LEDA1 can be configured as a general-purpose input and output, GPIO0. The zoomed video enable signal (ZV_STAT) can also be routed to this signal through the GPIO0 control register. GPIO0/LEDA1 defaults to a general-purpose input.  |
| GPIO1/LEDA2 | W11     | V10        | I/O  | GPIO1/socket activity LED indicator 2. When GPIO1/LEDA2 is configured as LEDA2, it provides an output indicating PC Card socket 1 activity. Otherwise, GPIO1/LEDA2 can be configured as a general-purpose input and output, GPIO1. A CSC interrupt can be generated on a GPDATA change, and this input can be used for power switch overcurrent (OC) sensing. See <i>GPIO1 control register</i> for programming details. GPIO1/LEDA2 defaults to a general-purpose input. |
| SPKROUT     | Y10     | P10        | 0    | Speaker output. SPKROUT is the output to the host system that can carry SPKR or CAUDIO through the PCI1251B from the PC Card interface. SPKROUT is driven as the exclusive-OR combination of card SPKR//CAUDIO inputs.  |
| SUSPEND     | Y11     | W10        | ı    | Suspend. SUSPEND is used to protect the internal registers from clearing when PRST is asserted. See <i>suspend mode</i> for details.  |

<sup>†</sup> Terminal name for slot A is preceded with A\_. For example, the full name for terminal T4 is A\_A25. ‡ Terminal name for slot B is preceded with B\_. For example, the full name for terminal C14 is B\_A25.

Table 15. 16-bit PC Card Interface Control (slots A and B)

|                     | TERM      | IINAL      |           |            |      |  |  |  |  |  |
|---------------------|-----------|------------|-----------|------------|------|--|--|--|--|--|
|                     | GFN       | NO.        | GJG       | NO.        | I/O  | FUNCTION   |  |  |  |  |
| NAME                | SLOT<br>A | SLOT<br>B‡ | SLOT<br>A | SLOT<br>B‡ | TYPE |  |  |  |  |  |
| BVD1<br>(STSCHG/RI) | V6        | A9         | R6        | E10        | -    | Battery voltage detect 1. BVD1 is generated by 16-bit memory PC Cards that include batteries. BVD1 is used with BVD2 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are kept high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and should be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. See <i>ExCA card status-change interrupt configuration register</i> on page 85 for enable bits. See <i>ExCA card status-change register</i> on page 84 and the <i>ExCA interface status register</i> on page 81 for the status bits for this signal.  Status change. STSCHG is used to alert the system to a change in the READY, write protect, or battery voltage dead condition of a 16-bit I/O PC Card.  Ring indicate. RI is used by 16-bit modem cards to indicate a ring detection.   |  |  |  |  |
| BVD2<br>(SPKR)      | Y5        | D10        | V5        | D10        | -    | Battery voltage detect 2. BVD2 is generated by 16-bit memory PC Cards that include batteries. BVD2 is used with BVD1 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and should be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. See ExCA card status-change interrupt configuration register on page 85 for enable bits. See ExCA card status-change register on page 84 and the ExCA interface status register on page 81 for the status bits for this signal.  Speaker. SPKR is an optional binary audio signal available only when the card and socket have been configured for the 16-bit I/O interface. The audio signals from cards A and B are combined by the PCI1251B and are output on SPKROUT.  DMA request. BVD2 can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. The PC Card asserts BVD2 to indicate a request for a DMA operation. |  |  |  |  |
| CD1<br>CD2          | G3<br>W6  | H20<br>C9  | F1<br>W6  | H14<br>B9  | I    | PC Card detect 1 and PC Card detect 2. CD1 and CD2 are internally connected to ground on the PC Card. When a PC Card is inserted into a socket, CD1 and CD2 are pulled low. For signal status, see <i>ExCA interface status register</i> on page 81.   |  |  |  |  |
| CE1<br>CE2          | K1<br>L2  | D20<br>D19 | J2<br>K6  | F16<br>E19 | 0    | Card enable 1 and card enable 2. CE1 and CE2 enable even- and odd-numbered address bytes. CE1 enables even-numbered address bytes, and CE2 enables odd-numbered address bytes.   |  |  |  |  |
| INPACK              | Y1        | D12        | V1        | D12        | I    | Input acknowledge. INPACK is asserted by the PC Card when it can respond to an I/O read cycle at the current address.  DMA request. INPACK can be used as the DMA request signal during DMA operations from a 16-bit PC Card that supports DMA. If used as a strobe, then the PC Card asserts this signal to indicate a request for a DMA operation.   |  |  |  |  |
| ĪORD                | L4        | E17        | K2        | E16        | 0    | I/O read. $\overline{\text{IORD}}$ is asserted by the PCI1251B to enable 16-bit I/O PC Card data output during host I/O read cycles.  DMA write. $\overline{\text{IORD}}$ is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The PCI1251B asserts $\overline{\text{IORD}}$ during DMA transfers from the PC Card to host memory.   |  |  |  |  |
| ĪOWR                | M2        | C19        | L6        | D18        | 0    | I/O write. IOWR is driven low by the PCI1251B to strobe write data into 16-bit I/O PC Cards during host I/O write cycles.  DMA read. IOWR is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The PCI1251B asserts IOWR during transfers from host memory to the PC Card.   |  |  |  |  |

Table 15. 16-bit PC Card Interface Control (slots A and B) (continued)

|                 | TERM                   | IINAL      |           |            |      |  |  |  |  |
|-----------------|------------------------|------------|-----------|------------|------|--|--|--|--|
|                 | GFN                    | NO.        | GJG       | NO.        | I/O  | FUNCTION   |  |  |  |
| NAME            | SLOT<br>A <sup>†</sup> | SLOT<br>B‡ | SLOT<br>A | SLOT<br>B‡ | TYPE |  |  |  |  |
| ŌĒ              | L3                     | C20        | K1        | E18        | 0    | Output enable. $\overline{\text{OE}}$ is driven low by the PCI1251B to enable 16-bit memory PC Card data output during host memory read cycles.  DMA terminal count. $\overline{\text{OE}}$ is used as terminal count (TC) during DMA operations to a 16-bit PC Card that supports DMA. The PCI1251B asserts $\overline{\text{OE}}$ to indicate TC for a DMA write operation.  |  |  |  |
| READY<br>(IREQ) | Y4                     | A10        | T5        | F10        | ı    | Ready. The ready function is provided by READY when the 16-bit PC Card and the host socket are configured for the memory-only interface. READY is driven low by the 16-bit memory PC Cards to indicate that the memory card circuits are busy processing a previous write command. READY is driven high when the 16-bit memory PC Card is ready to accept a new data transfer command. Interrupt request. IREQ is asserted by a 16-bit I/O PC Card to indicate to the host that a device on the 16-bit I/O PC Card requires service by the host software. IREQ is high (deasserted) when no interrupt is requested.  |  |  |  |
| REG             | Y2                     | B12        | W2        | D11        | 0    | Attribute memory select. REG remains high for all common memory accesses. When REG is asserted, access is limited to attribute memory (OE or WE active) and to the I/O space (IORD or IOWR active). Attribute memory is a separately accessed section of card memory and is generally used to record card capacity and other configuration and attribute information.  DMA acknowledge. REG is used as a DMA acknowledge (DACK) during DMA operations to a 16-bit PC Card that supports DMA. The PCI1251B asserts REG to indicate a DMA operation. REG is used in conjunction with the DMA read (IOWR) or DMA write (IORD) strobes to transfer data.                     |  |  |  |
| RESET           | W1                     | C13        | T2        | D13        | 0    | PC Card reset. RESET forces a hard reset to a 16-bit PC Card.  |  |  |  |
| WAIT            | V5                     | B10        | R5        | A10        | I    | Bus cycle wait. WAIT is driven by a 16-bit PC Card to delay the completion of (i.e., extend) the memory or I/O cycle in progress.  |  |  |  |
| WE              | P3                     | D16        | N7        | A16        | 0    | Write enable. WE is used to strobe memory write data into 16-bit memory PC Cards. WE is also used for memory PC Cards that employ programmable memory technologies.  DMA terminal count. WE is used as TC during DMA operations to a 16-bit PC Card that supports DMA. The PCI1251B asserts WE to indicate TC for a DMA read operation.  |  |  |  |
| WP<br>(IOIS16)  | U7                     | В9         | Т6        | А9         | I    | Write protect. WP applies to 16-bit memory PC Cards. WP reflects the status of the write-protect switch on 16-bit memory PC Cards. For 16-bit I/O cards, WP is used for the 16-bit port (IOIS16) function.  I/O is 16 bits. IOIS16 applies to 16-bit I/O PC Cards. IOIS16 is asserted by the 16-bit PC Card when the address on the bus corresponds to an address to which the 16-bit PC Card responds, and the I/O port that is addressed is capable of 16-bit accesses.  DMA request. WP can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. If used, the PC Card asserts WP to indicate a request for a DMA operation. |  |  |  |
| VS1<br>VS2      | Y3<br>U3               | A11<br>B14 | V4<br>R4  | F11<br>B13 | I/O  | Voltage sense 1 and voltage sense 2. VS1 and VS2, when used in conjunction with each other, determine the operating voltage of the 16-bit PC Card.   |  |  |  |

<sup>†</sup> Terminal name for slot A is preceded with A\_. For example, the full name for terminal P3 is A\_WE. ‡ Terminal name for slot B is preceded with B\_. For example, the full name for terminal D16 is B\_WE.

Table 16. CardBus PC Card Interface System (slots A and B)

| TERMINAL |                        |            |           |            |      |   |
|----------|------------------------|------------|-----------|------------|------|---|
|          | GFN                    | NO.        | GJG NO.   |            | 1/0  | FUNCTION  |
| NAME     | SLOT<br>A <sup>†</sup> | SLOT<br>B‡ | SLOT<br>A | SLOT<br>B‡ | TYPE | TONCHON   |
| CCLK     | T1                     | A17        | N4        | D15        | 0    | CardBus PC Card clock. CCLK provides synchronous timing for all transactions on the CardBus interface. All signals except CRST, CCLKRUN, CINT, CSTSCHG, CAUDIO, CCD1, CCD2, and CVS2–CVS1 are sampled on the rising edge of CCLK, and all timing parameters are defined with the rising edge of this signal. CCLK operates at the PCI bus clock frequency, but it can be stopped in the low state or slowed down for power savings. |
| CCLKRUN  | U7                     | В9         | Т6        | А9         | 0    | CardBus PC Card clock run. CCLKRUN is used by a CardBus PC Card to request an increase in the CCLK frequency, and by the PCI1251B to indicate that the CCLK frequency is decreased. CardBus clock run (CCLKRUN) follows the PCI clock run (CLKRUN)  |
| CRST     | W1                     | C13        | T2        | D13        | I/O  | CardBus PC Card reset. CRST is used to bring CardBus PC Card-specific registers, sequencers, and signals to a known state. When CRST is asserted, all CardBus PC Card signals must be placed in a high impedance state, and the PCI1251B drives these signals to a valid logic level. Assertion can be asynchronous to CCLK, but deassertion must be synchronous to CCLK.   |

<sup>†</sup> Terminal name for slot A is preceded with A\_. For example, the full name for terminal T1 is A\_CCLK.

<sup>‡</sup> Terminal name for slot B is preceded with B\_. For example, the full name for terminal A17 is B\_CCLK.

<sup>†</sup> Terminal name for slot A is preceded with A\_. For example, the full name for terminal N3 is A\_CPAR.

<sup>‡</sup> Terminal name for slot B is preceded with B\_. For example, the full name for terminal A19 is B\_CPAR.

### **Terminal Functions (Continued)**

Table 18. CardBus PC Card Interface Control (slots A and B)

| TERMINAL TERMINAL |                        |            |                        |            |      | ,  |  |  |
|-------------------|------------------------|------------|------------------------|------------|------|--|--|--|
|                   | GFN                    | I NO.      | GJG                    | NO.        | 1/0  | FUNCTION   |  |  |
| NAME              | SLOT<br>A <sup>†</sup> | SLOT<br>B‡ | SLOT<br>A <sup>†</sup> | SLOT<br>B‡ | TYPE | FUNCTION   |  |  |
| CAUDIO            | Y5                     | D10        | V5                     | D10        | I    | CardBus audio. CAUDIO is a digital input signal from a PC Card to the system speaker. The PCI1251B supports the binary audio mode and outputs a binary signal from the card to SPKROUT.  |  |  |
| CBLOCK            | P1                     | B18        | M2                     | A18        | I/O  | CardBus lock. CBLOCK is used to gain exclusive access to a target.   |  |  |
| CCD1<br>CCD2      | G3<br>W6               | H20<br>C9  | F1<br>W6               | H14<br>B9  | t    | CardBus detect 1 and CardBus detect 2. CCD1 and CCD2 are used in conjunction with CVS1 and CVS2 to identify card insertion and interrogate cards to determine the operating voltage and card type.   |  |  |
| CDEVSEL           | R2                     | A18        | N1                     | B16        | I/O  | CardBus device select. The PCI1251B asserts CDEVSEL to claim a CardBus cycle as the target device. As a CardBus initiator on the bus, the PCI1251B monitors CDEVSEL until a target responds. If no target responds before timeout occurs, then the PCI1251B terminates the cycle with an initiator abort.                              |  |  |
| CFRAME            | U1                     | C15        | P2                     | E14        | I/O  | CardBus cycle frame. CFRAME is driven by the initiator of a CardBus bus cycle. CFRAME is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When CFRAME is deasserted, the CardBus bus transaction is in the final data phase.                                       |  |  |
| CGNT              | P3                     | D16        | N7                     | A16        | Ι    | CardBus bus grant. CGNT is driven by the PCI1251B to grant a CardBus PC Card access to the CardBus bus after the current data transaction has been completed.  |  |  |
| CINT              | Y4                     | A10        | T5                     | F10        | Ι    | CardBus interrupt. CINT is asserted low by a CardBus PC Card to request interrupt servicing from the host.   |  |  |
| CIRDY             | T2                     | A16        | P1                     | B15        | I/O  | CardBus initiator ready. CIRDY indicates the CardBus initiator's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of CCLK when both CIRDY and CTRDY are asserted. Until CIRDY and CTRDY are both sampled asserted, wait states are inserted.                                  |  |  |
| CPERR             | P2                     | B17        | M4                     | A17        | I/O  | CardBus parity error.  |  |  |
| CREQ              | Y1                     | D12        | V1                     | D12        | _    | CardBus request. CREQ indicates to the arbiter that the CardBus PC Card desires use of the CardBus bus as an initiator.  |  |  |
| CSERR             | V5                     | B10        | R5                     | A10        | I    | CardBus system error. CSERR reports address parity errors and other system errors that could lead to catastrophic results. CSERR is driven by the card synchronous to CCLK, but deasserted by a weak pullup, and may take several CCLK periods. The PCI1251B can report CSERR to the system by assertion of SERR on the PCI interface. |  |  |
| CSTOP             | R1                     | C17        | M5                     | B17        | I/O  | CardBus stop. CSTOP is driven by a CardBus target to request the initiator to stop the current CardBus transaction. CSTOP is used for target disconnects, and is commonly asserted by target devices that do not support burst data transfers.   |  |  |
| CSTSCHG           | V6                     | A9         | R6                     | E10        | I    | CardBus status change. CSTSCHG is used to alert the system to a change in the card's status and is used as a wake-up mechanism.  |  |  |
| CTRDY             | P4                     | C16        | N5                     | E15        | I/O  | CardBus target ready. CTRDY indicates the CardBus target's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of CCLK, when both CIRDY and CTRDY are asserted; until this time, wait states are inserted.   |  |  |
| CVS1<br>CVS2      | Y3<br>U3               | A11<br>B14 | V4<br>R4               | F11<br>B13 | I/O  | CardBus voltage sense 1 and CardBus voltage sense 2. CVS1 and CVS2 are used in conjunction with CCD1 and CCD2 to identify card insertion and interrogate cards to determine the operating voltage and card type.   |  |  |

<sup>†</sup> Terminal name for slot A is preceded with A\_. For example, the full name for terminal Y5 is A\_CAUDIO.

<sup>‡</sup> Terminal name for slot B is preceded with B\_. For example, the full name for terminal D10 is B\_CAUDIO.

### power supply sequencing

The PCI1251B contains 3.3-V I/O buffers with 5-V tolerance requiring a core power supply and clamping voltage. The core power supply is always 3.3 V. The clamping voltage can be either 3.3 V or 5 V, depending on the interface. The following power-up and power-down sequences are recommended.

The power-up sequence is:

- 1. Apply 3.3-V power to the core.
- 2. Assert PRST to the device to disable the outputs during power up. Output drivers must be powered up in the high-impedance state to prevent high current levels through the clamping diodes to the 5-V supply.
- 3. Apply the clamping voltage.

The power-down sequence is:

- 1. Use PRST to switch outputs to a high-impedance state.
- 2. Remove the clamping voltage.
- 3. Remove the 3.3-V power from the core.

#### I/O characteristics

Figure 1 shows a 3-state bidirectional buffer. The *recommended operating conditions* table, on page 115, provides the electrical characteristics of the inputs and outputs. The PCI1251B meets the ac specifications of the 1997 PC Card Standard and PCI Local Bus Specification Rev. 2.2.

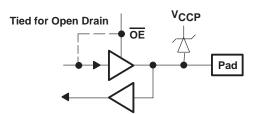

Figure 1. 3-State Bidirectional Buffer

#### NOTE:

Unused pins (input or I/O) must be held high or low to prevent them from floating.

#### clamping voltages

The clamping voltages are set to match whatever external environment the PCI1251B will be working with:  $3.3 \,\mathrm{V}$  or  $5 \,\mathrm{V}$ . The I/O sites can be pulled through a clamping diode to a voltage that protects the core from external signals. The core power supply is always  $3.3 \,\mathrm{V}$  and is independent of the clamping voltages. For example, PCI signaling can be either  $3.3 \,\mathrm{V}$  or  $5 \,\mathrm{V}$ , and the PCI1251B must reliably accommodate both voltage levels. This is accomplished by using a  $3.3 \,\mathrm{V}$  I/O buffer that is  $5 \,\mathrm{V}$  tolerant, with the applicable clamping voltage applied. If a system designer desires a  $5 \,\mathrm{V}$  PCI bus, then  $\mathrm{V}_{\mathrm{CCP}}$  can be connected to a  $5 \,\mathrm{V}$  power supply.

The PCI1251B requires five separate clamping voltages because it supports a wide range of features. The five voltages are listed and defined in the *recommended operating conditions* table, on page 115.

### PCI1251B GFN/GJG PC CARD CONTROLLER

SCPS043A - OCTOBER 1998

#### PCI interface

This section describes the PCI interface of the PCI1251B and how the device responds and participates in PCI bus cycles. The PCI1251B provides all required signals for PCI master/slave devices. The PCI1251B can operate in either 5-V or 3.3-V PCI signaling environments by connecting the V<sub>CCP</sub> terminals to the desired signaling level.

### PCI bus lock (LOCK)

The bus-locking protocol defined in the PCI specification is not highly recommended, but is provided on the PCI1251B as an additional compatibility feature. The PCI LOCK terminal is multiplexed with GPIO2, and the terminal function defaults to a general-purpose input (GPI). The use of LOCK is only supported by PCI-to-CardBus bridges in the downstream direction (away from the processor).

PCI LOCK indicates an atomic operation that may require multiple transactions to complete. When LOCK is asserted, nonexclusive transactions can proceed to an address that is not currently locked. A grant to start a transaction on the PCI bus does not guarantee control of LOCK; control of LOCK is obtained under its own protocol. It is possible for different initiators to use the PCI bus while a single master retains ownership of LOCK. To avoid confusion with the bus clock, the CardBus signal for this protocol is CBLOCK.

An agent may need to do an exclusive operation because a critical access to memory might be broken into several transactions, but the master wants exclusive rights to a region of memory. The granularity of the lock is defined by PCI to be 16 bytes, aligned. The lock protocol defined by PCI allows a resource lock without interfering with nonexclusive real-time data transfer, such as video.

### loading the subsystem identification (EEPROM interface)

The subsystem vendor ID register and subsystem ID register make up a doubleword of PCI configuration space located at offset 40h for functions 0 and 1. This doubleword register is used for system and option card (mobile dock) identification purposes and is required by some operating systems. Implementation of this unique identifier register is a PC '95 requirement.

The PCI1251B offers two mechanisms to load a read-only value into the subsystem registers. The first mechanism relies upon the system BIOS providing the subsystem ID value. The default access mode to the subsystem registers is read-only, but can be made read/write by clearing the SUBSYSRW bit in the system control register (bit 5, offset 80h). Once this bit is cleared (0), the BIOS can write a subsystem identification value into the registers at offset 40h. The BIOS must set the SUBSYSRW bit such that the subsystem vendor ID register and subsystem ID register is limited to read-only access. This approach saves the added cost of implementing the serial EEPROM.

In some conditions, such as in a docking environment, the subsystem vendor ID register and subsystem ID register must be loaded with a unique identifier through a serial EEPROM interface. The PCI1251B loads the doubleword of data from the serial EEPROM after a reset of the primary bus. The SUSPEND input gates the PCI reset from the entire PCI1251B core, including the serial EEPROM state machine (see *suspend mode*, on page 37, for details on using SUSPEND). The PCI1251B provides a two-line serial bus interface to a serial EEPROM.

The system designer must implement a pulldown resistor on the PCI1251B LATCH terminal to indicate the serial EEPROM mode. Only when this pulldown resistor is present will the PCI1251B attempt to load data through the serial EEPROM interface. The serial EEPROM interface is a two-pin interface with one data signal (SDA) and one clock signal (SCL). SDA is mapped to the PCI1251B IRQMUX6 terminal and SCL is mapped to the PCI1251B IRQMUX7 terminal. Figure 2 shows a typical PCI1251B application using the serial EEPROM interface.

#### loading the subsystem identification (EEPROM interface) (continued)

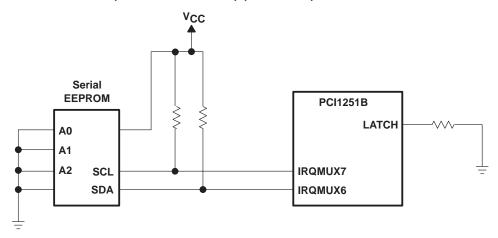

Figure 2. Serial EEPROM Application

When the PCI1251B is reset, the subsystem data is read automatically from the EEPROM. The PCI1251B masters the serial EEPROM bus and reads four bytes, as shown in Figure 3.

The EEPROM is addressed at word address 00h, as shown in Figure 3, and the address automatically increments after each byte transfer according to the protocol. Thus, to provide the subsystem register with data AABBCCDDh, the EEPROM should be programmed with address 0 = AAh, 1 = BBh, 2 = CCh, and 3 = DDh.

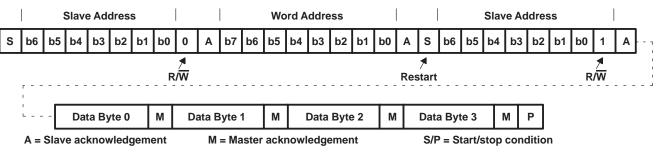

Figure 3. EEPROM Interface Subsystem Data Collection

The serial EEPROM is addressed at slave address 1010000b by the PCI1251B. All hardware address bits for the EEPROM should be tied to the appropriate level to achieve this address. The serial EEPROM chip in the sample application circuit (Figure 2) assumes the 1010b high address nibble. The lower three address bits are terminal inputs to the chip, and the sample application shows these terminal inputs tied to GND.

The serial EEPROM interface signals require pullup resistors, and the protocol is defined for the bidirectional transfers. Both SCL and SDA are placed in a high-impedance state and pulled high when the bus is not active. A high-to-low transition of the SDA line defines the start condition (S). A low-to-high transition of SDA while SCL is high is defined as the stop condition (P). One bit is transferred during each clock pulse. The data on the SDA line must remain stable during the high period of the clock pulse, as changes in the data line at this time are interpreted as a control signal. Data is valid and stable during the clock high period. Figure 4 illustrates this protocol.

loading the subsystem identification (EEPROM interface) (continued)

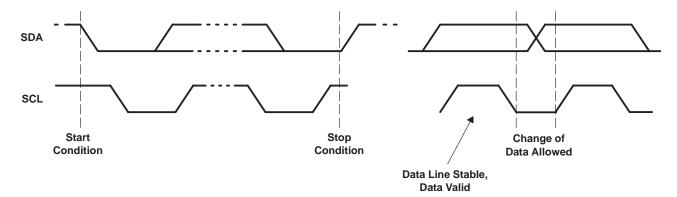

Figure 4. Serial EEPROM Start/Stop Conditions and Bit Transfers

Each address byte and data transfer is followed by an acknowledge bit, as indicated in Figure 3. When the PCI1251B transmits the addresses, it returns SDA to the high state and places the line in a high-impedance state. The PCI1251B then generates an SCL clock cycle and expects the EEPROM to pull down SDA during the acknowledge pulse. This procedure is referred to as a slave acknowledge with the PCI1251B transmitter and EEPROM receiver. Figure 5 illustrates the general acknowledges.

During the data byte transfers from the serial EEPROM to the PCI1251B, the EEPROM clocks the SCL signal. After the EEPROM transmits the data to the PCI1251B, it returns the SDA signal to the high state and places the line in a high-impedance state. The EEPROM then generates an SCL clock cycle and expects the PCI1251B to pull down SDA during the acknowledge pulse. This procedure is referred to as a master acknowledge with the EEPROM transmitter and PCI1251B receiver. Figure 5 illustrates the general acknowledges.

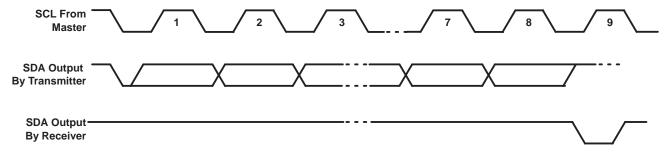

Figure 5. Serial EEPROM Protocol – Acknowledge

EEPROM interface status information is communicated through the general status register located at PCI offset 85h. The EEDETECT bit in this register indicates whether or not the PCI1251B serial EEPROM circuitry detects the pulldown resistor on LATCH. An error condition, such as a missing acknowledge, results in the DATAERR bit being set. The EEBUSY bit is set while the subsystem ID register is loading (serial EEPROM interface is busy).

### **PC Card applications**

This section describes the following PC Card interfaces: PC Card recognition (which details the card interrogation procedure), card-powering procedure (including the protocol of the P<sup>2</sup>C power switch interface), internal zoomed video (ZV) buffering provided by the PCI1251B and programming model, standard PC Card register models, and a brief discussion of the PC Card software protocol layers.

#### PC Card insertion/removal and recognition

The 1997 PC Card Standard addresses the card-detection and recognition process through an interrogation procedure that the socket must initiate on card insertion into a cold, unpowered socket. Through this interrogation, card voltage requirements and interface (16-bit versus CardBus) are determined.

The scheme uses the  $\overline{\text{CD1}}$ ,  $\overline{\text{CD2}}$ ,  $\overline{\text{VS1}}$ , and  $\overline{\text{VS2}}$  signals ( $\overline{\text{CCD1}}$ ,  $\overline{\text{CCD2}}$ , CVS1, and CVS2 for CardBus). A PC Card designer connects these four terminals in prescribed configuration determined by the type of card and the supply voltage. The encoding scheme for this, defined in the *1997 PC Card Standard*, is shown in Table 19.

| CD2//CCD2       | CD1//CCD1       | VS2//CVS2       | VS1//CVS1       | KEY      | INTERFACE       | VOLTAGE                 |  |
|-----------------|-----------------|-----------------|-----------------|----------|-----------------|-------------------------|--|

Table 19. PC Card Card-Detect and Voltage-Sense Connections

#### P<sup>2</sup>C power switch interface (TPS2206)

A power switch with a PCMCIA-to-peripheral control (P<sup>2</sup>C) interface is required for the PC Card powering interface. The TI TPS2206 dual-slot PC Card power interface switch provides the P<sup>2</sup>C interface to the CLOCK, DATA, and LATCH terminals of the PCI1251B. Figure 6 shows the terminal assignments of the TPS2206. Figure 7 illustrates a typical application where the PCI1251B represents the PCMCIA controller.

The CLOCK terminal on the PCI1251B can be an input or an output depending on whether bit 27 of the system control register is a 0 or a 1. The default is for the CLOCK terminal to be an input to control the serial interface and the PCI1251B internal state machine. The P2CCLK bit in the system control register can be set by the system BIOS to enable the PCI1251B to internally generate and drive the CLOCK from the PCI clock. When the system design implements CLOCK as an output from the PCI1251B, an external pulldown resistor is required since the CLOCK terminal defaults to an input.

### P<sup>2</sup>C power switch interface (TPS2206) (continued)

NC - No internal connection

Figure 6. TPS2206 Terminal Assignments

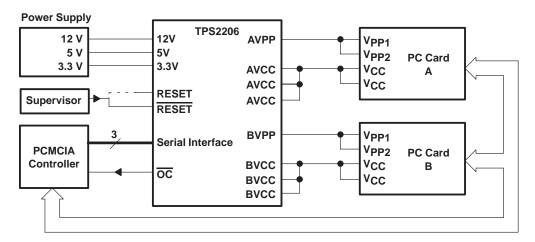

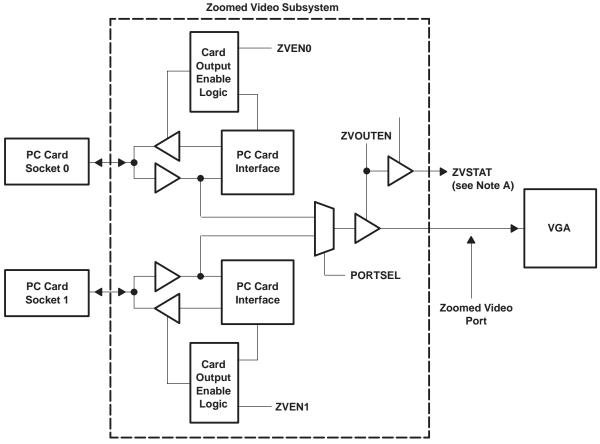

Figure 7. TPS2206 Typical Application

#### zoomed video support

The ZV port on the PCI1251B provides an internally buffered 16-bit ZV PC Card data path. This internal routing is programmed through the multimedia control register. Figure 8 shows the zoomed video subsystem implemented in the PCI1251B and details the bit functions found in the multimedia control register.

An output port (PORTSEL) is always selected. The PCI1251B defaults to socket 0 (see the *multimedia control register* on page 58). When ZVOUTEN is asserted, the zoomed video output terminals are enabled to allow the PCI1251B to route the zoomed video data. However, no data is transmitted unless either ZVEN0 or ZVEN1 is enabled in the multimedia control register. When the PORTSEL maps to a card port that is disabled (ZVEN0 or ZVEN1), then the zoomed video port is driven low; that is, no data is transmitted.

NOTES: A. ZVSTAT must be enabled through the GPIO control register.

Figure 8. Zoomed Video Subsystem

#### SPKROUT usage

SPKROUT carries the digital audio signal from the PC Card to the system. When a 16-bit PC Card is configured for I/O mode, the BVD2 pin becomes SPKR. This terminal, also used in CardBus applications, is referred to as CAUDIO. SPKR passes a TTL-level digital audio signal to the PCI1251B. The CardBus CAUDIO signal also can pass a single-amplitude binary waveform. The binary audio signals from the two PC Card sockets are XORed in the PCI1251B to produce SPKROUT. Figure 9 shows the SPKROUT connection.

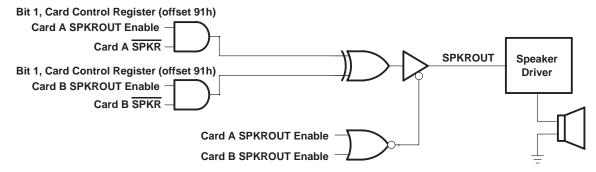

Figure 9. SPKROUT Connection to Speaker Driver

The SPKROUT signal is typically driven only by modem PC Cards. To verify SPKROUT on the PCI1251B, a sample circuit was constructed, and this simplified schematic is shown in Figure 10.

#### NOTE:

Earlier versions of the PC Card controller multiplexed SUSPEND/SPKROUT on the same pin, which meant that a pullup resistor was needed to differentiate the signals. Because the PCI1251B does not multiplex this or any other function on SPKROUT, this terminal does not require a pullup resistor.

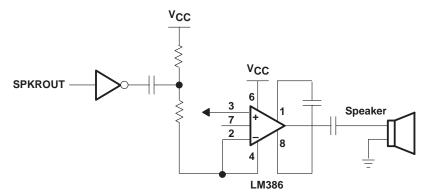

Figure 10. Simplified Test Schematic

#### LED socket activity indicators

Socket activity LEDs indicate when a PC Card is being accessed. The LED signals are multiplexed with general-purpose inputs and outputs (GPIOs); the default for these terminals is GPI. When configured for LED outputs, these terminals output an active high signal to indicate socket activity. LEDA1 indicates socket 0 (card A) activity, and LEDA2 indicates socket 1 (card B) activity.

The active-high LED signal is driven for 64-ms periods. When the LED is not being driven high, then it is driven to a low state. Either of the two circuits shown in Figure 11 can be implemented to provide LED signaling, and the board designer can implement the circuit that best fits the application.

As indicated, the LED signals are driven for 64 ms by a counter circuit. To avoid the possibility of the LEDs appearing to be stuck when the PCI clock is stopped, the LED signaling is cut off when either SUSPEND is asserted or when the PCI clock is stopped per the CLKRUN protocol.

If any additional socket activity occurs during this counter cycle, then the counter is reset and the LED signal remains driven. If socket activity is frequent (at least once every 64 ms), then the LED signals remain driven.

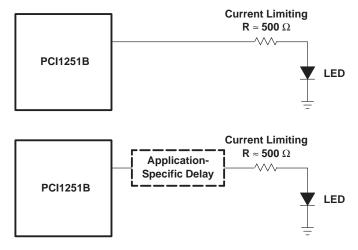

Figure 11. Two Sample LED Circuits

#### PC Card16 DMA support

The PCI1251B supports both PC/PCI (centralized) DMA and a distributed DMA slave engine for 16-bit PC Card DMA support. The distributed DMA (DDMA) slave register set provides the programmability necessary for the slave DDMA engine. Table 20 provides the DDMA register configuration.

| TYPE |              | REGISTER NAME   |              |          |     |  |  |  |  |  |  |  |  |

Table 20. Distributed DMA Registers

#### CardBus socket registers

The PCI1251B has socket registers for compatibility with the latest PCI-to-PCMCIA CardBus bridge specification. Table 21 lists these CardBus socket registers.

Table 21. CardBus Socket Registers

| REGISTER NAME           | OFFSET |
|-------------------------|--------|
| Socket event            | 00h    |
| Socket mask             | 04h    |
| Socket present state    | 08h    |
| Socket force event      | 0Ch    |
| Socket control          | 10h    |
| Reserved                | 14h    |
| Reserved                | 18h    |
| Reserved                | 1Ch    |
| Socket power management | 20h    |

#### programmable interrupt subsystem

Interrupts provide a way for I/O devices to let the microprocessor know that they require servicing. The dynamic nature of PC Cards, and the abundance of PC Card I/O applications require substantial interrupt support from the PCI1251B. The PCI1251B provides several interrupt signaling schemes to accommodate the needs of a variety of platforms. The different mechanisms for dealing with interrupts in this device are based on various specifications and industry standards. The ExCA register set provides interrupt control for some 16-bit PC Card functions, and the CardBus socket register set provides interrupt control for the CardBus PC Card functions. The PCI1251B is, therefore, backward compatible with existing interrupt control register definitions, and new registers have been defined where required.

The PCI1251B detects PC Card interrupts and events at the PC Card interface and notifies the host controller via one of several interrupt signaling protocols. To simplify the discussion of interrupts in the PCI1251B, PC Card interrupts are classified as either card status change (CSC) or as functional interrupts.

The method by which any type of PCI1251B interrupt is communicated to the host interrupt controller varies from system to system. The PCI1251B offers system designers the choice of using parallel PCI interrupt signaling, parallel ISA-type IRQ interrupt signaling, or the IRQSER serialized ISA and/or PCI interrupt protocol. Traditional ISA IRQ signaling is provided through eight IRQMUX terminals. It is possible to use the parallel PCI interrupts in combination with either parallel IRQs or serialized IRQs, as detailed in the sections that follow.

#### PC Card functional and CSC interrupts

PC Card functional interrupts are defined as requests from a PC Card application for interrupt service and are indicated by asserting specially-defined signals on the PC Card interface. Functional interrupts are generated by 16-bit I/O PC Cards and by CardBus PC Cards.

Card status change-type interrupts are defined as events at the PC Card interface that are detected by the PCI1251B and may warrant notification of host card and socket services software for service. CSC events include both card insertion and removal from PC Card sockets, as well as transitions of certain PC Card signals.

Table 22 summarizes the sources of PC Card interrupts and the type of card associated with them. CSC and functional interrupt sources are dependent on the type of card inserted in the PC Card socket. The three types of cards that can be inserted into any PC Card socket are 16-bit memory card, 16-bit I/O card, and CardBus cards. The functional interrupt events are valid only for 16-bit I/O and CardBus cards; that is, the functional interrupts are not valid for 16-bit memory cards. Furthermore, card insertion and removal-type CSC interrupts are independent of the card type.

#### PC Card functional and CSC interrupts (continued)

Table 22. PC Card Interrupt Events and Description

| CARD TYPE        | EVENT                              | TYPE       | SIGNAL                  | DESCRIPTION  |
|------------------|------------------------------------|------------|-------------------------|--|
| 16-bit<br>memory | Battery conditions<br>(BVD1, BVD2) | csc        | BVD1(STSCHG)//CSTSCHG   | A transition on BVD1 indicates a change in the PC Card battery conditions.                                   |
|                  |                                    |            | BVD2(SPKR)//CAUDIO      | A transition on BVD2 indicates a change in the PC Card battery conditions.                                   |
|                  | Wait states<br>(READY)             | CSC        | READY(IREQ)//CINT       | A transition on READY indicates a change in the ability of the memory PC Card to accept or provide data.     |
| 16-bit I/O       | Change in card status (STSCHG)     | CSC        | BVD1(STSCHG)//CSTSCHG   | The assertion of STSCHG indicates a status change on the PC Card.  |
|                  | Interrupt request<br>(IREQ)        | Functional | READY(IREQ)//CINT       | The assertion of IREQ indicates an interrupt request from the PC Card.                                       |
| CardBus          | Change in card status (CSTSCHG)    | CSC        | BVD1(STSCHG)//CSTSCHG   | The assertion of CSTSCHG indicates a status change on the PC Card.   |
|                  | Interrupt request<br>(CINT)        | Functional | READY(IREQ)//CINT       | The assertion of CINT indicates an interrupt request from the PC Card.                                       |
|                  | Power cycle complete               | CSC        | N/A                     | An interrupt is generated when a PC Card power-up cycle has completed.                                       |
| All PC Cards     | Card insertion or removal          | CSC        | CD1//CCD1,<br>CD2//CCD2 | A transition on either CD1//CCD1 or CD2//CCD2 indicates an insertion or removal of a 16-bit CardBus PC Card. |
|                  | Power cycle complete               | csc        | N/A                     | An interrupt is generated when a PC Card power-up cycle has completed.                                       |

The naming convention for PC Card signals describes the function for 16-bit memory and I/O cards, as well as CardBus. For example, READY(IREQ)//CINT includes READY for 16-bit memory cards, IREQ for 16-bit I/O cards, and CINT for CardBus cards. The 16-bit memory card signal name is first, with the I/O card signal name second, enclosed in parentheses. The CardBus signal name follows after a forward double slash (//).

The PC Card standard describes the power-up sequence that must be followed by the PCI1251B when an insertion event occurs and the host requests that the socket V<sub>CC</sub> and V<sub>PP</sub> be powered. Upon completion of this power-up sequence, the PCI1251B interrupt scheme can be used to notify the host system (see Table 23), denoted by the power cycle complete event. This interrupt source is considered a PCI1251B internal event, because it depends on the completion of applying power to the socket.

#### interrupt masks and flags

Host software may individually mask (or disable) most of the potential interrupt sources listed in Table 23 by setting the appropriate bits in the PCI1251B. By individually masking the interrupt sources listed, software can control those events that cause a PCI1251B interrupt. Host software has some control over the system interrupt the PCI1251B asserts by programming the appropriate routing registers. The PCI1251B allows host software to route PC Card CSC and PC Card functional interrupts to separate system interrupts. Interrupt routing is somewhat specific to the interrupt signaling method used, and is discussed in more detail in the following sections.

#### interrupt masks and flags (continued)

When an interrupt is signaled by the PCI1251B, the interrupt service routine must determine which of the events in Table 23 caused the interrupt. Internal registers in the PCI1251B provide flags that report which interrupt source was the cause of the interrupt. By reading these status bits, the interrupt service routine can determine the action to be taken.

Table 23 details the registers and bits associated with masking and reporting potential interrupts. All interrupts, except the functional PC Card interrupts, can be masked. An interrupt status flag is available for all types of interrupts.

| CARD TYPE              | EVENT                                | MASK                                     | FLAG                                     |
|------------------------|--------------------------------------|--|--|
| 16-bit                 | Battery conditions<br>(BVD1, BVD2)   | ExCA offset 05h/45h/805h<br>bits 1 and 0 | ExCA offset 04h/44h/804h<br>bits 1 and 0 |
| memory                 | Wait states<br>(READY)               | ExCA offset 05h/45h/805h<br>bit 2        | ExCA offset 04h/44h/804h<br>bit 2        |
| 16-bit I/O             | Change in card status<br>(STSCHG)    | ExCA offset 05h/45h/805h<br>bit 0        | ExCA offset 04h/44h/804h<br>bit 0        |
|                        | Interr <u>upt re</u> quest<br>(IREQ) | Always enabled                           | PCI configuration offset 91h bit 0       |
| All 16-bit<br>PC Cards | Power cycle complete                 | ExCA offset 05h/45h/805h<br>bit 3        | ExCA offset 04h/44h/804h<br>bit 3        |
| CardBus                | Change in card status<br>(CSTSCHG)   | Socket mask<br>bit 0                     | Socket event<br>bit 0                    |
|                        | Interrupt request<br>(CINT)          | Always enabled                           | PCI configuration offset 91h bit 0       |
|                        | Power cycle complete                 | Socket mask<br>bit 3                     | Socket event<br>bit 3                    |
|                        | Card insertion or removal            | Socket mask<br>bits 2 and 1              | Socket event<br>bits 2 and 1             |

Table 23. Interrupt Mask and Flag Registers

Notice that there is not a mask bit to stop the PCI1251B from passing PC Card functional interrupts through to the appropriate interrupt scheme. These interrupts are not valid until the card is properly powered, and there should never be a card interrupt that does not require service after proper initialization.

Various methods of clearing the interrupt flag bits are listed in Table 23. The flag bits in the ExCA registers (16-bit PC Card-related interrupt flags) can be cleared by two different methods. One method is an explicit write of 1 to the flag bit to clear, and the other is by reading the flag bit register. The selection of flag bit clearing is made by bit 2 in the global control register (ExCA offset 1Eh/5Eh/81Eh), and defaults to the flag cleared on read method.

The CardBus-related interrupt flags can be cleared by an explicit write of 1 to the interrupt flag in the socket event register. Although some of the functionality is shared between the CardBus registers and the ExCA registers, software should not program the chip through both register sets when a CardBus card is functioning.

#### legacy interrupt multiplexer

The IRQ multiplexer implemented in the PCI1251B provides a mechanism to route the IRQMUX signals to any of the 15 legacy IRQ signals. IRQMUX7-IRQMUX6 share the PC/PCI DMA terminals and take precedence when routed. The other six IRQMUX signals (IRQMUX5-IRQMUX0) are available in all platforms. To use the IRQMUX interrupt signaling, software must program the device control register (PCI offset 92h) to select the legacy IRQ signaling scheme.

The IRQMUX functionality describing PCREQ/IRQMUX7 is shown in Figure 12.

### legacy interrupt multiplexer (continued)

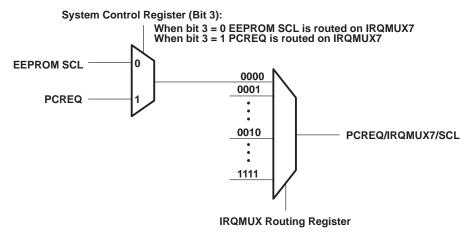

Figure 12. Interrupt Mux Functionality – Example of IRQMUX7 Routing

If parallel ISA IRQs are selected in the device control register, then the IRQMUX routing register (PCI offset 8Ch) must be programmed with the associated ISA IRQ connections. The PCI1251B supports up to eight parallel ISA IRQ signal connections (IRQMUX7–IRQMUX0). Figure 13 is an example of PCI1251B IRQ implementation that provides eight ISA interrupts. The system In this example cannot support PC/PCI DMA because all eight ISA IRQs are used. In this example, IRQMUX7 and IRQMUX6 are used to signal ISA IRQs and are not available for PC/PCI DMA. For systems not using all eight IRQs, PC/PCI DMA can be implemented and can coexist with ISA IRQs by using IRQMUX6 and IRQMUX7 for PC/PCI DMA; that is, legacy IRQs and PC/PCI DMA implementation are not mutually exclusive. However, if the IRQMUX registers are programmed to use IRQMUX7–IRQMUX6, then they override PC/PCI DMA.

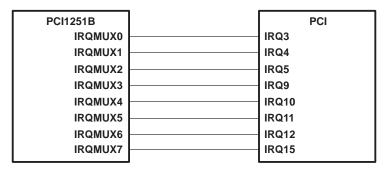

Figure 13. IRQ Implementation

Software is responsible for programming the IRQMUX routing register to reflect the IRQ configuration shown in Figure 13. In this example, programming is accomplished by writing a doubleword of data (FCBA9543h) to the PCI1251B IRQMUX routing register, PCI offset 8Ch. In this example (FCBA9543h), F corresponds to IRQ15, C to IRQ12, B to IRQ11, A to IRQ10, 9 to IRQ9, 5 to IRQ5, 4 to IRQ4, and 3 to IRQ3.

The IRQMUX routing register is shared between the two PCI1251B functions, and only one write to function 0 or function 1 is necessary to configure the IRQMUX signals.

#### using parallel PCI interrupts

Parallel PCI interrupts are available when in: parallel PCI interrupt mode, IRQMUX signaling mode, or when IRQs are serialized with the IRQSER protocol. The PCI interrupt signaling is dependent on the interrupt mode. The interrupt mode is selected via the device control register (92h). The IRQSER/INTB pin signals INTB when one of the parallel interrupt modes is selected via bits 2–1 in the device control register (92h).

#### using parallel PCI interrupts (continued)

PCI INTB is also available on the IRQMUX0 terminal by programming bits 3–0 to 0001b. See the *IRQMUX* routing register (8Ch). PCI INTA is available on the GPIO3 terminal by programming bits 7–6 in the GPIO3 control register (8Bh) to 00b.

The value read from the interrupt pin register is card slot dependent. The value read also depends on the interrupt INTRTIE bit in the system control register and the signaling mode selected through the device control register. When the INTRTIE bit is set, this register reads 0x01 (INTA) for both functions. The PCI1251B defaults to signaling PCI and IRQ interrupts through IRQSER serial interrupt terminal. Refer to Table 24 for a complete description of the register contents.

| INTERRUPT SIGNALING MODE                             | INTRTIE<br>BIT | INTPIN<br>FUNCTION 0     | INTPIN<br>FUNCTION 1     |
|--|----------------|--------------------------|--------------------------|
| Parallel PCI interrupts only                         | 0              | 0x01 (INTA)              | 0x02 (INTB)              |
| Parallel IRQ and parallel PCI interrupts             | 0              | 0x01 (INTA)              | 0x02 (INTB)              |
| IRQ serialized (IRQSER) and parallel PCI interrupts  | 0              | 0x01 (INTA)              | 0x02 (INTB)              |
| IRQ and PCI serialized (IRQSER) interrupts (default) | 0              | 0x01 (INTA)              | 0x02 (INTB)              |
| Parallel PCI interrupts only                         | 1              | 0x01 ( <del>INTA</del> ) | 0x01 ( <del>INTA</del> ) |
| Parallel IRQ and parallel PCI interrupts             | 1              | 0x01 ( <del>INTA</del> ) | 0x01 ( <del>INTA</del> ) |
| IRQ serialized (IRQSER) and parallel PCI interrupts  | 1              | 0x01 (INTA)              | 0x01 ( <del>INTA</del> ) |
| IRQ and PCI serialized (IRQSER) interrupts (default) | 1              | 0x01 (INTA)              | 0x01 (INTA)              |

Table 24. Interrupt Pin Register Cross Reference

### power management overview

In addition to the low-power CMOS technology process used for the PCI1251B, various features are designed into the device to allow implementation of popular power-saving techniques. These features and techniques are discussed in this section.

### PCI CLKRUN protocol

The PCI CLKRUN feature is the primary method of power management on the PCI bus side of the PCI1251B. Since some chipsets do not implement CLKRUN, this is not always available to the system designer, and alternate power savings features are provided. If CLKRUN is not implemented, then the CLKRUN terminal should be tied low. CLKRUN is enabled by default using bit 1 (KEEPCLK) in the system control register (80h).

#### CardBus PC Card power management

The PCI1251B implements its own card power management engine that can be used to turn off the CCLK at a socket when there is no activity to the CardBus PC Card. The CCLK can also be configured as divide by 16 instead of *stopped*. The clock run protocol is followed on the CardBus interface to control this clock management.

#### PCI power management (PCIPM)

The PCI power management (PCIPM) specification establishes the infrastructure required to let the operating system control the power of PCI functions. This is done by defining a standard PCI interface and operations to manage the power of PCI functions on the bus. The PCI bus and the PCI functions can be assigned one of four software-visible power management states that result in varying levels of power savings.

### PCI power management (PCIPM) (continued)

The four power management states of PCI functions are:

- D0 Fully-on state
- D1 and D2 Intermediate states
- D3 Off state

Similarly, bus power states of the PCI bus are B0–B3. The bus power states B0–B3 are derived from the device power state of the originating bridge device.

For the operating system-driven power management, the PCI function should support four power management operations. The operations are: capabilities reporting, power status reporting, setting the power state, and system wake up. The operating system identifies the capabilities of the PCI function by traversing the new capabilities list. The presence of *new capabilities* is indicated by a 1 in the PCI status register, offset 06h, bit 4.

The capabilities pointer provides access to the first item in the linked list of capabilities. For the PCI1251B, a CardBus bridge with PCI configuration space header type 2, the capabilities pointer is mapped to an offset of 14h. The first byte of each capability register block is required to be a unique ID of that capability. PCI power management has been assigned an ID of 01h. The next byte is a pointer to the next pointer item in the list of capabilities. If there are no more items in the list, then the next item pointer should be set to 0. The registers following the next item pointer are specific to the function's capability. The PCIPM capability implements the register block outlined in Table 25.

**Table 25. Power Management Registers** 

|  | REGISTER NA | ME |  | OFFSET |  |  |  |  |  |  |
|--|-------------|----|--|--------|--|--|--|--|--|--|
| Power management capabilities Next item pointer Capability ID              |             |    |  |        |  |  |  |  |  |  |
| Data PMCSR bridge support extensions Power management control status (CSR) |             |    |  |        |  |  |  |  |  |  |

The PMC register is a static read-only register that provides information on the capabilities of the function related to power management. The PMCSR register enables control of power management states and enables monitors power management events. The data register is an optional register that provides state-dependent power measurements, such as power consumption or heat dissipation.

#### suspend mode

The SUSPEND signal, provided for backward compatibility, gates the PCI reset (PRST) signal from the PCI1251B. However, additional functionality has been defined for SUSPEND to provide additional power management options.

SUSPEND provides a mechanism to gate the PCLK from the PCI1251B, as well as gate PRST. This can potentially save power while in an idle state; however, it requires substantial design effort to implement. Some issues to consider are:

- What if cards are present in the sockets?
- What if the cards in the sockets are powered?
- How to pass CSC (insertion/removal) events?

Even without the PCI clock to the PCI1251B core, there are asynchronous-type functions (such as RI\_OUT) that can pass CSC events, wake-up events, etc., back to the system. If a system designer chooses to not pass card removal events through to the system, then the PCI1251B would not be able to power down the empty socket without the power switch clock (CLOCK) generated externally. Refer to the *P*<sup>2</sup>*C* power switch interface on page 27 for details. Figure 14 is a functional implementation diagram.

### suspend mode (continued)

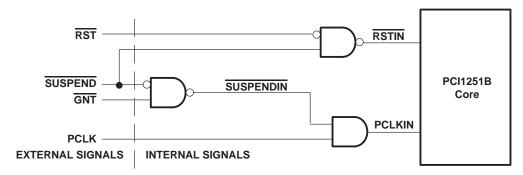

Figure 14. SUSPEND Functional Implementation

Figure 15 is a signal diagram of the suspend function.

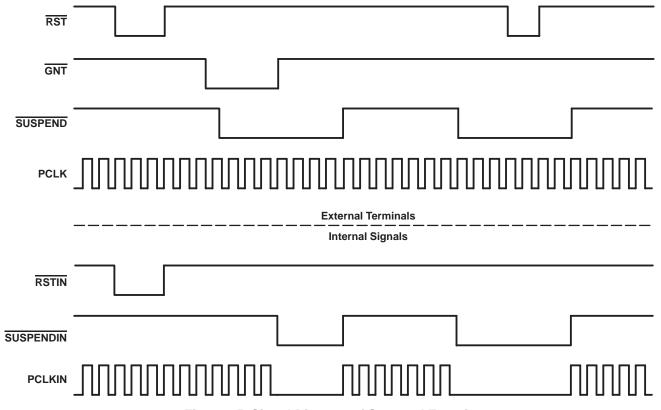

Figure 15. Signal Diagram of Suspend Function

### requirements for suspend mode

The PCI bus must not be parked on the PCI1251B when SUSPEND is asserted. The PCI1251B responds to SUSPEND being asserted by placing the REQ pin in a high impedance state and gates the internal clock and reset.

The GPIOs, IRQMUX signals, and RI\_OUT signals are active during SUSPEND unless they are disabled in the appropriate PCI1251B registers.

#### ring indicate

The RI\_OUT output is an important feature in power management and is basically used so that a system can go into a suspended mode and wake up on modem rings and other card events. RI\_OUT on the PCI1251B can be asserted under any of the following conditions:

- A 16-bit PC Card modem in a powered socket asserts  $\overline{RI}$  to indicate an incoming call to the system.
- A powered down CardBus card asserts CSTSCHG (CBWAKE) requesting system and interface wake up.
- A CSC event, such as insertion/removal of cards, battery voltage levels, occurs.

CSTSCHG from a powered CardBus card is indicated as a CSC event, not as a CBWAKE event. These two RI\_OUT events are enabled separately. Figure 15 shows various enable bits for the PCI1251B RI\_OUT function; however, it does not show the masking of CSC events (see *interrupt masks and flags*, on page 33, for a detailed description of CSC interrupt masks and flags).

RI\_OUT is multiplexed with PME on the same terminal. The default is for RI\_OUT to be signaled on this terminal. In PCI power management systems the PME signal should be enabled by setting bit 8 (PME\_EN) in the power management control/status register (A4h) and setting RIMUX 80h to 1.

In addition to bit 0 in the system control register, the RIENB bit (bit 7) in the card control register (91h) must be set to enable RI OUT.

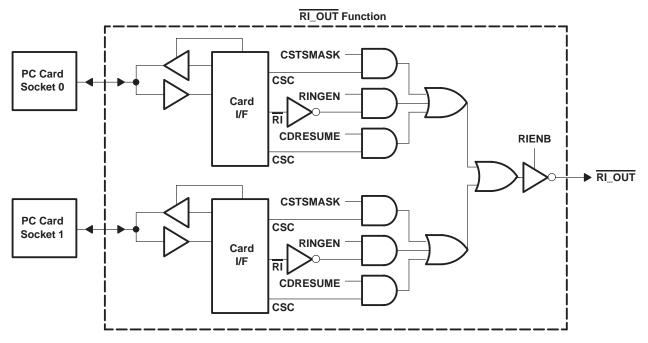

Figure 16. RI OUT Functional Diagram

Routing of CSC events to  $\overline{\text{RI\_OUT}}$  is enabled on a per-socket basis, and is programmed by the RIENB bit in the *card control register* on page 67. This bit is socket dependent (not shared), as shown in Figure 15.

Ring indicate (RI) from the 16-bit PC Card interface is masked by the ExCA control bit RINGEN in the *ExCA* interrupt and general control register on page 83. This is programmed on a per-socket basis and is only applicable when a 16-bit card is powered in the socket.

The CBWAKE signaling to  $\overline{RI\_OUT}$  is enabled through the same mask as the CSC event for CSTSCHG. The mask bit, CSTSMASK, is programmed through the *socket mask register* (page 102) in the CardBus socket registers.

## PC Card controller programming model

This section describes the PCI1251B PCI configuration registers that make up the 256-byte PCI configuration header for each PCI1251B function. As noted below, some bits are global in nature and should be accessed only through function 0.

### PCI configuration registers (functions 0 and 1)

The PCI1251B is a multifunction PCI device, and the PC Card controller is integrated as PCI functions 0 and 1. The configuration header, compliant with the PCI specification as a CardBus bridge header, is PC99 compliant as well. Table 26 shows the PCI configuration header, which includes both the predefined portion of the configuration space and the user-definable registers.

Table 26. PCI Configuration Registers (Functions 0 and 1)

|                       | REGISTE                 | R NAME               |                    | OFFSET  |  |  |  |  |  |

| Name    |    |    |    |    |    |    |   | Vend | or ID |   |   |   |   |   |   |   |
| Туре    | R  | R  | R  | R  | R  | R  | R | R    | R     | R | R | R | R | R | R | R |
| Default | 0  | 0  | 0  | 1  | 0  | 0  | 0 | 0    | 0     | 1 | 0 | 0 | 1 | 1 | 0 | 0 |

Register: **Vendor ID**Type: Read-only

Offset: 00h (functions 0, 1)

Default: 104Ch

Description: This 16-bit register contains a value allocated by the PCI SIG (special interest group) and

identifies the manufacturer of the PCI device. The vendor ID assigned to TI is 104Ch.

### device ID register

| Bit     | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8     | 7    | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|----|----|----|----|----|----|---|-------|------|---|---|---|---|---|---|---|
| Name    |    |    |    |    |    |    |   | Devid | e ID |   |   |   |   |   |   |   |
| Туре    | R  | R  | R  | R  | R  | R  | R | R     | R    | R | R | R | R | R | R | R |
| Default | 1  | 0  | 1  | 0  | 1  | 1  | 0 | 0     | 0    | 0 | 0 | 1 | 1 | 1 | 1 | 1 |

Register: **Device ID**Type: Read-only

Offset: 02h (functions 0, 1)

Default: AC1Fh

Description: This 16-bit register contains a value assigned to the PCI1251B by TI. The device identification

for the PCI1251B is AC1F.

#### command register

| Bit     | 15 | 14      | 13 | 12 | 11 | 10 | 9 | 8   | 7 | 6   | 5 | 4 | 3 | 2   | 1   | 0   |
|---------|----|---------|----|----|----|----|---|-----|---|-----|---|---|---|-----|-----|-----|
| Name    |    | Command |    |    |    |    |   |     |   |     |   |   |   |     |     |     |
| Туре    | R  | R       | R  | R  | R  | R  | R | R/W | R | R/W | R | R | R | R/W | R/W | R/W |
| Default | 0  | 0       | 0  | 0  | 0  | 0  | 0 | 0   | 0 | 0   | 0 | 0 | 0 | 0   | 0   | 0   |

Register: Command

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 04h Default: 0000h

Description: This register provides control over the PCI1251B interface to the PCI bus. All bit functions

adhere to the definitions in PCI Local Bus Specification 2.2. None of the bit functions in this register are shared between the two PCI1251B PCI functions. Two command registers exist in the PCI1251B, one for each function. Software must manipulate the two PCI1251B functions as separate entities when enabling functionality through the command register. The SERR\_EN and PERR\_EN enable bits in this register are internally wired OR between the two functions, and these control bits appear separately according to their software function.

# **Table 27. Command Register**

| BIT   | SIGNAL  | TYPE | FUNCTION  |
|-------|---------|------|---|
| 15–10 | RSVD    | R    | Reserved. Bits 15–10 return 0s when read. Writes have no effect.  |
| 9     | FBB_EN  | R    | Fast back-to-back enable. The PCI251 does not generate fast back-to-back transactions; therefore, bit 9 returns 0 when read.  |
| 8     | SERR_EN | R/W  | System Error (SERR) enable. Bit 8 controls the enable for the SERR driver on the PCI interface. SERR can be asserted after detecting an address parity error on the PCI bus. Both bit 8 and bit 6 must be set for the PCI1251B to report address parity errors.  0 = Disable SERR output driver (default).  1 = Enable SERR output driver.                      |
| 7     | ADSTPNG | R    | Address/data stepping control. The PCI1251B does not support address/data stepping, and bit 7 is hardwired to 0. Writes to this bit have no effect.   |
| 6     | PERR_EN | R/W  | Parity error response enable. Bit 6 controls the PCI1251B's response to parity errors through PERR. Data parity errors are indicated by asserting PERR, whereas address parity errors are indicated by asserting SERR.  0 = PCI1251B ignores detected parity error (default). 1 = PCI1251B responds to detected parity errors.                                  |
| 5     | VGA_SNP | R    | VGA palette snoop. Bit 5 controls how PCI devices handle accesses to video graphics array (VGA) palette registers. The PCI1251B does not support VGA palette snooping; therefore, this bit is hardwired to 0. Bit 5 returns 0 when read. Writes to this bit have no effect.   |
| 4     | MWI_EN  | R    | Memory write and invalidate enable. Bit 4 controls whether a PCI initiator device can generate memory write and invalidate commands. The PCI1251B controller does not support memory write and invalidate commands; it uses memory write commands instead; therefore, this bit is hardwired to 0. Bit 4 returns 0 when read. Writes to this bit have no effect. |
| 3     | SP_CYCL | R    | Special cycles. Bit 3 controls whether or not a PCI device ignores PCI special cycles. The PCI1251B does not respond to special cycle operations; therefore, this bit is hardwired to 0. Bit 3 returns 0 when read. Writes to this bit have no effect.  |
| 2     | BUSMSTR | R/W  | Bus master control. Bit 2 controls whether or not the PCI1251B can act as a PCI bus initiator (master).  The PCI1251B can take control of the PCI bus only when this bit is set.  0 = Disables the PCI1251B's ability to generate PCI bus accesses (default).  1 = Enables the PCI1251B's ability to generate PCI bus accesses.                                 |
| 1     | MEM_EN  | R/W  | Memory space enable. Bit 1 controls whether or not the PCI1251B can claim cycles in PCI memory space.  0 = Disables the PCI1251B's response to memory space accesses (default).  1 = Enables the PCI1251B's response to memory space accesses.  |
| 0     | IO_EN   | R/W  | I/O space control. Bit 0 controls whether or not the PCI1251B can claim cycles in PCI I/O space.  0 = Disables the PCI1251B from responding to I/O space accesses (default).  1 = Enables the PCI1251B to respond to I/O space accesses.  |

status register

| Bit     | 15  | 14  | 13  | 12  | 11  | 10 | 9 | 8   | 7   | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|-----|-----|-----|-----|-----|----|---|-----|-----|---|---|---|---|---|---|---|
| Name    |     |     |     |     |     |    |   | Sta | tus |   |   |   |   |   |   |   |
| Туре    | R/W | R/W | R/W | R/W | R/W | R  | R | R/W | R   | R | R | R | R | R | R | R |
| Default | 0   | 0   | 0   | 0   | 0   | 0  | 1 | 0   | 0   | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

Register: Status

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 06h (functions 0, 1)

Default: 0210h

Description: This register provides device information to the host system. Bits in this register may be read

normally. A bit in the status register is reset when a 1 is written to that bit location; a 0 written to a bit location has no effect. All bit functions adhere to the definitions in the  $PCI\ Local\ Bus$ 

Specification 2.2. PCI bus status is shown through each function (see Table 28).

### Table 28. Status Register

| BIT  | SIGNAL    | TYPE | FUNCTION   |
|------|-----------|------|--|
| 15   | PAR_ERR   | R/W  | Detected parity error. Bit 15 is set when a parity error is detected (either address or data). Write a 1 to clear this bit.  |
| 14   | SYS_ERR   | R/W  | Signaled system error. Bit 14 is set when SERR is enabled and the PCI1251B signals a system error to the host. Write a 1 to clear this bit.  |
| 13   | MABORT    | R/W  | Received master abort. Bit 13 is set when a cycle initiated by the PCI1251B on the PCI bus has been terminated by a master abort. Write a 1 to clear this bit.   |
| 12   | TABT_REC  | R/W  | Received target abort. Bit 12 is set when a cycle initiated by the PCI1251B on the PCI bus was terminated by a target abort. Write a 1 to clear this bit.  |
| 11   | TABT_SIG  | R/W  | Signaled target abort. Bit 11 is set by the PCI1251B when it terminates a transaction on the PCI bus with a target abort. Write a 1 to clear this bit.   |
| 10–9 | PCI_SPEED | R    | DEVSEL timing. These bits encode the timing of DEVSEL and are hardwired 01b, indicating that the PCI1251B asserts PCI_SPEED at a medium speed on nonconfiguration cycle accesses.  |
| 8    | DATAPAR   | R/W  | Data parity error detected. Write a 1 to clear this bit.  0 = The conditions for setting bit 8 have not been met.  1 = A data parity error occurred, and the following conditions were met:  a. PERR was asserted by any PCI device including the PCI1251B.  b. The PCI1251B was the bus master during the data parity error.  c. The parity error response bit is set in the command. |
| 7    | FBB_CAP   | R    | Fast back-to-back capable. The PCI1251B cannot accept fast back-to-back transactions; thus, bit 7 is hardwired to 0.   |
| 6    | UDF       | R    | User-definable feature support. The PCI1251B does not support the user-definable features; thus, bit 6 is hardwired to 0.  |
| 5    | 66_CAP    | R    | 66-MHz capable. The PCI1251B operates at a maximum PCLK frequency of 33 MHz; therefore, bit 5 is hardwired to 0.   |
| 4    | CAP_LST   | R    | Capabilities list. Bit 4 returns 1 when read. This bit indicates that capabilities in addition to standard PCI capabilities are implemented. The linked list of PCI power management capabilities is implemented in this function.   |
| 3–0  | RSVD      | R    | Reserved. Bits 3–0 return 0s when read.  |

SCPS043A - OCTOBER 1998

### revision ID register

| Bit     | 7 | 6 | 5 | 4      | 3     | 2 | 1 | 0 |
|---------|---|---|---|--------|-------|---|---|---|
| Name    |   |   |   | Revisi | on ID |   |   |   |
| Туре    | R | R | R | R      | R     | R | R | R |
| Default | 0 | 0 | 0 | 0      | 0     | 0 | 0 | 0 |

Register: **Revision ID** Type: Read-only

Offset: 08h (functions 0, 1)

Default: 00h

Description: This register indicates the silicon revision of the PCI1251B. This data sheet reflects the

PCI1251B revision is 00h silicon.

### PCI class code register

| Bit     | 23 | 22         | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12    | 11    | 10 | 9 | 8 | 7 | 6 | 5      | 4     | 3       | 2      | 1 | 0 |

Register: **PCI Class code** Type: Read-only

Offset: 09h (functions 0, 1)

Default: 060700h

Description: This register recognizes the PCI1251B functions 0 and 1 as a bridge device (06h), and

CardBus bridge device (07h) with a 00h programming interface.

### cache line size register

| Bit     | 7   | 6   | 5   | 4       | 3        | 2   | 1   | 0   |
|---------|-----|-----|-----|---------|----------|-----|-----|-----|
| Name    |     |     |     | Cache I | ine size |     |     |     |
| Туре    | R/W | R/W | R/W | R/W     | R/W      | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0       | 0        | 0   | 0   | 0   |

Register: Cache line size Type: Read/Write

Offset: 0Ch (functions 0, 1)

Default:

Description: This register is programmed by host software to indicate the system cache line size.

SCPS043A - OCTOBER 1998

latency timer register

| Bit     | 7   | 6   | 5   | 4      | 3       | 2   | 1   | 0   |
|---------|-----|-----|-----|--------|---------|-----|-----|-----|
| Name    |     |     |     | Latenc | y timer |     |     |     |
| Туре    | R/W | R/W | R/W | R/W    | R/W     | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0      | 0       | 0   | 0   | 0   |

Register: Latency timer
Type: Read/Write

Offset: 0Dh Default: 00h

Description: This register specifies the latency timer for the PCI1251B in units of PCI clock cycles. When

the PCI1251B is a PCI bus initiator and asserts  $\overline{\text{FRAME}}$ , the latency timer begins counting from zero. If the latency timer expires before the PCI1251B transaction has terminated, then

the PCI1251B terminates the transaction when its GNT is deasserted.

### header type register

| Bit     | 7 | 6 | 5 | 4     | 3       | 2 | 1 | 0 |
|---------|---|---|---|-------|---------|---|---|---|
| Name    |   |   |   | Heade | er type |   |   |   |
| Туре    | R | R | R | R     | R       | R | R | R |
| Default | 1 | 0 | 0 | 0     | 0       | 0 | 1 | 0 |

Register: **Header type** Type: Read-only

Offset: 0Eh (functions 0, 1)

Default: 82h

Description: This register returns 82h when read, indicating that the PCI1251B functions 0 and 1

configuration spaces adhere to the CardBus bridge PCI header. The CardBus bridge PCI header ranges from PCI register 0 to 7Fh, and 80h–FFh are user-definable extension

registers.

### **BIST** register

| Bit     | 7 | 6 | 6 5 |   | 3  | 2 | 1 | 0 |
|---------|---|---|-----|---|----|---|---|---|
| Name    |   |   | P P |   | ST |   |   |   |
| Туре    | R | R | R R |   | R  | R | R | R |
| Default | 0 | 0 | 0   | 0 | 0  | 0 | 0 | 0 |

Register: **BIST**Type: Read-only

Offset: 0Fh (functions 0, 1)

Default: 00h

Description: Because the PCI1251B does not support a built-in self-test (BIST), this register returns the

value of 00h when read. This register returns 0s for the two PCI1251B functions.

SCPS043A - OCTOBER 1998

### CardBus socket registers/ExCA base-address register

| Bit     | 31  | 30  | 29  | 28  | 27 | 26 | 25       | 24      | 23      | 22      | 21 | 20 | 19 | 18 | 17 | 16 |

| Name    |     |   |     |     |    | Ca | ardBus s | ocket/E | xCA bas | e addre | SS |    |    |    |    |    |
| Туре    | R/W | R/W   | R/W | R/W | R  | R  | R        | R       | R       | R       | R  | R  | R  | R  | R  | R  |
| Default | 0   | 0   | 0   | 0   | 0  | 0  | 0        | 0       | 0       | 0       | 0  | 0  | 0  | 0  | 0  | 0  |

Register: CardBus socket/ExCA base address

Type: Read-only, Read/Write

Offset: 10h

Default: 0000 0000h

Description: This register is programmed with a base address referencing the CardBus socket registers

and the memory-mapped ExCA register set. Bits 31–12 are read/write, and allow the base address to be located anywhere in the 32-bit PCI memory address space on a 4-kbyte boundary. Bits 11–0 are read-only, returning 0s when read. When software writes all 1s to this register, the value readback is FFFF F000h, indicating that at least 4 kbytes of memory address space are required. The CardBus registers start at offset 000h, and the memory-mapped ExCA registers begin at offset 800h. This register is not shared by functions

0 and 1, mapping each socket control separately.

### capability pointer register

| Bit     | 7 | 6 | 5 | 4         | 3         | 2 | 1 | 0 |
|---------|---|---|---|-----------|-----------|---|---|---|
| Name    |   |   |   | Capabilit | y pointer |   |   |   |
| Туре    | R | R | R | R         | R         | R | R | R |
| Default | 1 | 0 | 1 | 0         | 0         | 0 | 0 | 0 |

Register: Capability pointer

Type: Read-only
Offset: 14h
Default: A0h

Description: This register provides a pointer into the PCI configuration header where the PCI power

management register block resides. PCI header doublewords at A0h and A4h provide the power management (PM) registers. Each socket has its own capability pointer register. This

register returns A0h when read.

secondary status register

| Bit     | 15  | 14  | 13  | 12  | 11  | 10 | 9 | 8       | 7         | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|-----|-----|-----|-----|-----|----|---|---------|-----------|---|---|---|---|---|---|---|
| Name    |     |     |     |     |     |    |   | Seconda | ry status | 3 |   |   |   |   |   |   |
| Туре    | R/W | R/W | R/W | R/W | R/W | R  | R | R/W     | R         | R | R | R | R | R | R | R |
| Default | 0   | 0   | 0   | 0   | 0   | 0  | 1 | 0       | 0         | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Register: Secondary status

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 16h Default: 0200h

Description: This register (see Table 29) is compatible with the PCI-to-PCI bridge secondary status

register and indicates CardBus-related device information to the host system. This register is very similar to the PCI status register (offset 06h), and status bits are cleared by writing a 1. This register is not shared by the two socket functions and is accessed on a per-socket basis.

Table 29. Secondary Status Register

| BIT  | SIGNAL    | TYPE | FUNCTION  |
|------|-----------|------|---|
| 15   | CBPARITY  | R/W  | Detected parity error. Bit 15 is set when a CardBus parity error is detected (either address or data). Write a 1 to clear this bit.   |
| 14   | CBSERR    | R/W  | Signaled system error. Bit 14 is set when CSERR is signaled by a CardBus card. The PCI1251B does not assert CSERR. Write a 1 to clear this bit.   |
| 13   | CBMABORT  | R/W  | Received master abort. Bit 13 is set when a cycle initiated by the PCI1251B on the CardBus bus has been terminated by a master abort. Write a 1 to clear this bit.  |
| 12   | REC_CBTA  | R/W  | Received target abort. Bit 12 is set when a cycle initiated by the PCI1251B on the CardBus bus is terminated by a target abort. Write a 1 to clear this bit.  |
| 11   | SIG_CBTA  | R/W  | Signaled target abort. Bit 11 is set by the PCI1251B when it terminates a transaction on the CardBus bus with a target abort. Write a 1 to clear this bit.  |
| 10–9 | CB_SPEED  | R    | CDEVSEL timing. These bits encode the timing of CDEVSEL and are hardwired 01b, indicating that the PCI1251B asserts CB_SPEED at a medium speed.   |
| 8    | CB_DPAR   | R/W  | CardBus data parity error detected. Write a 1 to clear this bit.  0 = The conditions for setting bit 8 have not been met.  1 = A data parity error occurred and the following conditions were met:  a. CPERR was asserted on the CardBus interface.  b. The PCI1251B was the bus master during the data parity error.  c. The parity error response bit is set in the bridge control. |
| 7    | CBFBB_CAP | R    | Fast back-to-back capable. The PCI1251B cannot accept fast back-to-back transactions; thus, bit 7 is hardwired to 0.  |
| 6    | CB_UDF    | R    | User-definable feature support. The PCI1251B does not support the user-definable features; thus, bit 6 is hardwired to 0.   |
| 5    | CB66MHZ   | R    | 66-MHz capable. The PCI1251B CardBus interface operates at a maximum CCLK frequency of 33 MHz; therefore, bit 5 is hardwired to 0.  |
| 4–0  | RSVD      | R    | Reserved. Bits 4–0 return 0s when read.   |

SCPS043A - OCTOBER 1998

#### PCI bus number register

| Bit     | 7   | 6   | 5   | 4       | 3      | 2   | 1   | 0   |
|---------|-----|-----|-----|---------|--------|-----|-----|-----|
| Name    |     |     |     | PCI bus | number |     |     |     |
| Туре    | R/W | R/W | R/W | R/W     | R/W    | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0       | 0      | 0   | 0   | 0   |

Register: **PCI bus number**Type: Read/Write

Offset: 18h (functions 0, 1)

Default: 00h

Description: This register is programmed by the host system to indicate the bus number of the PCI bus to

which the PCI1251B is connected. The PCI1251B uses this register in conjunction with the CardBus bus number and subordinate bus number registers to determine when to forward

PCI configuration cycles to its secondary buses.

#### CardBus bus number register

| Bit     | 7   | 6   | 5   | 4         | 3         | 2   | 1   | 0   |
|---------|-----|-----|-----|-----------|-----------|-----|-----|-----|
| Name    |     |     |     | CardBus b | us number |     |     |     |
| Туре    | R/W | R/W | R/W | R/W       | R/W       | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0         | 0         | 0   | 0   | 0   |

Register: CardBus bus number

Type: Read/Write

Offset: 19h Default: 00h

Description: This register is programmed by the host system to indicate the bus number of the CardBus

bus to which the PCI1251B is connected. The PCI1251B uses this register in conjunction with the PCI bus number and subordinate bus number registers to determine when to forward PCI configuration cycles to its secondary buses. This register is separate for each PCI1251B

controller function.

### subordinate bus number register

| Bit     | 7   | 6   | 5   | 4              | 3       | 2 | 1   | 0   |
|---------|-----|-----|-----|----------------|---------|---|-----|-----|
| Name    |     |     |     | Subordinate bu |         |   |     |     |
| Туре    | R/W | R/W | R/W | R/W            | R/W R/W |   | R/W | R/W |
| Default | 0   | 0   | 0   | 0              | 0       | 0 | 0   | 0   |

Register: Subordinate bus number

Type: Read/Write
Offset: 1Ah
Default: 00h

Description: This register is programmed by the host system to indicate the highest-numbered bus below

the CardBus bus. The PCI1251B uses this register in conjunction with the PCI bus number and CardBus bus number registers to determine when to forward PCI configuration cycles to

its secondary buses. This register is separate for each CardBus controller function.

CardBus latency timer register

| Bit     | 7   | 6   | 5   | 4          | 3           | 2   | 1   | 0   |
|---------|-----|-----|-----|------------|-------------|-----|-----|-----|
| Name    |     |     |     | CardBus la | tency timer |     |     |     |
| Туре    | R/W | R/W | R/W | R/W        | R/W         | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0          | 0           | 0   | 0   | 0   |

Register: CardBus latency timer

Type: Read/Write

Offset: 1Bh (functions 0, 1)

Default: 00h

Description: This register is programmed by the host system to specify the latency timer for the PCI1251B

CardBus interface in units of CCLK cycles. When the PCI1251B is a CardBus initiator and asserts CFRAME, the CardBus latency timer begins counting. If the latency timer expires before the PCI1251B transaction has terminated, then the PCI1251B terminates the transaction at the end of the next data phase. A recommended minimum value for this register

is 20h, which allows most transactions to be completed.

#### memory base registers 0, 1

| Bit     | 31  | 30                                       | 29  | 28  | 27 | 26 | 25   | 24       | 23       | 22     | 21 | 20 | 19 | 18 | 17 | 16 |

Register: Memory base registers 0, 1

Type: Read-only, Read/Write

Offset: 1 Ch, 24h Default: 0000 0000h

Description: These registers indicate the lower address of a PCI memory address range. These registers

are used by the PCI1251B to determine when to forward a memory transaction to the CardBus bus, and when to forward a CardBus cycle to PCI. Bits 31–12 of these registers are read/write which allow the memory base to be located anywhere in the 32-bit PCI memory space on 4-kbyte boundaries. Bits 11–0 are read-only and always return 0s. Writes to these bits have no effect. Bits 8 and 9 of the bridge control register specify whether memory windows 0 and 1 are prefetchable or nonprefetchable. The memory base register or the memory limit register must be nonzero for the PCI1251B to claim any memory transactions through CardBus memory windows (i.e., these windows are not enabled by default to pass the first 4 kbytes of memory to

CardBus).

SCPS043A - OCTOBER 1998

#### memory limit registers 0, 1

| Bit     | 31  | 30  | 29  | 28  | 27 | 26 | 25  | 24        | 23        | 22     | 21 | 20 | 19 | 18 | 17 | 16 |

Register: **Memory limit registers 0, 1**Type: Read-only, Read/Write

Offset: 20h, 24h Default: 0000 0000h

Description: These registers indicate the upper address of a PCI memory address range. They are used by

the PCI1251B to determine when to forward a memory transaction to the CardBus bus, and when to forward a CardBus cycle to PCI. Bits 31–12 of these registers are read/write and allow the memory base to be located anywhere in the 32-bit PCI memory space on 4-kbyte boundaries. Bits 11–0 are read-only and always return 0s. Writes to these bits have no effect. Bits 8 and 9 of the bridge control register specify whether memory windows 0 and 1 are prefetchable or nonprefetchable. The memory base register or the memory limit register must be nonzero for the PCI1251B to claim any memory transactions through CardBus memory windows (i.e., these windows are not enabled by default to pass the first 4 kbytes of memory to

CardBus).

Register: **I/O base registers 0, 1**Type: Read-only, Read/Write

Offset: 2Ch, 34h Default: 0000 0000h

Description: These registers indicate the lower address of a PCI I/O address range. They are used by the

PCI1251B to determine when to forward an I/O transaction to the CardBus bus, and when to forward a CardBus cycle to the PCI bus. The lower 16 bits of this register locate the bottom of the I/O window within a 64-kbyte page, and the upper 16 bits (31–16) are all 0, which locates this 64-kbyte page in the first page of the 32-bit PCI I/O address space. Bits 31–16 and bits 1–0 are read-only and always return 0s, forcing I/O windows to be aligned on a natural doubleword boundary in the first 64-kbyte page of PCI I/O address space. These I/O windows are enabled when either the I/O base register or the I/O limit register are nonzero. The I/O windows are not enabled by default to pass the first doubleword of I/O to CardBus.

Either the I/O base or the I/O limit register must be nonzero to enable any I/O transactions.

Register: **I/O limit registers 0, 1**Type: Read-only, Read/Write

Offset: 30h, 38h Default: 0000 0000h

Description: These registers indicate the upper address of a PCI I/O address range. They are used by the

PCI1251B to determine when to forward an I/O transaction to the CardBus bus, and when to forward a CardBus cycle to PCI. The lower 16 bits of this register locate the top of the I/O window within a 64-kbyte page, and the upper 16 bits are a page register that locates this 64-kbyte page in 32-bit PCI I/O address space. Bits 15–2 are read/write and allow the I/O limit address to be located anywhere in the 64-kbyte page (indicated by bits 31–16 of the appropriate I/O base) on doubleword boundaries.

Bits 31–16 are read-only and always return 0s when read. The page is set in the I/O base register. Bits 1–0 are read-only and always return 0s, forcing I/O windows to be aligned on a natural doubleword boundary. Writes to read-only bits have no effect. The PCI1251B assumes that the lower two bits of the limit address are 1s.

These I/O windows are enabled when either the I/O base register or the I/O limit register are nonzero. The I/O windows are not enabled by default to pass the first doubleword of I/O to CardBus).

Either the I/O base or the I/O limit register must be nonzero to enable any I/O transactions.

#### interrupt line register

| Bit     | 7   | 6              | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |  |  |
|---------|-----|----------------|-----|-----|-----|-----|-----|-----|--|--|--|--|--|
| Name    |     | Interrupt line |     |     |     |     |     |     |  |  |  |  |  |
| Туре    | R/W | R/W            | R/W | R/W | R/W | R/W | R/W | R/W |  |  |  |  |  |
| Default | 1   | 1              | 1   | 1   | 1   | 1   | 1   | 1   |  |  |  |  |  |

Register: Interrupt line
Type: Read/Write
Offset: 3Ch
Default: FFh

Description: This register is used to communicate interrupt line routing information. This register is not

used by the PCI1251B, because there are many programmable interrupt signaling options. This register is considered reserved; however, host software may read and write to this

register. Each PCI1251B function 0 and 1 has an interrupt line register.

SCPS043A - OCTOBER 1998

### interrupt pin register

| Bit     | 7 | 6             | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |  |
|---------|---|---------------|---|---|---|---|---|---|--|--|--|--|
| Name    |   | Interrupt pin |   |   |   |   |   |   |  |  |  |  |
| Туре    | R | R             | R | R | R | R | R | R |  |  |  |  |
| Default | 1 | 1             | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |

Register: Interrupt pin Type: Read-only Offset: 3Dh

Default: Depends on the interrupt signaling mode

Description: The value read from this register is function dependent. The value depends on the interrupt

INTRTIE bit in the system control register and the signaling mode, selected through the device control register. When the INTRTIE bit is set, this register reads 0x01 (INTA) for both functions. The PCI1251B defaults to signaling PCI and IRQ interrupts through IRQSER serial interrupt terminal. Refer to Table 30 for a complete description of the register contents.

Table 30. Interrupt Pin Register Cross Reference

| INTERRUPT SIGNALING MODE                             | INTRTIE<br>BIT | INTPIN<br>FUNCTION 0     | INTPIN<br>FUNCTION 1     |

|---------|----|----------------|----|----|----|-----|-----|-----|-----|-----|-----|---|-----|-----|-----|-----|
| Name    |    | Bridge control |    |    |    |     |     |     |     |     |     |   |     |     |     |     |
| Туре    | R  | R              | R  | R  | R  | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W |
| Default | 0  | 0              | 0  | 0  | 0  | 0   | 1   | 1   | 0   | 1   | 0   | 0 | 0   | 0   | 0   | 0   |

Register: **Bridge control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 3Eh (functions 0, 1)

Default: 0340h

Description: This register provides control over various PCI1251B bridging functions. Some bits in this

register are global and should be accessed only through function 0. Refer to Table 31 for a

complete description of the register contents.

# **Table 31. Bridge Control Register**

| BIT   | SIGNAL    | TYPE | FUNCTION  |
|-------|-----------|------|---|
| 15–11 | RSVD      | R    | Reserved. Bits 15–11 return 0s when read.   |
| 10    | POSTEN    | R/W  | Write posting enable. Enables write posting to and from the CardBus sockets. Write posting enables posting of write data on burst cycles. Operating with write posting disabled inhibits performance on burst cycles. Note that bursted write data can be posted, but various write transactions may not. Bit 10 is socket dependent and is not shared between functions 0 and 1. |
| 9     | PREFETCH1 | R/W  | Memory window 1 type. Bit 9 specifies whether or not memory window 1 is prefetchable. This bit is socket dependent. Bit 9 is encoded as:  0 = Memory window 1 is nonprefetchable.  1 = Memory window 1 is prefetchable (default).   |
| 8     | PREFETCH0 | R/W  | Memory window 0 type. Bit 8 specifies whether or not memory window 0 is prefetchable. This bit is encoded as:  0 = Memory window 0 is nonprefetchable.  1 = Memory window 0 is prefetchable (default).  |
| 7     | INT_RT_EN | R/W  | PCI interrupt – IREQ routing enable. Bit 7 is used to select whether PC Card functional interrupts are routed to PCI interrupts or the IRQ specified in the ExCA registers.  0 = Functional interrupts routed to PCI interrupts (default)  1 = Functional interrupts routed by ExCA registers   |
| 6     | CRST      | R/W  | CardBus reset. When bit 6 is set, CRST is asserted on the CardBus interface. CRST can also be asserted by passing a PRST assertion to CardBus.  0 = CRST deasserted 1 = CRST asserted (default)   |
| 5†    | MABTMODE  | R/W  | Master abort mode. Bit 5 controls how the PCI1251B responds to a master abort when the PCI1251B is an initiator on the CardBus interface. This bit is common between each socket.  0 = Master aborts not reported (default)  1 = Signal target abort on PCI and SERR (if enabled)   |
| 4     | RSVD      | R    | Reserved. Bit 4 returns 0 when read.  |
| 3     | VGAEN     | R/W  | VGA enable. Bit 3 affects how the PCI1251B responds to VGA addresses. When this bit is set, accesses to VGA addresses are forwarded.  |
| 2     | ISAEN     | R/W  | ISA mode enable. Bit 2 affects how the PCI1251B passes I/O cycles within the 64-kbyte ISA range. This bit is not common between sockets. When this bit is set, the PCI1251B does not forward the last 768 bytes of each 1K I/O range to CardBus.  |
| 1     | CSERREN   | R/W  | CSERR enable. Bit 1 controls the response of the PCI1251B to CSERR signals on the CardBus bus.  This bit is separate for each socket.  0 = CSERR is not forwarded to PCI SERR.  1 = CSERR is forwarded to PCI SERR.   |
| 0     | CPERREN   | R/W  | CardBus parity error response enable. Bit 0 controls the response of the PCI1251B to CardBus parity errors. This bit is separate for each socket.  0 = CardBus parity errors are ignored.  1 = CardBus parity errors are reported using CPERR.  |

<sup>†</sup> This bit is global and should be accessed only through function 0.

SCPS043A - OCTOBER 1998

### subsystem vendor ID register

| Bit     | 15 | 14                  | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|----|---------------------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Name    |    | Subsystem vendor ID |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Туре    | R  | R                   | R  | R  | R  | R  | R | R | R | R | R | R | R | R | R | R |
| Default | 0  | 0                   | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Register: Subsystem vendor ID

Type: Read-only (Read/Write when bit 5 in the system control register is 0)

Offset: 40h (functions 0, 1)

Default: 0000h

Description: This register is used for system and option-card identification purposes, and may be required

for certain operating systems. This register is read-only or read/write, depending on the setting of bit 5 (SUBSYSRW) in the system control register. When bit 5 is 0, this register is read/write; when bit 5 is 1, this register is read-only. The default mode is read-only.

#### subsystem ID register

| Bit     | 15 | 14           | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|----|--------------|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Name    |    | Subsystem ID |    |    |    |    |   |   |   |   |   |   |   |   |   |   |
| Туре    | R  | R            | R  | R  | R  | R  | R | R | R | R | R | R | R | R | R | R |
| Default | 0  | 0            | 0  | 0  | 0  | 0  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Register: Subsystem ID

Type: Read-only (Read/Write when bit 5 in the system control register is 0)

Offset: 42h (functions 0, 1)

Default: 0000h

Description: This register is used for system and option-card identification purposes and may be required

for certain operating systems. This register is read-only or read/write, depending on the setting of bit 5 (SUBSYSRW) in the system control register. When bit 5 is 0, this register is read/write; when bit 5 is 1, this register is read-only. The default mode is read-only.

If an EEPROM is present, then the subsystem ID and subsystem vendor ID will be loaded from

EEPROM after a reset.

Register: PC Card 16-bit I/F legacy-mode base address Read-only, Read/Write (see individual bit descriptions) Type:

Offset: 44h (functions 0, 1) 0000 0000h

Default:

Description: The PCI1251B supports the index/data scheme of accessing the ExCA registers, which is mapped by this register. An address written to this register is the address for the index register and the address + 1 is the data address. Using this access method, applications requiring index/data ExCA access can be supported. The base address can be mapped anywhere in 32-bit I/O space on a word boundary; hence, bit 0 is read-only, returning 1 when read. As specified in the PCI to PCMCIA CardBus Bridge Register Description (Yenta), this register is shared by functions 0 and 1. Refer to the ExCA register set description for register offsets.

Register: System control

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 80h (functions 0, 1)

Default: 0044 9060h

Description: System-level initializations are performed through programming this doubleword register.

Some of the bits are global and should be written only through function 0. Refer to Table 32 for

a complete description of the register contents.

# Table 32. System Control Register

| BIT    | SIGNAL    | TYPE | FUNCTION  |
|--------|-----------|------|---|
| 31–30† | SER_STEP  | R/W  | Serialized PCI interrupt routing step. Bits 31–30 are used to configure the serialized PCI interrupt stream signaling, and accomplish an even distribution of interrupts signaled on the four PCI interrupt slots. Bits 31–30 are global to both PCI1251B functions.  00 = INTA/INTB signal in INTA/INTB IRQSER slots (default)  01 = INTA/INTB signal in INTB/INTC IRQSER slots  10 = INTA/INTB signal in INTC/INTD IRQSER slots  11 = INTA/INTB signal in INTD/INTA IRQSER slots  |
| 29†    | INTRTIE   | R/W  | Tie internal PCI interrupts. When this bit is set, the INTA and INTB signals are tied together internally and are signaled as INTA. INTA can then be shifted by using the SER_STEP bits. This bit is global to both PCI1251B functions.  0 = INTA and INTB are not tied together internally (default).  1 = INTA and INTB are tied together internally.   |
| 28     | RSVD      | R    | Reserved. Bit 28 returns 0 when read.   |
| 27†    | P2CCLK    | R/W  | P <sup>2</sup> C power switch clock. The PCI1251B defaults CLOCK as an input clock to control the serial interface and the internal state machine. Bit 27 can be set to enable the PCI1251B to generate and drive the CLOCK from the PCI clock. When in a SUSPEND state, however, CLOCK must be input to the PCI1251B to successfully power down sockets after card removal without indicating to the system the removal event.  0 = CLOCK provided externally, input to PCI1251B (default) 1 = CLOCK generated by PCI clock and driven by PCI1251B |
| 26†    | SMIROUTE  | R/W  | SMI interrupt routing. Bit 26 is shared between functions 0 and 1, and selects whether IRQ2 or CSC is signaled when a write occurs to power a PC Card socket.  0 = PC Card power change interrupts routed to IRQ2 (default)  1 = A CSC interrupt is generated on PC Card power changes.   |
| 25     | SMISTATUS | R/W  | SMI interrupt status. This socket-dependent bit is set when a write occurs to set the socket power, and the SMIENB bit is set. Writing a 1 to bit 25 clears the status.  0= SMI interrupt signaled  1 = SMI interrupt not signaled  |
| 24†    | SMIENB    | R/W  | SMI interrupt mode enable. When bit 24 is set, the SMI interrupt signaling is enabled and generates an interrupt when a write to the socket power control occurs. This bit is shared and defaults to 0 (disabled).  0 = SMI interrupt mode is disabled (default).  1 = SMI interrupt mode is enabled.   |
| 23     | RSVD      | R    | Reserved  |
| 22     | CBRSVD    | R/W  | CardBus reserved terminals signaling. When bit 22 is set, the RSVD CardBus terminals are driven low when a CardBus card is inserted. When this bit is low (as default), these signals are placed in a high-impedance state.  0 = 3-state CardBus RSVD  1 = Drive Cardbus RSVD low (default)   |
| 21     | VCCPROT   | R/W  | VCC protection enable. Bit 21 is socket dependent.  0 = VCC protection enabled for 16-bit cards (default)  1 = VCC protection disabled for 16-bit cards   |
| 20     | RSVD      | R/W  | Reserved. Bit 20 returns 0 when read.   |
| 19     | CDREQEN   | R/W  | PC/PCI DMA card enable. When bit 19 is set, the PCI1251B allows 16-bit PC Cards to request PC/PCI DMA using the DREQ signaling. DREQ is selected through the socket DMA register 0.  0 = Ignore DREQ signaling from PC Cards (default)  1 = Signal DMA request on DREQ  |
| 18–16  | CDMACHAN  | R/W  | CDMACHANPC/PCI DMA channel assignment. Bits 18–16 are encoded as:  0–3 = 8-bit DMA channels  4 = PCI master; not used (default).  5–7 = 16-bit DMA channels   |

<sup>†</sup> These bits are global and should be accessed only through function 0.

# Table 32. System Control Register (Continued)

| BIT | SIGNAL      | TYPE | FUNCTION   |
|-----|-------------|------|--|
| 15† | MRBURSTDN   | R/W  | Memory read burst enable downstream. When bit 15 is set, memory read transactions are allowed to burst downstream.  0 = MRBURSTDN downstream is disabled.  1 = MRBURSTDN downstream is enabled (default).  |
| 14† | MRBURSTUP   | R/W  | Memory read burst enable upstream. When bit 14 is set, the PCI1251B allows memory read transactions to burst upstream.  0 = MRBURSTUP upstream is disabled (default).  1 = MRBURSTUP upstream is enabled.  |
| 13  | SOCACTIVE   | R    | Socket activity status. When set, bit 13 indicates access has been performed to or from a PC card, and is cleared upon read of this status bit. This bit is socket dependent.  0 = No socket activity (default)  1 = Socket activity   |
| 12  | RSVD        | R    | Reserved. Bit 12 returns 1 when read. This is the power-rail bit in functions 0 and 1.   |
| 11† | PWRSTREAM   | R    | Power stream in progress status bit. When set high, bit 11 indicates that a power stream to the power switch is in progress and a powering change has been requested. When this bit is clear, it indicates that the power stream is complete.  0 = Power stream is complete and delay has expired.  1 = Power stream is in progress. |
| 10† | DELAYUP     | R    | Power-up delay in progress status. When set, bit 9 indicates that a power-up stream has been sent to the power switch and proper power may not yet be stable. This bit is cleared when the power-up delay has expired.  0 = Power-up delay has expired.  1 = Power-up stream sent to switch. Power may not be stable.                |
| 9†  | DELAYDOWN   | R    | Power-down delay in progress status. When set, bit 10 indicates that a power-down stream has been sent to the power switch and proper power may not yet be stable. This bit is cleared when the power-down delay has expired.  0 = Power-down delay has expired.  1 = Power-down stream sent to switch. Power may not be stable.     |
| 8   | INTERROGATE | R    | Interrogation in progress. When set, bit 8 indicates an interrogation is in progress and clears when interrogation completes. This bit is socket dependent.  0 = Interrogation not in progress (default)  1 = Interrogation in progress  |
| 7   | RSVD        | R    | Reserved. Bit 7 returns 0 when read.   |
| 6†  | PWRSAVINGS  | R/W  | Power savings mode enable. When this bit is set and if a CB card is inserted, idle, and without a CB clock, then the applicable CB state machine will not be clocked.  |
| 5†  | SUBSYSRW    | R/W  | Subsystem ID (SSID), subsystem vendor ID (SSVID), ExCA ID, and revision register read/write enable. Bit 5 is shared by functions 0 and 1.  0 = SSID, SSVID, ExCA ID, and revision register are read/write.  1 = SSID, SSVID, ExCA ID, and revision register are read-only (default).   |
| 4†  | CB_DPAR     | R/W  | CardBus data parity SERR signaling enable  0 = CardBus data parity not signaled on PCI SERR (default)  1 = CardBus data parity signaled on PCI SERR  |
| 3†  | CDMA_EN     | R/W  | PC/PCI DMA enable. Bit 3 enables PC/PCI DMA when set, and disables IRQMUX7 and IRQMUX6 signaling.  0 = Centralized DMA disabled (default)  1 = Centralized DMA enabled   |
| 2   | RSVD        | R    | Reserved   |
| 1†  | KEEPCLK     | R/W  | Keep clock. This bit works with PCI and CB CLKRUN protocols.  0 = Allows normal functioning of both CLKRUN protocols.(default)  1 = Does not allow CB clock or PCI clock to be stopped using the CLKRUN protocols.   |
| o†  | RIMUX       | R/W  | RI_OUT/PME multiplex enable.  0 = RI_OUT and PME signals are both routed to the RI_OUT/PME terminal. If both are enabled at the same time, then RI_OUT will have precedence over PME.  1 = Only PME signals are routed to the RI_OUT/PME terminal.   |

<sup>†</sup> These bits are global and should be accessed only through function 0.

SCPS043A - OCTOBER 1998

### multimedia control register

| Bit     | 7   | 6                  | 5 | 4 | 3 | 2 | 1   | 0   |  |
|---------|-----|--------------------|---|---|---|---|-----|-----|--|
| Name    |     | Multimedia control |   |   |   |   |     |     |  |
| Туре    | R/W | R/W                | R | R | R | R | R/W | R/W |  |
| Default | 0   | 0                  | 0 | 0 | 0 | 0 | 0   | 0   |  |

Register: Multimedia control

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 84h (functions 0, 1)

Default: 00h

Description: This register provides port mapping for the PCI1251B zoomed video/data ports (see zoomed

video support, on page 29). Access this register only through function 0. Refer to Table 33 for

a complete description of the register contents.

## Table 33. Multimedia Control Register

| BIT | SIGNAL  | TYPE | FUNCTION  |
|-----|---------|------|---|
| 7   | ZVOUTEN | R/W  | ZV output enable. Bit 7 enables the output for the PCI1251B outsourcing ZV terminals. When this bit is reset 0, these terminals are in a high-impedance state.  0 = PCI1251B ZV output terminals disabled (default)  1 = PCI1251B ZV output terminals enabled |
| 6   | PORTSEL | R/W  | ZV port select. Bit 6 controls the multiplexing control over which PC Card ZV port data is driven to the outsourcing PCl1251B ZV port.  0 = Output card 0 ZV if enabled (default)  1 = Output card 1 ZV if enabled  |
| 5–2 | RSVD    | R    | Reserved. Bits 5–2 return 0s when read. Writes have no effect.  |
| 1   | ZVEN1   | R/W  | PC Card 1 ZV mode enable. Bit 1 enables the zoomed video mode for socket 1. When set, the PCI1251B inputs ZV data from the PC Card interface and disables output drivers on ZV terminals.  0 = PC Card 1 ZV disabled (default)  1 = PC Card 1 ZV enabled      |
| 0   | ZVEN0   | R/W  | PC Card 0 ZV mode enable. Bit 0 enables the zoomed video mode for socket 0. When set, the PCI1251B inputs ZV data from the PC Card interface and disables output drivers on ZV terminals.  0 = PC Card 0 ZV disabled (default)  1 = PC Card 0 ZV enabled      |

general status register

| Bit     | 7 | 6              | 5 | 4 | 3 | 2 | 1 | 0 |
|---------|---|----------------|---|---|---|---|---|---|
| Name    |   | General status |   |   |   |   |   |   |
| Туре    | R | R              | R | R | R | R | R | R |
| Default | 0 | 0              | 0 | 0 | 0 | Х | 0 | 0 |

Register: **General status** Type: Read-only

Offset: 85h (functions 0, 1)

Default: 0Xh

Description: This register provides general device status information. The status of the serial EEPROM

interface is provided through this register. Refer to Table 34 for a complete description of the

register contents.

Table 34. General Status Register

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7–3 | RSVD     | R    | Reserved. Bits 7–3 return 0s when read.  |
| 2†  | EEDETECT | R    | Serial EEPROM detect. When bit 2 is cleared, it indicates that the PCI1251B serial EEPROM circuitry has detected an EEPROM. A pullup resistor must be implemented on LATCH for bit 2 to be set. This status bit is encoded as:  0 = EEPROM not detected (default)  1 = EEPROM detected |
| 1†  | DATAERR  | R    | Serial EEPROM data error status. Bit 1 indicates when a data error occurs on the serial EEPROM interface. Bit 2 may be set due to a missing acknowledge. This bit is cleared by writing a 1.  0 = No error detected (default)  1 = Data error detected                                 |
| ot  | EEBUSY   | R    | Serial EEPROM busy status. Bit 0 indicates the status of the PCI1251B serial EEPROM circuitry. This bit is set during the loading of the subsystem ID value.  0 = Serial EEPROM circuitry not busy (default)  1 = Serial EEPROM circuitry busy   |

 $<sup>\</sup>ensuremath{^{\dagger}}$  These bits are global and should be accessed only through function 0.

SCPS043A - OCTOBER 1998

### **GPIO0** control register

| Bit     | 7   | 6             | 5 | 4   | 3   | 2 | 1   | 0   |  |
|---------|-----|---------------|---|-----|-----|---|-----|-----|--|
| Name    |     | GPIO0 control |   |     |     |   |     |     |  |
| Туре    | R/W | R/W           | R | R/W | R/W | R | R/W | R/W |  |
| Default | 1   | 0             | 0 | 0   | 0   | 0 | 0   | 0   |  |

Register: **GPIO0 control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 88h (functions 0, 1)

Default: 80h

Description: This register is used for control of the general-purpose I/O 0 (GPIO0). This terminal defaults to

a general-purpose input but can be reconfigured as the socket 0 activity LED output, a zoomed video enabled status output, or general-purpose output. Access this register only through function 0. Refer to Table 35 for a complete description of the register contents.

### Table 35. GPIO0 Control Register

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7–6 | GP0      | R/W  | General-purpose 0 mode. Bits 7–6 select the functionality of LEDA1/GPIO0. These bits are encoded as:  00 = Signal LEDA1 to indicate PC Card socket 0 activity  01 = Signal ZVSTAT to indicate zoomed video output enabled  10 = General-purpose input (GPI)  11 = General-purpose output (GPO) |
| 5   | RSVD     | R    | Reserved. Bit 5 returns 0 when read. Writes have no effect.  |
| 4   | GPINTEN0 | R/W  | GP interrupt enable. When bit 4 is set, a socket A card status change (CSC) interrupt is generated when the DELTA0 bit is set.   |
| 3   | DELTA0   | R/W  | DATAIN0 change status. Bit 3 is set when the DATAIN0 bit changes state when in GPI mode. Glitches on the GPI terminal may not be detected by software without bit 3. This bit is cleared by a write back of 1.   |
| 2   | RSVD     | R    | Reserved. Bit 2 returns 0 when read. Writes have no effect.  |
| 1   | DATAOUT0 | R/W  | General-purpose data output. When in general-purpose output mode, bit 1 represents the data. Data written to this bit in GPO mode is signaled to the output.   |
| 0   | DATAIN0  | R/W  | General-purpose data input. When in either general-purpose input or output mode, bit 0 represents the data on the GPIO terminal. Data signaled on the GPI terminal is identified through this bit.   |

SCPS043A - OCTOBER 1998

**GPIO1** control register

| Bit     | 7   | 6             | 5 | 4   | 3   | 2 | 1   | 0   |  |
|---------|-----|---------------|---|-----|-----|---|-----|-----|--|
| Name    |     | GPIO1 control |   |     |     |   |     |     |  |
| Туре    | R/W | R/W           | R | R/W | R/W | R | R/W | R/W |  |
| Default | 1   | 0             | 0 | 0   | 0   | 0 | 0   | 0   |  |

Register: **GPIO1 control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 89h (functions 0, 1)

Default: 80h

Description: This register is used for control of the general-purpose I/O 1 (GPIO1). This terminal defaults to

a general-purpose input, but can be reconfigured as the socket 1 activity LED output or general-purpose output. Access this register only through function 0. Refer to Table 36 for a

complete description of the register contents.

Table 36. GPIO1 Control Register

| BIT | SIGNAL   | TYPE | FUNCTION  |
|-----|----------|------|---|
| 7–6 | GP1      | R/W  | General-purpose 1 mode. Bits 7–6 select the functionality of LEDA2/GPIO1. These bits are encoded as:  00 = Signal LEDA2 to indicate PC Card socket 1 activity.  01 = Reserved.  10 = General-purpose input (GPI).  11 = General-purpose output (GPO). |
| 5   | RSVD     | R    | Reserved. Bit 5 returns 0 when read. Writes have no effect.   |
| 4   | GPINTEN1 | R/W  | GP interrupt enable. When bit 4 is set, a socket A card status change (CSC) interrupt is generated when the DELTA1 bit is set.  |
| 3   | DELTA1   | R/W  | DATAIN1 change status. Bit 3 is set when the DATAIN1 bit changes state when in GPI mode. Glitches on the GPI terminal may not be detected by software without bit 3. This bit is cleared by a write back of 1.  |
| 2   | RSVD     | R    | Reserved. Bit 2 returns 0 when read. Writes have no effect.   |
| 1   | DATAOUT1 | R/W  | General-purpose data output. When in general-purpose output mode, bit 1 represents the data. Data written to this bit in GPO mode is signaled to the output.  |
| 0   | DATAIN1  | R/W  | General-purpose data input. When in either general-purpose input or output mode, bit 0 represents the data on the GPIO terminal. Data signaled on the GPI terminal is identified through this bit.  |

SCPS043A - OCTOBER 1998

### **GPIO2** control register

| Bit     | 7   | 6             | 5 | 4   | 3   | 2 | 1   | 0   |  |
|---------|-----|---------------|---|-----|-----|---|-----|-----|--|
| Name    |     | GPIO2 control |   |     |     |   |     |     |  |
| Туре    | R/W | R/W           | R | R/W | R/W | R | R/W | R/W |  |
| Default | 1   | 0             | 0 | 0   | 0   | 0 | 0   | 0   |  |

Register: **GPIO2 control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 8Ah (functions 0, 1)

Default: 80h

Description: This register is used for control of the general-purpose I/O 2 (GPIO2). This terminal defaults to

a general-purpose input but can be reconfigured as PCI  $\overline{\text{LOCK}}$ , a zoomed video enabled status output, or general-purpose output. Access this register only through function 0. Refer

to Table 37 for a complete description of the register contents.

### **Table 37. GPIO2 Control Register**

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7–6 | GP2      | R/W  | General-purpose 2 mode. Bits 7–6 select the functionality of LOCK/GPIO2. These bits are encoded as:  00 = Terminal is configured as PCI LOCK.  01 = Signal ZVSTAT to indicate zoomed video output is enabled.  10 = General-purpose input (GPI)  11 = General-purpose output (GPO) |
| 5   | RSVD     | R    | Reserved. Bit 5 returns 0 when read. Writes have no effect.  |
| 4   | GPINTEN2 | R/W  | GP interrupt enable. When bit 4 is set, a socket B card status change (CSC) interrupt is generated when the DELTA2 bit is set.   |
| 3   | DELTA2   | R/W  | DATAIN2 change status. Bit 3 is set when the DATAIN2 bit changes state when in GPI mode. Glitches on the GPI terminal may not be detected by software without bit 3. This bit is cleared by a write back of 1.   |
| 2   | RSVD     | R    | Reserved. Bit 2 returns 0 when read. Writes have no effect.  |
| 1   | DATAOUT2 | R/W  | General-purpose data output. When in general-purpose output mode, bit 1 represents the data. Data written to this bit in GPO mode is signaled to the output.   |
| 0   | DATAIN2  | R/W  | General-purpose data input. When in either general-purpose input or output mode, bit 0 represents the data on the GPIO terminal. Data signaled on the GPI terminal is identified through this bit.   |

SCPS043A - OCTOBER 1998

**GPIO3** control register

| Bit     | 7   | 6             | 5 | 4   | 3   | 2 | 1   | 0   |
|---------|-----|---------------|---|-----|-----|---|-----|-----|
| Name    |     | GPIO3 control |   |     |     |   |     |     |
| Туре    | R/W | R/W           | R | R/W | R/W | R | R/W | R/W |
| Default | 1   | 0             | 0 | 0   | 0   | 0 | 0   | 0   |

Register: **GPIO3 control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 8Bh (functions 0, 1)

Default: 80h

Description: This register is used for control of the general-purpose I/O 3 (GPIO3). This terminal defaults to

a general-purpose input but can be reconfigured as PCI INTA or general-purpose output. Access this register only through function 0. Refer to Table 38 for a complete description of

the register contents.

**Table 38. GPIO3 Control Register** 

| BIT | SIGNAL   | TYPE | FUNCTION  |
|-----|----------|------|---|
| 7–6 | GP3      | R/W  | General-purpose 3 mode. Bits 7–6 select the functionality of INTA/GPIO3. These bits are encoded as:  00 = Terminal is configured as PCI INTA.  01 = Reserved  10 = General-purpose input (GPI)  11 = General-purpose output (GPO) |
| 5   | RSVD     | R    | Reserved. Bit 5 returns 0 when read. Writes have no effect.   |
| 4   | GPINTEN3 | R/W  | GP interrupt enable. When bit 4 is set, a socket B card status change (CSC) interrupt is generated when the DELTA3 bit is set.  |
| 3   | DELTA3   | R/W  | DATAIN3 change status. Bit 3 is set when the DATAIN3 bit changes state when in GPI mode. Glitches on the GPI terminal may not be detected by software without bit 3. This bit is cleared by a write back of 1.                    |
| 2   | RSVD     | R    | Reserved. Bit 2 returns 0 when read. Writes have no effect.   |
| 1   | DATAOUT3 | R/W  | General-purpose data output. When in general-purpose output mode, bit 1 represents the data. Data written to this bit in GPO mode is signaled to the output.  |
| 0   | DATAIN3  | R/W  | General-purpose data input. When in either general-purpose input or output mode, bit 0 represents the data on the GPIO terminal. Data signaled on the GPI terminal is identified through this bit.                                |

Register: **IRQMUX** routing

Read/Write (see individual bit descriptions) Type:

Offset: 8Ch (functions 0, 1) 0000 0000h

Default:

Description: This register is used for the legacy interrupt mux routing feature of the PCI1251B, which is

described in the programmable interrupt subsystem on page 32. If the parallel IRQ interrupt scheme is selected, then all PCI1251B interrupts sent to ISA IRQs are signaled on the corresponding IRQMUX7-IRQMUX0 signals. These signals are routed directly to various IRQ inputs on the system PIC, and the routing information is programmed through this register. Each terminal has at least one secondary function that can be selected by programming the bits appropriately. Access this register only through function 0. Refer to

Table 39 for a complete description of the register contents.

**Table 39. IRQMUX Routing Register** 

| BIT   | SIGNAL  | TYPE | FUNCTION  |
|-------|---------|------|---|
| 31–28 | IRQMUX7 | R/W  | IRQMUX7 routing. Bits 31–28 select one of 15 interrupts that may be routed on IRQMUX7. When these bits are 0000 and bit 3 in the system control register is set, this pin is used for PCREQ DMA signaling.  NOTE: These bits must not be configured for IRQ signaling if IRQMUX7 is being used for PCREQ signaling.  0000 = EEPROM SCL routed on IRQMUX7 (default)  0000 = PCREQ routed on IRQMUX7 when bit 3 of the system control register is 1  0001 = PCREQ routed on IRQMUX7  0010 = IRQ2 routed on IRQMUX7  0011 = IRQ3 routed on IRQMUX7  : 1111 = IRQ15 routed on IRQMUX7   |
| 27–24 | IRQMUX6 | R/W  | IRQMUX6 routing. Bits 27–24 select one of 15 interrupts that may be routed on IRQMUX6. When these bits are 0000 and bit 3 in the system control register is set, this pin is used for PCGNT DMA signaling.  NOTES: 1. These bits must not be configured for IRQ signaling if IRQMUX6 is being used for PCGNT signaling.  2. An EEPROM cannot be used if IRQMUX7 and IRQMUX6 are being used for DMA PCREQ PCGNT.  0000 = EEPROM SDA routed on IRQMUX6 (default) 0000 = PCGNT routed on IRQMUX6 when bit 3 of the system control register is 1 0001 = IRQ1 routed on IRQMUX6 0010 = IRQ2 routed on IRQMUX6 0011 = IRQ3 routed on IRQMUX6 : 1111 = IRQ15 routed on IRQMUX6 |

# Table 39. IRQMUX Routing Register (Continued)

| BIT   | SIGNAL  | TYPE | FUNCTION   |
|-------|---------|------|--|
| 23–20 | IRQMUX5 | R/W  | IRQMUX5 routing. Bits 23–20 select one of 15 interrupts that may be routed on IRQMUX5. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = CardBus audio (CBAUDIO) routed on IRQMUX5  0010 = IRQ2 routed on IRQMUX5  0011 = IRQ3 routed on IRQMUX5  : 1111 = IRQ15 routed on IRQMUX5                        |
| 19–16 | IRQMUX4 | R/W  | IRQMUX4 routing. Bits 19–16 select one of 15 interrupts that may be routed on IRQMUX4. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = ZVSTAT routed on IRQMUX4  0010 = RI_OUT routed on IRQMUX4  0011 = IRQ3 routed on IRQMUX4  0100 = IRQ4 routed on IRQMUX4  : 1111 = IRQ15 routed on IRQMUX4        |
| 15–12 | IRQMUX3 | R/W  | IRQMUX3 routing. Bits 15–12 select one of 15 interrupts that may be routed on IRQMUX3. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = LEDA or LEDB routed on IRQMUX3  0010 = RI_OUT routed on IRQMUX3  0011 = IRQ3 routed on IRQMUX3  0100 = IRQ4 routed on IRQMUX3  :  1111 = IRQ15 routed on IRQMUX3 |
| 11–8  | IRQMUX2 | R/W  | IRQMUX2 routing. Bits 11–8 select one of 15 interrupts that may be routed on IRQMUX2. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = LEDB routed on IRQMUX2  0010 = IRQ2 routed on IRQMUX2  0011 = IRQ3 routed on IRQMUX2  : 1111 = IRQ15 routed on IRQMUX2  |
| 7–4   | IRQMUX1 | R/W  | IRQMUX1 routing. Bits 7–4 select one of 15 interrupts that may be routed on IRQMUX1. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = LEDA routed on IRQMUX1  0010 = IRQ2 routed on IRQMUX1  0011 = IRQ3 routed on IRQMUX1  : 1111 = IRQ15 routed on IRQMUX1   |
| 3–0   | IRQMUX0 | R/W  | IRQMUX0 routing. Bits 3–0 select one of 15 interrupts that may be routed on IRQMUX0. When these bits are 0000, then no routing is selected.  0000 = No IRQ routing selected (default)  0001 = INTB routed on IRQMUX0  0010 = IRQ2 routed on IRQMUX0  0011 = IRQ3 routed on IRQMUX0  :  1111 = IRQ15 routed on IRQMUX0  |

SCPS043A - OCTOBER 1998

### retry status register

| Bit     | 7   | 6            | 5   | 4 | 3 | 2 | 1   | 0 |  |  |
|---------|-----|--------------|-----|---|---|---|-----|---|--|--|
| Name    |     | Retry status |     |   |   |   |     |   |  |  |
| Туре    | R/W | R/W          | R/W | R | R | R | R/W | R |  |  |
| Default | 1   | 1            | 0   | 0 | 0 | 0 | 0   | 0 |  |  |

Register: Retry status

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 90h (functions 0, 1)

Default: C0h

Description: This register enables the retry timeout counters and displays the retry expiration status. The

flags are set when the PCI1251B retries a PCI or CardBus master request, and the master does not return within 2<sup>15</sup> PCI clock cycles. The flags are cleared by writing a 1 to the bit. These bits are expected to be incorporated into the PCI command, PCI status, and bridge control registers by the PCI SIG. Access this register only through function 0. Refer to

Table 40 for a complete description of the register contents.

#### Table 40. Retry Status Register

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7   | PCIRETRY | R/W  | PCI retry timeout counter enable. Bit 7 is encoded:  0 = PCI retry counter disabled  1 = PCI retry counter enabled (default)             |
| 6†  | CBRETRY  | R/W  | CardBus retry timeout counter enable. Bit 6 is encoded:  0 = CardBus retry counter disabled  1 = CardBus retry counter enabled (default) |
| 5   | TEXP_CBB | R/W  | CardBus target B retry expired. Write a 1 to clear bit 5.  0 = Inactive (default)  1 = Retry has expired                                 |
| 4   | RSVD     | R    | Reserved. Bit 4 returns 0 when read.   |
| 3†  | TEXP_CBA | R    | CardBus target A retry expired. Write a 1 to clear bit 3.  0 = Inactive (default)  1 = Retry has expired.                                |
| 2   | RSVD     | R    | Reserved. Bit 2 returns 0 when read.   |
| 1   | TEXP_PCI | R/W  | PCI target retry expired. Write a 1 to clear bit 1.  0 = Inactive (default)  1 = Retry has expired.                                      |
| 0   | RSVD     | R    | Reserved. Bit 0 returns 0 when read.   |

<sup>&</sup>lt;sup>†</sup> These bits are global and should be accessed only through function 0.

card control register

| Bit     | 7   | 6            | 5 | 4 | 3 | 2   | 1   | 0   |  |  |
|---------|-----|--------------|---|---|---|-----|-----|-----|--|--|
| Name    |     | Card control |   |   |   |     |     |     |  |  |
| Туре    | R/W | R/W          | R | R | R | R/W | R/W | R/W |  |  |
| Default | 0   | 0            | 0 | 0 | 0 | 0   | 0   | 0   |  |  |

Register: Card control

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 91h Default: 00h

Description: This register is provided for PCI1130 compatibility. It provides the PC Card function interrupt

flag (IFG) and an alias for the ZVEN0 and ZVEN1 bits found in the PCI1251B multimedia control register. When this register is accessed by function 0, the ZVEN0 bit will alias with ZVENABLE. When this register is accessed by function 1, the ZVEN1 bit will alias with ZVENABLE. Setting ZVENABLE only places the PC Card socket interface ZV terminals in a high-impedance state, but does not enable the PCI1251B to drive ZV data onto the ZV terminals. RI\_OUT is enabled through this register, and the enable bit is shared between functions 0 and 1. Refer to Table 41 for a complete description of the register contents.

**Table 41. Card Control Register** 

| BIT | SIGNAL    | TYPE | FUNCTION  |
|-----|-----------|------|---|
| 7†  | RIENB     | R/W  | Ring indicate output enable.  0 = Disables any routing of RI_OUT signal (default).  1 = Enables RI_OUT signal for routing to the RI_OUT/PME terminal when RIMUX is set to 0, and for routing to IRQMUX3/4.  |
| 6   | ZVENABLE  | R/W  | Compatibility ZV mode enable. When set, the corresponding PC Card Socket interface ZV terminals enter a high-impedance state. This bit defaults to 0.   |
| 5   | RSVD      | R    | Reserved. Bit 5 returns 0 when read.  |
| 4–3 | RSVD      | R    | Reserved. Bits 4–3 default to 0.  |
| 2   | AUD2MUX   | R/W  | CardBus Audio-to-IRQMUX. When set, the CAUDIO CardBus signal is routed to the corresponding IRQMUX terminal. Function 0, A_CAUDIO is routed to IRQMUX0, and function 1, B_AUDIO is routed to IRQMUX1. If this bit is set for both functions, then function 0 is routed.  0 = CAUDIO set to CAUDPWM on IRQMUX routed (default)  1 = CAUDIO is not routed.                                      |
| 1   | SPKROUTEN | R/W  | Speaker out enable. When bit 1 is set, SPKR on the PC Card is enabled and is routed to SPKROUT on the PCI bus. The SPKR signal from socket 0 is exclusive ORed with the SPKR signal from socket 1 and sent to SPKROUT. The SPKROUT terminal drives data only when either functions SPKROUTEN bit is set. This bit is encoded as:  0 = SPKR to SPKROUT not enabled 1 = SPKR to SPKROUT enabled |
| 0   | IFG       | R/W  | Interrupt flag. Bit 0 is the interrupt flag for 16-bit I/O PC Cards and for CardBus cards. Bit 0 is set when a functional interrupt is signaled from a PC Card interface and is socket dependent (i.e., not global). Write back a 1 to clear this bit.  0 = No PC Card functional interrupt detected (default)  1 = PC Card functional interrupt detected                                     |

<sup>&</sup>lt;sup>†</sup> This bit is global and should be accessed only through function 0.

SCPS043A - OCTOBER 1998

### device control register

| Bit     | 7 | 6              | 5   | 4 | 3   | 2   | 1   | 0   |  |  |
|---------|---|----------------|-----|---|-----|-----|-----|-----|--|--|
| Name    |   | Device control |     |   |     |     |     |     |  |  |
| Туре    | R | R/W            | R/W | R | R/W | R/W | R/W | R/W |  |  |
| Default | 0 | 1              | 1   | 0 | 0   | 1   | 1   | 0   |  |  |

Register: **Device control** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 92h (functions 0, 1)

Default: 66h

Description: This register is provided for PCI1130 compatibility and contains bits that are shared between

functions 0 and 1. The interrupt mode select is programmed through this register which is composed of PCI1251B global bits. The socket-capable force bits are also programmed through this register. Refer to Table 42 for a complete description of the register contents.

**Table 42. Device Control Register** 

| BIT  | SIGNAL    | TYPE | FUNCTION  |
|------|-----------|------|---|
| 7    | RSVD      | R    | Reserved. Bit 7 returns 0 when read.  |
| 6†   | 3VCAPABLE | R/W  | 3-V socket capable force 0 = Not 3-V capable 1 = 3-V capable (default)  |
| 5    | IO16R2    | R/W  | Diagnostic bit. This bit defaults to 1.   |
| 4    | RSVD      | R    | Reserved. Bit 4 returns 0 when read. Writes have no effect.   |
| 3†   | TEST      | R/W  | TI test. Only a 0 should be written to bit 3. This bit can be set to shorten the interrogation counter.   |
| 2–1† | INTMODE   | R/W  | Interrupt mode. Bit 2–1 select the interrupt signaling mode. The interrupt mode bits are encoded:  00 = Parallel PCI interrupts only  01 = Parallel IRQ and parallel PCI interrupts  10 = IRQ serialized interrupts and parallel PCI interrupts INTA and INTB  11 = IRQ and PCI serialized interrupts (default) |
| 0†   | RSVD      | R/W  | Reserved. NAND tree enable bit. There is a NAND tree diagnostic structure in the PCI1251B, and it tests only the pins that are inputs or I/Os. Any output-only terminal on the PCI1251B is excluded from the NAND tree test.  |

<sup>†</sup> These bits are global and should be accessed only through function 0.

diagnostic register

| Bit     | 7   | 6          | 5   | 4   | 3   | 2   | 1   | 0   |  |  |
|---------|-----|------------|-----|-----|-----|-----|-----|-----|--|--|
| Name    |     | Diagnostic |     |     |     |     |     |     |  |  |
| Туре    | R/W | R/W        | R/W | R/W | R/W | R/W | R/W | R/W |  |  |
| Default | 0   | 1          | 1   | 0   | 0   | 0   | 0   | 1   |  |  |

Register: **Diagnostic** Type: Read/Write

Offset: 93h (functions 0, 1)

Default: 61h

Description: This register is provided for internal TI test purposes. It is a read/write register, but only 0s

should be written to this register. Refer to Table 43 for a complete description of the register

contents.

**Table 43. Diagnostic Register** 

| BIT            | SIGNAL    | TYPE | FUNCTION  |
|----------------|-----------|------|---|
| 7†             | TRUE_VAL  | R/W  | True value. This bit defaults to 0 when read. This bit is encoded as:  0 = Reads true values in PCI vendor ID and PCI device ID registers (default)  1 = Reads all 1s in reads to the PCI vendor ID and PCI device ID registers |
| 6              | RSVD      | R/W  | Reserved. This bit is R/W with no function.   |
| 5              | CSC       | R/W  | CSC interrupt routing control.  0 = CSC interrupts routed to PCI if ExCA 803 bit 4 = 1  1 = CSC interrupts routed to PCI if ExCA 805 bits 7–4 = 0000b. (default)  In this case, the setting of ExCA 803 bit 4 is a "don't care" |
| 4†             | DIAG      | R/W  | Diagnostic RETRY_DIS. Delayed transaction disable.  |
| 3†             | DIAG      | R/W  | Diagnostic RETRY_EXT. Extends the latency from 16 to 64.  |
| 2†             | DIAG      | R/W  | Diagnostic DISCARD_TIM_SEL_CB. Set = 2 <sup>10</sup> , reset = 2 <sup>15</sup> .  |
| 1 <sup>†</sup> | DIAG      | R/W  | Diagnostic DISCARD_TIM_SEL_PCI. Set = 2 <sup>10</sup> , reset = 2 <sup>15</sup> .   |
| 0†             | ASYNC_CSC | R/W  | Asynchronous interrupt generation.  0 = CSC interrupt not generated asynchronously  1 = CSC interrupt generated asynchronously (default)  |

<sup>†</sup> These bits are global and should be accessed only through function 0.

SCPS043A - OCTOBER 1998

### socket DMA register 0

| Bit     | 31                    | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17  | 16  |

Register: Socket DMA register 0

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 94h (functions 0, 1)
Default: 0000 0000h

Description: The socket DMA register 0 provides control over the PC Card DMA request (DREQ) signaling.

Refer to Table 44 for a complete description of the register contents.

## Table 44. Socket DMA Register 0

| BIT  | SIGNAL  | TYPE | FUNCTION  |
|------|---------|------|---|
| 31–2 | RSVD    | R    | Reserved. Bits 31–2 return 0s when read.  |
| 1–0  | DREQPIN | R/W  | DMA request (DREQ). Bits 1–0 indicate which pin on the 16-bit PC Card interface acts as DREQ during DMA transfers. This field is encoded as:  00 = Socket not configured for DMA (default).  01 = DREQ uses SPKR.  10 = DREQ uses IOIS16.  11 = DREQ uses INPACK. |

### socket DMA register 1

| Bit     | 31                    | 30                    | 29  | 28  | 27  | 26  | 25  | 24  | 23  | 22  | 21  | 20  | 19 | 18  | 17  | 16  |

Register: Socket DMA register 1

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: 98h (functions 0, 1)
Default: 0000 0000h

Description: The socket DMA register 1 provides control over the distributed DMA (DDMA) registers and

the PCI portion of DMA transfers. The DMA base address locates the DDMA registers in a 16-byte region within the first 64 kbytes of PCI I/O address space. Refer to Table 45 for a

complete description of the register contents.

#### NOTE:

32-bit transfers are not supported; the maximum transfer possible for 16-bit PC Cards is 16 bits.

Table 45. Socket DMA Register 1

| BIT   | SIGNAL   | TYPE | FUNCTION  |
|-------|----------|------|---|
| 31–16 | RSVD     | R    | Reserved. Bits 31–16 return 0s when read.   |
| 15–4  | DMABASE  | R/W  | DMA base address. Locates the socket's DMA registers in PCI I/O space. This field represents a 16-bit PCI I/O address. The upper 16 bits of the address are hardwired to 0, forcing this window to within the lower 64 kbytes of I/O address space. The lower four bits are hardwired to 0 and are included in the address decode. Thus, the window is aligned to a natural 16-byte boundary. |
| 3     | EXTMODE  | R    | Extended addressing. This feature is not supported by the PCI1251B and always returns a 0.  |
| 2–1   | XFERSIZE | R/W  | Transfer size. Bits 2–1 specify the width of the DMA transfer on the PC Card interface and are encoded as:  00 = Transfers are 8 bits (default).  01 = Transfers are 16 bits.  10 = Reserved  11 = Reserved   |
| 0     | DDMAEN   | R/W  | DDMA registers decode enable. Enables the decoding of the distributed DMA registers based on the value of DMABASE.  0 = Disabled (default) 1 = Enabled  |

SCPS043A - OCTOBER 1998

### capability ID register

| Bit     | 7             | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |  |
|---------|---------------|---|---|---|---|---|---|---|--|--|--|--|
| Name    | Capability ID |   |   |   |   |   |   |   |  |  |  |  |
| Туре    | R             | R | R | R | R | R | R | R |  |  |  |  |
| Default | 0             | 0 | 0 | 0 | 0 | 0 | 0 | 1 |  |  |  |  |

Register: Capability ID
Type: Read-only
Offset: A0h
Default: 01h

Description: This register identifies the linked list item as the register for PCI power management. The

register returns 01h when read, which is the unique ID assigned by the PCI SIG for the PCI

location of the capabilities pointer and the value.

### next-item pointer register

| Bit     | 7                 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |  |
|---------|-------------------|---|---|---|---|---|---|---|--|--|--|--|
| Name    | Next-item pointer |   |   |   |   |   |   |   |  |  |  |  |
| Туре    | R                 | R | R | R | R | R | R | R |  |  |  |  |
| Default | 0                 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |  |

Register: **Next-item pointer** 

Type: Read-only
Offset: A1h
Default: 00h

Description: This register is used to indicate the next item in the linked list of the PCI power management

capabilities. Because the PCI1251B functions only include one capabilities item, this register

returns 0s when read.

power management capabilities register

| Bit     | 15 | 14                            | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Register: Power management capabilities

Type: Read-only (see individual bit descriptions)

Offset: A2h (functions 0, 1)

Default: 7E21h

Description: This register contains information on the capabilities of the PC Card function related to power

management. Both PCI1251B CardBus bridge functions support D0, D2, and D3 power

states. Refer to Table 46 for a complete description of the register contents.

**Table 46. Power Management Capabilities Register** 

| BIT   | SIGNAL  | TYPE | FUNCTION   |  |  |  |  |
|-------|---------|------|--|--|--|--|--|
| 15–11 | PME_SUP | R    | PME support. This 4-bit field indicates the power states from which the PCI1251B supports asserting PME.  A 0 for any bit indicates that the CardBus function cannot assert PME from that power state. These four bits return 1110b when read. Each of these bits is described below:  Bit 15 contains the value 0, indicating that PME cannot be asserted from D3 <sub>COId</sub> state.  Bit 14 contains the value 1, indicating that PME can be asserted from D3 <sub>hot</sub> state.  Bit 13 contains the value 1, indicating that PME can be asserted from D2 state.  Bit 12 contains the value 1, indicating that PME can be asserted from D1 state.  Bit 11 contains the value 1, indicating that PME can be asserted from the D0 state. |  |  |  |  |
| 10    | D2_SUP  | R    | D2 support. Bit 10 returns a 1 when read, indicating that the CardBus function supports the D2 device power state.   |  |  |  |  |
| 9     | D1_SUP  | R    | D1 support. Bit 9 returns a 1 when read, indicating that the CardBus function supports the D1 device power state.  |  |  |  |  |
| 8–6   | RSVD    | R    | Reserved. Bits 8–6 return 000b when read.  |  |  |  |  |
| 5     | DSI     | R    | Device-specific initialization. Bit 5 returns 1 when read, indicating that the CardBus controller functions require special initialization (beyond the standard PCI configuration header) before the generic class device driver is able to use it.  |  |  |  |  |
| 4     | AUX_PWR | R    | Auxiliary power source. This bit is meaningful only if bit 15 (D3 <sub>COld</sub> supporting PME) is set. When set, bit 4 indicates that support for PME in D3cold requires auxiliary power.  0 = Function supplies its own auxiliary power source  1 = Support for PME in D3cold requires auxiliary power supplied to the system by a proprietary source.   |  |  |  |  |
| 3     | PMECLK  | R    | PME clock. When set, bit 3 indicates that the function relies on the presence of the PCI clock for PME operation.  0 = PCI clock not required for the function to generate PME  1 = PCI function required to generate PME  |  |  |  |  |
| 2–0   |         | R    | Version. Bits 2–0 return 001b when read, indicating that there are four bytes of general-purpose power management (PM) registers as described in the <i>PCI Bus Power Management Interface Specification Revision 1.0.</i>   |  |  |  |  |

SCPS043A - OCTOBER 1998

#### power management control/status register

| Bit     | 15  | 14                              | 13 | 12 | 11 | 10 | 9 | 8   | 7 | 6 | 5 | 4 | 3 | 2 | 1   | 0   |
|---------|-----|---------------------------------|----|----|----|----|---|-----|---|---|---|---|---|---|-----|-----|
| Name    |     | Power management control/status |    |    |    |    |   |     |   |   |   |   |   |   |     |     |
| Туре    | R/W | R                               | R  | R  | R  | R  | R | R/W | R | R | R | R | R | R | R/W | R/W |
| Default | 0   | 0                               | 0  | 0  | 0  | 0  | 0 | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0   | 0   |

Register: Power management control/status

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: A4h (functions 0, 1)

Default: 000000h

Description: This register determines and changes the current power state of the PCI1251B CardBus

function. The contents of this register are not affected by the internally-generated reset caused by the transition from  $D3_{hot}$  to D0 state. Refer to Table 47 for a complete description of

the register contents.

#### NOTE:

A transition from the D3<sub>hot</sub> state to the D0 state resets all PCI, ExCA, and CardBus registers. TI specific, PCI power management, and legacy base address registers are not affected.

Table 47. Power Management Control/Status Register

| BIT   | SIGNAL    | TYPE | FUNCTION  |  |  |
|-------|-----------|------|---|--|--|
| 15    | PMESTAT   | R/W  | PME status. Bit 15 is set when the CardBus function would normally assert PME, independent of the state of the PME_EN bit. Bit 15 is cleared by a write back of 1, and this also clears the PME signal if PME was asserted by this function. Writing a 0 to this bit has no effect. |  |  |
| 14–13 | DATASCALE | R    | Data scale. This 2-bit field returns 0s when read. The CardBus function does not return any dynamic data as indicated by the DYN_DATA bit.  |  |  |
| 12–9  | DATASEL   | R    | Data select. This 4-bit field returns 0s when read. The CardBus function does not return any dynamic lata as indicated by the DYN_DATA bit.   |  |  |
| 8     | PME_EN    | R/W  | PME enable. Bit 8 enables the function to assert PME. If this bit is cleared, then assertion of PME is disabled.  |  |  |
| 7–2   | RSVD      | R    | Reserved. Bits 7–2 return 0s when read.   |  |  |
| 1–0   | PWRSTATE  | R/W  | Power state. This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. This field is encoded as: $00 = D0$ $01 = D1$ $10 = D2$ $11 = D3_{hot}$   |  |  |

#### power management control/status register bridge support extensions

| Bit     | 7 | 6  | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|--|---|---|---|---|---|---|--|--|--|
| Name    |   | Power management control/status register bridge support extensions |   |   |   |   |   |   |  |  |  |
| Туре    | R | R  | R | R | R | R | R | R |  |  |  |
| Default | 1 | 0  | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |

Register: Power management control/status register bridge support extensions

Type: Read-only

Offset: A6h (functions 0, 1)

Default: 80h

Description: The power management control/status register bridge support extensions support PCI bridge

specific functionality and are required for all PCI-to-PCI bridges. Refer to Table 48 for a

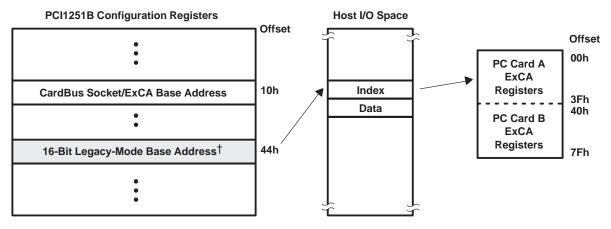

complete description of the register contents.

Table 48. Power Management Control/Status Register Bridge Support Extensions

| BIT | SIGNAL  | TYPE | FUNCTION  |
|-----|---------|------|---|
| 7   | BPCC_EN | R    | Bus power/clock control. When read, bit 7 returns 1b. This bit is encoded as:  0 = Bus power/clock control is disabled.  1 = Bus power/clock control is enabled (default).  A 0 indicates that the bus power/clock control policies defined in the PCI Power Management specification are disabled. When the bus power/clock control enable mechanism is disabled the bridge's PMCSR PowerState field cannot be used by the system software to control the power or the clock of the bridge's secondary bus. A 1 indicates that the bus power/clock control mechanism is enabled. |
| 6   | B2_B3   | R    | B2/B3 support for D3 <sub>hot</sub> . The state of this bit determines the action that is to occur as a direct result of programming the function to D3 <sub>hot</sub> . This bit is meaningful only if bit 7 BPCC_Enable is a 1. This bit is encoded as:  0 = When the bridge is programmed to D3 <sub>hot</sub> , its secondary bus has its power removed (B3)  1 = When the bridge is programmed to D3 <sub>hot</sub> , its secondary bus's PCI clock is stopped (B2).   |
| 5–0 | RSVD    | R    | Reserved. These bits return 0s when read.   |

## ExCA compatibility registers (functions 0 and 1)

The ExCA (Exchangeable Card Architecture) registers implemented in the PCI1251B are register-compatible with the popular Intel 82365SL–DF PCMCIA controller. ExCA registers are identified by an offset value that is compatible with the legacy I/O index/data scheme used on the Intel 82365 ISA controller. The ExCA registers are accessed through this scheme by writing the register offset value into the index register (I/O base) and reading or writing the data register (I/O base + 1). The I/O base address used in the index/data scheme is programmed in the PC Card 16-Bit I/F legacy mode base address register, which is shared by both card sockets. The offsets from this base address run contiguous from 00h to 3Fh for socket A, and from 40h to 7Fh for socket B. Figure 17 illustrates an ExCA I/O mapping. Table 49 identifies each ExCA register and its respective ExCA offset.

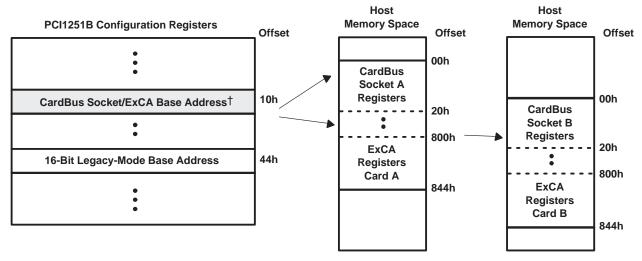

†The 16-bit legacy mode base address register is shared by functions 0 and 1 as indicated by the shading.

Figure 17. ExCA Register Access Through I/O

The TI PCI1251B also provides a memory mapped alias of the ExCA registers by directly mapping them into PCI memory space. They are located through the CardBus Socket Registers/ExCA Registers Base Address Register (PCI Register 10h) at memory offset 800h. Each socket has a separate base address programmable by function. Figure 18 illustrates an ExCA memory mapping. The memory offsets are 800h–844h for both functions 0 and 1. This illustration also identifies the CardBus Socket Register mapping, which is mapped into the same 4K window at memory offset 0h.

## ExCA compatibility registers (functions 0 and 1) (continued)

† The CardBus socket/ExCA base address mode register is separate for functions 0 and 1.

Figure 18. ExCA Register Access Through Memory

The ExCA interrupt registers, as defined by the 82365SL Specification, control such card functions as reset, type, interrupt routing, and interrupt enables. Special attention must be paid to the interrupt routing registers and the host interrupt signaling method selected for the PCI1251B to ensure that all possible PCI1251B interrupts can potentially be routed to the programmable interrupt controller. The ExCA registers that are critical to the interrupt signaling are at memory address ExCA offset 803h and 805h.

Access to I/O mapped 16-bit PC cards is available to the host system via two ExCA I/O windows. These are regions of host I/O address space into which the card I/O space is mapped. These windows are defined by start, end, and offset addresses programmed in the ExCA registers described in this section. I/O windows have byte granularity.

Access to memory mapped 16-bit PC Cards is available to the host system via five ExCA memory windows. These are regions of host memory space into which the card memory space is mapped. These windows are defined by start, end, and offset addresses programmed in the ExCA registers described in this section. Memory windows have 4-kbyte granularity.

Table 49. ExCA Registers and Offsets

|  | PCI MEMORY ADDRESS | ExCA OFF | SET (HEX) |
|--|--------------------|----------|-----------|
| REGISTER NAME                              | OFFSET (HEX)       | CARD A   | CARD B    |
| Identification and revision                | 800                | 00       | 40        |
| Interface status                           | 801                | 01       | 41        |
| Power control                              | 802                | 02       | 42        |
| Interrupt and general control              | 803                | 03       | 43        |
| Card status change                         | 804                | 04       | 44        |
| Card status-change-interrupt configuration | 805                | 05       | 45        |
| Address window enable                      | 806                | 06       | 46        |
| I / O window control                       | 807                | 07       | 47        |

SCPS043A - OCTOBER 1998

## ExCA identification and revision register<sup>†</sup> (index 00h)

| Bit     | 7   | 6                                | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|----------------------------------|-----|-----|-----|-----|-----|-----|--|--|--|
| Name    |     | ExCA identification and revision |     |     |     |     |     |     |  |  |  |
| Туре    | R/W | R/W                              | R/W | R/W | R/W | R/W | R/W | R/W |  |  |  |
| Default | 1   | 0                                | 0   | 0   | 0   | 1   | 0   | 0   |  |  |  |

Register: ExCA identification and revision

Type: Read-only, Read/Write (see individual bit descriptions)
Offset: Card A ExCA offset 00h

Card B ExCA offset 40h

Default: 84h

Description: This register provides host software with information on 16-bit PC Card support and Intel

82365SL-DF compatibility. Refer to Table 50 for a complete description of the register

contents.

## Table 50. ExCA Identification and Revision Register (Index 00h)

| BIT | SIGNAL | TYPE | FUNCTION  |  |  |  |
|-----|--------|------|---|--|--|--|
| 7–6 | IFTYPE | R/W  | Interface type. These bits default to 10b and identify the 16-bit PC Card support provided by the PCI1251B. The PCI1251B supports both I/O and memory 16-bit PC cards.  |  |  |  |
| 5–4 | RSVD   | R/W  | Reserved. Bits 5–4 can be used for Intel 82365SL-DF emulation.  |  |  |  |
| 3–0 | 365REV | R/W  | Intel 82365SL-DF revision. This read/write field stores the Intel 82365SL-DF revision supported by the PCI1251B. Host software can read this field to determine compatibility to the Intel 82365SL-DF register set. This field defaults to 0100b upon PCI1251B reset. |  |  |  |

<sup>&</sup>lt;sup>†</sup> When bit 5 in the system control register is 1, this register is read-only.

ExCA interface status register (index 01h)

| Bit     | 7 | 6                     | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|-----------------------|---|---|---|---|---|---|--|--|--|
| Name    |   | ExCA interface status |   |   |   |   |   |   |  |  |  |
| Туре    | R | R                     | R | R | R | R | R | R |  |  |  |
| Default | 0 | 0                     | Х | Х | Х | Х | Х | Х |  |  |  |

Register: **ExCA interface status** 

Type: Read-only (see individual bit descriptions)

Offset: CardBus socket address + 801h: Card A ExCA offset 01h

Card B ExCA offset 41h

Default: 00XX XXXXb

Description: This register provides information on the current status of the PC Card interface. An X in the

default bit value indicates that the value of the bit after reset depends on the state of the PC Card interface. Refer to Table 51 for a complete description of the register contents.

Table 51. ExCA Interface Status Register (Index 01h)

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7   | RSVD     | R    | Reserved. Bit 7 returns 0 when read. Writes have no effect.  |
| 6   | CARDPWR  | R    | Card Power. Bit 6 indicates the current power status of the PC Card socket. This bit reflects how the power control register has been programmed. Bit 6 is encoded as:  0 = V <sub>CC</sub> and V <sub>PP</sub> to the socket turned off (default)  1 = V <sub>CC</sub> and V <sub>PP</sub> to the socket turned on  |
| 5   | READY    | R    | Ready. Bit 5 indicates the current status of the READY signal at the PC Card interface.  0 = PC Card not ready for data transfer  1 = PC Card ready for data transfer  |
| 4   | CARDWP   | R    | Card write protect. Bit 4 indicates the current status of WP at the PC Card interface. This signal reports to the PCI1251B whether or not the memory card is write protected. Furthermore, write protection for an entire PCI1251B 16-bit memory window is available by setting the appropriate bit in the memory window offset high-byte register.  0 = WP is 0. PC Card is R/W.  1 = WP is 1. PC Card is read-only.  |
| 3   | CDETECT2 | R    | Card detect 2. Bit 3 indicates the status of CD2 at the PC Card interface. Software may use this and CDETECT1 to determine if a PC Card is fully seated in the socket.  0 = CD2 is 1. No PC Card is inserted.  1 = CD2 is 0. PC Card is at least partially inserted.   |
| 2   | CDETECT1 | R    | Card detect 1. Bit 2 indicates the status of CD1 at the PC Card interface. Software may use this and CDETECT2 to determine if a PC Card is fully seated in the socket.  0 = CD1 is 1. No PC Card is inserted.  1 = CD1 is 0. PC Card is at least partially inserted.   |
| 1–0 | BVDSTAT  | R    | Battery voltage detect. When a 16-bit memory card is inserted, the field indicates the status of the battery voltage detect signals (BVD1, BVD2) at the PC Card interface, where bit 1 reflects the BVD1 status and bit 0 reflects BVD2.  00 = Battery dead 01 = Battery dead 10 = Battery low; warning 11 = Battery good  When a 16-bit I/O card is inserted, this field indicates the status of SPKR (bit 1) and STSCHG (bit 0) at the PC Card interface. In this case, the two bits in this field directly reflect the current state of these card outputs. |

SCPS043A - OCTOBER 1998

### ExCA power control register (index 02h)

| Bit     | 7   | 6                  | 5 | 4   | 3   | 2 | 1   | 0   |  |  |
|---------|-----|--------------------|---|-----|-----|---|-----|-----|--|--|
| Name    |     | ExCA power control |   |     |     |   |     |     |  |  |
| Туре    | R/W | R                  | R | R/W | R/W | R | R/W | R/W |  |  |
| Default | 0   | 0                  | 0 | 0   | 0   | 0 | 0   | 0   |  |  |

Register: **ExCA power control** 

Type: Read-only, Read/Write (see individual bit descriptions)
Offset: Card A ExCA offset 02h

Card B ExCA offset 42h

Default: 00h

Description: This register provides PC Card power control. Bit 7 of this register controls the 16-bit outputs

on the socket interface and can be used for power management in 16-bit PC Card

applications. Refer to Table 52 for a complete description of the register contents.

#### Table 52. ExCA Power Control Register (Index 02h)

| BIT | SIGNAL  | TYPE | FUNCTION   |
|-----|---------|------|--|
| 7   | COE     | R/W  | Card output enable. Bit 7 controls the state of all of the 16-bit outputs on the PCI1251B. This bit is encoded as:  0 = 16-bit PC Card outputs disabled (default)  1 = 16-bit PC Card outputs enabled  |
| 6–5 | RSVD    | R    | Reserved. Bits 6–5 return 0s when read. Writes have no effect.   |
| 4–3 | EXCAVCC | R/W  | V <sub>CC</sub> . Bits 4–3 are used to request changes to card V <sub>CC</sub> . This field is encoded as: $00 = 0 \text{ V (default)}$ $01 = 0 \text{ V reserved}$ $10 = 5 \text{ V}$ $11 = 3 \text{ V}$  |
| 2   | RSVD    | R    | Reserved. Bit 2 returns 0 when read. Writes have no effect.  |
| 1–0 | EXCAVPP | R/W  | Vpp. Bits 1–0 are used to request changes to card Vpp. The PCI1251B ignores this field unless V <sub>CC</sub> to the socket is enabled (i.e., 5 V or 3.3 V). This field is encoded as: $00 = 0 \text{ V (default)}$ $01 = \text{V}_{CC}$ $10 = 12 \text{ V}$ $11 = 0 \text{ V reserved}$ |

ExCA interrupt and general-control register (index 03h)

| Bit     | 7   | 6                                  | 5 | 4 | 3 | 2 | 1 | 0 |  |  |
|---------|-----|------------------------------------|---|---|---|---|---|---|--|--|
| Name    |     | ExCA interrupt and general control |   |   |   |   |   |   |  |  |
| Туре    | R/W | R/W R/W R/W R/W R/W R/W            |   |   |   |   |   |   |  |  |
| Default | 0   | 0                                  | 0 | 0 | 0 | 0 | 0 | 0 |  |  |

Register: **ExCA interrupt and general control**Type: Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 803h: Card A ExCA offset 03h

Card B ExCA offset 43h

Default: 00h

Description: This register controls interrupt routing for I/O interrupts, as well as other critical 16-bit

PC Card functions. Refer to Table 53 for a complete description of the register contents.

Table 53. ExCA Interrupt and General-Control Register (Index 03h)

| BIT | SIGNAL    | TYPE | FUNCTION   |
|-----|-----------|------|--|
| 7   | RINGEN    | R/W  | Card ring indicate enable. Bit 7 enables the ring indicate function of BVD1/RI. This bit is encoded as:  0 = Ring indicate disabled (default)  1 = Ring indicate enabled   |
| 6   | CARD_RST  | R/W  | Card reset. Bit 6 controls the 16-bit PC Card RESET, and allows host software to force a card reset. Bit 6 affects 16-bit cards only. This bit is encoded as 0 = RESET signal asserted (default) 1 = RESET signal deasserted   |
| 5   | CARDTYPE  | R/W  | Card type. Bit 5 indicates the PC card type. This bit is encoded as:  0 = Memory PC Card installed (default)  1 = I/O PC Card installed  |
| 4   | CSCROUTE  | R/W  | PCI Interrupt CSC routing enable bit. When bit 4 is set (high), the card status change interrupts are routed to PCI interrupts. When low, the card status change interrupts are routed using bits 7–4 in the ExCA card status change interrupt configuration register. This bit is encoded as:  0 = CSC interrupts are routed by ExCA registers (default).  1 = CSC interrupts are routed to PCI interrupts.   |
| 3–0 | INTSELECT | R/W  | Card interrupt select for I/O PC Card functional interrupts. Bits 3–0 select the interrupt routing for I/O PC Card functional interrupts. This field is encoded as:  0000 = No interrupt routing (default). CSC interrupts routed to PCI interrupts. This bit setting is OR'ed with ExCA bit 4 for backwards compatibility.  0001 = IRQ1 enabled 0010 = SMI enabled 0011 = IRQ3 enabled 0100 = IRQ4 enabled 0101 = IRQ5 enabled 0100 = IRQ6 enabled 0111 = IRQ7 enabled 1001 = IRQ9 enabled 1001 = IRQ9 enabled 1010 = IRQ10 enabled 1011 = IRQ11 enabled 1101 = IRQ11 enabled 1101 = IRQ12 enabled 1101 = IRQ13 enabled 1101 = IRQ14 enabled 1111 = IRQ14 enabled |

SCPS043A - OCTOBER 1998

#### ExCA card status-change register (index 04h)

| Bit     | 7 | 6                       | 5 | 4 | 3 | 2 | 1 | 0 |  |  |
|---------|---|-------------------------|---|---|---|---|---|---|--|--|
| Name    |   | ExCA card status change |   |   |   |   |   |   |  |  |
| Туре    | R | R R R R R R             |   |   |   |   |   |   |  |  |
| Default | 0 | 0                       | 0 | 0 | 0 | 0 | 0 | 0 |  |  |

Register: ExCA card status change

Type: Read-only (see individual bit descriptions)

Offset: CardBus socket address + 804h: Card A ExCA offset 04h

Card B ExCA offset 44h

Default: 00h

Description: This register reflects the status of PC Card CSC interrupt sources. The ExCA card

status-change interrupt configuration register, Table 55, enables these interrupt sources to generate an interrupt to the host. When the interrupt source is disabled, the corresponding bit in this register always reads 0. When an interrupt source is enabled, the corresponding bit in this register is set to indicate that the interrupt source is active. After generating the interrupt to the host, the interrupt service routine must read this register to determine the source of the interrupt. The interrupt service routine is responsible for resetting the bits in this register as well. Resetting a bit is accomplished by one of two methods: a read of this register or an explicit write back of 1 to the status bit. The choice of these two methods is based on the interrupt flag clear mode select, bit 2, in the global control register. Refer to Table 54 for a complete description of the register contents.

Table 54. ExCA Card Status-Change Register (Index 04h)

| BIT | SIGNAL      | TYPE | FUNCTION  |
|-----|-------------|------|---|
| 7–4 | RSVD        | R    | Reserved. Bits 7–4 return 0s when read. Writes have no effect.  |
| 3   | CDCHANGE    | R    | Card detect change. Bit 3 indicates whether a change on CD1 or CD2 occurred at the PC Card interface. A read of this bit or writing a 1 to this bit clears it. This bit is encoded as:  0 = No change detected on either CD1 or CD2  1 = Change detected on either CD1 or CD2   |
| 2   | READYCHANGE | R    | Ready change. When a 16-bit memory is installed in the socket, bit 2 includes whether the source of a PCI1251B interrupt was due to a change on READY at the PC Card interface, indicating that the PC Card is now ready to accept new data. A read of this bit or writing a 1 to this bit clears it. This bit is encoded as:  0 = No low-to-high transition detected on READY (default)  1 = Detected low-to-high transition on READY  When a 16-bit I/O card is installed, bit 2 is always 0. |
| 1   | BATWARN     | R    | Battery warning change. When a 16-bit memory card is installed in the socket, bit 1 indicates whether the source of a PCI1251B interrupt was due to a battery-low warning condition. A read of this bit or writing a 1 to this bit clears it. This bit is encoded as:  0 = No battery warning condition (default)  1 = Detected battery warning condition  When a 16-bit I/O card is installed, bit 1 is always 0.  |
| 0   | BATDEAD     | R    | Battery dead or status change. When a 16-bit memory card is installed in the socket, bit 0 indicates whether the source of a PCI1251B interrupt was due to a battery dead condition. A read of this bit or writing a 1 to this bit clears it. This bit is encoded as:  0 = STSCHG deasserted (default)  1 = STSCHG asserted  Ring indicate. When the PCI1251B is configured for ring indicate operation, bit 0 indicates the status of RI.  |

#### ExCA card status-change-interrupt configuration register (index 05h)

| Bit     | 7   | 6  | 5 | 4 | 3 | 2 | 1 | 0   |  |  |
|---------|-----|--|---|---|---|---|---|-----|--|--|
| Name    |     | ExCA status-change-interrupt configuration |   |   |   |   |   |     |  |  |
| Туре    | R/W | R/W R/W R/W R/W R/W R/W R/W R/             |   |   |   |   |   | R/W |  |  |
| Default | 0   | 0  | 0 | 0 | 0 | 0 | 0 | 0   |  |  |

Register: ExCA card status-change-interrupt configuration

Type: Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 805h: Card A ExCA offset 05h

Card B ExCA offset 45h

Default: 00h

Description: This register controls interrupt routing for card status-change interrupts, as well as masking

CSC interrupt sources. Refer to Table 55 for a complete description of the register contents.

Table 55. ExCA Card Status-Change-Interrupt Configuration Register (Index 05h)

| BIT | SIGNAL    | TYPE | FUNCTION   |
|-----|-----------|------|--|
| 7–4 | CSCSELECT | R/W  | Interrupt select for card status change. Bits 7–4 select the interrupt routing for card status change interrupts. 0000 = CSC interrupts routed to PCI interrupts if bit 5 of the Diagnostic register (PCI Offset 93h) is set to 1b. In this case bit 4 of ExCA 803 is a don't care. This is the default setting.  0000 = No ISA interrupt routing if bit 5 of the Diagnostic register (PCI Offset 93h) is set to 0b. In this case, CSC interrupts are routed to PCI interrupts by setting bit 4 of ExCA 803 to 1b. This field is encoded as:  0000 = No interrupt routing (default)  0001 = IRQ1 enabled  0010 = SMI enabled  0010 = IRQ4 enabled  0010 = IRQ5 enabled  0011 = IRQ5 enabled  1010 = IRQ6 enabled  1000 = IRQ8 enabled  1001 = IRQ9 enabled  1001 = IRQ10 enabled  1011 = IRQ11 enabled  1011 = IRQ11 enabled  1101 = IRQ12 enabled  1110 = IRQ13 enabled  1111 = IRQ15 enabled |
| 3   | CDEN      | R/W  | Card detect enable. Bit 3 enables interrupts on CD1 or CD2 changes. This bit is encoded as:  0 = Disables interrupts on CD1 or CD2 line changes (default)  1 = Enables interrupts on CD1 or CD2 line changes   |
| 2   | READYEN   | R/W  | Ready enable. Bit 2 enables/disables a low-to-high transition on PC Card READY to generate a host interrupt. This interrupt source is considered a card status change. This bit is encoded as:  0 = Disables host interrupt generation (default)  1 = Enables host interrupt generation  |
| 1   | BATWARNEN | R/W  | Battery Warning Enable. Bit 1 enables/disables a battery warning condition to generate a CSC interrupt. This bit is encoded as:  0 = Disables host interrupt generation (default)  1 = Enables host interrupt generation   |
| 0   | BATDEADEN | R/W  | Battery dead enable. Bit 0 enables/disables a battery dead condition on a memory PC Card or assertion of the STSCHG I/O PC Card signal to generate a CSC interrupt.  0 = Disables host interrupt generation (default)  1 = Enables host interrupt generation   |

#### ExCA address window enable register (index 06h)

| Bit     | 7   | 6                          | 5 | 4   | 3   | 2   | 1   | 0   |  |  |
|---------|-----|----------------------------|---|-----|-----|-----|-----|-----|--|--|
| Name    |     | ExCA address window enable |   |     |     |     |     |     |  |  |
| Туре    | R/W | R/W                        | R | R/W | R/W | R/W | R/W | R/W |  |  |
| Default | 0   | 0                          | 0 | 0   | 0   | 0   | 0   | 0   |  |  |

Register: ExCA address window enable

Type: Read-only, Read/Write (see individual bit descriptions)
Offset: Card A ExCA offset 06h

Card B ExCA offset 46h

Default: 00h

Description: This register enables/disables the memory and I/O windows to the 16-bit PC Card. By default,

all windows to the card are disabled. The PCI1251B does not acknowledge PCI memory or I/O cycles to the card if the corresponding enable bit in this register is 0, regardless of the programming of the memory or I/O window start/end/offset address registers. Refer to

Table 56 for a complete description of the register contents.

## Table 56. ExCA Address Window Enable Register (Index 06h)

| BIT | SIGNAL    | TYPE | FUNCTION   |
|-----|-----------|------|--|
| 7   | IOWIN1EN  | R/W  | I/O window 1 enable. Bit 7 enables/disables I/O window 1 for the PC Card. This bit is encoded as:  0 = I/O window 1 disabled (default)  1 = I/O window 1 enabled             |
| 6   | IOWIN0EN  | R/W  | I/O window 0 enable. Bit 6 enables/disables I/O window 0 for the PC Card. This bit is encoded as:  0 = I/O window 0 disabled (default)  1 = I/O window 0 enabled             |
| 5   | RSVD      | R    | Reserved. Bit 5 returns 0 when read. Writes have no effect.  |
| 4   | MEMWIN4EN | R/W  | Memory window 4 enable. Bit 4 enables/disables memory window 4 for the PC Card. This bit is encoded as:  0 = Memory window 4 disabled (default)  1 = Memory window 4 enabled |
| 3   | MEMWIN3EN | R/W  | Memory window 3 enable. Bit 3 enables/disables memory window 3 for the PC Card. This bit is encoded as:  0 = Memory window 3 disabled (default)  1 = Memory window 3 enabled |
| 2   | MEMWIN2EN | R/W  | Memory window 2 enable. Bit 2 enables/disables memory window 2 for the PC Card. This bit is encoded as:  0 = Memory window 2 disabled (default)  1 = Memory window 2 enabled |
| 1   | MEMWIN1EN | R/W  | Memory window 1 enable. Bit 1 enables/disables memory window 1 for the PC Card. This bit is encoded as:  0 = Memory window 1 disabled (default)  1 = Memory window 1 enabled |
| 0   | MEMWIN0EN | R/W  | Memory window 0 enable. Bit 0 enables/disables memory window 0 for the PC Card. This bit is encoded as:  0 = Memory window 0 disabled (default)  1 = Memory window 0 enabled |

### ExCA I/O window control register (index 07h)

| Bit     | 7   | 6                           | 5 | 4 | 3 | 2 | 1 | 0   |  |  |
|---------|-----|-----------------------------|---|---|---|---|---|-----|--|--|

| Туре    | R/W | R/W R/W R/W R/W R/W R/W R/W |   |   |   |   |   | R/W |  |  |
| Default | 0   | 0                           | 0 | 0 | 0 | 0 | 0 | 0   |  |  |

Register: ExCA I/O window control

Type: Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 807h: Card A ExCA offset 07h

Card B ExCA offset 47h

Default: 00h

Description: This register contains parameters related to I/O window sizing and cycle timing. Refer to

Table 57 for a complete description of the register contents.

## Table 57. ExCA I/O Window Control Register (Index 07h)

| BIT | SIGNAL     | TYPE | FUNCTION   |
|-----|------------|------|--|
| 7   | WAITSTATE1 | R/W  | I/O window 1 wait state. Bit 7 controls the I/O window 1 wait state for 16-bit I/O accesses. Bit 7 has no effect on 8-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as:  0 = 16-bit cycles have standard length (default).  1 = 16-bit cycles are extended by one equivalent ISA wait state.    |
| 6   | ZEROWS1    | R/W  | I/O window 1 zero wait state. Bit 6 controls the I/O window 1 wait state for 8-bit I/O accesses. Bit 6 has no effect on 16-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as:  0 = 8-bit cycles have standard length (default).  1 = 8-bit cycles are reduced to equivalent of three ISA cycles. |
| 5   | IOIS16W1   | R/W  | I/O window 1 IOIS16 source. Bit 5 controls the I/O window 1 automatic data sizing feature that uses IOIS16 from the PC Card to determine the data width of the I/O data transfer. This bit is encoded as:  0 = Window data width determined by DATASIZE1, bit 4 (default).  1 = Window data width determined by IOIS16.  |
| 4   | DATASIZE1  | R/W  | I/O window 1 data size. Bit 4 controls the I/O window 1 data size. Bit 4 is ignored if the I/O window 1 IOIS16 source bit (bit 5) is set. This bit is encoded as:  0 = Window data width is 8 bits (default).  1 = Window data width is 16 bits.   |
| 3   | WAITSTATE0 | R/W  | I/O window 0 wait state. Bit 3 controls the I/O window 0 wait state for 16-bit I/O accesses. Bit 3 has no effect on 8-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as:  0 = 16-bit cycles have standard length (default).  1 = 16-bit cycles are extended by one equivalent ISA wait state.    |
| 2   | ZEROWS0    | R/W  | I/O window 0 zero wait state. Bit 2 controls the I/O window 0 wait state for 8-bit I/O accesses. Bit 2 has no effect on 16-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as:  0 = 8-bit cycles have standard length (default).  1 = 8-bit cycles are reduced to equivalent of three ISA cycles. |
| 1   | IOIS16W0   | R/W  | I/O window 0 IOIS16 source. Bit 1 controls the I/O window 0 automatic data sizing feature that uses IOIS16 from the PC Card to determine the data width of the I/O data transfer. This bit is encoded as:  0 = Window data width is determined by DATASIZE0, bit 0 (default).  1 = Window data width is determined by IOIS16.  |
| 0   | DATASIZE0  | R/W  | I/O window 0 data size. Bit 0 controls the I/O window 0 data size. Bit 0 is ignored if the I/O window 0 IOIS16 source bit (bit 1) is set. This bit is encoded as:  0 = Window data width is 8 bits (default).  1 = Window data width is 16 bits.   |

SCPS043A - OCTOBER 1998

### ExCA I/O window 0 and 1 start-address low-byte register (index 08h, 0Ch)

| Bit     | 7   | 6  | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|--|-----|-----|-----|-----|-----|-----|--|--|--|
| Name    |     | ExCA I/O window 0 and 1 start-address low byte |     |     |     |     |     |     |  |  |  |
| Туре    | R/W | R/W  | R/W | R/W | R/W | R/W | R/W | R/W |  |  |  |
| Default | 0   | 0  | 0   | 0   | 0   | 0   | 0   | 0   |  |  |  |

Register: ExCA I/O window 0 start-address low byte

Offset: CardBus socket address + 808h: Card A ExCA offset 08h

Card B ExCA offset 48h

Register: ExCA I/O window 1 start-address low byte

Offset: CardBus socket address + 80Ch: Card A ExCA offset 0Ch

Card B ExCA offset 4Ch

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the low byte of the 16-bit I/O window start address for I/O windows 0

and 1. The eight bits of these registers correspond to the lower eight bits of the start address.

### ExCA I/O window 0 and 1 start-address high-byte register (index 09h, 0Dh)

| Bit     | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|---|-----|-----|-----|-----|-----|-----|--|--|--|
| Name    |     | ExCA I/O window 0 and 1 start-address high byte |     |     |     |     |     |     |  |  |  |
| Туре    | R/W | R/W   | R/W | R/W | R/W | R/W | R/W | R/W |  |  |  |

Register: ExCA I/O window 0 start-address high byte

Offset: CardBus socket address + 809h: Card A ExCA offset 09h

Card B ExCA offset 49h

Register: ExCA I/O window 1 start-address high byte

Offset: CardBus socket address + 80Dh: Card A ExCA offset 0Dh

Card B ExCA offset 4Dh

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the high byte of the 16-bit I/O window start address for I/O windows 0

and 1. The eight bits of these registers correspond to the upper eight bits of the start address.

SCPS043A - OCTOBER 1998

#### ExCA I/O window 0 and 1 end-address low-byte register (index 0Ah, 0Eh)

| Bit     | 7   | 6  | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|--|-----|-----|-----|-----|-----|-----|--|--|--|

Offset: CardBus socket address + 829h: Card A ExCA offset 29h

Card B ExCA offset 69h

Register: ExCA memory window 4 start-address high byte

Offset: CardBus socket address + 831h: Card A ExCA offset 31h

Card B ExCA offset 71h

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the high nibble of the 16-bit memory window start address for memory

windows 0, 1, 2, 3, and 4. The lower four bits of these registers correspond to bits A23–A20 of the start address. In addition, the memory window data width and wait states are set in

this register. Refer to Table 58 for a complete description of the register contents.

Table 58. ExCA Memory Window 0-4 Start-Address High-Byte Register (Index 11h, 19h, 21h, 29h, 31h)

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7   | DATASIZE | R/W  | Data size. Bit 7 controls the memory window data width. This bit is encoded as:  0 = Window data width is 8 bits (default).  1 = Window data width is 16 bits.   |
| 6   | ZEROWAIT | R/W  | Zero wait state. Bit 6 controls the memory window wait state for 8- and 16-bit accesses. This wait-state timing emulates the ISA wait state used by the Intel 82365SL-DF. This bit is encoded as:  0 = 8- and 16-bit cycles have standard length (default).  1 = 8-bit cycles are reduced to equivalent of three ISA cycles.  16-bit cycles are reduced to equivalent of two ISA cycles. |
| 5–4 | SCRATCH  | R/W  | Scratch pad bits. Bits 5–4 have no effect on memory window operation.  |
| 3–0 | STAHN    | R/W  | Start-address high nibble. Bits 3–0 represent the upper address bits A23–A20 of the memory window start address.   |

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the low byte of the 16-bit memory window offset address for memory

windows 0, 1, 2, 3, and 4. The eight bits of these registers correspond to bits A19-A12 of the

offset address.

#### ExCA memory window 0-4 offset-address high-byte register (index 15h, 1Dh, 25h, 2Dh, 35h)

| Bit     | 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|---|-----|-----|-----|-----|-----|-----|--|--|--|
| Name    |     | ExCA memory window 0-4 offset-address high byte |     |     |     |     |     |     |  |  |  |
| Туре    | R/W | R/W   | R/W | R/W | R/W | R/W | R/W | R/W |  |  |  |

Register: ExCA memory window 0 offset-address high byte

Offset: CardBus socket address + 815h: Card A ExCA offset 15h

Card B ExCA offset 55h

Register: ExCA memory window 1 offset-address high byte

CardBus socket address + 81Dh: Card A ExCA offset 1Dh

Card B ExCA offset 5Dh

Register: ExCA memory window 2 offset-address high byte

Offset: CardBus socket address + 825h: Card A ExCA offset 25h

Card B ExCA offset 65h

Register: ExCA memory window 3 offset-address high byte

Offset: CardBus socket address + 82Dh: Card A ExCA offset 2Dh

Card B ExCA offset 6Dh

Register: ExCA memory window 4 offset-address high byte

Offset: CardBus socket address + 835h: Card A ExCA offset 35h

Card B ExCA offset 75h

Type: Read-only, Read/Write (see individual bit descriptions)

Default: 00h Size: One byte

Offset:

Description: These registers contain the high six bits of the 16-bit memory window offset address for

memory windows 0, 1, 2, 3, and 4. The lower six bits of these registers correspond to bits A25–A20 of the offset address. In addition, the write protection and common/attribute memory configurations are set in this register. Refer to Table 60 for a complete description of

the register contents.

#### Table 60. ExCA Memory Window 0-4 Offset-Address High-Byte Register (Index 15h, 1Dh, 25h, 2Dh, 35h)

| BIT | SIGNAL | TYPE | FUNCTION  |
|-----|--------|------|---|
| 7   | WINWP  | R/W  | Write protect. Bit 7 specifies whether write operations to this memory window are enabled. This bit is encoded as:  0 = Write operations are allowed (default).  1 = Write operations are not allowed.                      |
| 6   | REG    | R/W  | Bit 6 specifies whether this memory window is mapped to card attribute or common memory. This bit is encoded as:  0 = Memory window is mapped to common memory (default).  1 = Memory window is mapped to attribute memory. |
| 5–0 | OFFHB  | R/W  | Offset-address high byte. Bits 5–0 represent the upper address bits A25–A20 of the memory window offset address.  |

SCPS043A - OCTOBER 1998

#### ExCA I/O window 0 and 1 offset-address low-byte register (index 36h, 38h)

| Bit     | 7   | 6   | 5        | 4              | 3                | 2        | 1   | 0   |
|---------|-----|-----|----------|----------------|------------------|----------|-----|-----|
| Name    |     |     | ExCA I/C | ) window 0 and | 1 offset-address | low byte |     |     |
| Туре    | R/W | R/W | R/W      | R/W            | R/W              | R/W      | R/W | R/W |
| Default | 0   | 0   | 0        | 0              | 0                | 0        | 0   | 0   |

Register: ExCA I/O window 0 offset-address low byte

Offset: CardBus socket address + 836h: Card A ExCA offset 36h

Card B ExCA offset 76h

Register: ExCA I/O window 1 offset-address low byte

Offset: CardBus socket address + 838h: Card A ExCA offset 38h

Card B ExCA offset 78h

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the low byte of the 16-bit I/O window offset address for I/O windows 0

and 1. The eight bits of these registers correspond to the lower eight bits of the offset address,

and bit 0 is always 0.

### ExCA I/O window 0 and 1 offset-address high-byte register (index 37h, 39h)

| Bit     | 7   | 6   | 5        | 4  | 3   | 2   | 1   | 0   |  |

Register: ExCA I/O window 0 offset-address high byte

Offset: CardBus socket address + 837h: Card A ExCA offset 37h

Card B ExCA offset 77h

Register: ExCA I/O window 1 offset-address high byte

Offset: CardBus socket address + 839h: Card A ExCA offset 39h

Card B ExCA offset 79h

Type: Read/Write

Default: 00h Size: One byte

Description: These registers contain the high byte of the 16-bit I/O window offset address for I/O windows 0

and 1. The eight bits of these registers correspond to the upper eight bits of the offset address.

ExCA card detect and general-control register (index 16h)

| Bit     | 7 | 6 | 5   | 4                 | 3                | 2     | 1   | 0 |
|---------|---|---|-----|-------------------|------------------|-------|-----|---|
| Name    |   |   | ExC | A I/O card detect | t and general co | ntrol |     |   |
| Туре    | R | R | W   | R/W               | R                | R     | R/W | R |
| Default | Х | Х | 0   | 0                 | 0                | 0     | 0   | 0 |

Register: ExCA card detect and general control

Type: Read-only, Write-only, Read/Write (see individual bit descriptions)

Offset: Card Bus socket address + 816h: Card A ExCA offset 16h

Card B ExCA offset 56h

Default: XX00 0000b

Description: This register controls how the ExCA registers for the socket respond to card removal, as well

as reports the status of  $\overline{\text{VS1}}$  and  $\overline{\text{VS2}}$  at the PC Card interface. Refer to Table 61 for a

complete description of the register contents.

Table 61. ExCA Card Detect and General-Control Register (Index 16h)

| BIT | SIGNAL    | TYPE | FUNCTION  |
|-----|-----------|------|---|
| 7   | VS2STAT   | R    | $\overline{\text{VS2}}$ state. Bit 7 reports the current state of $\overline{\text{VS2}}$ at the PC Card interface and, therefore, does not have a default value. $0 = \overline{\text{VS2}}$ low $1 = \overline{\text{VS2}}$ high  |
| 6   | VS1STAT   | R    | $\overline{\text{VS1}}$ state. Bit 6 reports the current state of $\overline{\text{VS1}}$ at the PC Card interface and, therefore, does not have a default value. $0 = \overline{\text{VS1}}$ low $1 = \overline{\text{VS1}}$ high  |
| 5   | SWCSC     | W    | Software card detect interrupt. If the card detect enable bit in the card status change interrupt configuration register is set, then writing a 1 to bit 5 causes a card detect card status change interrupt for the associated card socket. If the card detect enable bit is cleared to 0 in the card status change interrupt configuration register, then writing a 1 to the software card detect interrupt bit has no effect. A read operation of bit 5 always returns 0. Writing a 1 to this bit also clears it. If bit 2 of the global control register is set and a 1 is written to clear bit 3 of the ExCA card status change interrupt register, then this bit also is cleared. |
| 4   | CDRESUME  | R/W  | Card detect resume enable. If bit 4 is set to 1 and once a card detect change has been detected on CD1 and CD2 inputs, then RI_OUT goes from high to low. RI_OUT remains low until the card status change bit in the card status change register is cleared. If this bit is a 0, then the card detect resume functionality is disabled.  0 = Card detect resume disabled (default) 1 = Card detect resume enabled   |
| 3–2 | RSVD      | R    | Reserved. Bits 3–2 return 0s when read. Writes have no effect.  |
| 1   | REGCONFIG | R/W  | Register configuration on card removal. Bit 1 controls how the ExCA registers for the socket react to a card removal event. This bit is encoded as:  0 = No change to ExCA registers on card removal (default)  1 = Reset ExCA registers on card removal  |
| 0   | RSVD      | R    | Reserved. Bit 0 returns 0 when read. Writes have no effect.   |

SCPS043A - OCTOBER 1998

### ExCA global-control register (index 1Eh)

| Bit     | 7 | 6 | 5 | 4                   | 3   | 2   | 1   | 0   |
|---------|---|---|---|---------------------|-----|-----|-----|-----|
| Name    |   |   |   | ExCA global control |     |     |     |     |
| Туре    | R | R | R | R/W                 | R/W | R/W | R/W | R/W |
| Default | 0 | 0 | 0 | 0                   | 0   | 0   | 0   | 0   |

Register: ExCA global control

Type: Read-only, Read/Write (see individual bit descriptions)
Offset: CardBus socket address + 81Eh: Card A ExCA offset 1Eh
Card B ExCA offset 5Eh

Default: 00h

Description: This register controls both PC Card sockets and is not duplicated for each socket. The host

interrupt mode bits in this register are retained for Intel 82365SL-DF compatibility. Refer to

Table 62 for a complete description of the register contents.

### Table 62. ExCA Global-Control Register (Index 1Eh)

| BIT | SIGNAL   | TYPE | FUNCTION  |
|-----|----------|------|---|
| 7–5 | RSVD     | R    | Reserved. Bits 7–5 returns 0s when read. Writes have no effect.   |
| 4   | INTMODEB | R/W  | Level/edge interrupt mode select – card B. Bit 4 selects the signaling mode for the PCI1251B host interrupt for card B interrupts. This bit is encoded as:  0 = Host interrupt is edge mode (default).  1 = Host interrupt is level mode.   |
| 3   | INTMODEA | R/W  | Level/edge interrupt mode select – card A. Bit 3 selects the signaling mode for the PCI1251B host interrupt for card A interrupts. This bit is encoded as:  0 = Host interrupt is edge mode (default).  1 = Host interrupt is level mode.   |
| 2   | IFCMODE  | R/W  | Interrupt flag clear mode select. Bit 2 selects the interrupt flag clear mechanism for the flags in the ExCA card status change register. This bit is encoded as:  0 = Interrupt flags are cleared by read of CSC register (default).  1 = Interrupt flags are cleared by explicit write back of 1.   |
| 1   | CSCMODE  | R/W  | Card status change level/edge mode select. Bit 1 selects the signaling mode for the PCI1251B host interrupt for card status changes. This bit is encoded as:  0 = Host interrupt is edge mode (default).  1 = Host interrupt is level mode.   |
| 0   | PWRDWN   | R/W  | Power-down mode select. When bit 0 is set to 1, the PCI1251B is in power-down mode. In power-down mode, the PCI1251B card outputs are placed in a high-impedance state until an active cycle is executed on the card interface. Following an active cycle, the outputs are again placed in a high-impedance state. The PCI1251B still receives DMA requests, functional interrupts, and/or card status change interrupts; however, an actual card access is required to wake up the interface. This bit is encoded as:  0 = Power-down mode is disabled (default).  1 = Power-down mode is enabled. |

SCPS043A - OCTOBER 1998

#### ExCA memory window 0-4 page register (index 40h, 41h, 42h, 43h, 44h)

| Bit     | 7   | 6   | 5   | 4             | 3              | 2   | 1   | 0   |
|---------|-----|-----|-----|---------------|----------------|-----|-----|-----|
| Name    |     |     |     | ExCA memory w | indow 0–4 page |     |     |     |
| Туре    | R/W | R/W | R/W | R/W           | R/W            | R/W | R/W | R/W |
| Default | 0   | 0   | 0   | 0             | 0              | 0   | 0   | 0   |

Register: ExCA memory window 0-4 page

Type: Read/Write

Offset: CardBus socket address + 840h 841h, 842h, 843h, 844h

Default: 00h

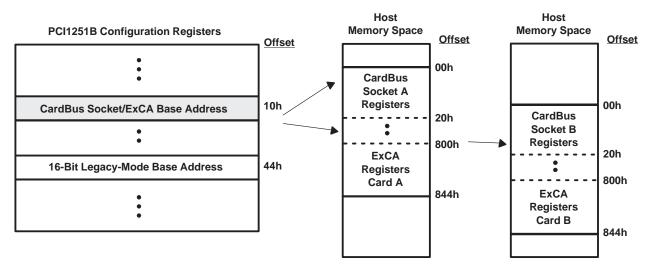

Description: The upper eight bits of a 4-byte PCI memory address are compared to the contents of this

register when decoding addresses for 16-bit memory windows. Each window has its own page register, all of which default to 00h. By programming this register to a nonzero value, host software can locate 16-bit memory windows in any one of 256 16-Mbyte regions in the 4-Gbyte PCI address space. These registers are only accessible when the ExCA registers are memory mapped, i.e., these registers can not be accessed using the index/data I/O scheme.

## CardBus socket registers (functions 0 and 1)

The PCMCIA CardBus specification requires a CardBus socket controller to provide five 32-bit registers that report and control socket-specific functions. The PCI1251B provides the CardBus socket/ExCA base address register (PCI offset 10h) to locate these CardBus socket registers in PCI memory address space. Each socket has a separate base address register for accessing the CardBus socket registers (see Figure 18). Table 63 gives the location of the socket registers in relation to the CardBus socket/ExCA base address.

The PCI1251B implements an additional register at offset 20h that provides power management control for the socket.

NOTE: The CardBus socket/ExCA base address mode register is separate for functions 0 and 1.

Figure 19. Accessing CardBus Socket Registers Through PCI Memory

Table 63. CardBus Socket Registers

| REGISTER NAME           | OFFSET |
|-------------------------|--------|
| Socket event            | 00h    |

Register: Socket event

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 00h

Default: 0000 0000h

Description: This register indicates a change in socket status has occurred. These bits do not indicate what

the change is, only that one has occurred. Software must read the socket present state register for current status. Each bit in this register can be cleared by writing a 1 to that bit. The bits in this register can be set to a 1 by software by writing a 1 to the corresponding bit in the socket force event register. All bits in this register are cleared by PCI reset. They can be immediately set again, if, when coming out of PC Card reset, the bridge finds the status unchanged (i.e., CSTSCHG reasserted or card detect is still true). Software must clear this register before enabling interrupts. If it is not cleared and interrupts are enabled, then an interrupt is generated (but not masked) based on any bit set. Refer to Table 64 for a complete

description of the register contents.

**Table 64. Socket Event Register** 

| BIT  | SIGNAL    | TYPE | FUNCTION  |
|------|-----------|------|---|
| 31–4 | RSVD      | R    | Reserved. Bits 31–4 return 0s when read.  |
| 3    | PWREVENT  | R/W  | Power cycle. Bit 3 is set when the PCI1251B detects that the PWRCYCLE bit in the socket present-state register has changed. This bit is cleared by writing a 1.   |
| 2    | CD2EVENT  | R/W  | CCD2. Bit 2 is set when the PCI1251B detects that the CDETECT2 field in the socket present-state register has changed. This bit is cleared by writing a 1.  |
| 1    | CD1EVENT  | R/W  | CCD1. Bit 3 is set when the PCI1251B detects that the CDETECT1 field in the socket present-state register has changed. This bit is cleared by writing a 1.  |
| 0    | CSTSEVENT | R/W  | CSTSCHG. Bit 0 is set when the CARDSTS field in the socket present-state register has changed state. For CardBus cards, bit 0 is set on the rising edge of CSTSCHG. For 16-bit PC Cards, bit 0 is set on both transitions of CSTSCHG. This bit is reset by writing a 1. |

SCPS043A - OCTOBER 1998

### socket mask register

| Bit     | 31          | 30          | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19  | 18  | 17  | 16  |

| Name    |             | Socket mask |    |    |    |    |    |    |    |    |    |    |     |     |     |     |
| Туре    | R           | R           | R  | R  | R  | R  | R  | R  | R  | R  | R  | R  | R/W | R/W | R/W | R/W |
| Default | 0           | 0           | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0  | 0   | 0   | 0   | 0   |

Register: Socket mask

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 04h

Default: 0000 0000h

Description: This register allows software to control the CardBus card events that generate a status

change interrupt. The state of these mask bits does not prevent the corresponding bits from reacting in the socket event register. Refer to Table 65 for a complete description of the

register contents.

Table 65. Socket Mask Register

| BIT  | SIGNAL   | TYPE | FUNCTION  |
|------|----------|------|---|
| 31–4 | RSVD     | R    | Reserved. Bits 31–4 return 0s when read.  |
| 3    | PWRMASK  | R/W  | Power cycle. Bit 3 masks the PWRCYCLE bit in the socket present state register from causing a status change interrupt.  0 = PWRCYCLE event does not cause CSC interrupt (default).  1 = PWRCYCLE event causes CSC interrupt.  |
| 2–1  | CDMASK   | R/W  | Card detect mask. Bits 2–1 mask the CDETECT1 and CDETECT2 bits in the socket present-state register from causing a CSC interrupt.  00 = Insertion/removal does not cause CSC interrupt (default).  01 = Reserved (undefined)  10 = Reserved (undefined)  11 = Insertion/removal causes CSC interrupt. |
| 0    | CSTSMASK | R/W  | CSTSCHG mask. Bit 0 masks the CARDSTS field in the socket present-state register from causing a CSC interrupt.  0 = CARDSTS event does not cause CSC interrupt (default).  1 = CARDSTS event causes CSC interrupt.  |

Register: Socket present state

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 08h

Default: 3000 000Xh

Description: This register reports information about the socket interface. Writes to the socket force event

register are reflected here, as well as general socket interface status. Information about PC  $Card\ V_{CC}$  support and card type is only updated at each insertion. Also, the PCI1251B uses  $\overline{CCD1}$  and  $\overline{CCD2}$  during card identification, and changes on these signals during this operation are not reflected in this register. Refer to Table 66 for a complete description of the

register contents.

# Table 66. Socket Present-State Register

| BIT   | SIGNAL    | TYPE | FUNCTION  |
|-------|-----------|------|---|
| 31    | YVSOCKET  | R    | YV socket. Bit 31 indicates whether or not the socket can supply $V_{CC} = Y.Y V$ to PC Cards. The PCI1251B does not support Y.Y-V $V_{CC}$ ; therefore, this bit is always reset unless overridden by the socket force event register. This bit is hardwired to 0. |
| 30    | XVSOCKET  | R    | XV socket. Bit 30 indicates whether or not the socket can supply $V_{CC} = X.X V$ to PC Cards. The PCI1251B does not support X.X-V $V_{CC}$ ; therefore, this bit is always reset unless overridden by the socket force event register. This bit is hardwired to 0. |
| 29    | 3VSOCKET  | R    | 3-V socket. Bit 29 indicates whether or not the socket can supply $V_{CC}$ = 3.3 V to PC Cards. The PCI1251B does support 3.3-V $V_{CC}$ ; therefore, this bit is always set unless overridden by bit 6 of the device control register.                             |
| 28    | 5VSOCKET  | R    | 5-V socket. Bit 28 indicates whether or not the socket can supply $V_{CC} = 5 \text{ V}$ to PC Cards. The PCI1251B does support 5-V $V_{CC}$ ; therefore, this bit is always 1.   |
| 27–14 | RSVD      | R    | Reserved. Bits 27–14 return 0s when read.   |
| 13    | YVCARD    | R    | YV card. Bit 13 indicates whether or not the PC Card inserted in the socket supports V <sub>CC</sub> = Y.Y V. This bit can be set by writing to the corresponding bit in the socket force event register.   |
| 12    | XVCARD    | R    | XV card. Bit 12 indicates whether or not the PC Card inserted in the socket supports $V_{CC} = X.X V$ . This bit can be set by writing to the corresponding bit in the socket force event register.   |
| 11    | 3VCARD    | R    | 3-V card. Bit 11 indicates whether or not the PC Card inserted in the socket supports $V_{CC} = 3.3 \text{ V}$ . This bit can be set by writing to the corresponding bit in the socket force event register.  |
| 10    | 5VCARD    | R    | 5-V card. Bit 10 indicates whether or not the PC Card inserted in the socket supports $V_{CC} = 5$ V. This bit can be set by writing to the corresponding bit in the socket force event register.   |
| 9     | BADVCCREQ | R    | Bad V <sub>CC</sub> request. Bit 9 indicates that the host software has requested that the socket be powered at an invalid voltage.  0 = Normal operation (default)  1 = Invalid V <sub>CC</sub> request by host software   |
| 8     | DATALOST  | R    | Data lost. Bit 8 indicates that a PC Card removal event may have caused lost data because the cycle did not terminate properly or because write data still resides in the PCI1251B.  0 = Normal operation (default)  1 = Potential data loss due to card removal    |
| 7     | NOTACARD  | R    | Not a card. Bit 7 indicates that an unrecognizable PC Card has been inserted in the socket. This bit is not updated until a valid PC Card is inserted into the socket.  0 = Normal operation (default)  1 = Unrecognizable PC Card detected                         |
| 6     | IREQCINT  | R    | READY(IREQ)//CINT. Bit 6 indicates the current status of READY(IREQ)//CINT at the PC Card interface.  0 = READY(IREQ)//CINT low 1 = READY(IREQ)//CINT high  |
| 5     | CBCARD    | R    | CardBus card detected. Bit 5 indicates that a CardBus PC Card is inserted in the socket. This bit is not updated until another card interrogation sequence occurs (card insertion).   |
| 4     | 16BITCARD | R    | 16-bit card detected. Bit 4 indicates that a 16-bit PC Card is inserted in the socket. This bit is not updated until another card interrogation sequence occurs (card insertion).   |
| 3     | PWRCYCLE  | R/W  | Power cycle. Bit 3 indicates that the status of each card powering request. This bit is encoded as:  0 = Socket powered down (default)  1 = Socket powered up   |
| 2     | CDETECT2  | R    | CCD2. Bit 2 reflects the current status of CCD2 at the PC Card interface. Changes to this signal during card interrogation are not reflected here.  0 = CCD2 low (PC Card may be present)  1 = CCD2 high (PC Card not present)                                      |
| 1     | CDETECT1  | R    | CCD1. Bit 1 reflects the current status of CCD1 at the PC Card interface. Changes to this signal during card interrogation are not reflected here.  0 = CCD1 low (PC Card may be present)  1 = CCD1 high (PC Card not present)                                      |
| 0     | CARDSTS   | R    | CSTSCHG. Bit 0 reflects the current status of CSTSCHG at the PC Card interface.  0 = CSTSCHG low  1 = CSTSCHG high  |

Register: Socket force event

Type: Read-only, Write-only (see individual bit descriptions)

Offset: CardBus socket address + 0Ch

Default: 0000 00XXh

Description: This register is used to force changes to the socket event register and the socket present state

register. The CVSTEST bit in this register must be written when forcing changes that require card interrogation. Refer to Table 67 for a complete description of the register contents.

Table 67. Socket Force Event Register

| BIT   | SIGNAL     | TYPE | FUNCTION   |
|-------|------------|------|--|
| 31–15 | RSVD       | R    | Reserved. Bits 31–15 return 0s when read.  |
| 14    | CVSTEST    | W    | Card VS test. When bit 14 is set, the PCI1251B reinterrogates the PC Card, updates the socket present state register, and reenables the socket power control.                  |
| 13    | FYVCARD    | W    | Force YV card. Writes to bit 13 cause the YVCARD bit in the socket present state register to be written. When set, this bit disables the socket power control.                 |
| 12    | FXVCARD    | W    | Force XV card. Writes to bit 12 cause the XVCARD bit in the socket present state register to be written. When set, this bit disables the socket power control.                 |
| 11    | F3VCARD    | W    | Force 3-V card. Writes to bit 11 cause the 3VCARD bit in the socket present state register to be written. When set, this bit disables the socket power control.                |
| 10    | F5VCARD    | W    | Force 5-V card. Writes to bit 10 cause the 5VCARD bit in the socket present state register to be written. When set, this bit disables the socket power control.                |
| 9     | FBADVCCREQ | W    | Force bad $V_{CC}$ request. Changes to the BADVCCREQ bit in the socket present state register can be made by writing to bit 9.   |
| 8     | FDATALOST  | W    | Force data lost. Writes to bit 8 cause the DATALOST bit in the socket present state register to be written.  |
| 7     | FNOTACARD  | W    | Force not a card. Writes to bit 7 cause the NOTACARD bit in the socket present state register to be written.   |
| 6     | RSVD       | R    | Reserved. Bit 6 returns 0 when read.   |
| 5     | FCBCARD    | W    | Force CardBus card. Writes to bit 5 cause the CBCARD bit in the socket present state register to be written.   |
| 4     | F16BITCARD | W    | Force 16-bit card. Writes to bit 4 cause the 16BITCARD bit in the socket present state register to be written.   |
| 3     | FPWRCYCLE  | W    | Force power cycle. Writes to bit 3 cause the PWREVENT bit in the socket event register to be written, and the PWRCYCLE bit in the socket present state register is unaffected. |
| 2     | FCDETECT2  | W    | Force CCD2. Writes to bit 2 cause the CD2EVENT bit in the socket event register to be written, and the CDETECT2 bit in the socket present state register is unaffected.        |
| 1     | FCDETECT1  | W    | Force CCD1. Writes to bit 1 cause the CD1EVENT bit in the socket event register to be written, and the CDETECT1 bit in the socket present state register is unaffected.        |
| 0     | FCARDSTS   | W    | Force CSTSCHG. Writes to bit 0 cause the CSTSEVENT bit in the socket event register to be written, and the CARDSTS bit in the socket present state register is unaffected.     |

Register: Socket control

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 10h

Default: 0000 0000h

Description: This register provides control of the voltages applied to the socket and instructions for CB

CLKRUN protocol. The PCI1251B ensures that the socket is powered up only at acceptable voltages when a CardBus card is inserted. Refer to Table 68 for a complete description of the

register contents.

**Table 68. Socket Control Register** 

| BIT  | SIGNAL  | TYPE | FUNCTION   |
|------|---------|------|--|
| 31–8 | RSVD    | R    | Reserved. Bits 31–8 return 0s when read.   |
| 7    | STOPCLK | R/W  | CB CLKRUN protocol instructions.  0 = CB CLKRUN protocol can only attempt to stop/slow the CB clock if the socket is idle and the PCI CLKRUN protocol is preparing to stop/slow the PCI bus clock.  1 = CB CLKRUN protocol can attempt to stop/slow the CB clock if the socket is idle.                              |
| 6–4  | VCCCTRL | R/W  | $V_{CC} \ control. \ Bits 6-4 \ are used to request card \ V_{CC} \ changes.$ $000 = Request \ power \ off \ (default)$ $001 = Reserved$ $010 = Request \ V_{CC} = 5 \ V$ $011 = Request \ V_{CC} = 3.3 \ V$ $100 = Request \ V_{CC} = X.X \ V$ $101 = Request \ V_{CC} = Y.Y \ V$ $110 = Reserved$ $111 = Reserved$ |
| 3    | RSVD    | R    | Reserved. Bit 3 returns 0 when read.   |
| 2-0  | VPPCTRL | R/W  | Vpp control. Bits 2–0 are used to request card Vpp changes.  000 = Request power off (default)  001 = Request Vpp = 12 V  010 = Request Vpp = 5 V  011 = Request Vpp = 3.3 V  100 = Request Vpp = X.X V  101 = Request Vpp = Y.Y V  110 = Reserved  111 = Reserved   |

## socket power management register

Register: Socket power management

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: CardBus socket address + 20h

Default: 0000 0000h

Description: This register provides power management control over the socket through a mechanism for

slowing or stopping the clock on the card interface when the card is idle.

## Table 69. Socket Power Management Register

| BIT   | SIGNAL    | TYPE | FUNCTION   |
|-------|-----------|------|--|
| 31–26 | RSVD      | R    | Reserved. Bits 31–26 return 0s when read.  |
| 25    | SKTACCES  | R    | Socket access status. This bit provides information on when a socket access has occurred. This bit is cleared by a read access.  0 = A PC card access has not occurred (default).  1 = A PC card access has occurred.  |
| 24    | SKTMODE   | R    | Socket mode status. This bit provides clock mode information.  0 = Clock is operating normally.  1 = Clock frequency has changed.  |
| 23–17 | RSVD      | R    | Reserved. Bits 23–17 return 0s when read.  |
| 16    | CLKCTRLEN | R/W  | CardBus clock control enable. When bit 16 is set, clock control (CLKCTRL bit 0) is enabled.  0 = Clock control is disabled (default).  1 = Clock control is enabled.   |
| 15–1  | RSVD      | R    | Reserved. Bits 15–1 return 0s when read.   |
| 0     | CLKCTRL   | R/W  | CardBus clock control. This bit determines whether the CB CLKRUN protocol will attempt to stop or slow the CB clock during idle states. Bit 16 enables this bit.  0 = Allows CB CLKRUN protocol to stop the CB clock (default).  1 = Allows CB CLKRUN protocol to slow the CB clock by a factor of 16. |

#### distributed DMA (DDMA) registers

The DMA base address, programmable in PCI configuration space at offset 98h, points to a 16-byte region in PCI I/O space where the DDMA registers reside. The names and locations of these registers are summarized in Table 70. These PCI1251B register definitions are identical to those registers of the same name in the Intel 8237 DMA controller; however, some register bits defined in the 8237 do not apply to distributed DMA in a PCI environment. The similarity between the register models retains some level of compatibility with legacy DMA and simplifies the translation required by the master DMA device when it forwards legacy DMA writes to DMA channels.

While the DMA register definitions are identical to those in the 8237 of the same name, some register bits defined in the 8237 do not apply to distributed DMA in a PCI environment. In such cases, the PCI1251B implements these obsolete register bits as read-only nonfunctional bits. The reserved registers shown in Table 70 are implemented as read-only and return 0s when read. Writes to reserved registers have no effect.

**Table 70. DDMA Registers** 

| TYPE |              | REGISTER NAME |              |          |     |  |  |  |  |  |  |
|------|--------------|---------------|--------------|----------|-----|--|--|--|--|--|--|

Register: DMA current address/base address

Type: Read/Write

Offset: DMA base address + 00h

Default: 0000h Size: Two bytes

Description: This register is used to set the starting (base) memory address of a DMA transfer. Reads from

this register indicate the current memory address of a direct memory transfer.

For the 8-bit DMA transfer mode, the current address register contents are presented on AD15–AD0 of the PCI bus during the address phase. Bits 7–0 of the page register are presented on AD23–AD16 of the PCI bus during the address phase.

For the 16-bit DMA transfer mode, the current address register contents are presented on AD16–AD1 of the PCI bus during the address phase, and AD0 is driven to logic 0. Bits 7–1 of the page register are presented on AD23–AD17 of the PCI bus during the address phase, and bit 0 is ignored.

### **DMA** page register

| Bit     | 7   | 6        | 5   | 4   | 3   | 2   | 1   | 0   |  |  |  |
|---------|-----|----------|-----|-----|-----|-----|-----|-----|--|--|--|

Register: **DMA page** Type: Read/Write

Offset: DMA base address + 02h

Default: 00h Size: One byte

Description: This register is used to set the upper byte of the address of a DMA transfer. Details of the

address represented by this register are explained in DMA current address/base

address register.

SCPS043A - OCTOBER 1998

### DMA current count/base count register

| Bit     | 15                           | 14  | 13  | 12             | 11              | 10  | 9   | 8   |  |  |  |

Register: DMA current count/base count

Type: Read/Write

Offset: DMA base address + 04h

Default: 0000h Size: Two bytes

Description: This register is used to set the total transfer count, in bytes, of a direct memory transfer. Reads

to this register indicate the current count of a direct memory transfer. In the 8-bit transfer mode, the count is decremented by 1 after each transfer and decremented by 2 after each

transfer in the 16-bit transfer mode.

### **DMA** command register

| Bit     | 7 | 6           | 5 | 4 | 3 | 2   | 1 | 0 |  |  |  |
|---------|---|-------------|---|---|---|-----|---|---|--|--|--|
| Name    |   | DMA command |   |   |   |     |   |   |  |  |  |
| Туре    | R | R           | R | R | R | R/W | R | R |  |  |  |
| Default | 0 | 0           | 0 | 0 | 0 | 0   | 0 | 0 |  |  |  |

Register: **DMA command** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: DMA base address + 08h

Default: 00h Size: One byte

Description: This register is used to enable and disable the DMA controller. Bit 2, the only read/write bit,

defaults to 0, enabling the DMA controller. All other bits are reserved. Refer to Table 71 for a

complete description of the register contents.

## Table 71. DMA Command Register

| BIT | TYPE | FUNCTION   |
|-----|------|--|
| 7–3 | R    | Reserved. Bits 7–3 return 0s when read.  |
| 2   | R/W  | DMA controller enable. Bit 2 enables and disables the distributed DMA slave controller in the PCI1251B and defaults to the enabled state.  0 = DMA controller enabled (default)  1 = DMA controller disabled |
| 1–0 | R    | Reserved. Bits 1–0 return 0s when read.  |

SCPS043A - OCTOBER 1998

**DMA** status register

| Bit     | 7 | 6          | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|------------|---|---|---|---|---|---|--|--|--|
| Name    |   | DMA status |   |   |   |   |   |   |  |  |  |
| Туре    | R | R          | R | R | R | R | R | R |  |  |  |
| Default | 0 | 0          | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |

Register: **DMA status** 

Type: Read-only (see individual bit descriptions)

Offset: DMA base address + 08h

Default: 00h Size: One byte

Description: This register indicates the terminal count and DMA request (DREQ) status. Refer to Table 72

for a complete description of the register contents.

# Table 72. DMA Status Register

| BIT | SIGNAL   | TYPE | FUNCTION   |
|-----|----------|------|--|
| 7–4 | DREQSTAT | R    | Channel request. In the 8237, bits 7–4 indicate the status of DREQ of each DMA channel. In the PCI1251B, these bits indicate the DREQ status of the single socket being serviced by this register. All four bits are set when the PC Card asserts DREQ and are reset when DREQ is deasserted. The status of the mask bit in the multichannel mask register has no effect on these bits.  |
| 3–0 | TC       | R    | Channel terminal count. The 8327 uses bits 3–0 to indicate the TC status of each of its four DMA channels. In the PCI1251B, these bits report information about a single DMA channel; therefore, all four of these register bits indicate the TC status of the single socket being serviced by this register. All four bits are set when the TC is reached by the DMA channel. These bits are reset when read or the DMA channel is reset. |

## **DMA** request register

| Bit     | 7 | 6           | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|-------------|---|---|---|---|---|---|--|--|--|
| Name    |   | DMA request |   |   |   |   |   |   |  |  |  |
| Туре    | W | W           | W | W | W | W | W | W |  |  |  |
| Default | 0 | 0           | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |

Register: **DMA request** Type: Write-only

Offset: DMA base address + 09h

Default: 00h Size: One byte

Description: This register is used to request a DDMA transfer through software. Any write to this register

enables software requests, and this register is to be used in block mode only.

SCPS043A - OCTOBER 1998

## **DMA** mode register

| Bit     | 7   | 6        | 5   | 4   | 3   | 2   | 1   | 0 |  |  |  |
|---------|-----|----------|-----|-----|-----|-----|-----|---|--|--|--|
| Name    |     | DMA mode |     |     |     |     |     |   |  |  |  |
| Туре    | R/W | R/W      | R/W | R/W | R/W | R/W | R/W | R |  |  |  |
| Default | 0   | 0        | 0   | 0   | 0   | 0   | 0   | 0 |  |  |  |

Register: **DMA mode** 

Type: Read-only, Read/Write (see individual bit descriptions)

Offset: DMA base address + 0Bh

Default: 00h Size: One byte

Description: This register is used to set the DMA transfer mode. to Table 73 for a complete description of

the register contents.

# **Table 73. DMA Mode Register**

| BIT | SIGNAL   | TYPE | FUNCTION  |
|-----|----------|------|---|
| 7–6 | DMAMODE  | R/W  | Mode select. The PCI1251B uses bits 7–6 to determine the transfer mode.  00 = Demand mode select (default)  01 = Single mode select  10 = Block mode select  11 = Reserved  |
| 5   | INCDEC   | R/W  | Address increment/decrement. The PCI1251B uses bit 5 to select the memory address in the current address/base address register to increment or decrement after each data transfer. This is in accordance with the 8237 use of this register bit, and is encoded as follows:  0 = Addresses increment (default).  1 = Addresses decrement.                                       |
| 4   | AUTOINIT | R/W  | Auto initialization  0 = Auto initialization disabled (default)  1 = Auto initialization enabled  |
| 3–2 | XFERTYPE | R/W  | Transfer type. Bits 3–2 select the type of direct memory transfer to be performed. A memory write transfer moves data from the PCI1251B PC Card interface to memory, and a memory read transfer moves data from memory to the PCI1251B PC Card interface. The field is encoded as:  00 = No transfer selected (default)  01 = Write transfer  10 = Read transfer  11 = Reserved |
| 1–0 | RSVD     | R    | Reserved. Bits 1–0 return 0s when read.   |

SCPS043A - OCTOBER 1998

DMA master clear register

| Bit     | 7 | 6                | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|------------------|---|---|---|---|---|---|--|--|--|
| Name    |   | DMA master clear |   |   |   |   |   |   |  |  |  |
| Туре    | W | W                | W | W | W | W | W | W |  |  |  |
| Default | 0 | 0                | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |

Register: DMA master clear

Type: Write-only

Offset: DMA base address + 0Dh

Default: 00h Size: One byte

Description: This register is used to reset the DDMA controller and resets all DDMA registers.

## DMA multichannel/mask register

| Bit     | 7 | 6                     | 5 | 4 | 3 | 2 | 1 | 0 |  |  |  |
|---------|---|-----------------------|---|---|---|---|---|---|--|--|--|
| Name    |   | DMA multichannel/mask |   |   |   |   |   |   |  |  |  |
| Туре    | R | R                     | R | R | R | R | R | R |  |  |  |
| Default | 0 | 0                     | 0 | 0 | 0 | 0 | 0 | 0 |  |  |  |

Register: **DMA multichannel/mask** 

Type: Read-only (see individual bit descriptions)

Offset: DMA base address + 0Fh

Default: 00h Size: One byte

Description: The PCI1251B uses only the least significant bit of this register to mask the PC Card DMA

channel. The PCI1251B sets the mask bit when the PC Card is removed. Host software is responsible for either resetting the socket's DMA controller or reenabling the mask bit. Refer

to Table 74 for a complete description of the register contents.

### Table 74. DMA Multichannel/Mask Register

| BIT | SIGNAL  | TYPE | FUNCTION  |
|-----|---------|------|---|
| 7–1 | RSVD    | R    | Reserved. Bits 7–1 returns 0s when read.  |
| 0   | MASKBIT | R    | Mask select. Bit 0 masks incoming DREQ signals from the PC Card. When set, the socket ignores DMA requests from the card. When cleared (or when reset), incoming DREQ assertions are serviced normally.  0 = DDMA service provided on card DREQ  1 = Socket DREQ signal ignored (default) |

# absolute maximum ratings over operating temperature ranges (unless otherwise noted)

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. Applies for external input and bidirectional buffers. V<sub>I</sub> > V<sub>CC</sub> does not apply to fail-safe terminals. PCI terminals are measured with respect to V<sub>CCP</sub> instead of V<sub>CC</sub>. PC Card terminals are measured with respect to V<sub>CCA</sub> or V<sub>CCB</sub>. ZV terminals are measured with respect to V<sub>CCI</sub>, and miscellaneous signals are measured with respect to V<sub>CCI</sub>. The limit specified applies for a dc condition.
  - Applies for external output and bidirectional buffers. V<sub>O</sub> > V<sub>CC</sub> does not apply to fail-safe terminals. PCI terminals are measured with respect to V<sub>CCP</sub> instead of V<sub>CC</sub>. PC Card terminals are measured with respect to V<sub>CCA</sub> or V<sub>CCB</sub>. ZV terminals are measured with respect to V<sub>CCI</sub>, and miscellaneous signals are measured with respect to V<sub>CCI</sub>. The limit specified applies for a dc condition.

<sup>†</sup> Applies to external inputs and bidirectional buffers without hysteresis

NOTE 3: Unused pins (input or I/O) must be held high or low to prevent them from floating.

<sup>‡</sup> Miscellaneous GFN pins are V13, W13, Y13, U12, V12, W12, U11, V11, W11, Y11, Y10, W10, Y09, W09, V09, U09, Y08, all IRQMUXx pins, LEDAx pins, SUSPEND, SPKROUT, RI\_OUT, INTA, INTB, and power switch control pins.

<sup>§</sup> Fail-safe GFN pins are A11, B14, C09, G03, H20, U03, W06, and Y03 (card detect and voltage sense pins).

<sup>¶</sup> Applies to external output buffers

<sup>#</sup> These junction temperatures reflect simulation conditions. The customer is responsible for verifying junction temperature.

<sup>†</sup> For PCI pins, V<sub>I</sub> = V<sub>CCP</sub>. For PC Card pins, V<sub>I</sub> = V<sub>CC(A/B)</sub>. For ZV pins, V<sub>I</sub> = V<sub>CCZ</sub>. For miscellaneous pins, V<sub>I</sub> = V<sub>CCI</sub>. † For I/O pins, input leakage (I<sub>IL</sub> and I<sub>IH</sub>) includes I<sub>OZ</sub> leakage of the disabled output.

NOTES: 4. V<sub>OH</sub> and I<sub>OL</sub> are not tested on SERR (GFN pin U19) and RI\_OUT (GFN pin Y13) because they are open-drain outputs.

5. I<sub>IH</sub> is not tested on LATCH (GFN pin W12) because it is pulled up with an internal resistor.

<sup>&</sup>lt;sup>†</sup>C<sub>LOAD</sub> includes the typical load-circuit distributed capacitance.

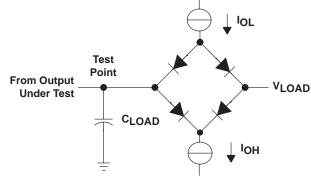

$$\ddagger \frac{\text{V}_{LOAD} - \text{V}_{OL}}{\text{I}_{OL}}$$
 = 50  $\Omega$ , where  $\text{V}_{OL}$  = 0.6 V,  $\text{I}_{OL}$  = 8 mA

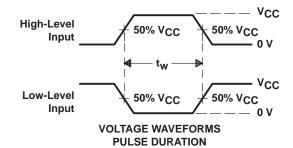

**VOLTAGE WAVEFORMS SETUP AND HOLD TIMES INPUT RISE AND FALL TIMES** 

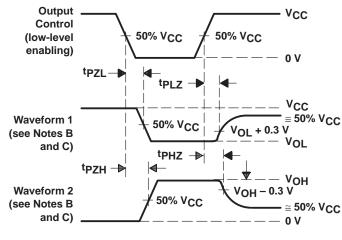

**VOLTAGE WAVEFORMS** PROPAGATION DELAY TIMES

**VOLTAGE WAVEFORMS ENABLE AND DISABLE TIMES, 3-STATE OUTPUTS** 

- NOTES: A. Phase relationships between waveforms were chosen arbitrarily. All input pulses are supplied by pulse generators having the following characteristics: PRR = 1 MHz,  $Z_O$  = 50  $\Omega$ ,  $t_r$  = 6 ns.
  - B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
  - C. For tpLZ and tpHZ, VoL and VoH are measured values.

### PC Card cycle timing

The PC Card cycle timing is controlled by the wait-state bits in the Intel 82365SL-DF compatible memory and I/O window registers. The PC Card cycle generator uses the PCI clock to generate the correct card address setup and hold times and the PC Card command active (low) interval. This allows the cycle generator to output PC Card cycles that are as close to the Intel 82365SL-DF timing as possible, while always slightly exceeding the Intel 82365SL-DF values. This ensures compatibility with existing software and maximizes throughput.

The PC Card address setup and hold times are a function of the wait-state bits. Table 75 shows address setup time in PCLK cycles and nanoseconds for I/O and memory cycles. Table 76 and Table 77 show command active time in PCLK cycles and nanoseconds for I/O and memory cycles. Table 78 shows address hold time in PCLK cycles and nanoseconds for I/O and memory cycles.

Table 75. PC Card Address Setup Time, t<sub>su(A)</sub>, 8-Bit and 16-Bit PCI Cycles

| WAIT-S | TS1 - 0 = 01<br>(PCLK/ns) |   |       |

# timing requirements over recommended ranges of supply voltage and operating free-air temperature, memory cycles (for 100-ns common memory) (see Note 5 and Figure 24)

|                 |  | ALTERNATE<br>SYMBOL | MIN                       | MAX | UNIT |
|-----------------|--|---------------------|---------------------------|-----|------|
| t <sub>su</sub> | Setup time, CE1 and CE2 before WE/OE low               | T1                  | 60                        |     | ns   |
| t <sub>su</sub> | Setup time, CA25–CA0 before WE/OE low                  | T2                  | t <sub>su(A)</sub> +2PCLK |     | ns   |
| t <sub>su</sub> | Setup time, REG before WE/OE low                       | Т3                  | 90                        |     | ns   |
| tpd             | Propagation delay time, WE/OE low to WAIT low          | T4                  |                           |     | ns   |
| t <sub>W</sub>  | Pulse duration, WE/OE low                              | T5                  | 200                       |     | ns   |
| th              | Hold time, WE/OE low after WAIT high                   | T6                  |                           |     | ns   |
| t <sub>h</sub>  | Hold time, CE1 and CE2 after WE/OE high                | T7                  | 120                       |     | ns   |
| t <sub>su</sub> | Setup time (read), CDATA15-CDATA0 valid before OE high | Т8                  |                           |     | ns   |
| th              | Hold time (read), CDATA15-CDATA0 valid after OE high   | T9                  | 0                         |     | ns   |
| th              | Hold time, CA25–CA0 and REG after WE/OE high           | T10                 | t <sub>h(A)</sub> +1PCLK  |     | ns   |
| t <sub>su</sub> | Setup time (write), CDATA15–CDATA0 valid before WE low | T11                 | 60                        |     | ns   |
| t <sub>h</sub>  | Hold time (write), CDATA15–CDATA0 valid after WE low   | T12                 | 240                       |     | ns   |

NOTE 8: These times are dependent on the register settings associated with ISA wait states and data size. They are also dependent on cycle type (read/write, memory/I/O) and WAIT from PC Card. The times listed here represent absolute minimums (the times that would be observed if programmed for zero wait state, 16-bit cycles) with a 33-MHz PCI clock.

#### **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
