

# SmartGLCD

240x128

# TO OUR VALUED CUSTOMERS

I want to express my thanks to you for being interested in our products and for having confidence in MikroElektronika.

The primary aim of our company is to design and produce high quality electronic products and to constantly improve the performance thereof in order to better suit your needs.

A handwritten signature in white ink, appearing to read 'N. Matic', is positioned on the right side of the page. The signature is fluid and cursive, with the first letter 'N' being particularly large and stylized.

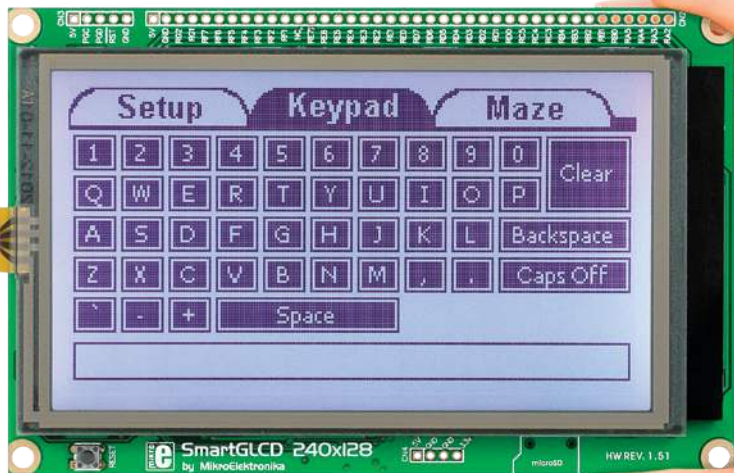

Nebojsa Matic

# What is the SmartGLCD 240x128?

The SmartGLCD 240x128 is a compact smart display, with many on-board peripherals. It's designed to become a control interface of your device. Main part of the board is a large 240x128 pixel graphical LCD with a 4-wire resistive touch screen. It features RGB backlight, which can greatly improve user experience, but can also be used as a signaling feature. The heart of the board is PIC18F87K22, an 8-bit microcontroller delivering 12MIPS of processing power. Other modules like USB UART, piezo buzzer, microSD slot and connection pads can be found on board as well. The board is preprogrammed with UART bootloader. We have also provided a nice example which will give you a great out-of-the-box experience.

# Package Contains

- 01 Damage resistant protective box

- 02 SmartGLCD 240x128 development board

- 03 DVD with documentation and examples

- 04 SmartGLCD 240x128 user's guide

- 05 SmartGLCD 240x128 schematic and pinout

- 06 USB cable

# 1. Key Features

- 01 GLCD 240x128 display
- 02 RESET button
- 03 Power supply pads
- 04 I/O pads
- 05 Pads for mikroProg programmer
- 06 USB connector
- 07 Touch panel connector
- 08 PIC18F87K22 microcontroller
- 09 Contrast potentiometer
- 10 microSD card slot
- 11 USB UART module
- 12 Buzzer

## System Specification

**power supply**  
Via USB cable (5V DC)

**power consumption**  
~350mA in idle state  
(backlight is ON)

**board dimensions**  
140x90cm (5.51x3.24")

**weight**  
~210g (0.46 lbs)

## 2. Power supply

The SmartGLCD board can be powered in two different ways: via USB connector (**CN1**) using MINI-B USB cable provided with the board (**Figure 2-1**), or via side headers (**CN2** or **CN4**) using external 5V power supply (**Figure 2-2** and **Figure 2-3**).

When the board is powered up the GLCD display will be automatically turned on. The USB connection can provide up to 500mA of current which is more than enough for the operation of all on-board modules and the microcontroller as well.

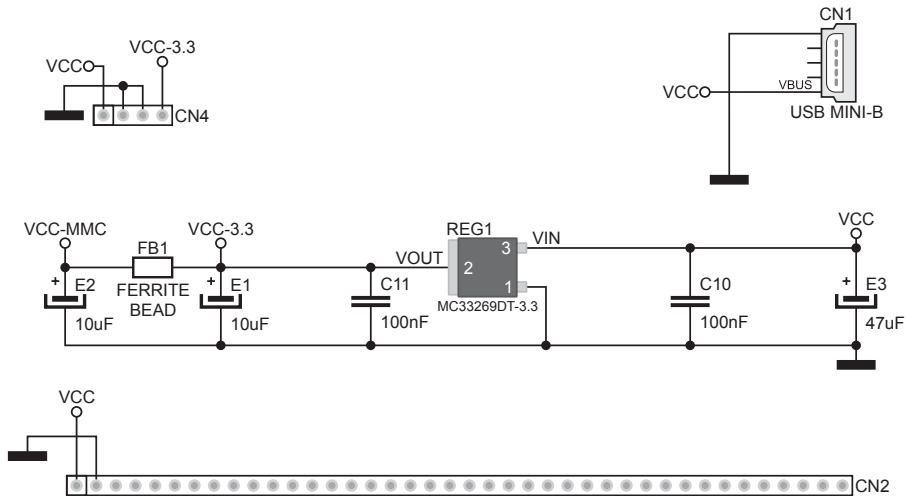

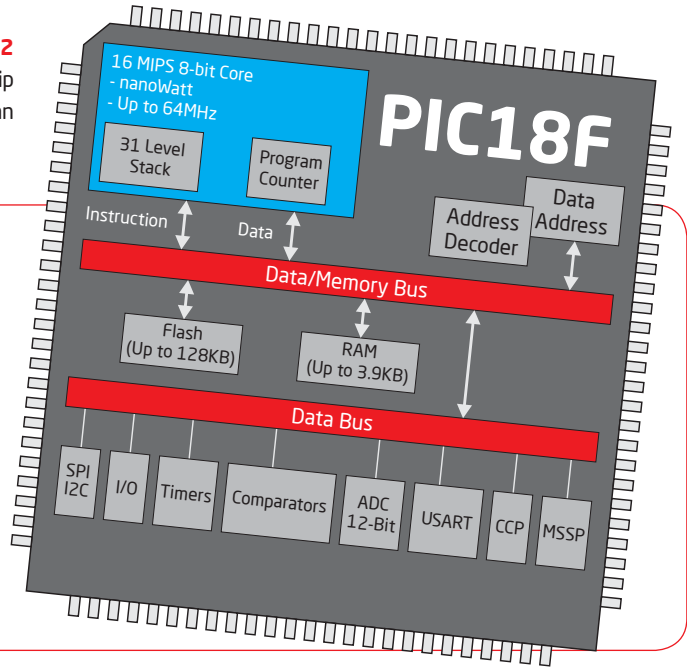

Figure 2-4: Power supply schematic

# 3. PIC18F87K22 microcontroller

The SmartGLCD development tool comes with the **PIC18F87K22** microcontroller. This 8-bit microcontroller is rich with on-chip peripherals and features 128KB of Flash and 4KB of RAM. It can easily handle demanding graphical applications.

## Key microcontroller features

- Up to **12 MIPS** Operation;
- 8-bit architecture;
- 128KB of Flash memory;
- 3,862 bytes of RAM;
- 1024 bytes of EEPROM;
- 80 pin TQFP;
- 24 ch, 12-bit ADC;
- UART, SPI, I<sup>2</sup>C; etc.

## 4. Programming the microcontroller

Figure 4-1:  
PIC18F87K22  
microcontroller

The microcontroller can be programmed in two ways:

- 01 Using USB UART mikroBootloader
- 02 Using external mikroProg™ for PIC, dsPIC, PIC32 programmer

# 5. Programming with bootloader

Microcontroller is preprogrammed with USB UART Bootloader, which can be used to upload new device firmware. To transfer firmware .HEX file from a PC to MCU you need to use mikroBootloader USB UART application, which can be downloaded from:

<http://www.mikroe.com/smartglcd/>

Upon download, unzip it to desired location and start the mikroBootloader application:

## mikroBootloader software

**note** Before starting mikroBootloader software, connect SmartGLCD to a PC using a USB cable provided with the package.

Figure 5-1: mikroBootloader window

**01** When you start mikroBootloader software a window should appear, as shown in the image above.

## Identifying device COM port

Figure 5-2: Identifying COM port

- 01 Open **Device Manager** window and expand **Ports (COM & LPT)** section to check which COM port is assigned to SmartGLCD board (in this case it is COM18).

## step 1 - Choosing COM port

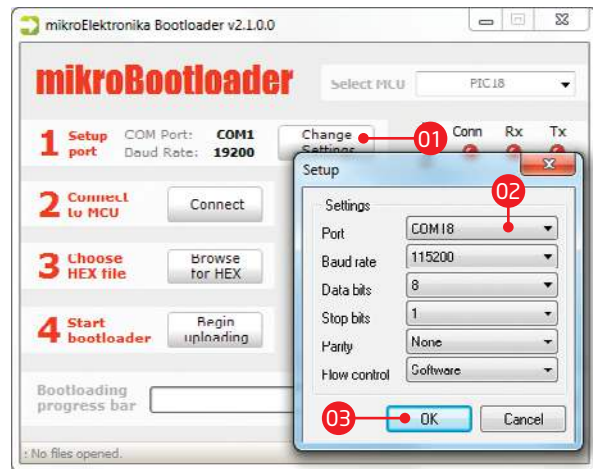

Figure 5-3: Choosing COM port

- 01 Click the **Change Settings** button.
- 02 From the drop down list, select appropriate **Port** (in this case it is COM18) and **Baud rate** (115200).
- 03 Click **OK**.

## step 2 - Establishing Connection

Figure 5-4: Connecting with mikroBootloader

- 01 Press the **Reset** button on SmartGLCD board and **click Connect** within 5s, otherwise the existing microcontroller program will run. If connected, the button's caption will be changed to **Disconnect**.

## step 3 - Browsing for .HEX file

Figure 5-5: Browse for HEX

- 01 Click the **Browse for HEX** button and from a pop-up window (Figure 5-6) choose a .HEX file to be uploaded in MCU memory.

## step 4 - Selecting .hex file

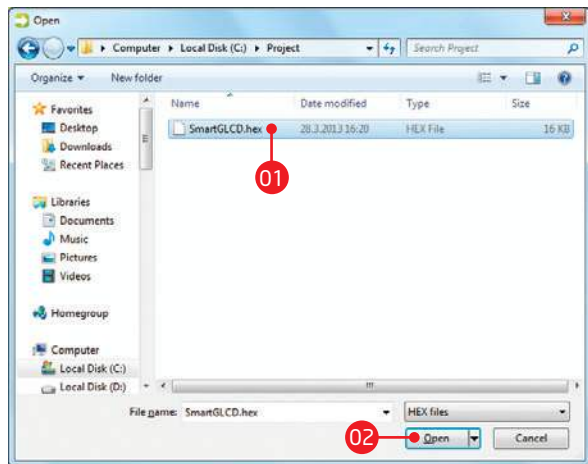

Figure 5-6: Locating and selecting .hex file

- 01 Select .HEX file from the **Open dialog** window.
- 02 Click the **Open** button.

## step 5 - Uploading .hex file

Figure 5-7: Begin uploading

- 01 In order to upload .HEX file click the **Begin uploading** button.

## step 6 - Progress bar

Figure 5-8: Progress bar

- 01 Progress bar enables you to monitor .HEX file uploading.

## step 7 - Finishing upload

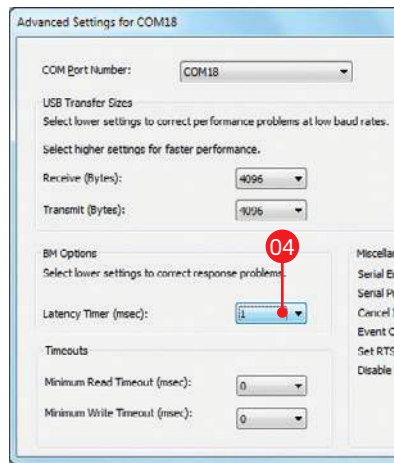

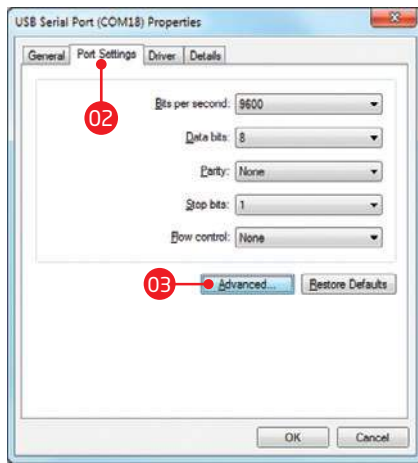

Figure 5-9: Restarting MCU

- 01 Click **OK** button after the uploading process has been finished.
- 02 Press **Reset** button on SmartGLCD board and wait for 5 seconds. Your program will run automatically.

# Tips and Tricks: Speed-up UART data transfer

**note** If .HEX file transfer from your PC to MCU is too slow, it's possible to speed up data transfer by setting latency time of COM port to 1 ms. This is done in Device Manager:

- 01 Right click on the **USB Serial Port (COM18)** item and then select **Properties**.
- 02 Select **Port Settings** tab.
- 03 Click the **Advanced...** button.
- 04 Set **Latency Timer** to **1** and click **OK**.

## 6. Programming with mikroProg™ programmer

The microcontroller can be programmed with the external **mikroProg™** programmer which can be connected to the board via **CN3** connector. Before establishing this connection it is necessary to solder 1x5 male header to **CN3** connection pads. This can be done in both ways: on the bottom, or the top side, as shown in **Figures 6-1** and **6-2**.

**note** If bootloader program is accidentally erased you can upload it again through mikroProg programmer. Program [Bootloader18F87K22.hex](#) can be found under Firmware folder (page 12).

Figure 6-3: mikroProg™ connection schematic

**note**

Make sure to use only the front row of mikroProg's IDC10 connector (side with a knob and incision) when connecting it to 1x5 header on your SmartGLCD board.

# 7. mikroProg Suite™ for PIC® Software

The **mikroProg™** programmer requires special programming software called **mikroProg Suite™ for PIC®**. It can be used for programming all Microchip® microcontroller families, including PIC10®, PIC12®, PIC16®, PIC18®, dsPIC30/33®, PIC24® and PIC32®. The software has intuitive interface and SingleClick™ programming technology. Just download the latest version of **mikroProg Suite™** and your programmer is ready to program new devices. **mikroProg Suite™** is updated regularly, at least four times a year, so your programmer will be more and more powerful with each new release.

Figure 7-1: Main window of mikroProg Suite™ for PIC® programming software

# Software Installation Wizard

01 Start Installation

02 Accept EULA and continue

03 Install for all users

04 Choose destination folder

05 Installation in progress

06 Finish installation

## 8. microSD Card Slot

**Figure 8-1:**  
microSD card slot

There is a built-in microSD card slot provided on-board. It enables the expansion of available memory space using microSD cards. Communication between the microcontroller and the card is done through Serial Peripheral Interface (**SPI**).

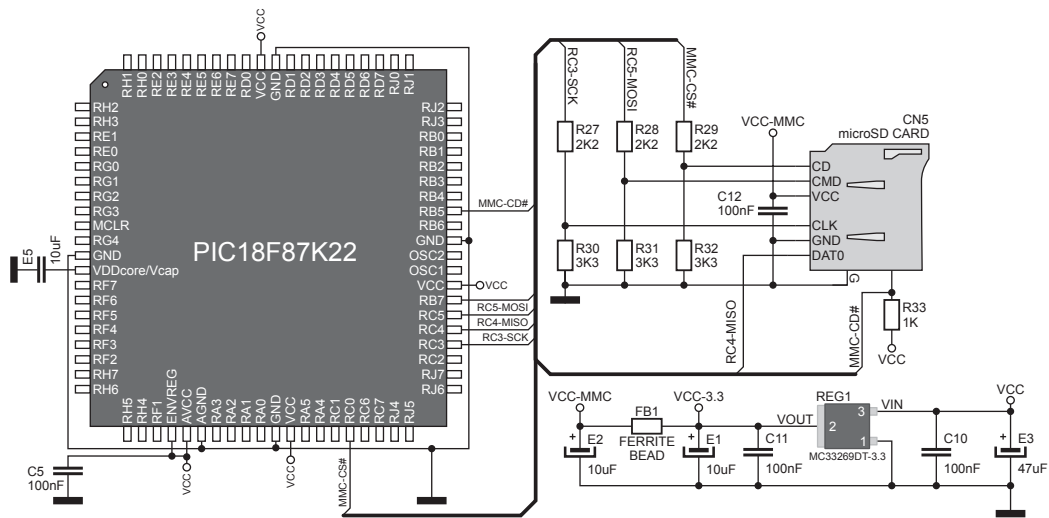

Figure 8-2: microSD Card Slot module connection schematic

## 9. Touch Screen

The development system features a **Graphical LCD in 240x128 pixel resolution**. Display is covered with a **4-wire resistive** touch panel. Together they form a functional unit called a touch screen, **Figure 9-1**. It enables data to be entered and displayed at the same time.

**Figure 9-1:**  
**Touch Screen**

Figure 9-2: Touch Screen connection schematic

# 10. RGB backlight

Graphical LCDs are only capable of showing monochromatic pixel but not color content. The color of the pixel is determined by the color of the backlight which illuminates the display. SmartGLCD has **the RGB color backlight** - a very useful feature which can give your graphical user interfaces an astonishing look.

Display's backlight module consists of three LEDs: red, green and blue, which can shine simultaneously. LED can be driven by PWM signals coming from three separate microcontroller pins. Duty ratio of the PWM signal determines the intensity of color (or brightness) of each LED. Combined together they can create more than 16 million different backlight colors.

Figure 10-1:  
The same graphics  
with different  
backlight colors

# 11. Contrast potentiometer

On the backside of the board there is a small potentiometer which can be used to change contrast of the GLCD. The brighter the backlight, the less contrast you will need to properly display the graphical content.

Figure 11-1:  
Contrast potentiometer

## 12. USB UART

Figure 12-1:  
Connecting USB cable  
to SmartGLCD board

Fast on-board **FTDI® chip** allows you to communicate with a PC or other UART devices using USB UART connection. Before connecting the board to a PC, make sure that you have the appropriate **FTDI drivers** installed on your operating system. Drivers can be found on the **Product DVD**:

[DVD://download/eng/software/development-tools/universal/ftdi/vcp\\_drivers.zip](DVD://download/eng/software/development-tools/universal/ftdi/vcp_drivers.zip)

USB-B connector (**CN1**) is used for connecting the USB cable, which is delivered with the board package. Plug it in as shown in **Figure 12-1**.

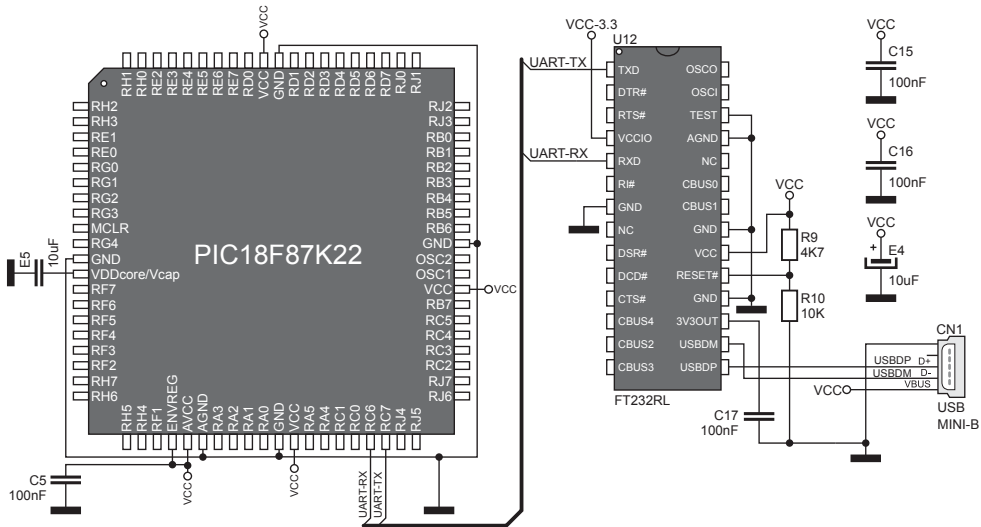

Figure 12-2: USB UART module connection schematic

# 13. Buzzer

Figure 13-1:  
Buzzer module

The board is also equipped with piezo buzzer. It is an electric component which can be used to create sound when provided with electrical signal. This is usually a PWM signal coming from a microcontroller pin. Before entering the buzzer itself, the signal is amplified by the on-board buzzer driver circuit. Frequency of the signal determines the pitch of the sound and duty cycle of the signal can be used to increase or decrease the volume.

Figure 13-2: Buzzer module schematic

# 14. Pinout

- Analog Lines
- Interrupt Lines
- SPI Lines
- I2C Lines
- UART lines

# What's next?

Your journey through each and every feature of SmartGLCD board ends here. You got to know it's modules and organization. Now you are ready to use it. We are suggesting several steps which are probably the best way to begin with. We invite you to join the users of SmartGLCD brand. You will find very useful projects and tutorials and can get help from a large ecosystem of users. Welcome!

## Compiler

You still don't have an appropriate compiler? Locate PIC® compiler that suits you best on the Product DVD provided with the package:

*DVD://download/eng/software/compilers/*

Choose between mikroC™, mikroBasic™ and mikroPascal™ and download fully functional demo version, so you can begin building your first applications.

## Projects

Once you have chosen your compiler, and since you already got the board, you are ready to start writing your first projects. **Visual GLCD software** for rapid development of graphical user interfaces enables you to quickly create your GUI. It will automatically create necessary code which is compatible with mikroElektronika compilers. Visual GLCD is rich with examples, which are an excellent starting point for your future projects. Just load the example, read well commented code, and see how it works on hardware. Visual GLCD is also available on the Product DVD.
