Description

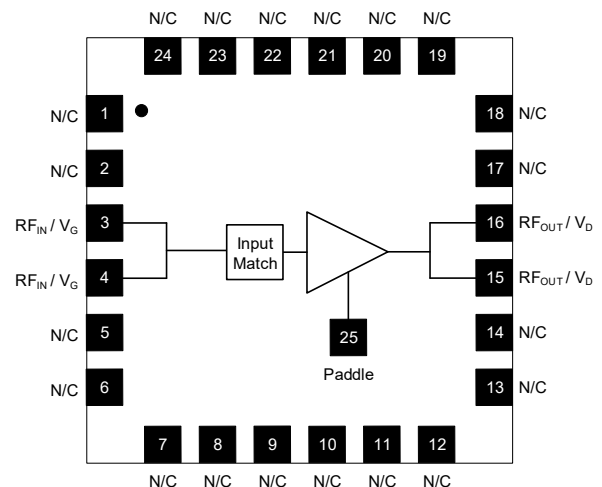

The MAGX-011086A is a GaN on silicon HEMT amplifier optimized for DC - 6 GHz operation in a user friendly package ideal for high bandwidth applications. The device has been designed for saturated and linear operation with output power levels of 4 W (36 dBm) in an industry standard, low inductance, surface mount QFN package. The pads of the package form a coplanar launch that naturally absorbs lead parasitics and features a small PCB outline for space constrained applications.

Absolute Maximum Ratings^{4,5,6,7,8}

Parameter	Absolute Maximum
Drain Source Voltage, V_{DS}	100 V
Gate Source Voltage, V_{GS}	-10 to 3 V
Gate Current, I_G	4 mA
Storage Temperature Range	-65°C to +150°C
Case Operating Temperature Range	-40°C to +85°C
Channel Operating Temperature Range, T_{CH}	-40°C to +225°C
Absolute Maximum Channel Temperature	+250°C

4. Exceeding any one or combination of these limits may cause permanent damage to this device.
5. MACOM does not recommend sustained operation near these survivability limits.
6. Operating at drain source voltage $V_{DS} < 32$ V will ensure $MTTF > 1 \times 10^7$ hours.
7. Operating at nominal conditions with $T_{CH} \leq 225^\circ\text{C}$ will ensure $MTTF > 1 \times 10^7$ hours.
8. $MTTF$ may be estimated by the expression $MTTF$ (hours) = $A e^{[B + C/(T+273)]}$ where T is the channel temperature in degrees Celsius, A = 3.686, B = -35.00, and C = 25,416.

Thermal Characteristics^{9,10}

Parameter	Test Conditions	Symbol	Typical	Units
Thermal Resistance	$V_{DS} = 28$ V, $T_J = 200^\circ\text{C}$	Θ_{JC}	12.5	°C/W

9. Junction temperature (T_J) measured using IR Microscopy. Case temperature measured using thermocouple embedded in heat-sink.
10. The thermal resistance of the mounting configuration must be added to the device Θ_{JC} , for proper T_J calculation during operation. The recommended via pattern, shown on page 4, on a 20 mil thick, 1 oz plated copper, PCB adds an additional 4 °C/W to the typical value.

Handling Procedures

Please observe the following precautions to avoid damage:

Static Sensitivity

Gallium Nitride Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these class 1A devices.

Load-Pull Performance: $V_{DS} = 28\text{ V}$, $I_{DQ} = 50\text{ mA}$, $T_A = 25^\circ\text{C}$

Evaluation Board and Recommended Tuning Solution
5.8 GHz Narrowband Circuit

Description

Parts measured on evaluation board (20-mil thick RO4350). The PCB's electrical and thermal ground is provided using a standard-plated densely packed via hole array (see recommended via pattern).

Matching is provided using a combination of lumped elements and transmission lines as shown in the simplified schematic above. Recommended tuning solution component placement, transmission lines, and details are shown on the next page.

Bias Sequencing

Turning the device ON

1. Set V_{GS} beyond pinch-off (V_P), typically -5 V.
2. Turn on V_{DS} to nominal voltage (28 V).
3. Increase V_{GS} until the I_{DS} current is reached.
4. Apply RF power to desired level.

Turning the device OFF

1. Turn the RF power off.
2. Decrease V_{GS} down to V_P .
3. Decrease V_{DS} down to 0 V.
4. Turn off V_{GS} .
